Welcome

Thank you for purchasing an ATEM Television Studio switcher for your live production work!

If you're new to live production switchers, then you're about to become involved in the most exciting part of the television industry and that's live production! There is nothing like live production and it's so easy to become addicted to the adrenaline rush of editing in real time while the live event unfolds before your eyes. It's real television the way it should be!

Previously, broadcast quality live production has always been way too high in cost for most people to afford, while affordable switchers lacked broadcast features and quality. ATEM Television Studio switchers change this letting you create the most amazing professional live production results. We hope you get years of use from your switcher and have lots of fun creating live production!

This instruction manual should contain all the information you'll need for installing your ATEM Television Studio switcher.

Please check the support page on our web site at www.blackmagicdesign.com for the latest version of software for your ATEM switcher. Simply connect your computer to the ATEM switcher and the ATEM hardware control panel via USB to update software so you get all the latest features! When downloading software, please register with your information so we can keep you updated when new software is released. We are constantly working on new features and improvements, so we would love to hear from you!

Grant Petty

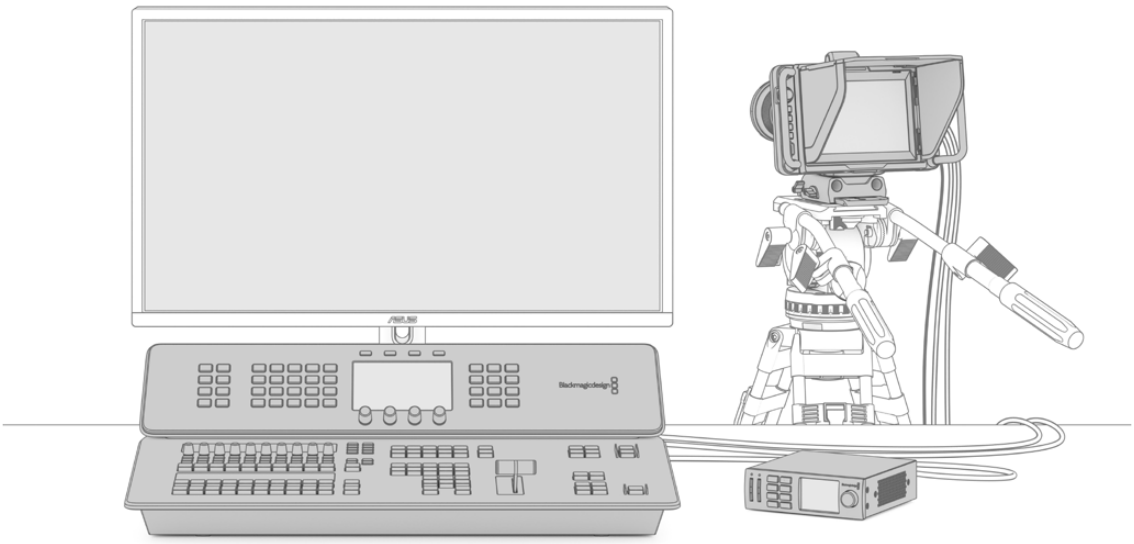
Introducing ATEM Television Studio

ATEM Television Studio switchers are professional broadcast grade digital production switchers capable of switching and processing a variety of video sources in live video production and broadcast environments. The switcher uses the current and familiar Mix Effects based design with software and hardware control options that provides an intuitive, fast and easy to use workflow for program/preview switching. If you're used to the older A/B direct switcher style, ATEM switchers also support A/B direct switching which makes it easy to get started.

You only need your ATEM switcher to get started as it has a built in control panel so you can switch your live production using just the switcher. However, if you want to add more control flexibility, you can also use ATEM Software Control, or even add one or more hardware control panels if you need a more advanced solution.



Setting up your ATEM Television Studio switcher can be as simple as plugging the multiview output into a monitor, plugging in a camera and then connecting the program output to a recording deck

What is an M/E Switcher?

If you have used low cost switchers before, then these might not have used the mix effects style of operation that's commonly called an M/E style of operation. If you have used an M/E style switcher, then you might want to skip ahead to install and get working with your new ATEM switcher.

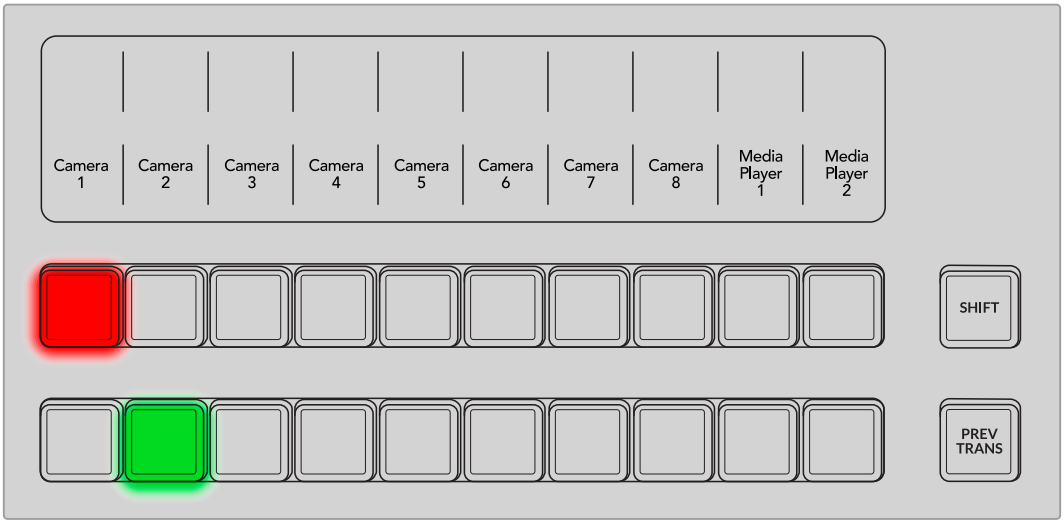
When you're starting out with a switcher for the first time, the ATEM can look a little intimidating with all its buttons and knobs, however it's all very logically laid out so it's very simple to use.

ATEM is a true high-end broadcast switcher that operates using the M/E workflow standards used in the broadcast industry. This means once you get familiar with how it works, you will feel instantly at home on virtually any switcher used in broadcast today.

The M/E style of operation has been developed over decades to help eliminate errors when switching live events and is a broadcast standard. It's extremely easy to see what's going on at any time so you don't get confused and make mistakes. The M/E style of operation lets you check the sources you are about to switch on air, as well as try effects before using them on air. You can see buttons for each keyer and transition, so you instantly know what's going on and what's about to happen.

The best way to learn about how your ATEM works is to grab your switcher and play with it while referencing this manual. You might want to jump ahead and install your switcher before reading the rest of this section.

To start, the most visible part of an M/E based control panel is the transition fader, which typically appears as a T bar or slider on a control panel, and the program and preview rows of source buttons.



The program and preview rows of buttons let you preview a source and then switch it to air

There are multiple types of transitions available, and they can be selected using the system control buttons to the left of the LCD or by pressing the specific transition button on the panel. You can choose from a wide range of wipe patterns and DVE effects, plus use the LCD menu to adjust the transition rate and other transition settings.

The other concept that is important to know about M/E style switchers, including ATEM, is the video on the program and preview rows is technically called the background video. This is because the upstream (effects) keyers and downstream keyers will overlay on top of this source. So you can load graphics into the keyers and see them with the preview video and when keys are turned on, you will see the overlay on top of the program video. This is very powerful and allows multiple layers to be built up.

Another great advantage of the ATEM M/E style of operation is you can tie keyers to the transition. This means when you do a mix transition, you can also fade on or off keyers at the same time. This allows you to build up a composition, and then bring the whole lot on air at the same time. This is what the next transition buttons do, and you can select background for normal transitions, or select one or more keyers to transition them on air.

You can even press multiple buttons on an ATEM Television Studio switcher's control panel to tie multiple keys and the background at the same time. There are also dedicated downstream key tie buttons to tie downstream keyers to the transition. Downstream keys also have dedicated cut and mix buttons and so are very flexible. Downstream keyers are always layered over the top of everything including the transition, so are a great place to key bugs and logos.

Finally, when your live production is finishing, it's nice to have a dedicated fade to black (FTB) control to fade everything to black. You can see the dedicated fade to black control on the bottom right of the switcher. This lets you fade everything to black, and helps make sure you don't miss a layer. Fade to black is at the extreme end of the processing chain so you get a clean fade of all sources.

The last part of an M/E style switcher is the select bus. This is above the program row, and simply allows sources to be selected for effects processing and other purposes, and there is a label above this to show what you're switching. The select bus is commonly used to select key inputs, and can also be used to run macros directly from the control panel.

As you can see by this quick overview, M/E style of operation allows confident live production with good feedback on what's going on and the state of your switcher and programming at any point in your production. Once you learn the M/E style of operation, you can move between models of production switchers with little retraining as they all work the same.

What is an A/B Direct Switcher?

If you have been using video switchers for a long time, then you might be used to older-style A/B direct switchers.

A/B direct switchers have an A bus and a B bus. One bus is the program bus which shows a red button for the current program output. The other is the preview bus which has a green button for the preview video. As you move the fader bar up and down, the buses switch so that the red program button follows the fader handle. This is where A/B direct switching is really easy to use as the buttons stay lit in the same positions and just switch color between green and red.

A/B direct switching becomes a little more confusing when the fader control is not used to make the switch. If you use a cut or auto transition button to bring your preview source on air, or if you use more than one control panel connected to your switcher, the fader control won't have moved on the control panel that you are using. The red program output always follows the fader control and, as you haven't moved it, the red program light has to move to another button on the same row and the green preview light has to move to another button in its row.

This can become quite confusing when sometimes using the fader control to make switches, and sometimes not, as the rows containing your preview and program buttons will sometimes switch and sometimes stay where they are which has the potential to lead to mistakes.

This is why modern M/E style switching is preferable because you'll always find your green preview button in the preview row, and the red program button in the program row. It's always consistent and there are no surprises with M/E style switching.

Understanding the ATEM Switcher

ATEM Television Studio switchers provide all the video processing, as well as all video input and output connectors.

The switcher has a built in control panel with buttons and knobs so you can switch directly from the switcher itself, or you can connect to a computer via Ethernet and use ATEM Software Control that emulates the same controls on a software panel. Using the software panel together with the built in control panel lets multiple operators switch your production. For example, you could switch cameras using the built in panel while other operators control the camera and audio levels using the software panel. The options are endless.

ATEM Television Studio switchers support HD video up to 1080p60 via 3G-SDI. ATEM Television Studio 4K8 switchers also support 4K video up to 2160p60. All inputs on your switcher have a built in resynchronizer and standards converter so you can plug in different formats and they will automatically convert to the switcher's set output format.

Each switcher features advanced chroma keyers, a Fairlight audio mixer, camera control adjustments and the ability to load stills into the media pool and much more. When connected to a network, you can select streaming inputs or record directly to network storage.

ATEM Television Studio switchers feature auxiliary outputs that can use any internal and external video sources. For example, program feeds if you need more program outputs, or clean feeds without down stream keying, or even specific video inputs. ATEM Television Studio HD8 switchers have 2 auxiliary outputs while the ATEM Television Studio 4K8 models have 10 auxiliary outputs. The extra auxiliary outputs on the ATEM Television Studio 4K8 model can be used to connect to external HyperDeck disk recorders and you can record all the video inputs for later editing. Recording the video inputs is called ISO recording as you are recording the isolated inputs.

ATEM Television Studio HD8 ISO

ATEM Television Studio HD8

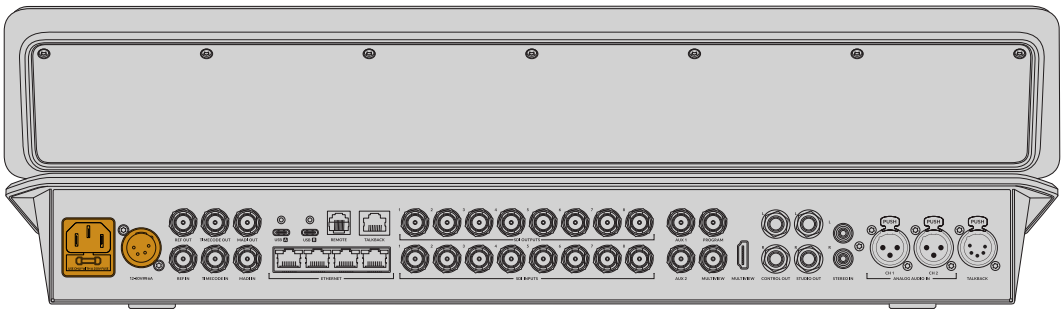
ATEM Television Studio 4K8

Getting Started

Getting started with your ATEM Television Studio is as simple as connecting power, adding your SDI video sources, connecting your multiview and using the built in control panel to check your inputs.

Plugging in Power

To power your ATEM Television Studio switcher, plug a standard IEC cable to the power input on the rear panel. ATEM Television Studio switchers also feature a DC input, which lets you connect power from an external 12V battery. Once powered the control panel LCDs will turn on and camera buttons will illuminate.



Connect power via the IEC or DC inputs on ATEM Television Studio

Connecting the Multiview

To check the inputs, connect a display to the multiview output using either the SDI or HDMI multiview connections.

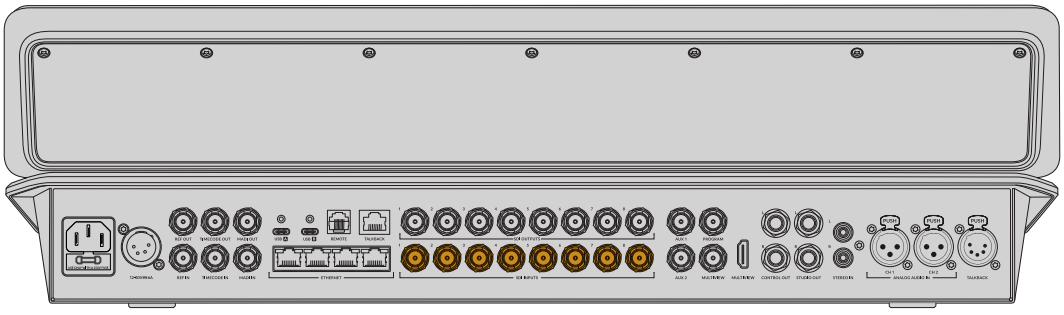
Once connected, you should see 8 small boxes and 2 large boxes on the display. Each box is a separate view and as you connect additional sources, they will appear on their respective views. You can customize the look of the multiview to show up to 16 views using ATEM Software Control. For more information, see ‘using the multiview’ later in this manual.

If you can see the multiview, then your ATEM is powered on and running fine and you can now start plugging in sources.

Connect your ATEM Television Studio switcher to a monitor to view the multiview output

Plugging in Sources

Plug your SDI cameras and other sources into ATEM Television Studio SDI inputs. These SDI connections feature format conversion and frame synchronizers so all sources will conform to the video format set on your switcher.



ATEM Television Studio SDI inputs

With ATEM Television Studio HD8 ISO switchers, you can also connect streaming sources via the Ethernet ports, such as Blackmagic Studio Camera 6K Pro. For more information on selecting sources via Ethernet, refer to ‘additional features on ISO models’ later in this manual.

Plugging in Audio

ATEM Television Studio switchers include a built in audio mixer which allows the use of embedded SDI audio from your cameras as well as external audio from the XLR and RCA inputs as well as the MADI BNC inputs. These additional audio inputs can be used for other audio sources such as camera microphones and pre-recorded audio.

Audio inputs on ATEM Television Studio

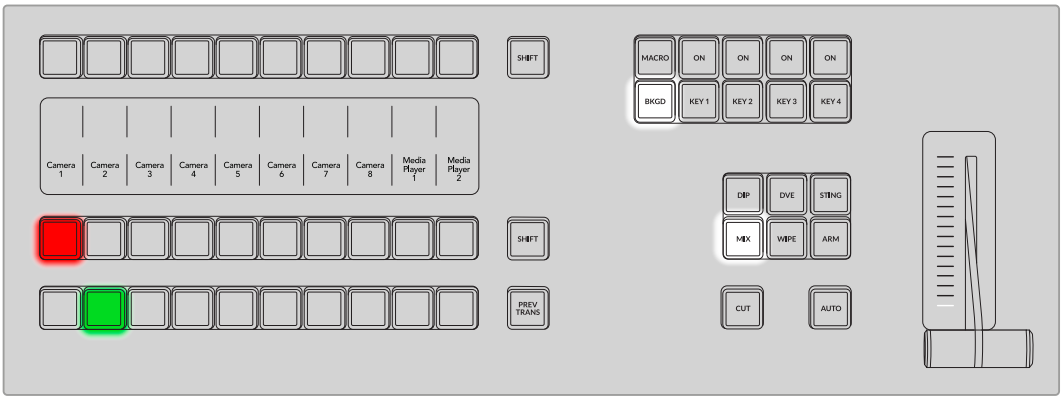
Once your audio is connected, you can confirm the signal on each channel by looking at the levels on the control panel's audio mixer.

Check audio levels via the meters on the Fairlight audio mixer

For more information refer to the audio mixer section later in this manual.

Performing a Transition

To start, the most visible part of an M/E based control panel is the transition fader, which typically appears as a T bar or slider on a control panel, and the program and preview rows of source buttons.

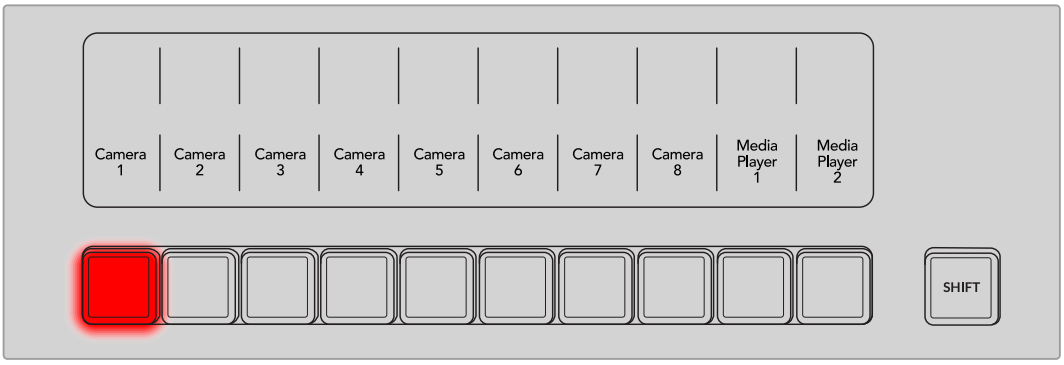


When checking your setup, the first step you may want to try is to perform a transition.

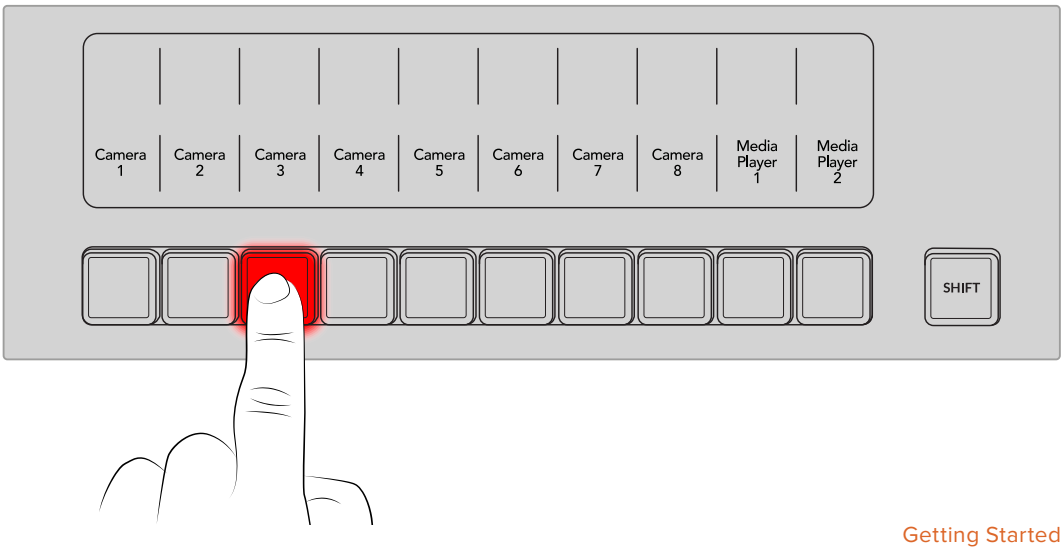
There are two switching modes available on your ATEM Television Studio switcher. The default mode is ‘program preview’ which lets you preview a source before switching it to air. However the program bus source select buttons in the top row can be used to hot switch sources to the program output. Be careful when selecting sources on this row, as they will instantly be switched on air.

Performing a cut from input 1 to input 3 using the program row:

1 Input 1 is illuminated red to indicate input 1 is currently live on air.



2 In the program row, press input 3.



Input 1 will now immediately switch to input 3 and you will see input 3 illuminated red, which means input 3 is now live on air. This is known as a cut as you are 'cutting' directly from one source to another.

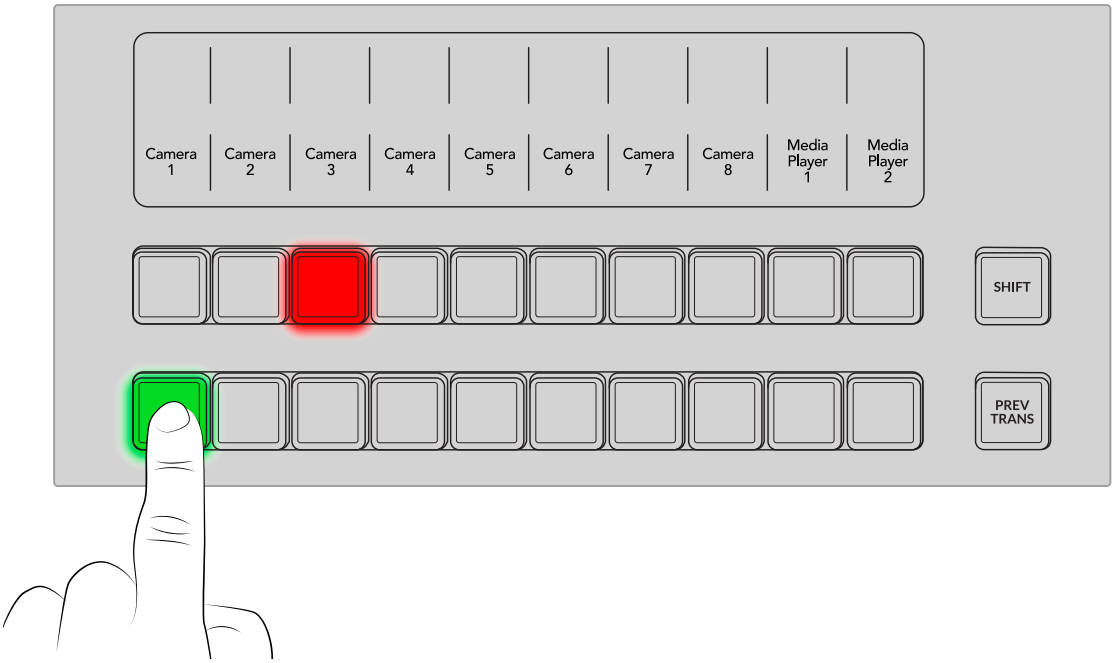
A safer and more orderly way to do transitions is to select them on the preview row, and then use a transition to cut or transition them on air.

This is a very powerful way to use a switcher, because you can select your source on the preview row, and see it on the preview video output to confirm that you have the correct source before you select the transition you want. You can see what's happening at all stages so it's hard to make mistakes. Only the M/E style of operation allows you to keep track of what's going on.

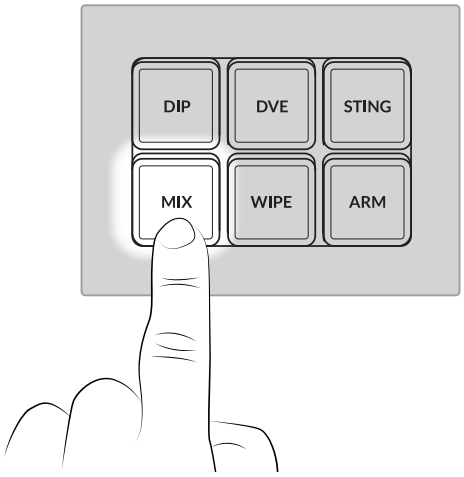
The bottom row of buttons is the preview bus source selection. This is where you will spend most of your time selecting sources about to go on air. This selected source is sent to the program output when the next transition occurs. The next transition can be triggered by pushing the cut button, the auto button, or by moving the transition fader up or down. You can select between a mix, dip, wipe, DVE or other transition depending on what you have selected in the transition control section.

In the following example a mix transition will be used to transition from source 3 back to source 1.

1 Select the next source by pressing button 1 on the preview row. The button will now illuminate green to show it is selected on the preview bus.

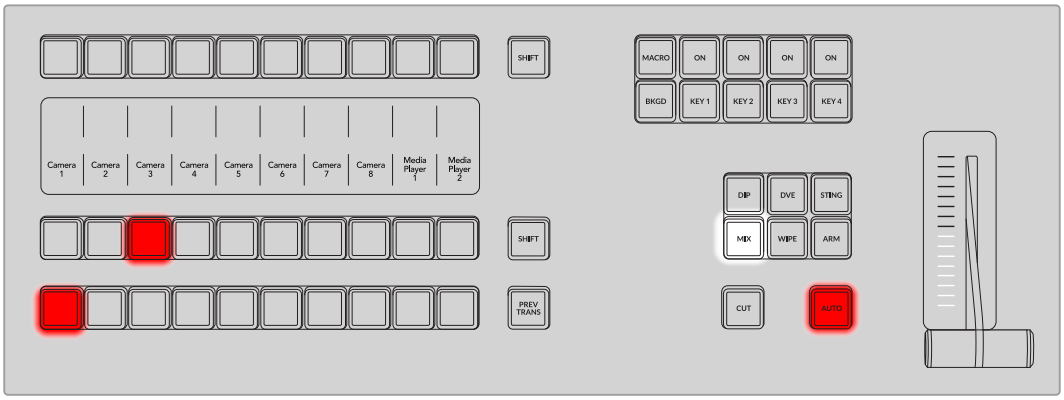


2 Press the dedicated ‘mix’ transition button.

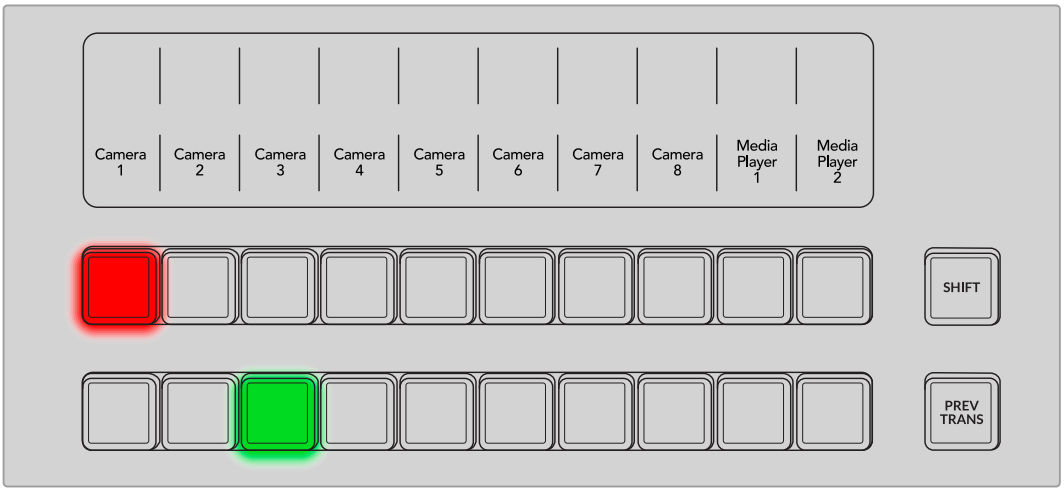


3 Now press the ‘auto’ button to perform the transition.

During the transition, input buttons on both the program and preview rows illuminate red to indicate they are both on air and the fader bar indicators will light up.



You might also notice that once your transition is complete, the sources selected on the preview and program rows swap over. This is because the source you selected on the preview row is now the new on air source, so it becomes selected on the program row once the transition is complete. Remember the program row always shows what’s on air.



Setting Your Network

Your ATEM switcher ships from the factory with settings to allow hardware control panels to simply be connected directly with an Ethernet cable. However your ATEM supports full Ethernet IP protocols so you can place your ATEM Television Studio switcher and external ATEM hardware panel on your network or anywhere on the planet using the internet. Connecting to a network means you have enormous flexibility with how you control your switcher. For example, you can connect an ATEM Camera Control Panel on the same network to your switcher and have one operator switching content while the other operators adjusts the cameras. In addition, you also have the software panel on your computer so you can even have a third operator handling audio, or managing media from the software panel.

ATEM Television Studio switchers default to DHCP so the switcher can get its network information automatically. However you can set a fixed IP address manually.

1. If you're not in the home menu, press the 'home' button to return to the main menu.
2. Press the 'network' soft control button above the LCD and use the right arrow button to navigate to 'IP address'. If your switcher can see the network, the assigned IP address will appear across the bottom of the screen.
3. To set a manual IP address, press the 'DHCP on' soft button above the LCD to turn DHCP off. Set your manual IP address using the corresponding knobs beneath the LCD. When using a static IP the switcher must share the same IP address subnet as any device you which to connect to, for example a HyperDeck, which typically means the first 3 fields in the IP address need to be the same.

4. Once you've entered your IP address, press the 'save changes' button.

Now your switcher is on your network, you can select your streaming platform via ATEM Software Control and use the 'on air' buttons to start your stream.

For more information on selecting your streaming platform refer to the 'output tab' later in this manual.

That's all there is to getting started! Keep reading this manual for information on how to use all the features and controls on your ATEM Television Studio switcher.

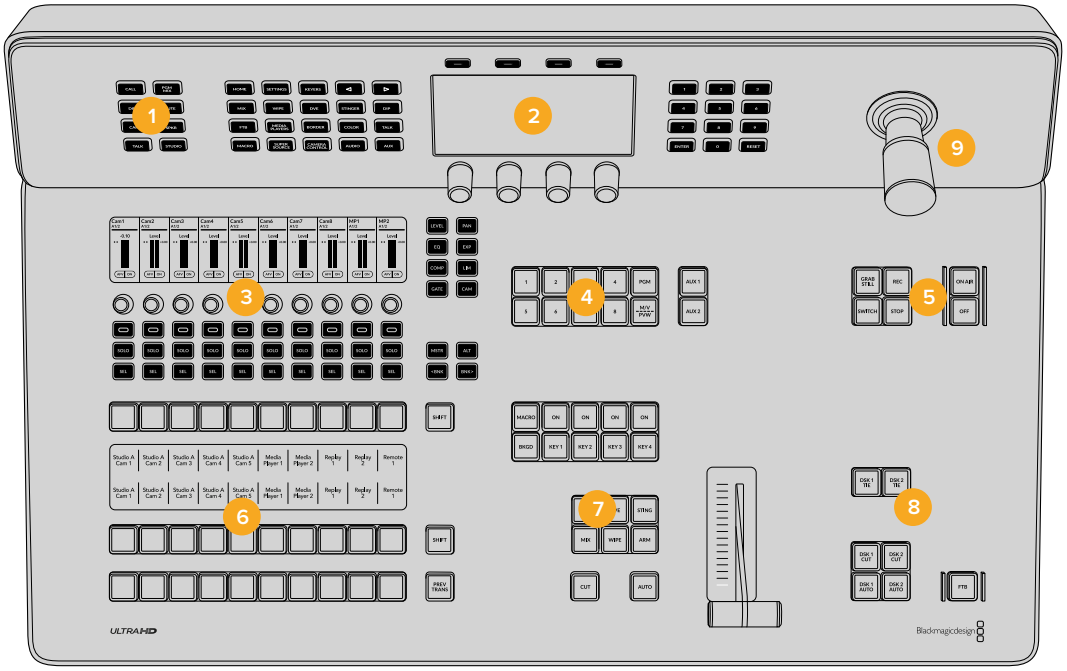
Using ATEM Television Studio

The advanced control panel on your ATEM Television Studio switcher includes program and preview rows, mix effects panel, talkback controls, dedicated Fairlight audio mixer and camera control buttons, menu LCD and T-bar for precise transition control.

The built in panel and the supplied ATEM Software Control panel work together so any change on one panel will be reflected on the other and you can use both panels at the same time. You can also plug in additional hardware control panels, such as ATEM Camera Control Panel, if you have another operator assigned to camera control.

Control Panel Overview

This section provides an introduction to the primary features of the control panel, for example the main system control, LCD menu, program and preview buttons, transition buttons, keyer buttons, Fairlight audio controls and more.



ATEM Television Studio 4K8

1 Talkback and Call Buttons

2 System Control

3 Audio Mixer

4 Aux Selection Buttons

5 Stream and Record buttons

6 Program, Preview and Source Select

7 DVE and Transitions

8 Downstream keyers and Fade to Black

9 Joystick on ATEM Television Studio 4K8 switchers

System Control

The top section of the control panel with the LCD and buttons immediately surrounding it is called system control and is like the switcher's mission control center. This forms the central access menu to change important settings and generally configure your switcher.

System Control

Navigating the LCD Menu

When you press a system control button, for example the 'home' button, the LCD will change accordingly to show the relevant controls and settings. Use the soft buttons and knobs above and below the LCD to make changes.

Each LCD menu can have one or more pages of settings which are indicated via the dots under the menu name. Navigating between pages of settings can be done by using the left and right arrow buttons or the numerical keypad to the right of the LCD.

For example, to select your switching mode between 'program preview' and 'A/B direct':

1 Press the 'settings' button. Once selected, you will notice the left and right arrow buttons illuminate along with the numbered buttons.

Numbered buttons to the right of the LCD display will illuminate for fast access to each menu page

2 Press the right arrow button repeatedly until the switching mode option appears or press the number 6 button to navigate to the switching mode menu immediately.

Use the numerical keypad to navigate the menus

3 From the soft selection options at the top of the LCD, select between program preview or a/b direct.

Use the soft selection keys above the LCD to select your switching mode

4 To exit the settings menu, press the home button.

The numerical keypad can also be used enter values directly. For example, to change the duration for auto transitions on the home screen, press the ‘auto rate’ knob, the keypad button will illuminate.

Enter the new duration value and press enter.

Press enter to confirm changes

Changing Settings

The home screen is the first menu you will see on the LCD and includes network settings and user profiles. Any time you want to return to the home screen all you need to do is press the ‘home’ button.

Press the LCD soft button above ‘button mapping’ to enter the ‘button mapping’ menu.

Home

The home menu will display the current inputs and transition rates as well as submenus for network settings, software version information and saving profiles.

Home	The main LCD display
Network	Set you switcher to DHCP or use a manual address.
About	Displays the software version
Profiles	Save all your preferred panel settings and macros and then reload them the next time you are using the panel, perfect for when the switcher will be used by more than one user.

Settings

Pressing the ‘settings’ button will display menus including ‘settings,’ ‘HyperDecks,’ and ‘button mapping’ which can be selected using the soft buttons above the LCD.

Changing Settings

Use the knobs, soft buttons and numerical keypad to adjust the options in the settings menu

Setting the Switcher Video Standard	The video setting is used to select the operating video standard of the ATEM switcher. Any time the video standard is changed, it will erase any frames you have loaded into the media pool.
Setting the Multiview Video Standard	If your production video standard is set to 1080p25 or higher, you can adjust the multiview output to a lower frame rate. This way you can set the multiview outputs to be down converted for even greater monitor compatibility.
Setting the Brightness	Customize the brightness of the buttons, labels and screens using the knobs in the brightness settings. This can be useful when working in darker environments.

Switcher Timecode	The timecode generator automatically runs time of day timecode from the moment you power the switcher. However, you can reset the counter to zero, or manually enter a new timecode value to start from.
Switching Mode	When you first receive your ATEM switcher, it will be set to program/preview switching which is the current standard for an M/E switcher. You can change this preference to A/B Direct if you wish to use older style A/B switching.
Fade To Black	The FTB button on ATEM Television Studio 4K8 can be enabled or disabled using the LCD soft buttons in system control.
Serial Port Settings	ATEM Television Studio switchers feature a RJ12 remote port on the rear for RS-422 control. You can select how it is used with the serial port menu.
Camera Control Settings	For ATEM Television Studio 4K8 models you can choose the tilt direction of your joystick by selecting 'inverted' or 'normal'. Use the monitoring knob to select the SDI output for camera control monitoring.
Language Selection	ATEM Television Studio switchers can be set to display in English, German, Spanish, French, Italian, Japanese, Korean, Polish, Portuguese, Russian, Turkish, Ukrainian and simplified Chinese languages.
Format Media	The final page of the settings menu lets you format the internal storage. This setting will be disabled for switchers without the optional storage. For more information, refer to 'storage media' later in this manual.
Startup State	If your ATEM Television Studio switcher uses the same settings for all your productions you can save the default startup state. Once saved, each time you power your switcher all your presets and preferences will load. These settings can be cleared using the 'clear startup state'.

HyperDeck Settings

You can connect up to 10 HyperDeck disk recorders and control them using system control. When connecting HyperDecks, use these settings to set the inputs, enable auto roll and frame offset settings and configure the IP address. For more information on setting up the HyperDecks, refer to 'HyperDeck Control' later in this manual.

Button Mapping

To access the button mapping settings, press the 'settings' button to open the general switcher settings LCD menu, then press the 'button mapping' soft button.

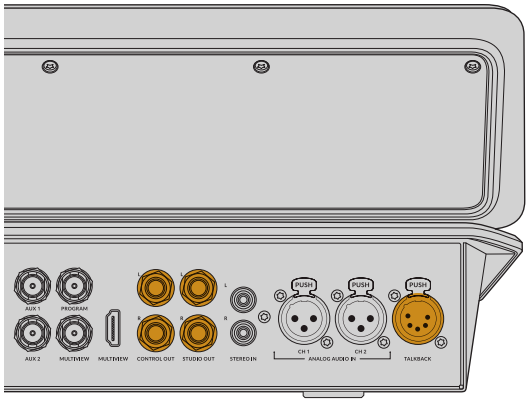
Use the control knobs under each LCD setting to select the button you want to map and the input you want to change it to. You can also change the button color and label color that is displayed on the panel if you want to highlight specific sources. For example, you may want to highlight your playback sources a different color so you can instantly identify them on the panel. The button will illuminate on both the preview and program rows until the source is switched to the preview or program output, where it will change to green or red respectively.

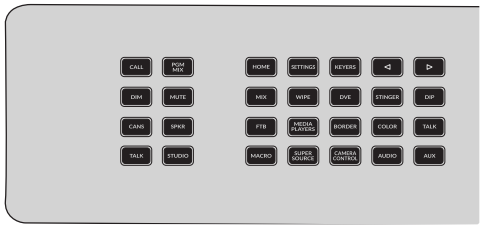
Once you have changed the setting, the change is made instantly and you don't have to worry about saving. Press the 'home' button to return to the home menu.

If you want to change the brightness of the buttons, press the 'settings' button to open the general switcher settings LCD menu, then use the arrows to navigate to the 4th page of the menu or press the number 4 on the numerical keypad. Rotate the corresponding knob to adjust the brightness of the labels and buttons to the desired level. Once you have configured all the button settings, press the 'home' button to return to the home menu. For more information refer to 'brightness settings' earlier in this manual.

Talkback and Call Buttons

Talkback and call buttons on the top left of the panel give you direct access to talkback features without the need for additional hardware. Plug an intercom headset equipped with microphone into the talkback 5 pin XLR socket on the rear of the switcher.





The Call Button

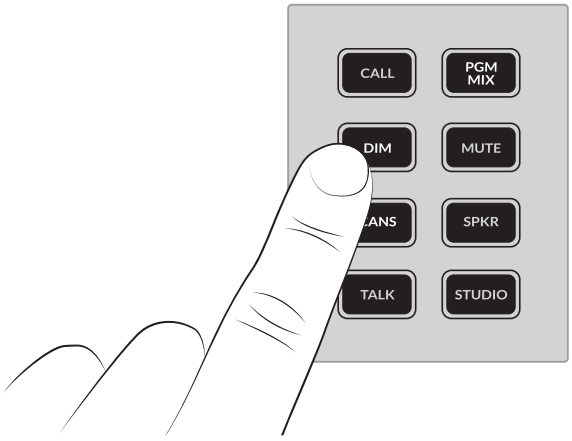
Holding down the 'call' button will flash the tally light on all connected cameras. This is a helpful way of seeking the camera operators' attention, or to let your operators know you are about to go live.

Program Mix

Press PGM MIX to hear the program mix. When cans or speaker is selected, the program mix can be heard via the talkback XLR and speakers attached to the control out connection.

Dim

To temporarily reduce the program mix level without adjusting the fader press DIM. To return to the set levels, press DIM again to return to the original level.



Mute

To temporarily mute the program mix output without adjusting the fader select MUTE.

Cans

When using a headset connected via the 5 pin talkback XLR connection on the back of the switcher, press the CANS button to enable audio via the connection. When selected, press PGM MIX to hear program mix

Speaker

Selecting the SPKR button will enable the audio via the control out connection on the rear of the switcher.

Talk

When using an intercom headset you can enable the microphone output by pressing TALK. Talk can only be heard on the studio output when the studio button is held down or double pressed to stay on.

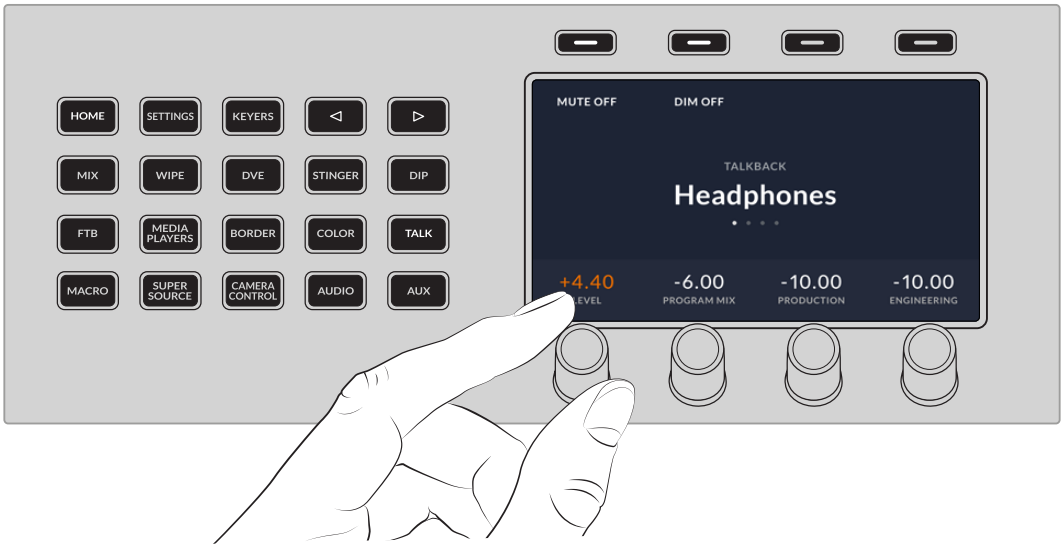
If you double press the TALK button, the mic stays on and the button stay illuminated until you double press the button again. When both STUDIO and SPKR buttons are selected, the mic will stays on for all talkback channels.

Studio

The STUDIO button turns on the output labeled ‘studio out’ on rear of panel which could be connected to a speaker in the studio for talent to hear. When ‘TALK’ is selected, either press and hold the studio button temporarily or double press to hold down and talk.

Levels for the headset, control and studio outputs can be adjusted using the audio and talk buttons in system control.

1. Press the ‘TALK’ button. The headphone settings are used to adjust the audio mix for the 5 pin XLR headset connection on the rear panel and continue onto the second page.
2. Rotate the corresponding knob to adjust your levels.

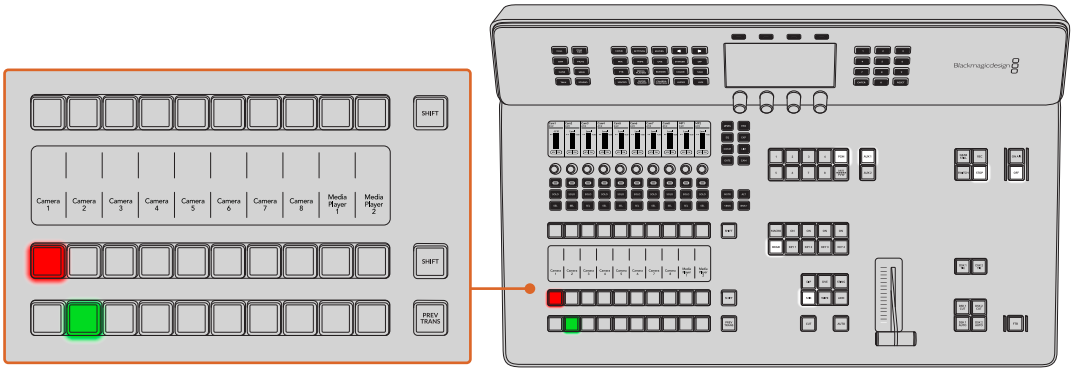


3 Adjust the ‘control out’ and ‘studio out’ levels using third and forth screens.

Settings	
Level	Adjusts the overall output level for headphones, studio out or control out.
Program Mix	Sets the program audio level.
Production	Raise or lower the production talkback levels for each output.
Engineering	Raise or lower the engineering talkback levels for each output.
Sidetone Headphones only	Available for headphones only, The sidetone level lets you mix your voice from your headset mic into the monitor output. This is helpful when wearing a headset that supports noise canceling.
Mic Gain Headphones only	Some talkback headsets have low microphone levels which can be hard to hear. Adjust the mic gain setting to increase or decrease the microphone volume.

Mix Effects

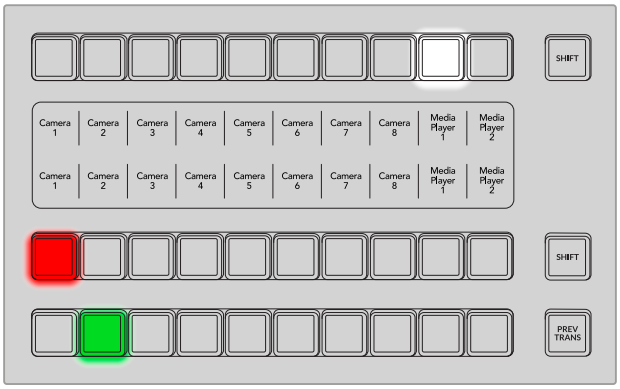
The program bus, preview bus and source names display are used together to switch sources on the program and preview outputs.



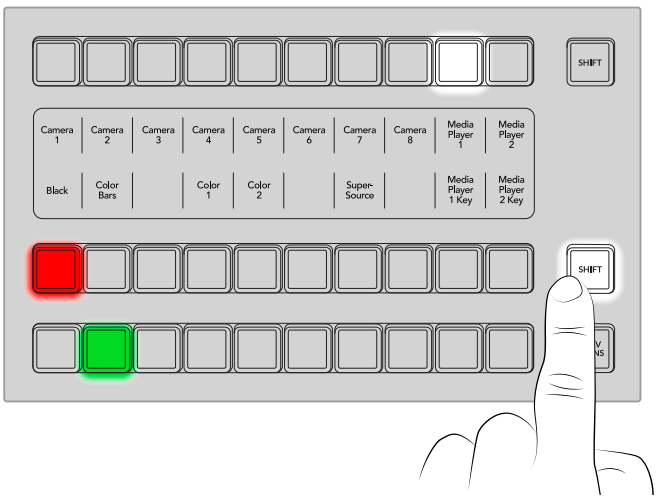
Source Name Displays

The source name displays use labels to represent the switcher's external inputs or internal sources. Labels for the external inputs can be edited on the settings window of the software control panel. Labels for the internal sources are fixed and don't need to be changed.

The displays show the labels for each row of button in the source select row, program row and preview row.



Pressing the SHIFT button will change the source names display to show extra sources, called shifted sources, allowing selection of up to 20 different sources.



Simultaneously pressing both SHIFT buttons next to the source select and program rows will change the source names display to show protected sources and these are available in the source select row for keyers and routing to auxiliary outputs. Protected sources are program, preview, clean feed 1 and clean feed 2.

Program Bus

The program bus is used to hot switch background sources to the program output. The source currently on air is indicated by a button that is illuminated red. A blinking red button indicates that the shifted source is on air. Pressing the SHIFT button will display the shifted source.

Preview Bus

The preview bus is used to select a source on the preview output. This source is sent to program when the next transition occurs. The selected source is indicated by a button that is illuminated green. A blinking green button indicates that a shifted source is on preview. Pressing the SHIFT button will display the shifted source.

Shift

The SHIFT button provides a global shift and is used to shift the program, preview and select buses along with the label. It also provides a shift for the transition type and other menu functions.

Double-pressing buttons in the preview and select buses, as well as the transition type buttons, is the same as shift-selecting them and can be a faster way to shift-select buttons. Double- pressing is not implemented for the program bus as it would cause the program output to momentarily show the wrong source.

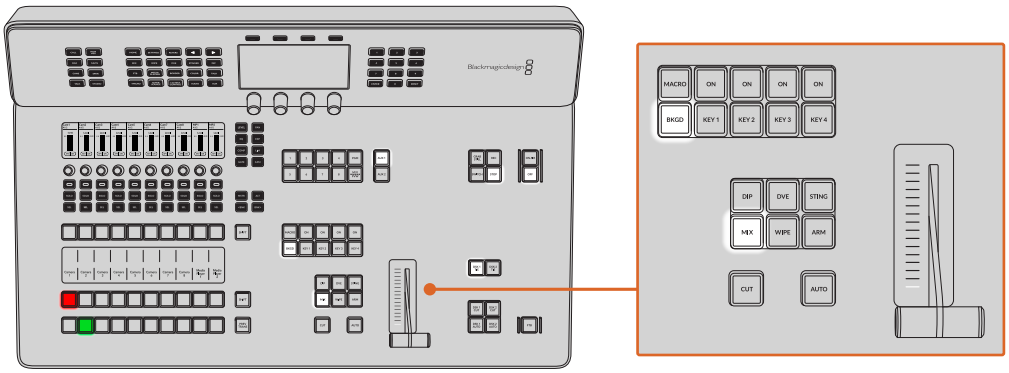
Source Select Bus

The source select bus works in conjunction with the source names display and is used to assign sources to auxiliary outputs and keyers. When the macro button is enabled, this row of buttons is also used for loading and running macros recorded to the corresponding slots. The buttons will illuminate blue when the macro button is enabled.

The destination display and select bus together show you the routing of sources to keys and auxiliary outputs. The currently selected source is indicated by an illuminated button. A blinking button indicates a shifted source. A green illuminated button identifies a protected source.

Protected sources are program, preview, clean feed 1 and clean feed 2.

Transition Control and Upstream Keyers



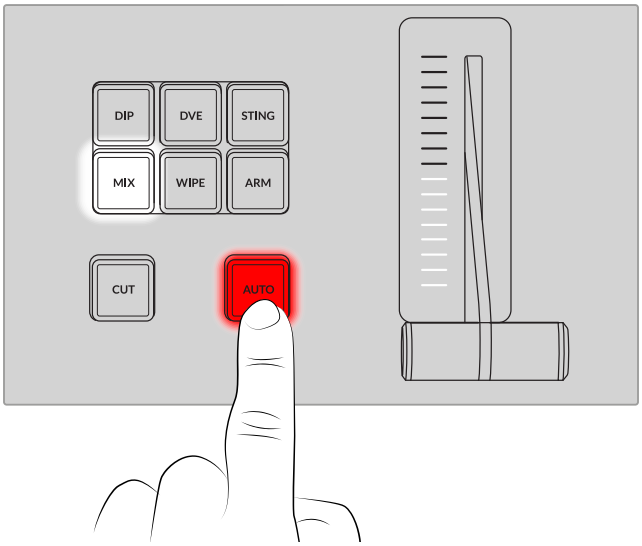
Cut

The CUT button performs an immediate transition of the Program and Preview outputs, regardless of the selected transition type.

Auto

The AUTO button will perform the selected transition at the rate specified in the auto rate setting located in the LCD 'home' menu. The transition rate for each transition type is set in the LCD menu and is displayed when the corresponding transition style button is selected.

The AUTO button illuminates red for the duration of the transition and the fader bar indicator illuminates with sequential LEDs to indicate the progress of the transition. If the software control panel is active, the virtual fader bar also updates to provide visual feedback on the progress of the transition.



Fader Bar and Fader Bar Indicator

The fader bar is used as an alternative to the AUTO button and allows the operator to manually control the transition. The fader bar Indicator next to the fader bar provides visual feedback on the progress of the transition.

The AUTO button illuminates red for the duration of the transition and the fader bar indicator updates to indicate the progress of the transition. If the software control panel is active, the virtual fader bar updates simultaneously.

Transition Type Buttons

The transition type buttons allow the operator to select one of five types of transitions; mix, wipe, dip, DVE and stinger, labeled STING. Transition types are selected by pressing the appropriately labeled transition type button. The button will illuminate when selected.

When a transition type is selected, the LCD menu shows the transition rate and provides instant access to all the corresponding settings for that transition type. Use the soft buttons and knobs to navigate through the settings and make changes.

Arm

The ARM button enables automatic playback from a connected HyperDeck selected on the preview bus following a transition. Similar to the auto roll function, the selected HyperDeck on the preview bus will begin to play when you press the CUT or AUTO button to initiate the transition. To use the ARM function press the dedicated ARM button and playback will auto roll for the selected HyperDeck input on the next transition only. To keep ARM enabled double press the ARM button, it will illuminate green to show it is enabled.

It's worth noting that any pre roll set via the HyperDeck will be ignored when ARM is enabled.

Preview Transition

The PREV TRANS button enables the preview transition mode allowing the operator to verify a transition by performing it on the preview output using the fader bar. Once you press this button the preview transition feature is enabled and you can preview your transition as many times as you like. This lets you test the transition before going to air and make changes and corrections as needed. You can even preview stinger transitions! Once adjusted, press the button again to disable the feature and you are ready to send your transition on air.

Next Transition

The BKGD, KEY 1, KEY 2, KEY 3, KEY 4 buttons are used to select the elements which will transition on air or off air with the next transition. Any combination of background and keys can be selected by pressing multiple buttons simultaneously. Double pressing the BKGD button selects all of the next transition upstream keyers that are currently on air and copies them to the Next Transition buttons.

Pressing any of the next transition buttons will clear selection of all others. When selecting the elements of the next transition, the switcher operator should look at the preview output because it provides an accurate representation of what the program output will look like after the transition is completed. When only the BKGD button is selected, a transition from the current source on the program bus to the source selected on the preview bus will occur.

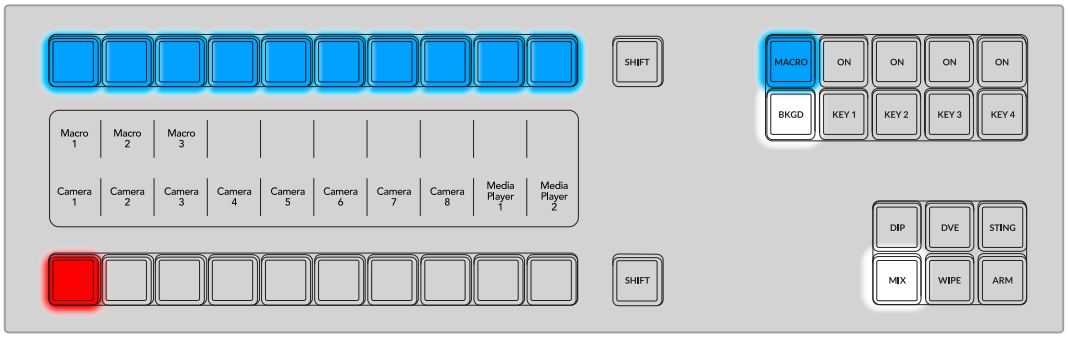
On Air

The ON AIR indicator buttons above each keyer are labeled ON and indicate which of the upstream keys are currently on air. These can also be used to immediately cut a key on or off air.

Macro

The MACRO button is used to enable the macro feature which changes the source select row of buttons to macro buttons corresponding to macro slots.

There are ten macro buttons in the source select row, so if you have macros recorded to slots greater than ten, you can access these by opening the macro settings in the LCD menu and changing the macro group using the control knob.

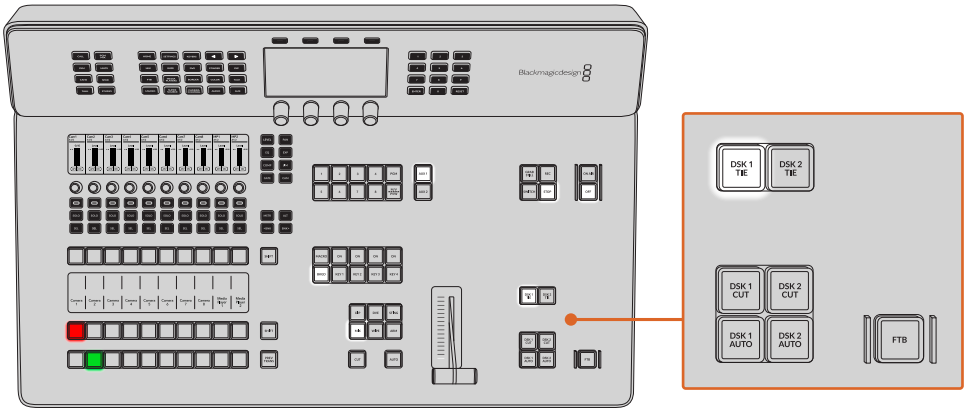


For more information on how to record and run macros using the ATEM Television Studio, refer to ‘using macros’ later in this manual.

Downstream Keyers

Downstream Key Tie

The DSK TIE button will enable the DSK on the preview output, along with the next transition effects and tie it to the main transition control so that the DSK can be taken to air with the next transition.



Because the tied downstream keyer is now tied to the main transition, the transition will happen at the rate specified in the auto rate setting in the LCD ‘home’ menu. When the DSK is tied, the signal routing to the clean feed 1 is unaffected.

Downstream Key Cut

The DSK CUT button is used to cut the DSK on or off air and indicates whether the DSK is currently on or off air. The button is illuminated if the DSK is currently on air.

Downstream Key Auto

The DSK AUTO button will mix the DSK on or off air at the rate specified in the DSK rate LCD menu setting.

Fade to Black

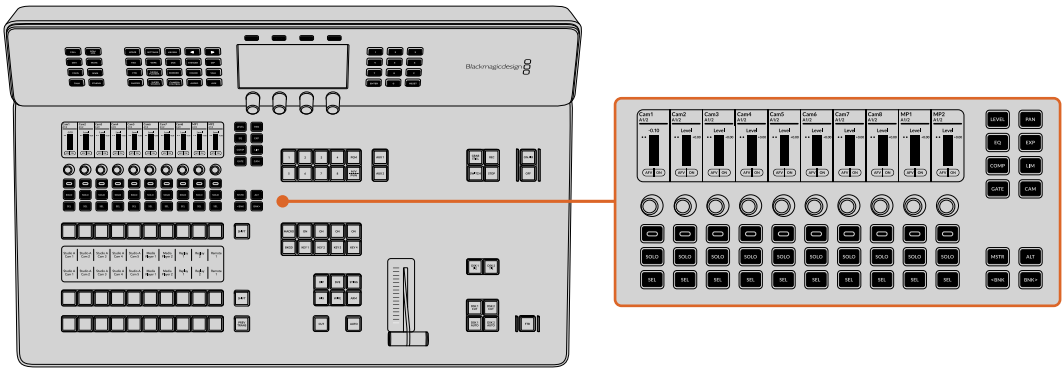
The FTB button will fade the program output to black at the rate specified in the FTB rate LCD menu setting. Once the program output has been faded to black, the FTB button will flash red until it is pressed again, fading the program output up from black at the same rate. A fade to black cannot be previewed.

You can also set your switcher to fade audio together with the fade to black by navigating to the FTB LCD menu and setting AFV to ‘on’. This sets the switcher to fade the audio to silence at the rate set for the fade to black. If you want audio to remain on during and after the fade to black, set AFV to ‘off’.

Audio Mixer

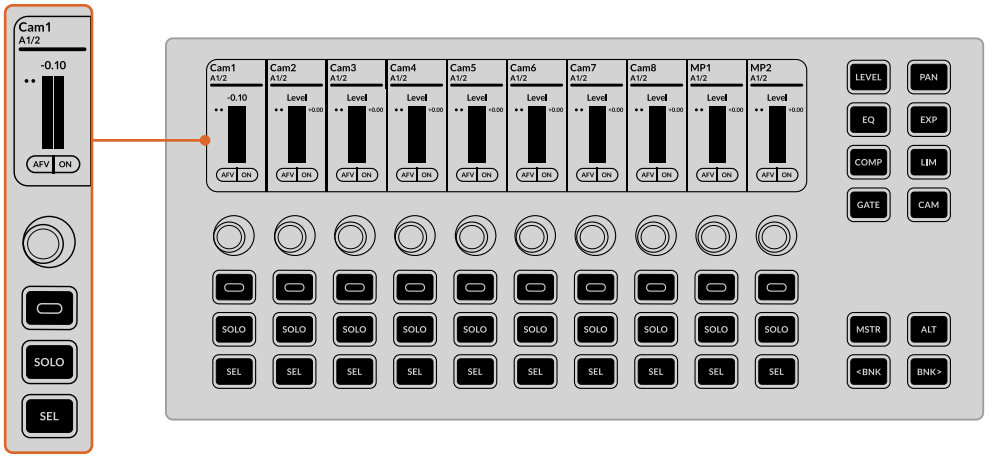
ATEM Television Studio switchers have advanced audio controls that let you enhance and refine the quality of sound on each input and master output, including input level controls, a 6 band parametric equalizer and powerful dynamics settings. This section of the manual shows the different audio controls you can use to shape and optimize the audio mix in your live production. In addition to adjusting audio, you can use the same knobs and buttons for camera control and to adjust the switcher audio outputs.

The audio mixer comes loaded with an assortment of physical controls that you can use to monitor and mix your live production. Some buttons serve a single purpose, while others serve multiple functions, therefore it's a good idea to understand the different types of controls before moving on to the specific button and knob details.



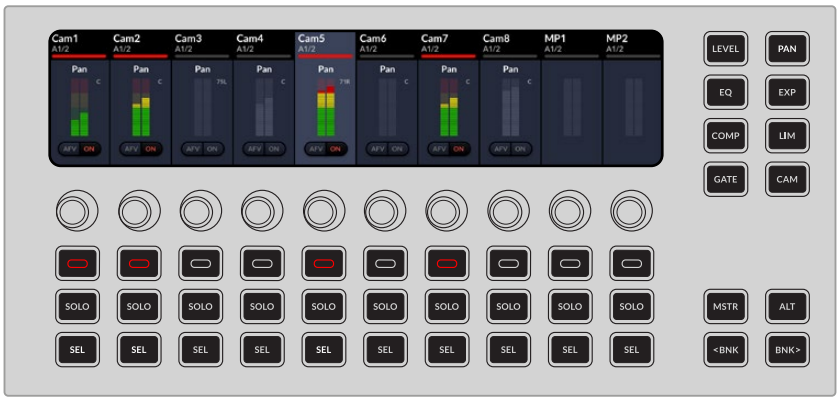
Channel Strips

The most prominent real estate on the audio mixer is dedicated to the channel strips. The default operational mode of the console provides 10 channel strips, each with an on, SOLO and SEL button, a rotary control knob for adjustments and a LCD screen that displays channel information. Any changes applied to the channel strip controls are mirrored in the audio page of ATEM Software Control.



LCD

When you first start your ATEM Television Studio switcher, the LCD at the top of each channel strip displays the input name and a levels meter. The LCD screens display different information based on the current mode selected using the buttons to the right of the channel strip. For example, when PAN is selected, audio meters for 10 inputs are displayed. If any of the inputs are set to split mono, each mono input will have it's own channel strip.



The LCD display will dynamically update when other modes are selected using the buttons to the right of the LCD. For example, when the EQ button is pressed the LCD will change to display the low mid and high filters and the buttons and knobs will control specific EQ parameters that mirror the EQ controls using the audio.

Rotary Knobs

When you want to make fast changes to specific parameters, these versatile knobs give you precision rotary control and are also referred to as encoders. To increase the level of an input, press LEVEL and rotate the knob to the right.

On Button

This soft control button can be used to select the button displayed on the LCD. For example, when LEVEL is selected, this button toggles the audio behavior between audio follows video, on and off. When LEVEL or PAN is selected, the button will illuminate red to indicate when the input is on air.

Solo Button

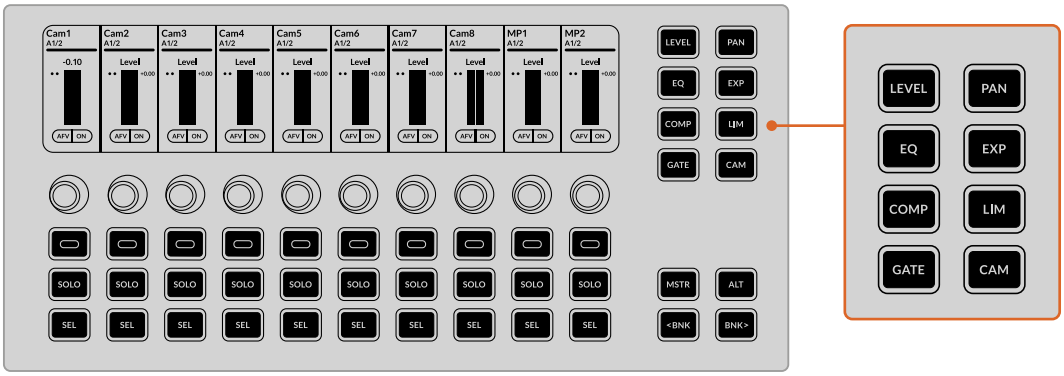
Press SOLO to hear only this channel. This can help to refine adjustments to the audio. When selected, a headset icon will appear on the LCD for the selected channel.

Select Button

Use the SEL button to select or de-select a channel.

Mode Buttons

Use the control buttons to assign the corresponding settings to the channel strips.



Press EQ a second time to display the high and low pass controls

Some settings contain more than one page of controls indicated on the first channel strip. To display the additional controls, press the mode button a second time. For example, to access the high and low pass filters, press EQ twice.

Modes

The audio modes available using the audio mixer on the front of the switcher mirror the settings available in ATEM Software Control. You can also use the camera control setting to control Blackmagic cameras including Blackmagic Studio Camera 6K Pro and URSA Broadcast G2 from your ATEM switcher.

Level	Adjust the audio level output for each channel using the corresponding knobs. The soft button in each channel strip can toggle the audio behavior between audio follows video, on and off. When alt is selected you can adjust the gain for each channel. Adjusting the gain up or down lowers or raises the volume of the selected input.
Equalizer	The EQ control set includes two pages of controls. Press the EQ button to load the Page 1 control set, mapped left to right across the encoders and SEL switches. Press EQ again to switch to Page 2. This EQ control set focuses on the High Pass and Low Pass filters on Bands 1 and 6, and the corresponding soft buttons toggle the filters ON/OFF or select shape. Press EQ again to return to Page 1 and repeat as needed to toggle between Page 1 and Page 2. The EQ control set mirrors all of the parameter controls available in the audio page of ATEM Software Control.
Compressor	The Compressor control set includes all of the Compressor parameters as available in the Dynamics window. As with all of the other control sets, the Channel 1 position is where you'll find the On/Off switch assigned to the soft button.
Gate	The GATE control set includes all of the gate parameter controls available in the audio page in ATEM Software Control. Use the select button to select which track is in focus. Gating is like an exaggerated expander, reducing the level or even silencing parts of a signal that fall below a certain level in order to reduce or eliminate noise in quiet parts of a recording.
Pan	Each audio channel has a simple stereo Pan control that lets you pan that input. Pan channel left or right by turning the corresponding channel knob. When adjusting each knob the channel will be selected as indicated by the illuminated SEL button.
Expander	The EXP control set includes all of the Expander parameter controls available in the audio page in ATEM Software Control. Use the select button to select which track is in focus. The subsequent seven channel strips include knob control for the Expander parameter in the order they appear on the Dynamics window.
Limiter	Like the other dynamics control sets, the Limiter control set includes all Limiter parameter controls assigned to the encoder knobs in the order they appear in the Dynamics window.
Camera Control	The audio mixer also has a camera control feature so you can control Blackmagic Cameras via the same knobs and buttons on your ATEM switcher. Press the CAM button to display the settings. Camera control settings are divided into three menu pages you can navigate between pages by pressing CAM again. You can also adjust camera control settings via the 'camera control' button in the system control. For more information on camera control, refer to 'using camera control' later in this manual.

Channel and Modifier Buttons

Beneath the mode buttons are the channel and modifier buttons.

Master

The MSTR button reveals the controls relating to the audio outputs via the rear panel of the switcher including the headset, control and studio outputs. In addition you can adjust the level for the master output.

Alt

Use the ALT button to reveal alternative parameters or functions. For example, when adjusting the level controls, pressing alt will reveal the gain controls.

Press the ALT button to reveal the gain controls

Bank

Use the BNK buttons to display the next group of inputs on the LCD. BNK> banks the channel strips to the right in groups of 10. <BNK banks to the previous set of 10 channels.

Audio Controls Workflow Guide

This section describes a basic workflow to help you get started using the audio mixer to refine and enhance your audio mix.

1. Generally, the first step to optimizing your mix is to normalize all the inputs so they are all at their maximum strength without clipping. This is normally done by increasing or decreasing the input gain level for each input so their signal peaks just below 0dB on the channel strip's level indicator.
2. If you want to split any mono inputs into two separate channels for stereo output, go to the general switcher settings and navigate to the audio tab. Enable the checkboxes for the mono inputs you want to change to stereo. Click 'done'.

> **TIP** If you want to split mono inputs into two separate channels, it's best to do this before normalizing the input as described in step 1, so that you can normalize both channels after they have been split.

3. Now, press the EQ button and make equalization changes to each input.

4 After setting EQ, open the dynamics controls using the EXP and GATE buttons. Make the required dynamics changes to generally improve and refine the input audio.

5 With EQ and dynamics set for each input, you can now open the EQ controls for the master output in ATEM Software Control and sweeten the final audio mix.

6 Now open the master output's dynamics controls and make any required changes to improve the final output.

Once all the audio mixer controls are set, you can then increase or decrease the levels on the audio mixer to set them at their best levels for the live mix and make adjustments where necessary during the production. You can also go back to any of the settings and make further adjustments if needed, but it's best to follow the same order as described above to get the best results from each function. For example, it's important to set EQ controls before making dynamics changes as the processing chain in your switcher applies dynamics to the audio after equalization.

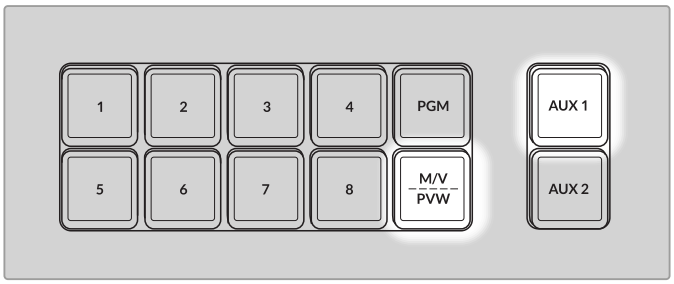
Most important of all is to apply the effects carefully so your audio still sounds natural but exciting too!

For more information on adjusting Fairlight controls, refer to 'Advanced Fairlight Controls' later in this manual.

NOTE It's worth noting that the audio mixer is automatically disabled when the USB connection is set to USB digital audio and the switcher detects audio returning from a USB audio mixer, such as Fairlight Live.

Selection Buttons

ATEM Television Studio switchers feature aux outputs on the rear panel that can have various inputs and internal sources routed to them. They are very similar to router outputs and all video inputs, color generators, media players, program, preview and even color bars can be output. The ten dedicated buttons on the front panel provides shortcuts for selecting any of the 8 inputs, program as well as a button you can toggle between multiview and preview.



The multiview button will illuminate white when multiview is selected and green when preview is selected

Other internal sources and media players including color bars can be selected using the auxiliary menu in system control for all available outputs. If you need a clean feed before all of the down stream keyers, then you can even select this to the output. This will give you a program feed without a logo or bug, so you can capture this as a broadcast master for later post production or transmission.

To select clean feed on aux 1:

1 Press the ‘aux’ button in system control.

2 Rotate the knob beneath output 1 until clean feed appears.

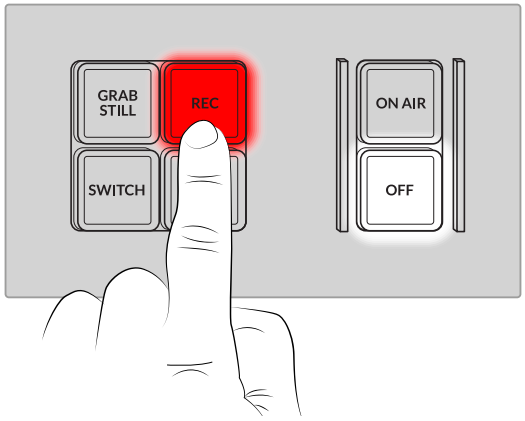
Routing the 3 auxiliary outputs on ATEM Television Studio HD8

The switcher will always perform a clean switch when an auxiliary output changes sources so this means you can use the switcher to cut between sources on the auxiliary output cleanly and without glitches.

The outputs are extremely powerful and can also be routed on the software control panel. The outputs menu available in the menu bar at the top of the software control panel regardless of the window currently selected so they are always available. For more information on setting outputs using ATEM Software control, see the ‘auxiliary outputs’ section later in this manual.

Stream and Record Buttons

ATEM Television Studio switchers let you both stream and record your production using dedicated buttons on the panel.



Use the dedicated buttons on the panel to stream and record your production

Grab Still	If you need to capture a still image from your broadcast simply press the ‘grab still’ button. This acts like a still store which lets you add capture files to the media pool. You can then immediately load a still into the media player and use it in your broadcast, or save the media pool to your computer.
Rec	You can record your stream via USB-C using an external disk or flash drive, or via the optional internal storage when using ISO models. Start recording the production using the ‘rec’ button. To finish recording press ‘stop’.
Stop	
Switch	When two external drives are connected via USB you can switch between which drive is actively recording using the ‘switch’ button.
On Air	Streaming is built into the switcher so you can stream directly without the need for additional software. Once you’ve connected to a network and selected your streaming service using ATEM Software Control you can start streaming immediately by pressing the ‘on air’ button. For more information on streaming settings refer to the ‘streaming’ section later in this manual.
Off	

To start streaming you will need to connect your switcher to your network. In addition to streaming to platforms including Blackmagic Cloud, YouTube and Twitch, connecting your switcher to your network will also let you use ATEM hardware panels such as ATEM Camera Control and connect to remote sources when using ATEM Television Studio HD8 ISO switchers.

If the video standard is set to an interlaced format, such as 1080i60, you can record or stream but not both at the same time.

For more information on getting a streaming key, refer to the ‘streaming’ section later in this manual.

Storage Media

ATEM Television Studio switchers let you record your program using an external drive or flash disk via the two USB-C connections on the rear panel. You can also connect to multi port USB-C hubs or the MultiDock 10G allowing you to connect one or multiple SSDs for far greater storage capacity.

You can also record internally on ATEM switchers featuring optional internal storage. This section explains how to prepare both external and internal storage.

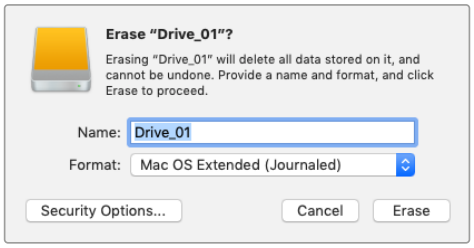
Preparing Storage via a Computer

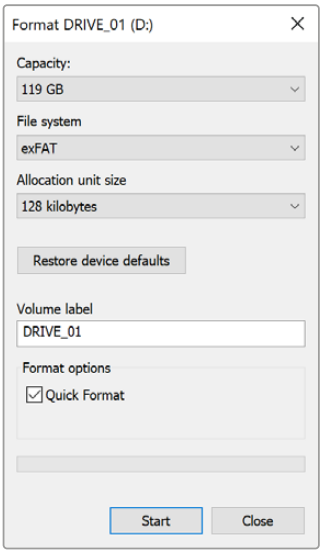
External disks can be formatted via a Mac or Windows computer. HFS+ is also known as Mac OS X Extended and is the recommended format as it supports 'journaling'. Data on journaled media is more likely to be recovered in the rare event that your storage media becomes corrupted. HFS+ is natively supported by Mac. exFAT is supported natively by Mac and Windows without needing any additional software, but does not support journaling. This can be a good choice if you need to read or write to the disk using both Mac and Windows computers.

Formatting Media on a Mac Computer

The Disk Utility application included with your Mac can format a drive in the HFS+ or exFAT formats. Make sure you back up anything important from your disk as you will lose everything on it when it is formatted.

1. Connect your disk to your computer with an external dock, USB hub, or cable adapter and dismiss any message offering to use your drive for Time Machine backups.
2. On your computer, go to applications/utilities and launch Disk Utility.
3. Click on the disk icon of your drive and then click the erase tab.
4. Set the format to Mac OS Extended (Journaled) or exFAT.
5. Type a name for the new volume and then click erase. Your media will quickly be formatted and made ready for recording.





Use the Format dialog box feature in Windows to format your external disk in the exFAT format

Formatting Media on a Windows computer

The format dialog box can format a drive in the exFAT format on a Windows PC. Make sure you back up anything important from your drive as you will lose everything on it when it is formatted.

1. Connect the drive to your computer with an external dock, USB hub, or cable adapter.
2. Open the start menu or start screen and choose computer. Right-click on your drive.
3. From the contextual menu, choose format.
4. Set the file system to exFAT and the allocation unit size to 128 kilobytes.
5. Type a volume label, select quick format and click 'start'.
6. Your drive will quickly be formatted and made ready for recording.

Preparing Storage Using ATEM Television Studio

Internal storage can be formatted using system control on the front panel or using ATEM Setup utility. In addition you can also format external disks as Mac OS Extended or exFAT using your switcher's control panel.

Formatting Storage using ATEM Television Studio System Control

To open the format menu press the 'settings' button and use the arrows to navigate to the format media screen.

Once you have opened the 'format media' menu, you can select between formatting internal storage or any external drives connected via USB.

1. For internal storage, rotate the 'media' knob and select 'internal'.

   For external drives, rotate the 'media' knob to the selected drive and then rotate the 'format' knob to select either Mac OS Extended or exFAT.

2. Press the 'format' button above the LCD.

3. Follow the on screen directions by holding the format button for 3 seconds until the tick appears in the countdown icon. Formatting will begin.

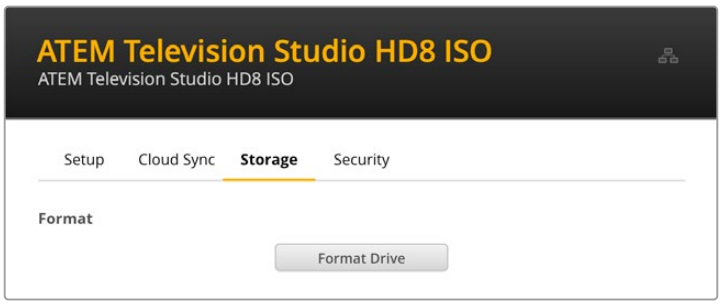
4. Once formatting is complete, the storage is ready to use. Press the 'ok' button above the LCD to return to the format media menu.

Formatting Internal Storage using ATEM Setup

You can also format you storage using the ATEM Setup utility installed with your ATEM switcher software. You will need to connect your switcher via USB to format the drive.

1. Open the ATEM Setup utility. If you are using Mac, it is located in applications in the Blackmagic ATEM Switchers folder. On Windows computers, ATEM setup can be accessed from Start > Programs > Blackmagic Design.

2. Once open, click on 'storage' and then select 'format drive'.



3 A warning screen will appear to let you know formatting will erase all files on the storage. If this is the first time you are formatting the storage. Click ‘format’ to continue.

4 A second warning screen will appear for you to confirm. This is to make sure people aren’t inadvertently deleting media on the storage. Click on ‘erase’.

5 A progress status will appear during formatting. Once complete the internal storage is ready to use.

Accessing Storage

If you are using external drives for recording, a simple way to access the video clips and any DaVinci Resolve projects is to disconnect the drive from the rear panel of the switcher and connect it to your computer, but you can also access the files via your network.

To access storage on a Mac computer:

1 Open Finder and click on ‘network’ in the sidebar menu.

2 Double click on your ATEM Television Studio switcher in the list.

3 Now double click on internal storage.

Your ATEM Television Studio switcher will now appear in the locations sidebar. To access storage on a Windows computer:

1 Click on the ‘Network’ menu item in File Explorer sidebar. You will see your ATEM Television Studio switcher listed.

2 Double click on your ATEM Television Studio switcher and a Windows security dialog box will appear asking for network credentials.

3 Enter your username and password.

NOTE Windows 11 no longer allows ‘guest’ accounts that don’t require a username and password to connect to network storage. Before accessing your ATEM switcher’s storage over a network, you will need to create a new user and set a password using ATEM Setup. For information on creating and managing users, see ‘security’ in the ‘ATEM Setup’ section of the manual.

4 Click ‘OK’.

You will now see your switcher in the File Explorer window and can access the storage like any other network drive.

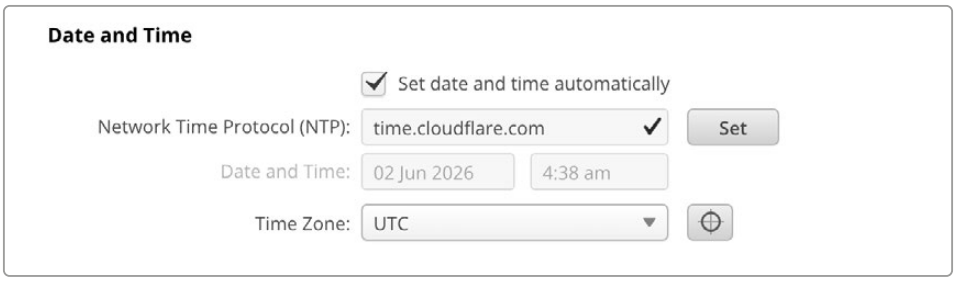
Alternatively, you can access your storage from the setup utility. On a Mac computer click the ‘Show in Finder’ button. On a Windows computer this button is ‘Show in File Explorer’.

Cloud Sync

Another way to access your media is by using Cloud Sync, where you can sync the internal storage or external drives on ATEM Television Studio model switchers with Dropbox.

Setting Date and Time

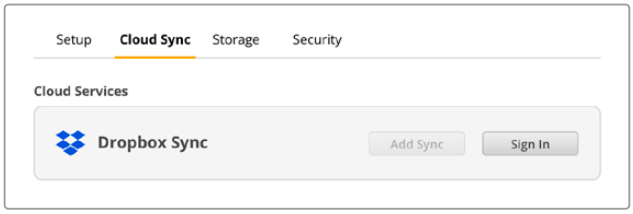
Cloud services such as Dropbox require the correct date and time to sync to your ATEM switcher internal storage. By default, your ATEM Television Studio will use the Cloudflare NTP server to automatically set the date and time.



To sync your online account with ATEM Television Studio all you need to do is sign into your online account using the cloud sync settings, set the folder you want to sync to and set the sync direction.

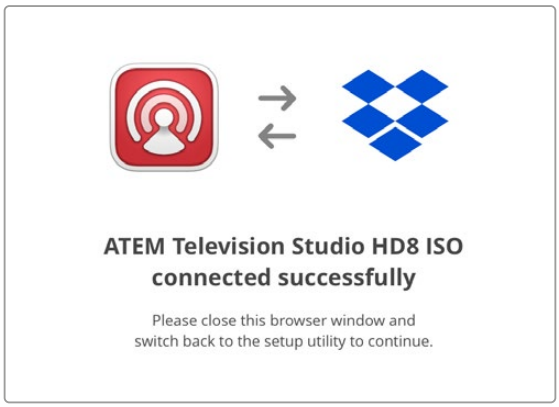
Sign into Dropbox

1. Click on the ‘sign in’ button for the Dropbox account. A sign in window will appear.
2. Sign into Dropbox.



Click the ‘allow’ button to confirm permissions for Blackmagic Cloud Store to edit and view content.

A confirmation message will indicate that you have successfully connected. If the connection failed, check your computer is connected to the Internet.

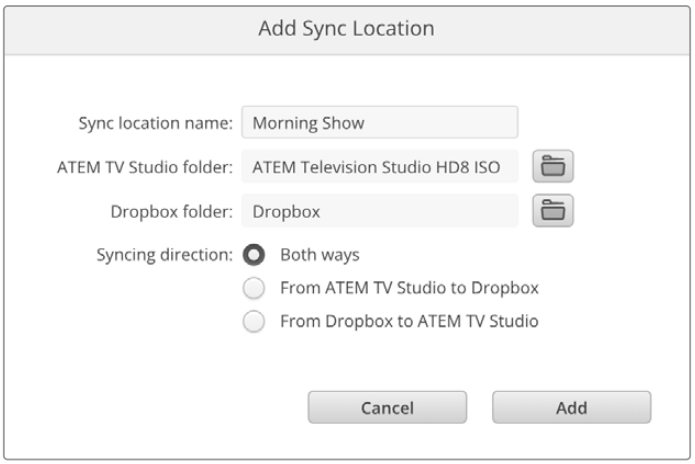


3. Click ‘close’.

Sync Folder and Direction

1 You will now see the ‘add sync’ button enabled. Click on the button to open the ‘add sync location’ window.

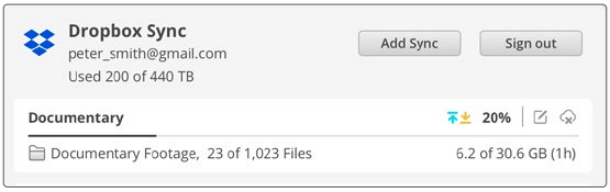
2 Name the sync location and click on the folder icons to point to your desired sync folders. These would typically share the same name.



3 Select the sync direction. For example, if you are syncing to Dropbox and you want to sync files from your switcher to Dropbox but not from Dropbox to your switcher, select ‘from ATEM TV Studio to Dropbox’.

4 Click ‘add’.

Your cloud service is now synced to your ATEM Television Studio switcher.



Status indicators provide information about the sync process

The sync arrows show the sync direction. A blue arrow shows that data is being sent from your switcher and a yellow arrow shows that data is being received. If data is being sent and received at the same time, then a blue and yellow arrow will be displayed. A gray arrow indicates when data is not being synced in that direction.

The percentage figure to the right of the sync arrows shows the current status of the sync progress.

Click on the ‘edit sync’ indicator to change the sync folder name and location.

Click on this indicator to delete the sync location. In the confirmation dialog box, click ‘continue’ to confirm or ‘cancel’ to abort the deletion.

If you have Blackmagic Cloud Store or Blackmagic Cloud Pod, you can add these syncs via the Blackmagic Cloud Setup utility to your own storage and keep a live copy as you record.

Using the Multiview

Your ATEM switcher has a powerful multiview feature that lets you monitor all inputs, together with the program and preview outputs as a group of views on one screen. The multiview also displays the media player, streaming status, disk recording disk status, audio levels, plus Fairlight EQ and dynamics indicators.

This feature provides a comprehensive overview so you will always know exactly what is happening with your broadcast!

The multiview is a powerful feature that lets you monitor all sources and outputs simultaneously

Below is a description of each view.

Preview

The preview view lets you monitor the source currently switched to the preview output. This view is helpful to practice switching between sources, previewing transitions or setting up a keyer so you can see what it will look like before switching to the program output. You need to change the switcher operation to program/preview style switching to make use of the preview view. There is more information about this in later sections of this manual.

Program View

The program view displays what is currently switched to the program output. This view will always show exactly what you are broadcasting.

Input Views

The input views display all the sources connected to the 8 inputs. Having all inputs on the multiview lets you see the image from every camera so you can make quick decisions. However, they don't always have to be cameras as you could also have a computer's video output or a HyperDeck disk recorder connected to the switcher's inputs and you can monitor them in the input views.

When an input is switched to the preview or program output, a green or red tally border will appear around the input's respective view. Green represents the preview output and red represents the program output, or 'on air'.

Media Player View

This view displays the graphic currently loaded in the media player. To load a graphic, simply go to the media pool in ATEM Software Control and drag a still into the media player. You can read more about how to use the media player and the media pool in the section 'ATEM media pool'.

Streaming View

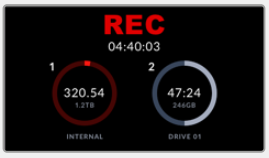
This view displays the streaming on air status, including the broadcast data rate and the cache status. You can also see what streaming platform you are currently broadcasting to as it is displayed at the bottom of the view.

- **On Air Indicator** Prior to recording, the on air status indicator will display 'off' to let you know the switcher is standing by and ready to broadcast. When streaming begins, the indicator will display a bright red 'on air' status until streaming is stopped.

  If there is an interruption during the stream, for example the internet connection speed becomes too slow and the cache is depleted, the on air indicator will begin flashing.

- **Broadcast Data Rate** The data rate is measured in megabits per second. For ATEM Television Studio switchers to broadcast 1080p60 video without losing frames, the data rate needs to be approximately 5 to 7 Mb per second.

- **Cache Status** The cache status displays the capacity of the switcher's built in memory buffer. The cache is a small amount of internal memory that continuously records and plays the program output. It acts as a safety measure if the broadcast data rate decreases below a level able to sustain video. The variable nature of the internet is mostly due to network activity or wireless signal strength, so if the broadcast data rate decreases, the buffer data will increase accordingly. If the connection speed becomes slow enough that it cannot support the video stream, the cache will fill with video frames to compensate. However, once the cache is 100% full, the video stream will be compromised, so you will want to avoid a full cache where possible. You can do this by testing the connection speed when you set up your stream. During a broadcast test, watch the cache display in the multiview. If the cache frequently approaches 100%, choose a lower quality in the live stream settings.
- **Tethering status** The smartphone icon is displayed when the ATEM switcher is connected to the internet using mobile tethering. The icon will become red when on air.



Recording View

If you are recording to external drives via USB-C or to the internal storage, this view will display the current recording status.

- **Recording Indicator** Prior to recording, or if there are no disks connected, the indicator will display 'stop'. When disks are connected, you will see them appear as icons below the indicator.

  When a disk is recording, the indicator displays 'rec' and will illuminate bright red.

- **Duration Counter** Underneath the recording indicator is the duration counter. When you press the record button on the switcher, the duration counter will start running.
- **Record Status Indicators** These indicators provide details on each drive and its recording status. For example, if you are using two drives, their drive names will be displayed along with available space and record time remaining. While a disk is recording, the indicator will illuminate red and shows how much disk space is left.

  The disks are ordered by capacity. For example, if you have 4 SSDs connected via a Blackmagic MultiDock 10G, the drive with the largest remaining space will be labeled 1. Drive 2 will be the SSD with the next largest available space. When drives 1 and 2 are full, drive 3 will then assume the disk 1 indicator and disk 2 will become drive 4. You can always see what drives are assigned to the disk numbers by looking at the disk names underneath their icons.

Audio View

During your broadcast you can monitor the audio levels for each source and the levels of the program output using the audio view.

- **Audio Meters** Each input and the program output has its own audio meter and you can monitor them all simultaneously. If the audio level rises above -10dB the meter will illuminate red to warn you that it is close to the maximum strength of 0dB. Once the level reaches 0dB the audio will clip. Clipping means the audio will distort and you will need to decrease the level using the switcher's audio level buttons or the audio mixer in ATEM Software Control. You can read more about ATEM Software Control in the next section of this manual.

  The audio meter is an important tool to monitor your levels so you can make sure your audio always sounds great!

- **Fairlight Icons** These icons let you know if EQ and dynamics controls are enabled in ATEM Software Control's audio page.

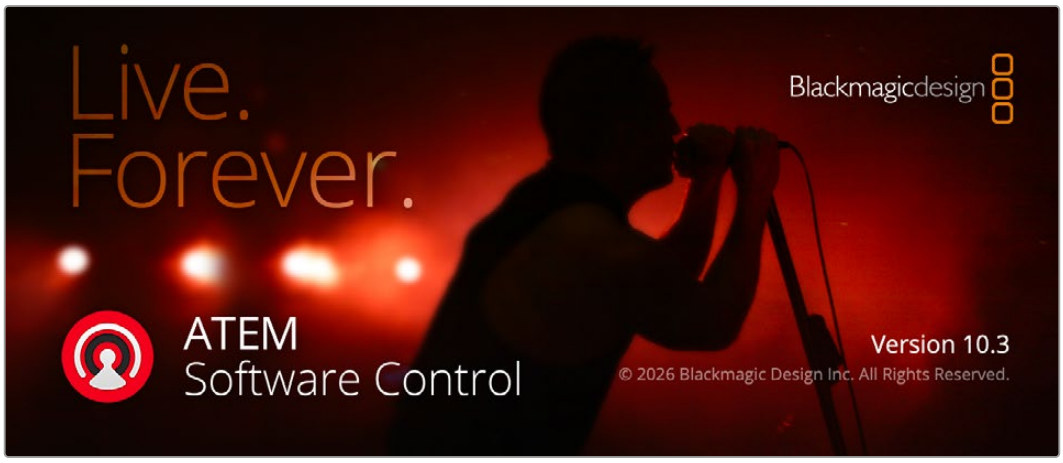
EQ DY	If the Fairlight icons are colored and illuminated, the EQ or dynamics tool is active and the input is on air.
EQ DY	If the icons are colored but dim, it means the tools are active, but the input is not on air.
EQ DY	If the icons are dim and colorless, the tools are inactive or bypassed on the audio page.

The multiview is an excellent tool that will let you spot every detail and put you in the moment. For example, it can help you previsualize ideas in the preview window before switching them to the program output. You can monitor each SDI source and test switching between them, set up a chroma key, or even preview a transition to see what it will look like before switching it to the program output!

ATEM Software Control

ATEM Software Control is included with your ATEM switcher and allows you to control your switcher in a similar way to the switcher's built in panel. Instead of menu buttons, the software uses a range of palettes on the right side that shows you all processing features of your production switcher. This allows you to control the switcher from another location, for example when the switcher is rack mounted in a different room to the person operating it.

Before you can get started with ATEM Software Control you will need to install the software.

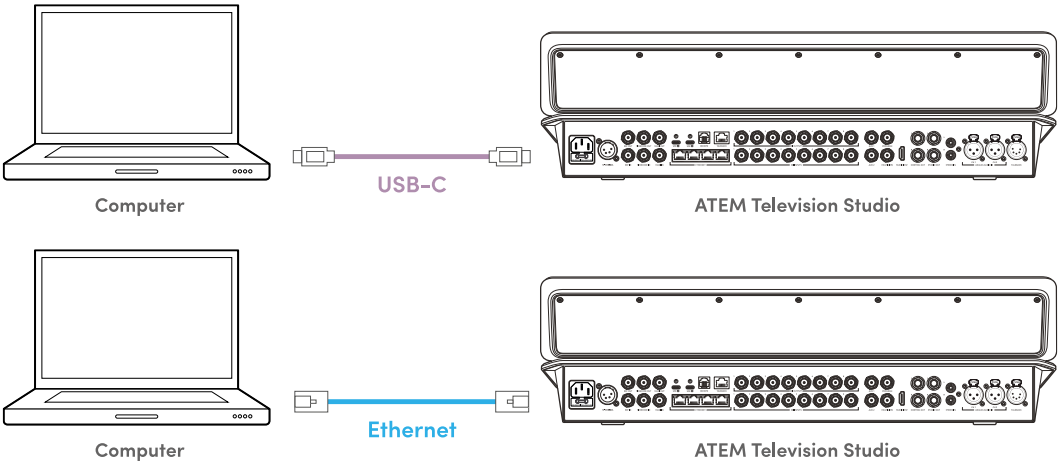


To install ATEM Software Control:

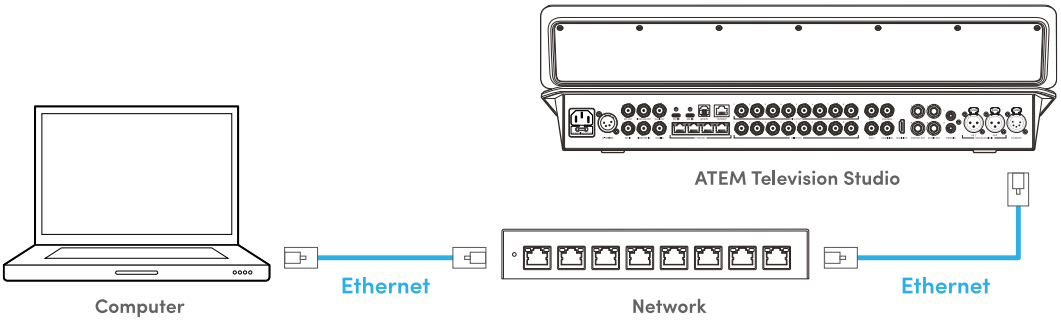
1. Launch your web browser, navigate to www.blackmagicdesign.com/support and download the latest ATEM switcher drivers.
2. When the file has finished downloading, double click 'install ATEM' icon to run the installer. Follow the prompts to the end and press 'install' to install the software.
3. Once the software is installed, navigate to 'Blackmagic ATEM Switchers' folder in your applications or programs folder and double click 'ATEM Software Control'.

Now the software is installed you will need to connect the switcher to the computer. This can be done by connecting the devices directly via Ethernet or USB.

Connecting Directly



Connecting via a Network



Lastly, you need to ensure your computer is connected and working on your network. Then when you launch the ATEM Software Control application, you will be prompted to select a switcher. If it can be seen on the network, you can select it from the list, or enter an IP address manually. Use the IP address you just entered for the switcher. Then the ATEM Software Control can find the switcher and communicate.

Switcher Control Panel

The software control panel has four main control windows: Switcher, Media, Audio and Camera. You can open these windows by selecting the buttons at the bottom of the interface or by pressing the Shift and left/right arrow hot keys. A general settings window can be opened by selecting the gear icon at the lower left of the interface. The switcher, media, audio and camera windows all contain unique settings for the switcher, which can only be made from the software control panel.

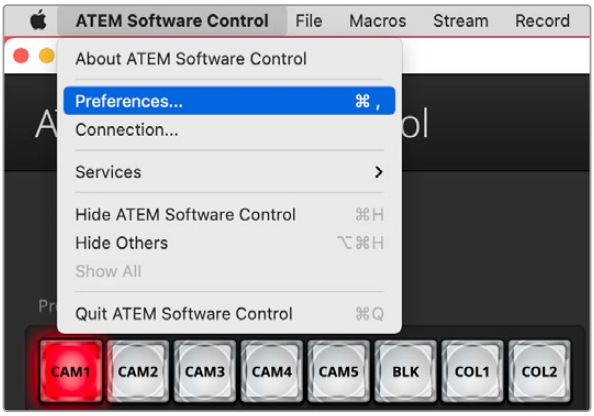
Switcher Panel

When first launched, the switcher screen is selected, which is the main control interface for the switcher. The software control panel must be connected to a switcher to run.

ATEM Software Control window

Preferences

The preferences settings are arranged as ‘general’ preferences and ‘mapping’ preferences. General preferences contain settings for transition control, language selection and enabling or disabling midi control. Mapping preferences let you assign inputs to specific buttons on the preview and program rows. Go to the menu bar at the top of your screen, select ‘ATEM Software Control’ and open the ‘preferences’.



Open preferences from the ATEM Software Control menu

General Preferences

When you first receive your ATEM switcher, it will be set to program/preview switching which is the current standard for an M/E switcher. You can change this preference to A/B Direct if you wish to use older style A/B switching.

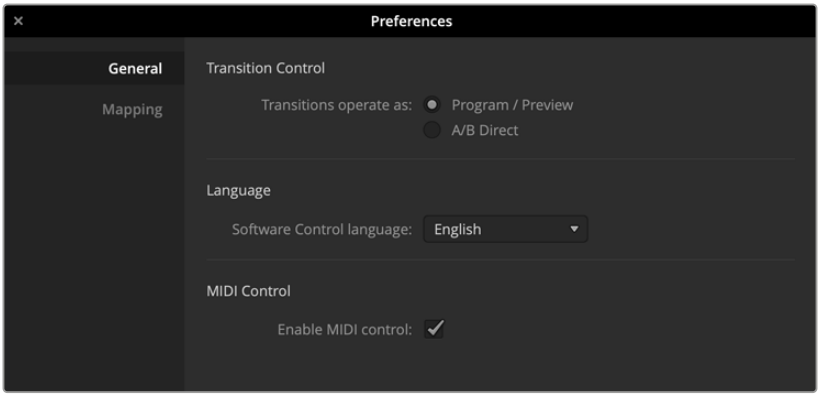
ATEM Software Control can be set to display in English, German, Spanish, French, Italian, Japanese, Korean, Polish, Portuguese, Russian, Turkish, Ukrainian and simplified Chinese languages.

When running ATEM Software Control for the first time after installation, a setup dialog box will prompt you to set the language for the software, but you can change the language of the software at any time.

From the language menu select your preferred language. A warning will appear asking you to confirm the action. Click ‘change’.

ATEM Software Control will now close and restart in your selected language.

To operate your ATEM switcher using a MIDI controller, check the box to enable MIDI control.

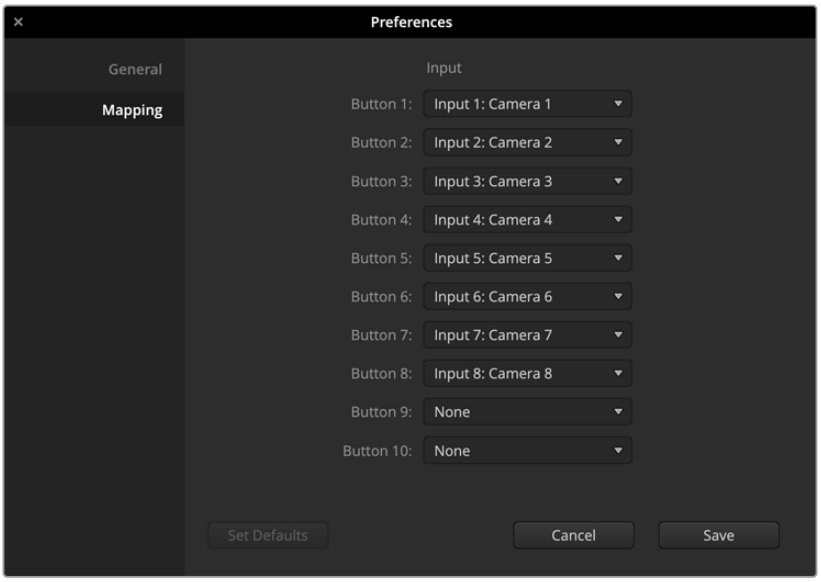


Set your general preferences

Button Mapping

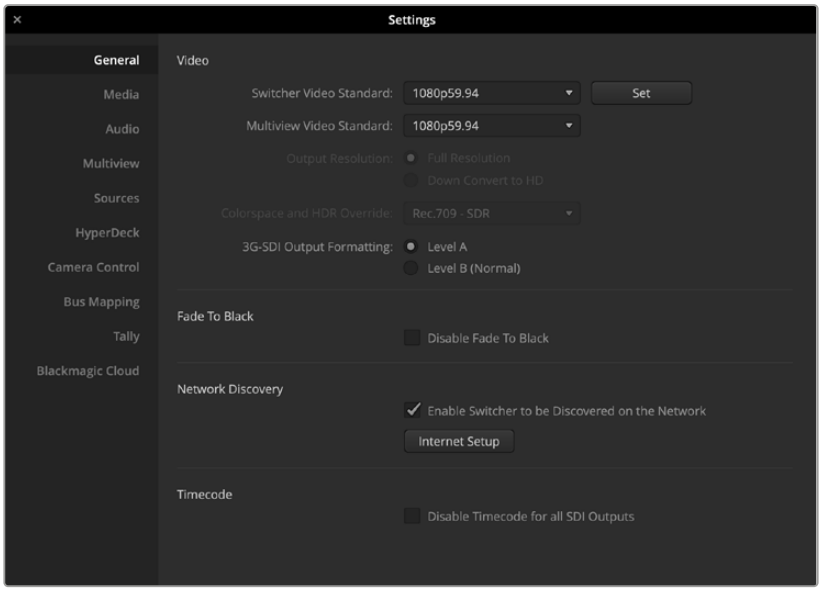
In the mapping preferences, you can assign inputs to specific buttons on the preview and program rows.

ATEM software and hardware control panels support button mapping so you can assign your most important sources, especially cameras, to the most accessible buttons in the program and preview rows. Occasional sources can be assigned to less prominent buttons. Button mapping is set independently for each control panel so button mapping set on a software control panel will not affect the button mapping set on a hardware control panel.



Changing Switcher Settings

Clicking on the switcher settings ‘gear’ icon in the bottom left hand corner will open the settings window where you can change general switcher settings, audio, multiview, sources, HyperDeck and camera control settings. These settings are divided into tabs.



ATEM Television Studio HD8 ISO general settings

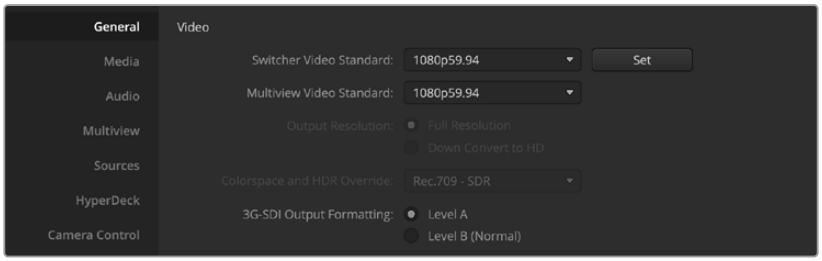
General Settings

The general tab contains settings for your video standard, media pool settings as well as choosing the camera control monitoring output.

Video

Setting the Switcher Video Standard

The video setting is used to select the operating video standard of the ATEM switcher. You can set the video standard to suit the region in which you are broadcasting, such as 1080i59.94 or 720p59.94 if you are broadcasting in NTSC based countries. If you are broadcasting in PAL based countries, you can set your video standard to formats such as 1080i50 or 720p50. A good way to work out the video standard you should use is to check cameras and then set the switcher video standard to the same format.



Set your video standard

ATEM Television Studio switchers support the following video standards.

HD Video Standards	720p50, 720p59.94, 720p60 1080p23.98, 1080p24, 1080p25, 1080p29.97, 1080p30, 1080p50, 1080p59.94, 1080p60 1080i50, 1080i59.94, 1080i60

ATEM Television Studio 4K8 switchers also support the following video standards.

Ultra HD Standards	2160p23.98, 2160p24, 2160p25, 2160p29.97, 2160p30, 2160p50, 2160p59.94, 2160p60

To set the video standard, select the video standard from the menu and then press the ‘set’ button. Any time the video standard is changed, it will erase any frames you have loaded into the media pool.

Setting the Multiview Video Standard

If your production video standard is set to 1080p25 or higher, you can adjust the multiview output to a lower frame rate. This way you can set the multiview outputs to be down converted for even greater monitor compatibility. For example, if your video standard is set to 1080p60, you can set the multiview output to 1080i60.

Set 3G SDI Output Level

If you’re outputting 1080p50 or higher HD video to equipment with 3G-SDI inputs, you may need to toggle between level A and B 3G-SDI output standards to maintain compatibility with equipment that can only accept level A or B 3G-SDI video. Level B is the default setting that works with most equipment, but you can switch to Level A by clicking the ‘level A’ radio button.

Fade To Black

To disable the FTB button on the front panel of the switcher along with ATEM Software Control click the ‘disable fade to black’ checkbox.

Downstream Key

You can override camera tally when the downstream key is at 100% opacity, such as during a sports replay package while using DaVinci Resolve Replay Editor. This helps notify the camera operator that they are not on air while the replay is active. However, if the downstream keyer is not fully opaque, the tally will remain active.

Network Discovery

ATEM Television Studio HD8 ISO model switchers are visible over your local network by default, so if you are planning on streaming directly to the switcher using Blackmagic Studio Camera 6K Pro or URSA Broadcast G2 you can get started straight away. To turn this off, uncheck ‘enable switcher to be discovered on the network’.

Media Settings

Media Pool

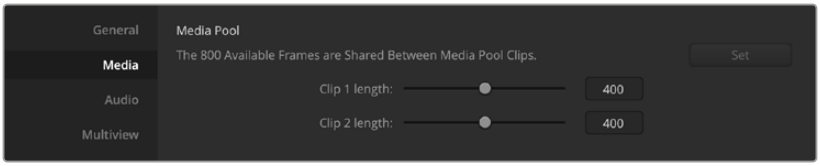
Adjusting the Media Pool Clip Length

Each ATEM switcher model has memory for graphics that’s called the media pool. This memory holds images with an alpha channel as well as video clips that can be assigned to a media player for use in the production.

ATEM Switcher Model	Still Graphics	Video Clips	Video Format	Clip Length
ATEM Television Studio HD8	20	2	720p	400 frames
			1080p	200 frames
ATEM Television Studio HD8 ISO	20	2	720p	400 frames
			1080p	200 frames
ATEM Television Studio 4K8	20	2	720p	1600 frames
			1080p	800 frames
			2160p	200 frames

Media pool capacities

By default, each clip receives equal amounts of the available memory which determines the maximum number of frames. If you need a clip to be longer, adjust the balance of frames. It’s worth remembering that lengthening one clip will shorten the other.



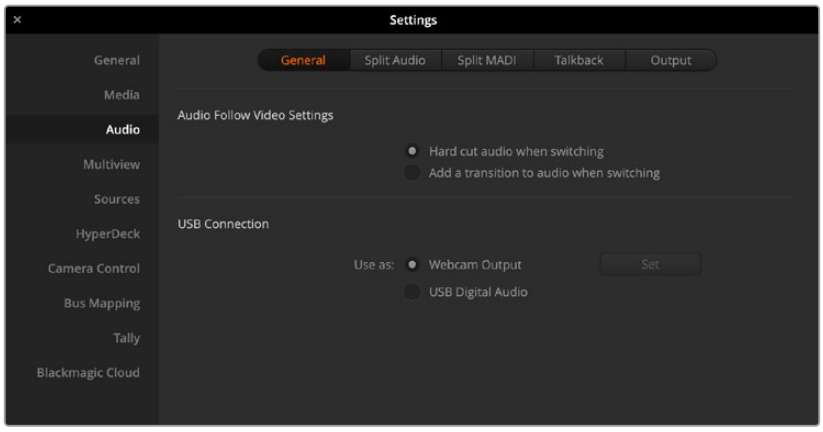
Media pool sharing

Audio Settings

The audio tab contains all the audio settings separated into five categories, general, split audio, split MADI, talkback and output or mix minus.

General

Use the general audio tab to set the audio follow video settings.



Audio Follow Video Settings

When using AFV, you can select the audio behavior during transitions using the radio buttons. To crossfade the audio when inputs change, check the radio button to add a transition. The audio will only be sent to the program output when the input is on air.

USB Connection

The USB connections on the rear of the ATEM Television Studio switchers are used for installing software updates as well as providing a webcam output. You can also configure the USB port to operate as a USB digital audio interface for use with Fairlight Live. Fairlight Live is a powerful software-based live audio mixer that supports hundreds of channels. It handles standard formats from stereo to surround sound as well as ambisonic and immersive audio workflows.

To use Fairlight Live select ‘USB digital audio’ and click the ‘set’ button.

If the USB connection is set to USB digital audio, the audio mixer controls in ATEM Software Control and on the switcher are automatically disabled when the switcher detects audio returning from the USB audio mixer.

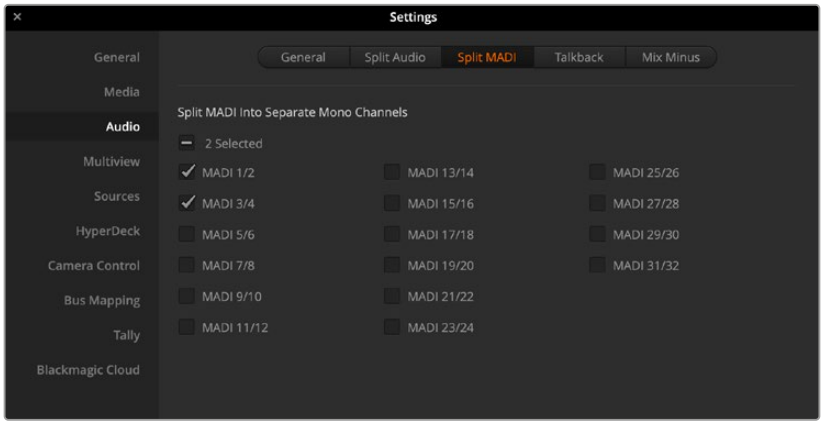
When using a Fairlight Live ATEM show template, this happens as soon as the show starts. With a custom show template or another USB audio mixing interface, it happens after you route the audio output back to the switcher.

For Fairlight Live, the output routing is configured in the patching matrix window.

Split Audio

ATEM Television Studio switchers can split a stereo input signal into two separate mono channels. This is helpful for mixing a mono input into both channels on the stereo master output. You can also select between splitting all audio into separate channels, or select each input individually.

You can also split MADI channels into separate mono channels.

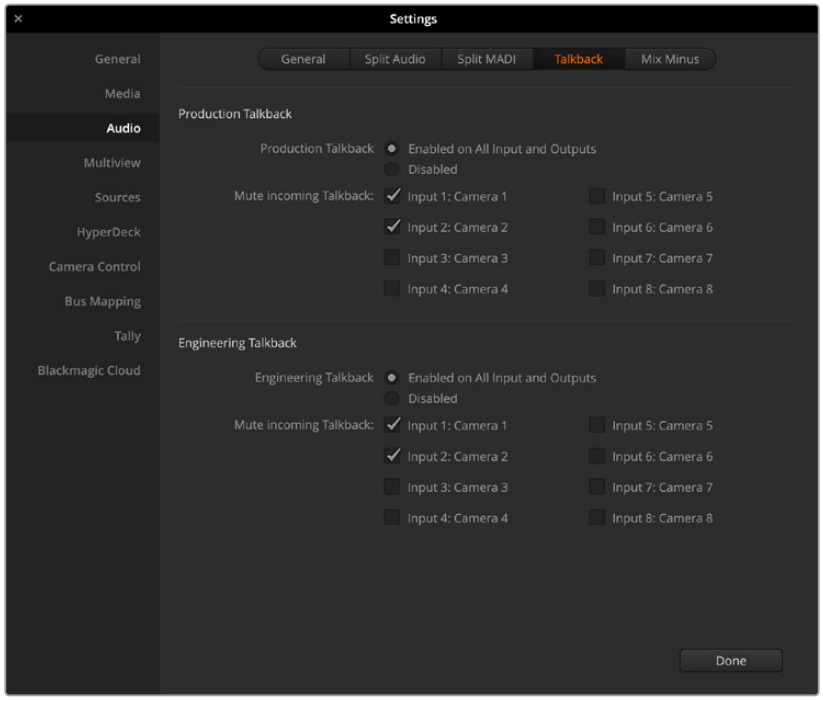


Use the checkboxes to split MADI into separate mono channels

Talkback

Set your talkback behavior via the talkback tab. Production talkback is embedded into SDI channels 15 and 16 and engineering talkback is embedded into SDI channel 13 and 14. Talkback can be enabled or disabled via the check box.

You may want to loop one of your ATEM's outputs to an input to achieve a desired effect. In some cases this can cause a feedback loop in SDI talkback channels. If this occurs, you can mute SDI channels talkback by clicking the 'mute' checkbox beside each input. If you do want to mute incoming talkback, make sure to check the box for both production and engineering talkback.



Mute incoming production talkback on inputs

Output

Adjust the audio return for the SDI, remote source and auxiliaries using the output menu on ATEM Television Studio HD8 model switchers.

SDI Audio

Select your audio return option using the menu. Options include program mix, monitor, production talkback, engineering talkback and mix minus. When selecting mix minus, select the audio source using the menu. This will remove the selected source from the return audio.

Auxiliaries Audio

When routing auxiliary outputs to camera sources, enabling mix minus for an input will output all program audio in the mix, minus that particular input.

Remote Source Audio

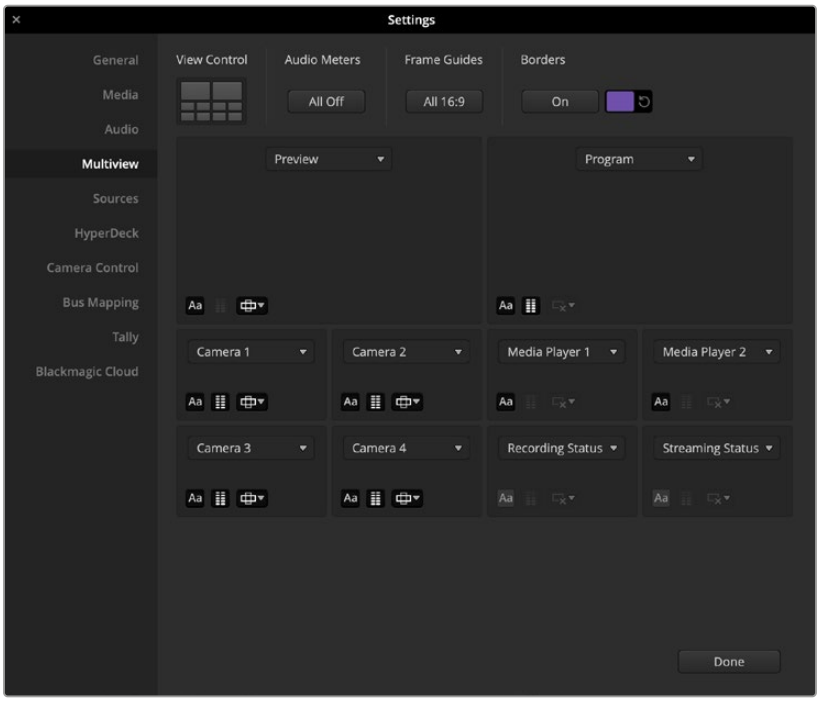
When using remote sources with ATEM Television Studio HD8 ISO models you can specify the return audio using the ‘set return to’ menu. When selecting mix minus, select the audio source using the menu. This will remove the selected source from the return audio.

Mix Minus

The mix minus settings on ATEM Television Studio 4K8 let you mute the audio from their return program feed. For example, when doing live crosses there can be a delay in the audio which may be distracting when the presenter can hear his or her own voice delayed on the program return feed. Enabling mix minus for an input will output all program audio in the mix, minus that particular input.

Multiview Settings

The multiview settings allow you to set the multiview orientation. The default view features two large windows at the top and eight smaller windows beneath, however each quadrant of the multiview can be set to either one large view or four smaller views so you can configure 4, 7, 10, 13 or 16 views. Click on each quadrant in the ‘view control’ to toggle between 1 and 4 views.



Configure the multiviews

Audio meters can be turned on or off for all the switcher sources and program view by enabling the 'All On' button in the multiview settings, or you can turn them on or off individually by clicking the audio meter icon in each view.

On each source and program view you can turn on safe area markers to make sure your program will look great on any monitor. Frame guides display as 16:9 for horizontal or 9:16 for vertical workflows. Select 'all' to turn on both frame guides.

The multiview will also display tally, so if any of the sources in the multiview are used in a layer on the program or preview outputs, the border will be highlighted red or green. A red border indicates the source is used on the program output and a green border indicates a source is selected on the preview output. Using the borders settings you can disable the border or select a color using the color menu. The labels on the multiview will also change to red or green when on the preview or program outputs. Labels can also be disabled on any window by clicking the 'Aa' icon.

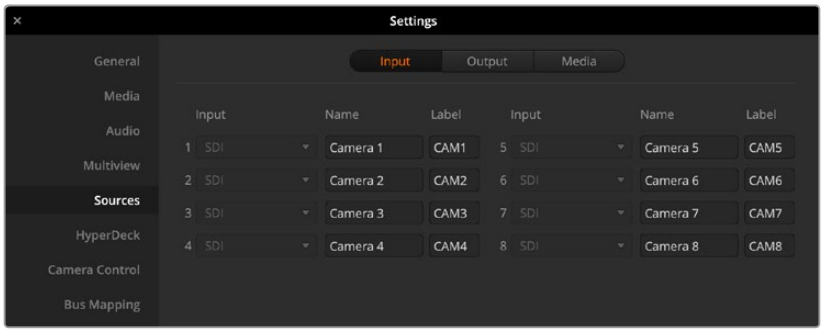
The multiview includes additional status views for streaming, recording and audio so you can monitor the space on hard drives or data rate while streaming. For more information on available views, refer to 'Using the Multiview' in this manual.

Sources

The sources tab can be used to change labels for the switchers inputs, outputs and media players. Each input and output will have a long name and a short name.

The long name supports up to 20 characters in length and are displayed in various source selection boxes on the software control panel, the multiview windows on screen labels and on the LCD displays on the switcher. The short 4 character name is used to identify the input buttons on software control panel.

To change an input name, click in the text field, enter the text and select set. The input name will be updated on the multiview, software control panel and switcher if one is connected. It's a very good idea to change both the short and long labels at the same time, so they match. For example Camera 1 would be entered in as a long label and CAM1 as the short label.



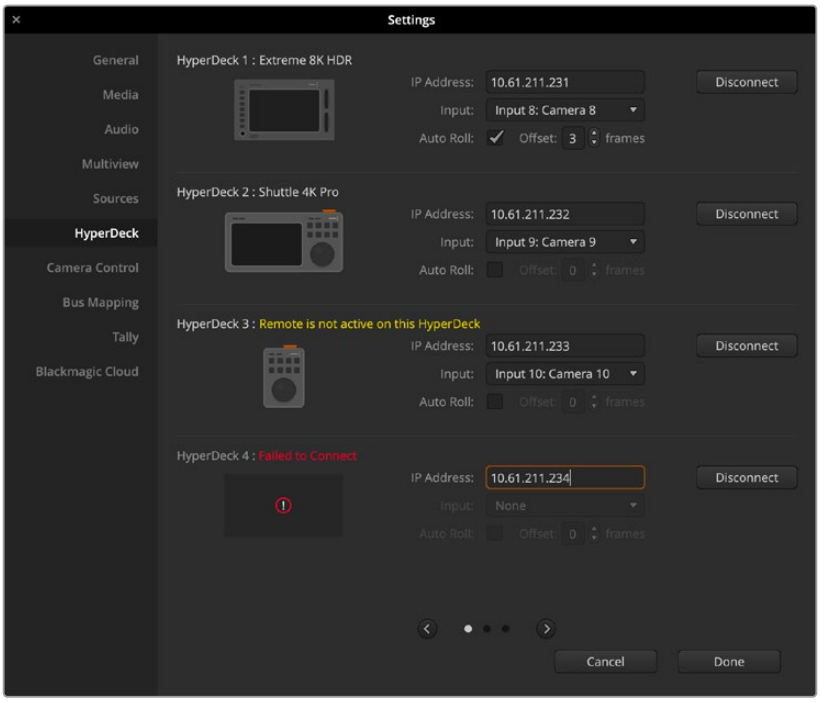
Enter the long and short names for the inputs and outputs

On ATEM Television Studio HD8 ISO model switchers you can use the sources tab to add remote cameras on your local network or via the internet. For more information refer to 'additional features on ISO models' later in this manual.

HyperDeck Settings

With ATEM Television Studio switchers you can connect up to 10 HyperDeck disk recorders and control them using ATEM Software Control. When connecting HyperDecks, use these settings to configure the IP Address, select the inputs your HyperDecks are connected to, turn the auto roll feature for each deck on or off and set their frame offset settings so they can switch cleanly.

Status indicators appear above and below each deck so you can see if they are successfully connected and if their remote buttons are active.



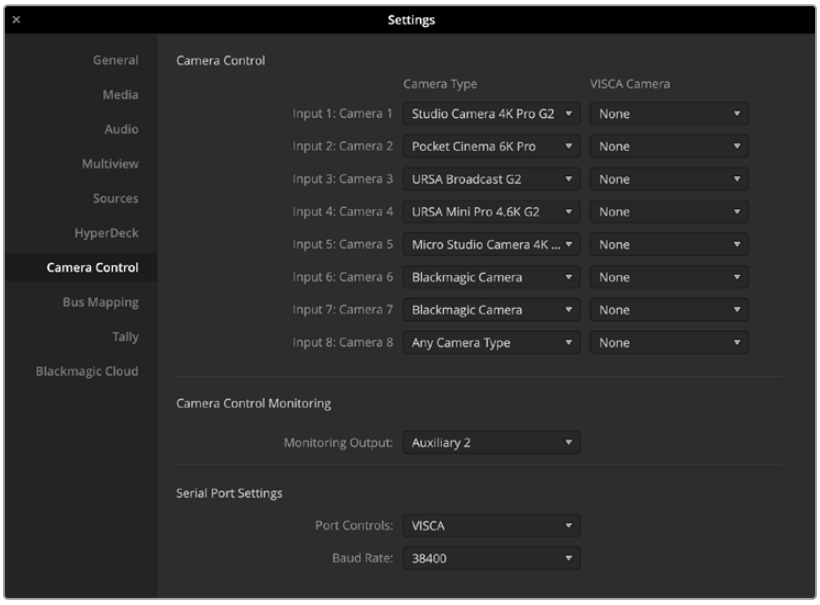
Add up to 10 HyperDecks

Customizing the labels for your HyperDeck inputs can make it easier to pick from the list.

For detailed information on setting up HyperDecks with your ATEM switcher and setting the ‘HyperDeck’ configuration settings, refer to the ‘HyperDeck control’ section of this manual.

Camera Control Settings

The camera control tab features settings for assigning cameras to inputs and selecting your monitoring output.



Camera Control

The camera type menu lets you select a Blackmagic camera for each input, or you can select ‘any camera type’ when adding third party cameras. Selecting the correct camera for the input will ensure that all the parameters for that camera are set correctly.

To add PTZ cameras and PTZ camera heads controlled by VISCA over IP:

1. Using the camera type menu select ‘any camera type’.
2. Click on the corresponding VISCA camera menu. If you’ve already added a VISCA camera it will appear in the list, or you can click the ‘add VISCA IP Camera’ option.
3. In the ‘add VISCA IP camera’ menu enter the IP address for the PTZ camera or camera head. You can also enter a custom camera name. Click ‘add’.

Camera Control Monitoring

You can select any SDI output or the webcam output for camera control monitoring. When controlling your cameras via the camera control panel, you can monitor the adjustments via the monitoring output. Click the menu to choose the output you want to use.

Serial Port Settings

You can select how it is used with the port controls menu. The options are ‘none’, VISCA and GVG, where GVG sets it to use GVG100, a common legacy interface for communicating with equipment such as linear editing suites. When VISCA is selected choose between 9600 or 38400 baud rates.

To detect remote VISCA cameras click on the ‘VISCA camera setup’ button.

A window will appear listing available serial VISCA cameras. You can also add ‘VISCA IP cameras’ by clicking the plus ‘+’ icon. Once serial VISCA cameras are detected they can be selected via the ‘VISCA camera’ menu for each input. To remove a VISCA over IP camera press the ‘-’ minus button.

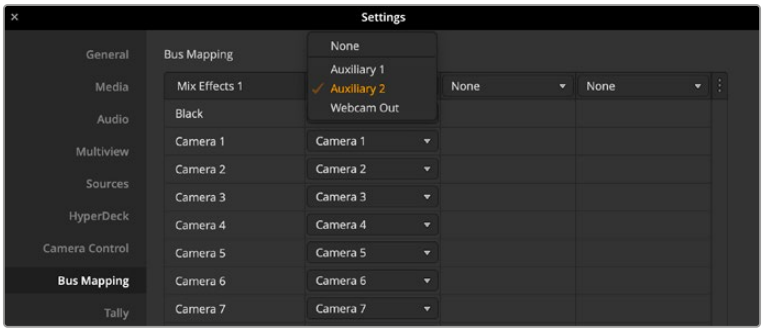
Bus Mapping

With ATEM Television Studio switchers you can link the auxiliary and webcam outputs to follow the operation of the primary M/E. This lets you create multiple outputs of the same program, with follower outputs controlled by the program row.

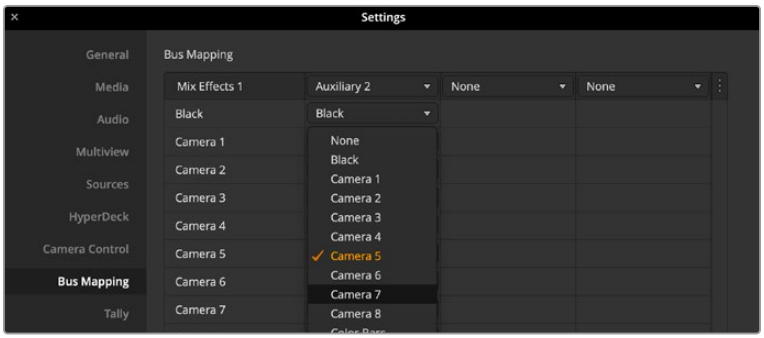
Using the bus mapping tab in settings, you can substitute sources on follower auxiliary outputs or the webcam output to override selected inputs. Once set, followers will match the program row for cuts and transitions, but can output different sources when needed. It is worth noting that these are simple cuts only outputs so they won’t include any transitions you may use in your program. For example, you could localize a program by substituting title graphics on each output with a different language. The follower will then perform every transition in sync with the primary, replacing any transitions with simple cuts, while showing the localized graphics you’ve assigned, resulting in up to 4 distinct program outputs.

To set up source substitution:

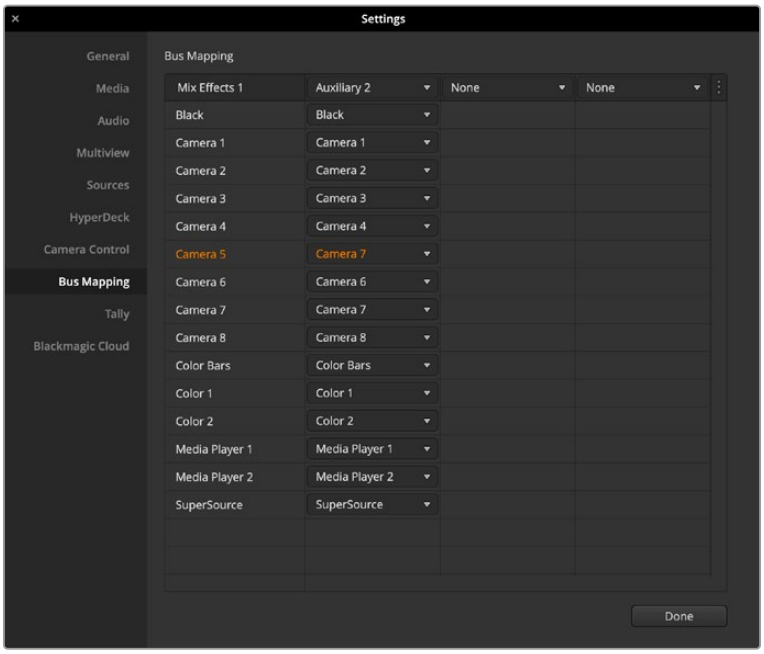
1. Using the menu at the top of the second column select an auxiliary or webcam output to use as a follower, for example, auxiliary 2. ATEM Television Studio HD8 models feature 2 auxiliary outputs, ATEM Television Studio 4K8 switchers feature 10.



2 In this example camera 5 will be substituted. Navigate to the corresponding source list under auxiliary 2 for camera 5 and click on the list menu.



3 Select camera 7 from the list. Camera 5 under the mix effects 1 will now highlight orange to indicate a substitution has been made.



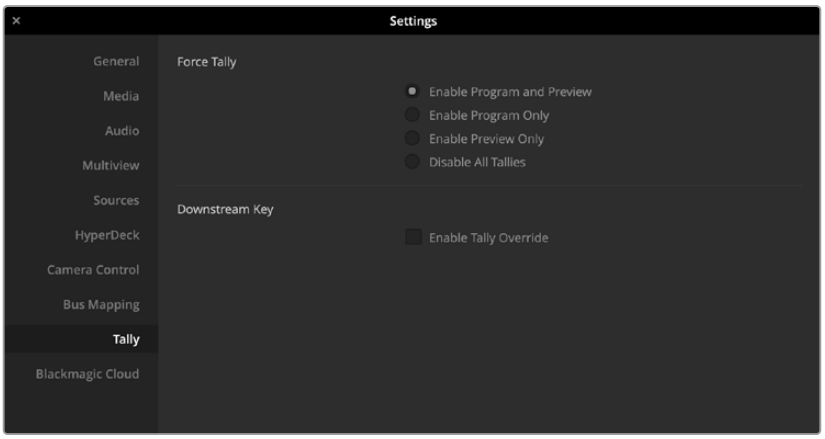
Now when you cut or transition to camera 5 on mix effects program, auxiliary 2 will cut to camera 7. A quick way to see this in action is if you map both program and auxiliary 2 to your multiview output.

It is worth noting that these are simple cuts only outputs so they won't include any transitions you may use in your program.

Tally

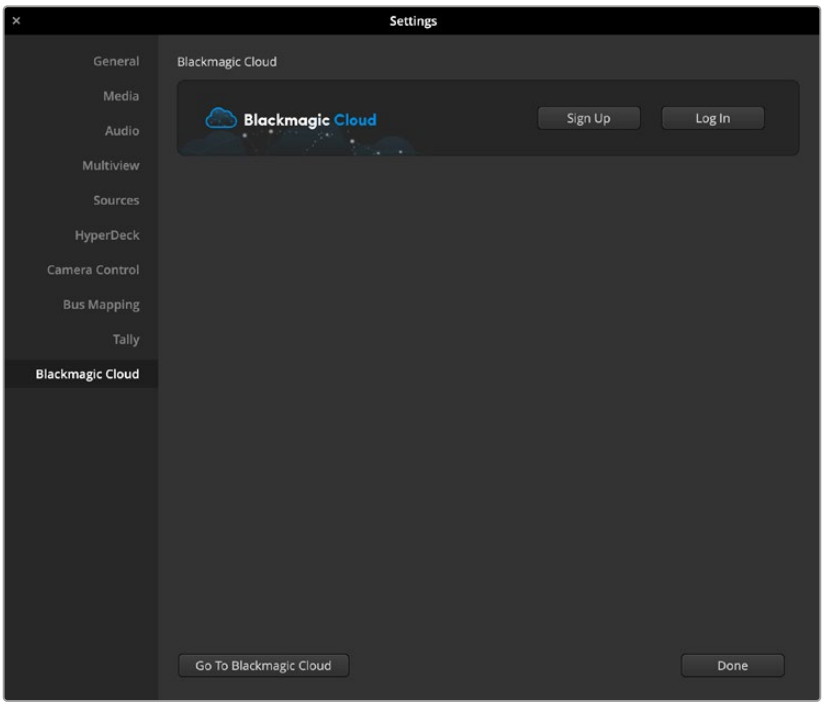
Enable tally on each M/E using the tally menu. These can be set independently per M/E and one M/E can have a different tally output to another.

To disable tally while a downstream key is on air click the ‘enable tally override’ checkbox.



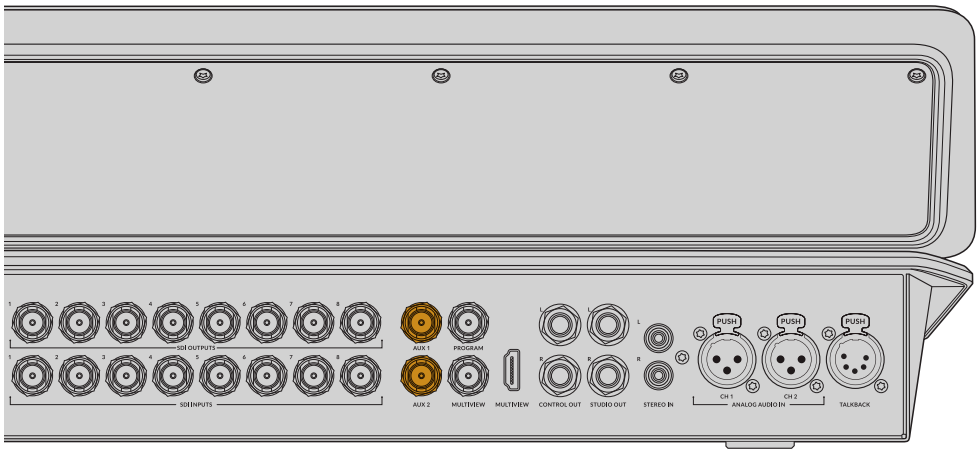
Blackmagic Cloud

If you are streaming to Blackmagic Cloud Stream Router or syncing projects to Blackmagic Cloud you will need to log in to Blackmagic Cloud. This can be done via the Blackmagic Cloud menu in the settings window or using the Live Stream palette.

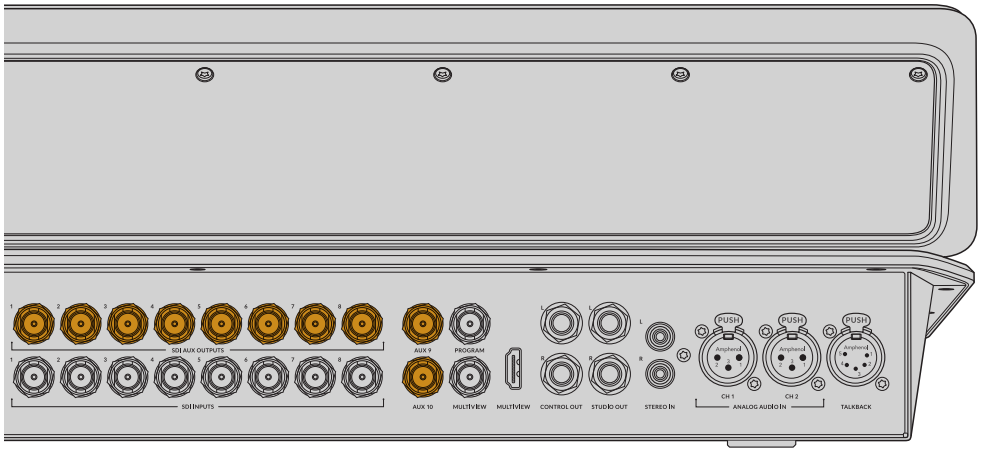


Auxiliary Outputs

The separate SDI auxiliary outputs and webcam output on your ATEM switcher can have various inputs and internal sources routed to them. They are very similar to router outputs and all video inputs, color generators, media players, program, preview and even color bars can be output. ATEM Television Studio HD8 switchers have 3 auxiliary outputs and ATEM Television Studio 4K8 switchers have 11 auxiliary outputs.



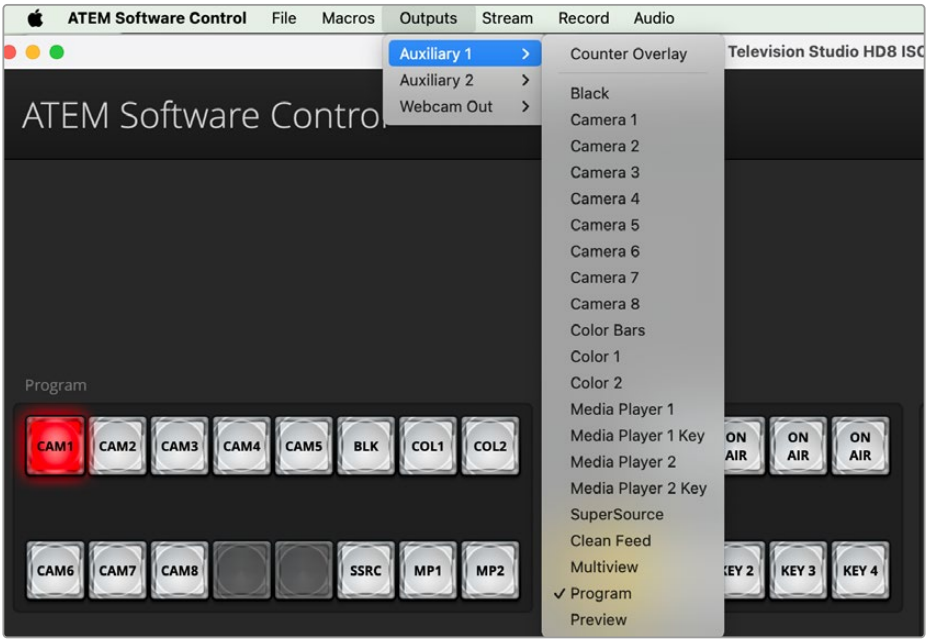
Auxiliary outputs on ATEM Television Studio HD8



Auxiliary outputs on ATEM Television Studio 4K8

Routing Auxiliary Outputs

Using the dedicated auxiliary or outputs menu to route the auxiliary outputs. Simply select the menu, then scroll the list for the source you want to output. When selected, the output on the selected aux will change immediately. You can see the current source with a tick in the menu item. There is a range of sources available, including black, all video inputs, color bars, media players fill and media player key outputs, program, preview and clean feeds.



Auxiliary outputs menu on ATEM Television Studio HD8

Aux outputs are extremely powerful and allow many exciting possibilities like alternative switcher outputs, or they are very commonly used for driving video projectors and video walls on stage during concerts and live performances. Most modern live performances have complex multi media aspects to them and the aux outputs are designed to allow you to control all these displays from your ATEM!

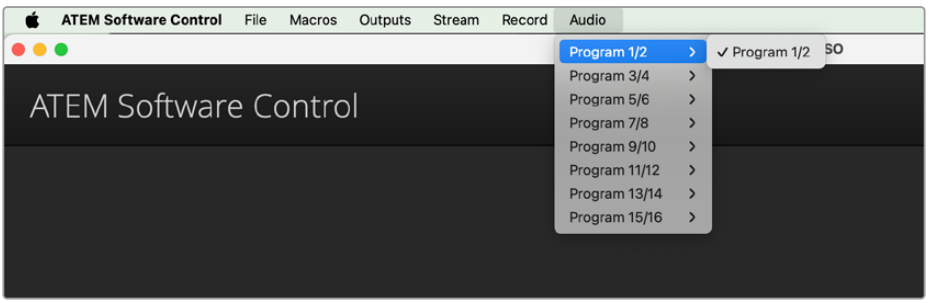
Audio Output Channel Mapping

You can map the embedded audio channels in the video output of the switcher. This means you can route various audio sources into channels in the SDI video output so it can be recorded on HyperDeck recorders.

For example, you might want to connect a microphone to a camera and then route this specific input to embedded audio channels 3&4 on the program output. Then if you select to record 4 or more channels of audio in the HyperDeck settings, the recording will have a raw recording of the camera microphones independent of the audio mix, and any audio engineer can get to those specific audio sources when doing an audio mix in post production.

This audio routing feature allows you control over all embedded audio channels in the SDI video output and is very powerful.

Your ATEM switcher can route the program out audio channels individually using the audio menu.



ATEM Television Studio audio routing options in ATEM Software Control

Program mix will always be assigned to channels 1 and 2, engineering talkback to 13 and 14 and production talkback to channels 15 & 16, but all other channels can be mapped separately using any of the SDI, MADI, XLR, RCA or microphone inputs.

Routing program audio using ATEM Software Control

1. Click on the audio menu in the upper toolbar.
2. Select a pair of program audio out channels and from the menu on the right hand side select the SDI input audio you want to route. For example, to route channels 3 and 4 from SDI input 2 to channels 3 and 4 on the program out, select 'audio out 3/4' in the first list menu and 'SDI input 2 audio 3/4' from the second list.

Using SuperSource

ATEM Television Studio switchers include a feature referred to as SuperSource that will allow you to arrange multiple sources on the monitor at one time. For example, if you are broadcasting a discussion between four presenters, you can superimpose them all over a background. The SuperSource processor appears on your ATEM switcher as a single video input.

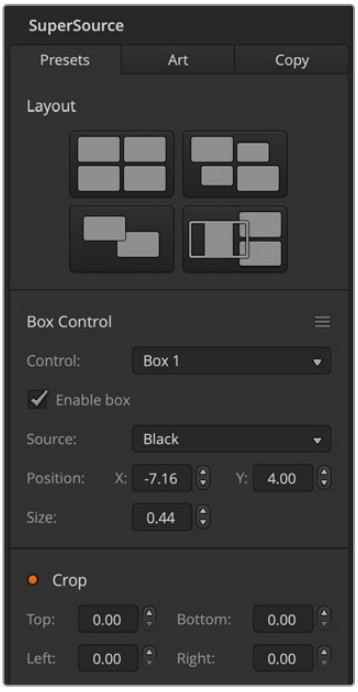
Setting up SuperSource

You can set up SuperSource using the palettes tab in ATEM Software Control or by pressing the SuperSource button to the left of the LCD screen.

Viewing SuperSource

To set up SuperSource, first you need to be able to view it on your monitor. Do this by either assigning SuperSource to one of the SDI outputs using the outputs menu or by placing SuperSource on one of the windows of your multiview layout.

Positioning Sources



SuperSource settings

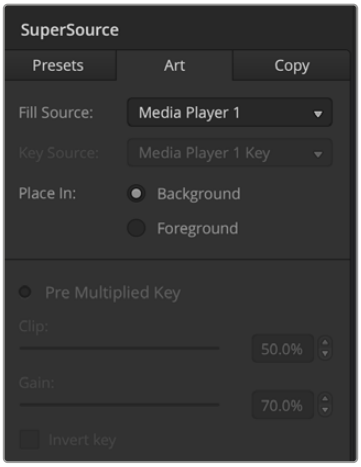
Open the SuperSource palette and choose one of the four preset layouts that is closest to the look you want. This will automatically arrange the boxes into the positions indicated in the software. Using the control menu, select which box you want to adjust. You can now change the x and y position along with the size of each box, or uncheck the 'enable box' to remove that box from the SuperSource view. The crop settings allow you to crop the sides of the boxes. Tick the crop checkbox and adjust the parameters for the top, bottom, left or right sides. To reset the position, size or crop of the box or all of the parameters, click the icon to the right of box control.

On the ATEM Television Studio switcher, press the button marked SuperSource and use the system control arrow buttons to navigate through the SuperSource settings. On the second page of the SuperSource menu, rotate the preset knob to pick the layout and then press the soft 'apply preset' button above the LCD. Once a box is selected, all the additional settings will apply to that box along with the joystick control.

Adjusting the size and position of the box can be done via the soft knobs below the LCD on the third menu page but it is much quicker using the panel joystick. Push the joystick around to change both the x and y position together. Twist the joystick clockwise to increase the size or counter clockwise to reduce the size of the box.

Background and Foreground Art

Click on the ‘art’ tab to reveal the art settings. Choose your fill source from the menu. If you are using the switcher panel, you can select the fill source using the source select bus. Place the source in the background or foreground. With foreground selected you can now select the key source from the menu or the source select bus on the switcher panel.

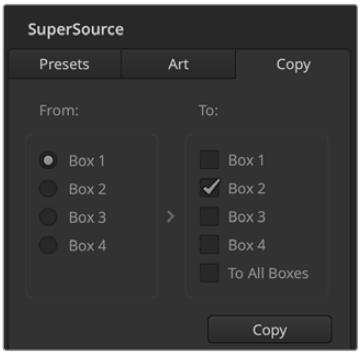


Art Background controls

When the foreground radio button is selected, you will need to choose whether your graphic is pre multiplied or not. If it is pre multiplied then click the checkbox. This will now allow the art to be placed over the enabled boxes. If your art is not pre multiplied then you can use the clip and gain controls as discussed in the ‘keying’ section of this manual to achieve the desired result. You can also invert the key.

On the panel switcher use the arrow buttons in system control to navigate to the settings. Using the fill source knob select your art and then whether you want it in the foreground or background using the soft buttons above the LCD. If the fill source is pre multiplied then proceed to the following page of settings and make sure the ‘pre multi key on’ button is shown. This will now allow the art to be placed over the enabled box or boxes. If your art is not pre multiplied then you can use the clip and gain controls as discussed in the keying section of this manual to achieve the desired result. You may also need to invert the key.

Copying Settings



Copying the settings of Box 1 to Box 2

To perform the copy function using ATEM Software Control, click the copy tab and the copy box settings dialogue will appear. You can quickly and easily copy the settings of the currently selected box to any of the other boxes, making an exact clone in just one click. The copied boxes will appear directly behind the master box and will also share the same source as the master.

If you are adjusting settings using the ATEM Television Studio switcher, navigate to the final page of the SuperSource menu and using the soft knobs below the LCD select the box to copy from and the box you want to copy to. You can also choose to copy to all boxes using the knob.

Putting SuperSource On Air

The entire SuperSource processor appears on your ATEM switcher as a video input. Simply select the SuperSource on the program bus using either ATEM Software Control or and switcher panel to use the composite you have just made.

Saving and Restoring Switcher Settings

After setting up your ATEM switcher, you can save your settings using two different options.

Save Startup State

If your switcher uses the same settings for all your productions you can save the default startup state. Once saved, each time you open ATEM Software Control all your presets and preferences will load. These settings can be cleared using the ‘clear startup state’.

Save Settings as an XML

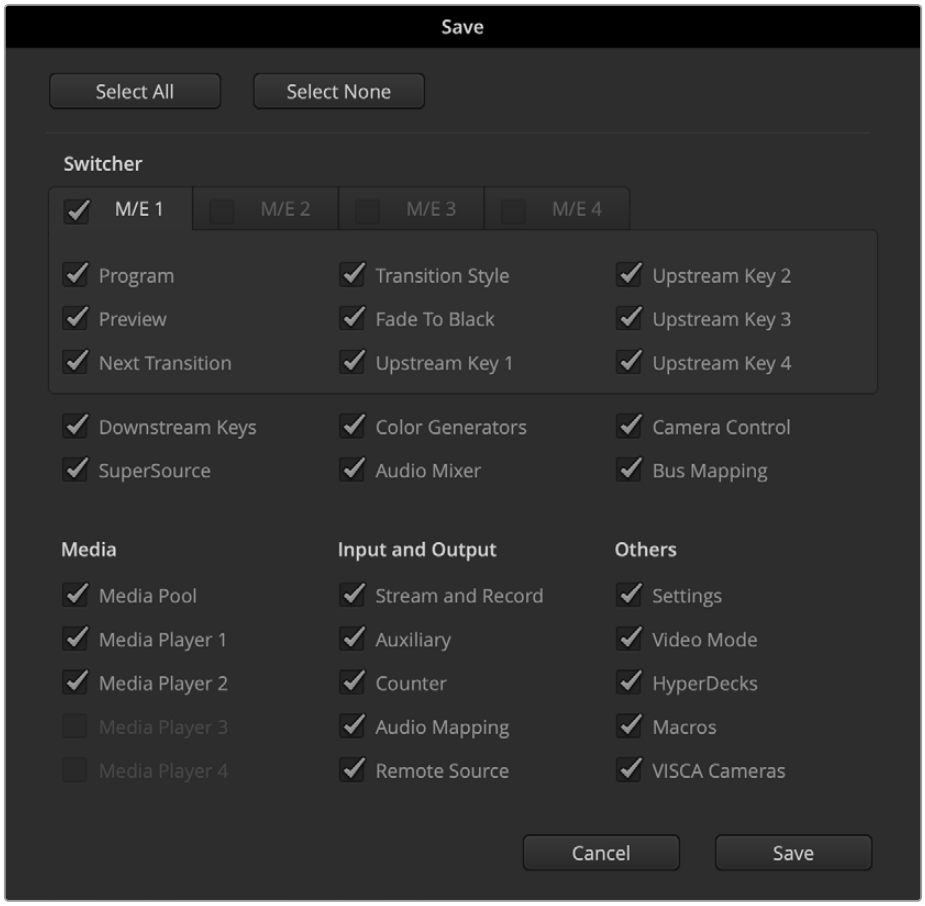
For workflows where you may have multiple productions each with their own setup, you can use the ‘save as’ feature. This powerful feature is incredibly time saving on live productions where regular settings are used. For example, you can immediately restore saved camera settings, lower third graphics and detailed key setups from a laptop or USB drive.

To save settings:

1. Go to the menu bar in ATEM Software Control and select File>Save As.
2. A window will open asking for a file name and destination folder. After you have made your selection, click Save.
3. The Save Switcher State panel containing checkboxes for all the available settings on each block of your ATEM switcher will open. The Select All checkbox is enabled by default. If you save with Select All enabled, ATEM Software Control saves your entire switcher settings. If you want to choose specific settings to save, you can deselect settings individually, or to remove all settings click Select All once to deselect them. Now you can select specific settings you want to save.
4. Click Save. A saving status will appear in the bottom right hand corner of the panel to confirm the save is complete.

ATEM Software Control saves your settings as an XML file together with a folder for ATEM Media Pool contents.

After you have saved your settings you can quick save at any time by selecting File>Save, or by pressing Command S for Mac, or Ctrl S for Windows. Doing so will not overwrite your previous save, but will add a new XML file to your destination folder which is clearly identified with a time and date stamp. This means you can always restore a previous save if necessary.



With ATEM Software Control you can save and restore all your switcher settings for your live production, including key settings, transition styles, media pool contents and more

If your switcher settings are saved on a laptop, it's easy to take all your settings with you on location. Connect your laptop to any ATEM switcher and quickly restore your switcher settings.

Live production can be a busy and exciting time and you're always working in the moment, which means you can easily forget to back up your saved files when the production is over.

If you have settings you want to keep, save them to your computer and an external drive, such as a USB drive. This means you can carry your settings with you and have a back up in case your settings are accidentally deleted on your computer.

To restore settings:

1. Go to the menu bar in ATEM Software Control and select File>Restore.
2. A window will ask for the file you want to open. Select your save file and click Open.
3. You'll now see a window containing active checkboxes for your saved settings on each block of your ATEM switcher. Leave Select All enabled to restore all your saved settings, or select only the checkboxes for the settings you want to restore.
4. Click Restore.

Factory Reset

To reset your ATEM switcher to factory settings open the ATEM Setup utility and click 'factory reset'. Switcher settings saved before a factory reset will remain.

Switching with ATEM Software Control

The switcher window is the main control interface for the switcher. During live production, the switcher window can be used to select sources and take them to air.

You can select the transition style, manage upstream/downstream keyers and turn on/off the fade to black. The palettes on the right hand side of the interface are where you adjust transition settings including transition rates, adjust color generators, control media players, and adjust the upstream and downstream keyers as well as control fade to black rate.

Mouse or Trackpad Operation

The virtual buttons, sliders and fader bar on the Software Control Panel are operated using your computer mouse or trackpad if you're using a laptop.

To activate a button, click once with the left mouse button. To activate a slider, click and hold down the left mouse button while dragging. Similarly, to control the fader bar, click and hold down the left mouse button on the fader bar handle and drag up or down.

Using Keyboard Hot Keys

Hot keys can be used allowing convenient control of some switcher functions using a standard QWERTY keyboard as shown in the following table:

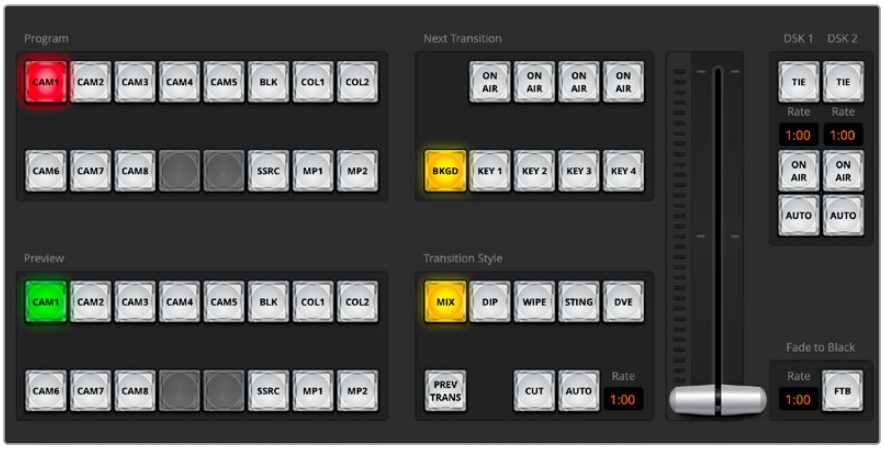
Hot Keys	Function
<1> - <0>	Previews source on switcher Inputs 1 - 10. 0 = input 10.
<Shift> <1> - <0>	Previews source on switcher Inputs 11 - 20. Shift 0 = input 20.
<Control> <1> - <0>	Hot switches source on switcher Inputs 1 - 10 to Program output
Press and release <Control>, then <1> - <0>	Hot switches source on switcher Inputs 1 - 10 to Program output. Hot switching remains on and the CUT button is lit red.
<Control> <Shift> <1> - <0>	Hot switches source on switcher Inputs 11 - 20 to Program output
Press and release <Control>, then <Shift> <1> - <0>	Hot switches source on switcher Inputs 11 - 20 to Program output. Hot switching remains on and the CUT button is lit red.

Hot Keys	Function
<Control>	Turns off hot switching if currently on. The CUT button is lit white.
<Space>	CUT
<Return> or <Enter>	AUTO

More information on how to use the switcher control panel is included in the next sections.

Mix Effects

The Mix Effects block of the switcher tab contains all the source select buttons for the program and preview buses, allowing external inputs or internal sources to be selected for next transition previewing or switching to air.



Mix effects panel on ATEM Television Studio

Program Bus Source Select Buttons

The program bus source select buttons are used to hot switch background sources to the program output. The source currently on air is indicated by a button that is illuminated red.

Preview Bus Source Select Buttons

The preview bus source select buttons are used to select a background source on the preview output, this source is sent to the program bus when the next transition occurs. The currently selected preview source is indicated by a button that is illuminated green.

The source select buttons for the Program bus match the Preview bus.

INPUTS	Input buttons match the number of external switcher inputs.
BLACK	Color black source internally generated by the switcher.
SUPERSOURCE	Use SuperSource to arrange multiple sources on the monitor at one time. Shift select for Bars.
BARS	Color bars source internally generated by the switcher. Shift select SuperSource for bars.
COLOR 1 and 2	Color sources internally generated by the switcher.
MEDIA 1 and 2	Internal media players that display stills or clips stored in the switcher.

Transition Control and Upstream Keyers

Transition Control

CUT

The CUT button performs an immediate transition of the program and preview outputs, overriding the selected transition style.

AUTO/RATE

The AUTO button will perform the selected transition at the rate specified in the ‘rate’ display. The transition rate for each transition style is set in the transition palette for that style and is displayed in the ‘rate’ window of the transition control block when the corresponding transition style button is selected.

The AUTO button illuminates red for the duration of the transition and the ‘rate’ display updates to indicate the number of frames remaining as the transition progresses. The fader bar indicator on ATEM Television Studio switchers updates to provide visual feedback on the progress of the transition.

Fader Bar

The fader bar is used as an alternative to the AUTO button and allows the operator to manually control the transition with a mouse. The AUTO button illuminates red for the duration of the transition and the ‘rate’ display updates to indicate the number of frames remaining as the transition progresses. The fader bar Indicator on the switcher updates to provide visual feedback on the progress of the transition.

Transition Style

The transition style buttons allow the operator to select one of five types of transitions; mix, dip, wipe, DVE, and stinger. The selected transition style is indicated by a yellow illuminated button. Selection of these buttons will be reflected by the corresponding tab in the Transitions processing palette. For example, when you have the transitions processing palette open and click on ‘wipe’, the palette will automatically reveal the ‘wipe’ tab so you can make adjustments to the transition such as duration or pattern style.

Arm

The ARM button enables automatic playback from a connected HyperDeck selected on the preview bus following a transition. Similar to the auto roll function, the selected HyperDeck on the preview bus will begin to play when you press the CUT or AUTO button to initiate the transition. To use the ARM function shift select and click the ARM button which will appear in place of the STING button. When pressed once playback will auto roll for the selected HyperDeck input on the next transition only. To keep ARM enabled press the shift key on your keyboard and double press the ARM button.

It’s worth noting that any pre roll set via the HyperDeck tab in the settings menu will be ignored when ARM is enabled.

PREV TRANS

The PREV TRANS button enables the preview transition mode, allowing the operator to verify a mix, dip, wipe or DVE transition by performing it on the preview output using the fader bar. When the PREV TRANS is selected you will see the preview output match the program output, and then it's simple to practice your selected transition with the fader bar to confirm you are going to get what you want. This is a very helpful feature to avoid mistakes on air!

Next Transition

The BKGD, KEY 1, KEY 2, KEY 3, KEY 4 buttons are used to select the elements which will transition on air or off air with the next transition. The number of available keyers depends on your switcher model. All keys can be faded on and off when the main transition occurs, or you can select just keys to transition individually, so the main transition control can be used to fade keys on and off.

When selecting the elements of the next transition, the switcher operator should look at the preview video output because it provides an accurate representation of what the program output will look like after the transition is completed. When only the BKGD button is selected, a transition from the current source on the program bus to the source selected on the preview bus will occur without any keyers. You can also select only keyers to transition, leaving the current background live throughout the transition.

ON AIR

The ON AIR indicator buttons indicate which of the keys are currently on air and can also be used to immediately cut a key on or off air.

Downstream Keyers

TIE

The TIE button will enable the DSK on the preview output, along with the next transition effects, and tie it to the main transition control so that the DSK can be taken to air with the next transition.

The DSK will transition at the rate specified in the RATE display of the transition control block. If the DSK is tied, the signal routing to the clean feed 1 is unaffected.

ON AIR

The ON AIR button is used to cut the DSK on or off air and indicates whether the DSK is currently on or off air. The button is illuminated if the DSK is currently on air.

AUTO

The AUTO button will mix the DSK on or off air at the rate specified in the DSK RATE window. This is similar to the main AUTO rate on the transition control block, however it's limited only to the specific downstream keyer. This can be used to fade up and down bugs and logos, such as live or replay bugs during production, without interfering with the main program production transitions.

Downstream Key and Fade to Black

Fade to Black (FTB)

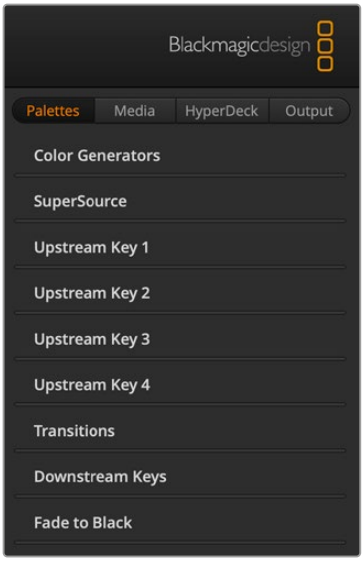
The FTB button will fade the whole program video output to black at the rate specified in the fade to black RATE window. Once the program output has been faded to black, the FTB button will flash red until it is pressed again. Doing so will fade up from black at the same rate, or you can enter a new rate in the rate window. Fade to black is mostly used at the start of your production, and at the end of your production, or when cutting to commercial breaks. It ensures all layers in the switcher are faded down together. A fade to black cannot be previewed. You can also set the audio mixer to fade the audio with your fade to black by selecting the AFV button on the master audio output fader.

Processing Palettes

The software control panel features tabs for the processing palette, media player, and output options. The palettes show the order of the processing in the switcher. You can expand and minimize palettes to save space and scroll them up and down to get the adjustments you need to set.

Palettes Tab

The Palettes tab contains the following processing controls.



Color Generator 1 and 2

The ATEM switcher has two color matte generators which can be configured from the color generator palette using a color picker or by setting hue, saturation, and luminance levels.

SuperSource

ATEM Television Studio switchers include a feature called SuperSource that will allow you to arrange multiple sources on the monitor at one time. For more information refer to the section ‘SuperSource’ later in this manual.

Upstream Keys

There are four upstream keyers which can be configured from the upstream key palettes. Each keyer has its own palette. Within each palette the keyer can be configured as a luma key, chroma key, pattern key or DVE.

The selected palette will display all the parameters that are available to configure the keyer. More information on how to use upstream keyers is included later in this manual.

Transitions

The transitions palette is where you can configure the parameters of each transition style. For example, for the dip transition the palette has a drop down menu where you can select the dip source and for the wipe transition the palette displays all the available wipe patterns. There are lots of variations of transitions, and a large number of transitions can be created by combining settings and features in the transitions palette.

NOTE It's worth noting that simply selecting a specific style of transition in this palette will only adjust the settings for these transitions, and you still need to select the style of transition you want to perform in the transition control section on the software or hardware switcher. For ease of use, some people like to use the hardware panel for switching, while using the software panel palettes for setting up the transition. The software and hardware panels work together and mirror all settings, so you can use any combination you like!

Downstream Keys

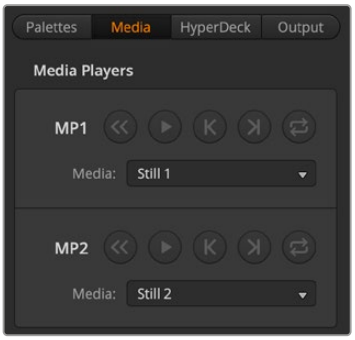
The downstream keyers which can be configured from the downstream keys palette. The palette has drop down boxes for selecting the fill and key signals to the keyer, sliders to set the clip and gain values, pre-multiplied, and mask settings. ATEM Television Studio switchers feature 2 downstream keyers.

Fade to Black

The Fade to Black palette is where you can set the fade to black transition rate. An 'audio follow video' checkbox is also provided as a shortcut for the audio mixer's master fader AFV button. Selecting this feature lets you fade your audio with your fade to black.

Media Tab

The media tab contains controls for your ATEM Switcher's media players and connected HyperDecks.



Media Players

Your ATEM switcher has media players which play back the clips and stills that are stored in the media pool memory built into the switcher. The drop down list is used to select the still or clip that will be played or made available on the media player input to the switcher. When a clip is selected, the transport controls in the media player can be used to play, pause and loop the clip. Controls are also provided to step forward and backward through frames of the clip. ATEM Television Studio switchers have 2 media players.

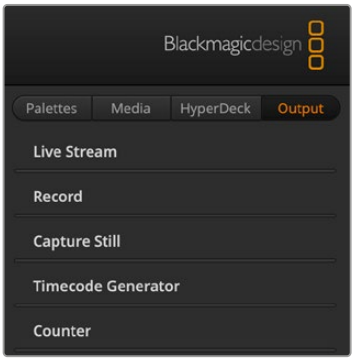
HyperDeck Tab

The HyperDeck tab lets you control up to ten HyperDecks.

HyperDecks

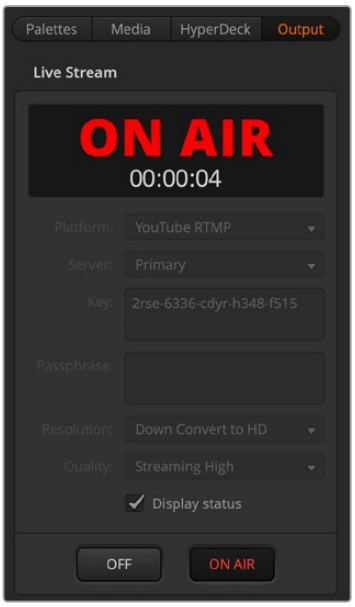
You can connect up to 10 HyperDeck disk recorders and control them using ATEM Software Control's HyperDecks palette. To change the number of HyperDecks displayed click on the cog icon and select the number from the list. For more information refer to the 'HyperDeck control' section of this manual.

Output Tab



Use the output tab to setup live streaming and recording settings. You can can also use the output tab to adjust the timecode and counter settings as well as to capture stills.

Live Stream



When using your switcher this important output option lets you set up your live stream by entering the streaming details from your streaming platform. After assigning all the settings, you can start your broadcast by clicking the ‘on air’ button, then stop the broadcast by clicking ‘off’.

The live stream status will clearly show you are on air by displaying a large red ‘on air’ indicator together with the timecode generator, which you can set using the timecode generator options.

Platform	Click in the ‘platform’ menu and select the streaming platform for your broadcast. Options include Facebook Live, YouTube Live and Twitch.
Server	Select the server that is closest to your location by clicking in the settings window and using the menu.
Key	Enter the stream key that has been assigned to your broadcast from the streaming platform. For information on how to obtain a stream key, refer to ‘getting a stream key’ in the ‘streaming’ section.
Passphrase	If you are using a streaming service with the SRT streaming protocol, enter the passphrase assigned from your streaming platform account.
Resolution	When ATEM Television Studio 4K8 switchers are set to 2160p you can downconvert the livestream to HD or keep it at the switcher standard using the resolution option.

Quality	Select the streaming quality and stream recording quality you want. This setting contains the following options: ▪ HyperDeck High 45 to 70 Mb/s ▪ HyperDeck Medium 25 to 45 Mb/s ▪ HyperDeck Low 12 to 20 Mb/s ▪ Streaming High 6 to 9 Mb/s ▪ Streaming Medium 4.5 to 7 Mb/s ▪ Streaming Low 3 to 4.5 Mb/s More information about the quality settings is included in this section of the manual.

For more information on how to use these options when setting up a live stream directly via Ethernet, including getting a stream key, refer to ‘streaming’ later in this manual.

Even though the settings are nice and simple and you only need to select the service and a few other options, there is an XML file that has additional settings that knowledgeable users could take advantage of to add other streaming services and customize the streaming menu with low level settings. Refer to the ‘changing switcher settings/saving and restoring switcher settings’ section for more information on how to save and restore using an XML file.

Streaming and HyperDeck Quality Settings

The data rate used by the quality setting will change depending on the video standard your switcher is running at. For example, if you select Streaming High quality and are running at 1080p24 then it would use the 6 Mb/s data rate.

The data rates used on HyperDeck High are 45 to 70 Mb/s, the rates for HyperDeck Medium are 25 to 45 Mb/s and the data rates used for HyperDeck Low are 12 to 20 Mb/s. The streaming data rates are lower to allow for transmitting the data over the internet, so the data rate for Streaming High is 6 to 9 Mb/s, the data rate for Streaming Medium is 4.5 to 7 Mb/s and the data rate for Streaming Low is 3 to 4.5 Mb/s.

You will notice that each setting has 2 data rates mentioned. The lower number is used for the lower frame rates of 24p, 25p and 30p, while the higher data rates are used when you are running higher frame rates of 50p and 60p. It’s also worth noting that the default setting for the streaming quality is Streaming High 6 to 9 Mb/s, as this gives a very high quality streaming channel, and a fairly good recording quality.

If you are not streaming, then you could just pick one of the HyperDeck quality settings. These are the same quality as the settings in HyperDeck Studio Mini and are a good quality data rate when you need broadcast quality recordings. However, with the latest software released for HyperDeck Studio Mini, it will also play the lower quality streaming data rates.

Record

If you are recording your stream, this palette is where you can control your disks and start and stop recording. You can also set a file name and trigger record in all connected Blackmagic cameras. For information on formatting media for recording, refer to the ‘storage media’ section.

File Name	Prior to recording, set a file name by typing it into the file name window. Click anywhere outside the window to confirm. If you stop and start recording, the file name will assign version numbers incrementally.
Drives	Formatted drives connected to your switcher will appear as a list in the record window. You can assign drives by selecting them from the menu. The drive window displays the disk capacity and record time remaining. Recording will always begin with the disk containing the largest available space, then proceed to the next disk with the largest available space. However, you can manually switch the drive you are recording to by clicking the 'switch' button. This is helpful if there is less than 5 minutes remaining on the current disk and you want to switch it over to the next disk at a determined moment in your broadcast.
Switch	Click the 'switch' button to change the drive you are currently recording to the next drive with the largest available space.

TIP You can also switch drives by pressing the 'switch' button on the ATEM Television Studio control panel.

Stop button	Click 'stop' to stop recording.
Record button	Click the record button marked 'rec' to start recording.
Display status	Enable or disable this feature by clicking the display status checkbox in the record options. The display status will appear in ATEM Software Control at the bottom right side of the user interface and shows the recording status. When recording, the record indicator will illuminate red and displays the current drive and record time remaining.
Record in all cameras	This feature lets you set all connected Blackmagic cameras to record when you press the record button. This is helpful if you want isolated recordings from each camera for editing later. Cameras will be automatically set to record using Blackmagic RAW at the quality setting the camera was last set to.

Sync to Blackmagic Cloud

Blackmagic Cloud is a collaboration platform that lets you work together as a team and share DaVinci Resolve projects worldwide.

When you sign into Blackmagic Cloud on your ATEM switcher you can choose to upload your recording or ISO project and clips from your external disk or flash drive directly to a DaVinci Resolve Cloud project. Alternatively the stream recording can be uploaded straight to your own private Blackmagic Cloud storage directly without syncing to a Resolve Cloud project.

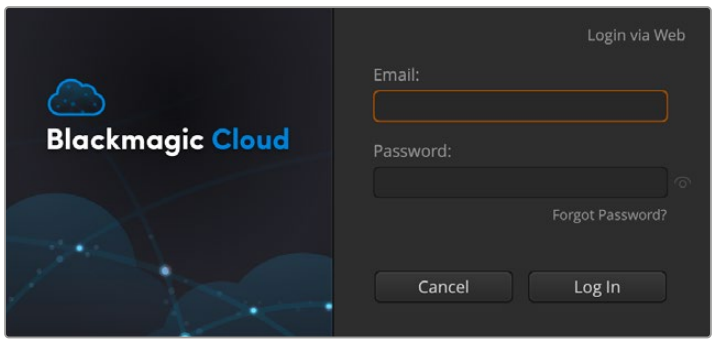
Logging into Blackmagic Cloud

Before logging into Blackmagic Cloud on your ATEM switcher, you will need to connect your switcher to the Internet by plugging a network cable from the Ethernet port to an internet router or a network switch.

To log into your Blackmagic Cloud account using ATEM Television Studio:

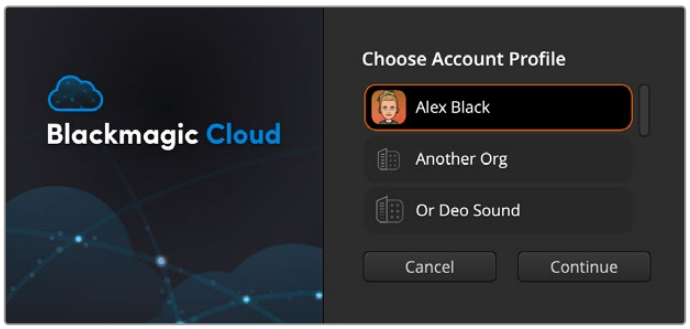
1 Click on the 'output' tab and select the 'record' menu.

2 Tick the checkbox to sync to Blackmagic Cloud and click the ‘log in’ button to open the Blackmagic Cloud log in window.



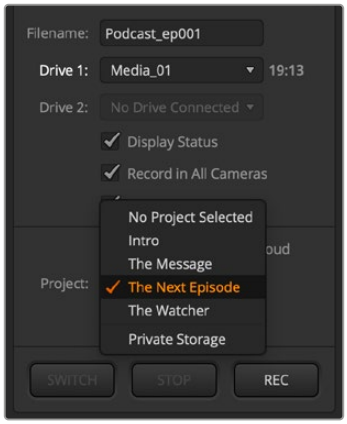
3 Enter your credentials into the email and password fields and click ‘log in’. Alternatively, click the ‘login via web’ option in the upper right hand corner and login via a web browser.

4 A window will appear allowing you to select between using a personal Blackmagic Cloud profile or an organization profile. Click the profile you wish to use and click ‘continue’.



Now you are logged in to Blackmagic Cloud, use the project menu to select which project you want to sync your media to. The menu will display existing Blackmagic DaVinci Cloud Projects.

If your project does not appear in the list, or you want a new project, you will need to adjust your settings or create a new DaVinci Resolve Cloud Project using DaVinci Resolve.

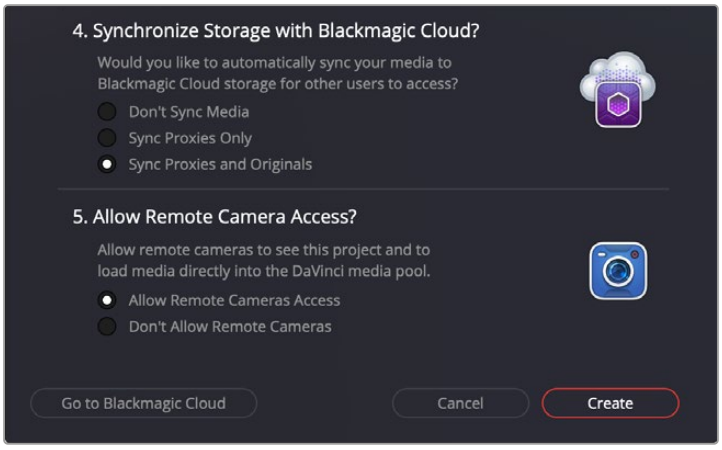


Allowing Access in DaVinci Resolve

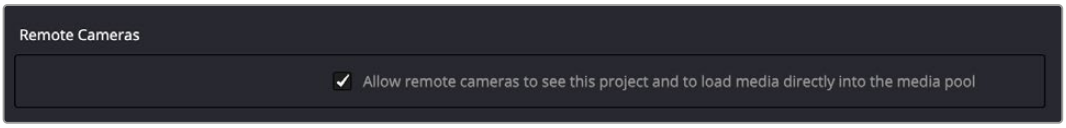
You can upload to both new and existing Blackmagic Cloud projects from your ATEM switcher by allowing remote camera access in DaVinci Resolve's settings. Once remote access has been enabled for a project, it will appear in the projects menu in the 'record' tab.

Allowing access to a new project:

1. Open DaVinci Resolve. In the 'project manager' window, select the 'cloud' tab and enter your Blackmagic Cloud login details.
2. Select a Blackmagic Cloud project library from the project library list and click 'new project'.
3. With the new project window open, enter the project details. Enable 'sync proxies and originals' along with 'allow remote camera access' in the new cloud project window and click 'create'.



If you want to upload clips to an existing DaVinci Resolve Cloud project, open the project settings and select 'Blackmagic Cloud'. Enable the 'allow remote cameras to see this project to load media directly into the media pool' option in the 'remote cameras' settings.



The Blackmagic Cloud project will appear in your ATEM switcher record tab when your switcher is connected to the internet and signed into your Blackmagic Cloud account.

For more information about DaVinci Resolve Cloud projects, refer to the DaVinci Resolve user manual. You can download the manual at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion

Capture Still

If you need to capture a still image from your broadcast simply click on the 'capture still' button. This acts like a still store which lets you add capture files to the media pool. You can then immediately load a still into the media player and use it in your broadcast, or save the media pool to your computer.

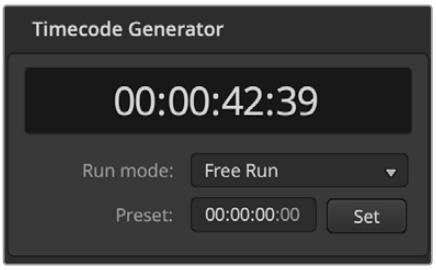
To save the media pool:

1. Go to the menu bar at the top of your screen and click on 'file/save as'.
2. Choose the location you want to save to.
3. Click 'save'.

Now that your media pool is saved on your computer, you can access the captured stills and use them in your graphics software.

Timecode Generator

The timecode generator automatically runs time of day timecode from the moment you launch ATEM Software Control. However, you can reset the counter to zero, or manually enter a new timecode value to start from.



The timecode generator can be set to time of day, or free run timecode where you can set a manual preset timecode

To manually set a preset timecode value:

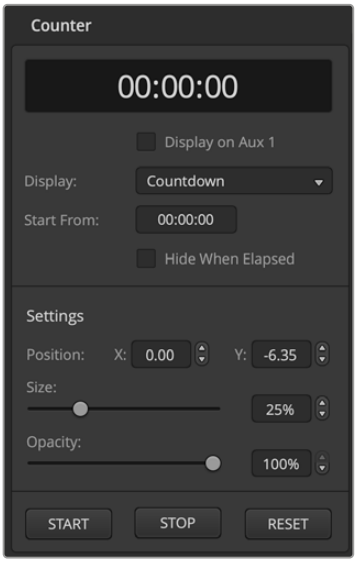
1. Click in the 'run mode' menu and select 'free run'.
2. In the smaller timecode counter, type in a defined timecode value. As you type, the new values will appear green.
3. To confirm the change and set the timecode running, click 'set'.

Time of Day

When ATEM Television Studio switchers are connected to your computer, the unit will sync time of day timecode with your computer. The unit has a built in clock that can continue running for approximately 6 days, so once you disconnect the switcher from your computer, the time of day timecode will continue until the battery is depleted. The battery will charge while connected to your computer via USB.

Counter

You can use the ATEM Television Studio switcher counter option to overlay a timer on output 1. This can be useful for a presenters monitor, where you can display a countdown if there is a time limit for the lecture, or a countup if there is no limit, but to monitor how long the lecture has been going.

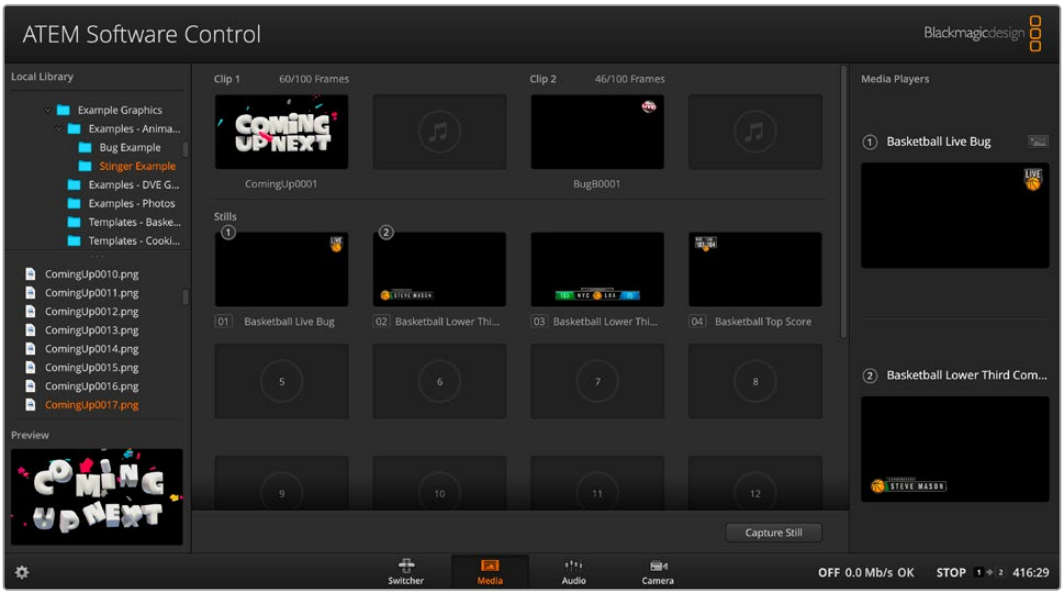


To set the counter:

1. Choose countdown or countup.
2. To set a time limit for the countdown, enter the start from time.
3. Using the settings, you can position the location of the counter on the overlay along with setting the size and opacity.
4. Once the settings are complete, you can start the counter. Make sure the counter overlay is selected by going to the outputs menu in the upper toolbar and check 'counter overlay' is selected on output 1.

ATEM Media Pool

Press the media icon in the lower toolbar of the switcher view to open the media window. The media window on ATEM switchers is where you can add graphics such as stills and video clips to your switcher and assign them to any of your switchers media players. There are two main areas on the switcher window, the browse window on the left hand side and the media pool and media players window to the right .



Click on the media tab at the bottom of the panel to open the media pool

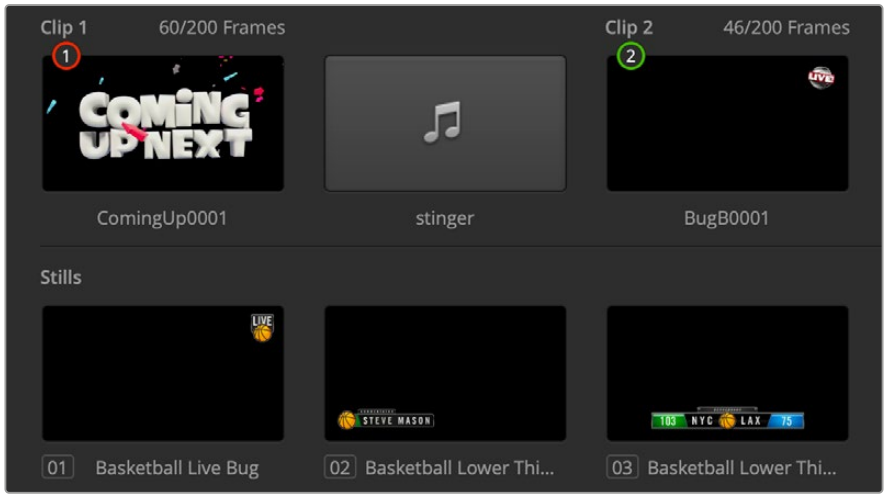
The Browse Window

The browse window is a simplified file browser that lets you navigate your computer to look for image files. All attached drives on your computer are displayed and you can select folders from them. View sub folders by clicking on the arrows next to each folder. The Preview window in the lower left corner will show any selected files. The ATEM media pool supports PNG, TGA, BMP, GIF, JPEG and TIFF still image formats. Audio files must be WAV, MP3 or AIFF. These files can then be added to the media pool.

The Media Pool Window

When files have been loaded into the media pool, the still and clip slots will show a thumbnail image. Clip slots will display the image from the middle of its loaded sequence. Above the clip slots you'll see information showing the number of frames in a loaded clip, plus the maximum number of frames that can be loaded for your selected video format. Stills are marked with a slot number so you can identify them when assigning a still image. The file name for each loaded still or clip is displayed underneath the slot so you can keep track of stills and clips you have loaded. The list of loaded clips and stills along with their name and number will appear in the media player palette in the switcher tab, in the media players view on ATEM hardware panels as well as in the Photoshop plug-in. On the switcher front panel, only the still name will appear unless the slot is empty.

Numbers will appear in the top left corner of the thumbnail to clearly show which slots are assigned to the relevant media players. When a media player slot is switched to the program output, the circle surrounding the number changes to red to indicate the slot is on air. When a slot is on the preview output, the color changes to green.



Browsing and loading files

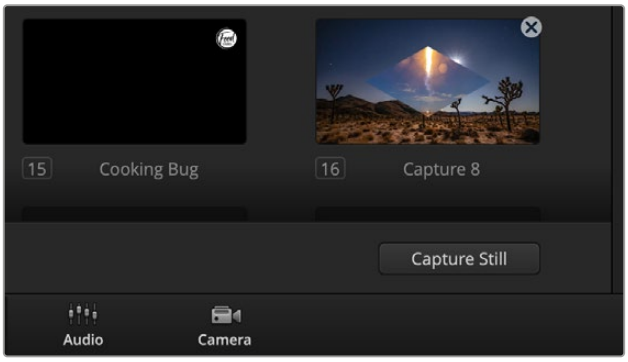
Loading a still is as easy as dragging it from the browse window and dropping it into an empty slot in the Media Pool. To load a motion clip, you'll need to load a sequence of still images. If the sequence is within a folder, click and drag the folder from the browse window and release over either of the two clip slots. If the sequence is not within in its own folder, click on the first file in the sequence, scroll down and shift click on the last file in the sequence. Now the highlighted file sequence can be dragged into any of the two clip slots in the media pool. You can load audio files to accompany your clip, for example when playing a stinger transition, by dragging the audio file from the browser and dropping it into the audio slot next to the clip slot. You can identify the audio slot by its audio icon.

When dropping a still, clip or audio file into a slot, a progress indicator will show the loading status. You can drop multiple files into the media pool, even if the first images have not yet completed loading, as they will continue to load one after the other. If a clip or still is dropped into a window which already has content loaded, the existing content will be replaced.

You can change the media player assignment from the media players tab by selecting your desired clip or still from the 'media' list. Simply click on the arrow in the player 'media' list to select from a list of media pool slots.

You can also change the media assignment using the media players menu in system control, or even when exporting via the ATEM Switcher Media Pool option within Photoshop. For more information on using the Photoshop export plugin, see 'using Adobe Photoshop with ATEM' later in this manual.

Capture Still



Click the capture still button to save a still from the broadcast

You can also capture a still from your broadcast using the capture still button in the lower right hand side of the media pool. Click the button and the still will populate into the next available image slot on your media pool.

Using the Audio Mixer

The audio tab is used to mix audio sources connected to the ATEM switcher via SDI, analog audio, MADI audio and also from the built-in media players.

Cameras, media players, MADI and external audio sources are listed along the top of the audio mixer along with the master audio output for the program outputs of the switcher.

Below each audio source is an audio level meter, a fader for setting the maximum audio level, and a knob for setting the left/right audio channel balance. The master fader on the right side of the audio mixer is used to set the gain on the audio level on the SDI program outputs and has its own audio level meter. The monitor fader and buttons appear below the master fader and set independent audio levels and also allow solo monitoring on the audio outputs.

The buttons below each audio level meter determine whether audio is always available for mixing or only when the source is on air. The solo, or headphones, button determines whether the audio source should be used for solo audio monitoring.

The audio mixer displays tally lights for any audio sources that are currently on air or when AFV is selected, as well as audio level, audio balance and buttons for selecting which audio should be used.

Tally

Any source whose audio is on air is lit with a red tally light in the software. External audio is on air by default so the EXT tally light is usually lit red. In the example on this page, Cam4 and Cam7 are lit because their audio is set to be always on. The tally light will be illuminated dull yellow when AFV is selected and the channel's associated camera is off air. This also applies to the master fader tally light when the master fader AFV button is selected. When FTB is activated, the master fader tally light will blink red.

Audio Level

Drag the audio level fader to set the gain on the audio level for each camera and audio source. The orange number under each audio level meter shows the maximum audio level set by the fader.

The number above the audio meter shows the peak audio level reached by the audio source. A green number represents low to medium audio levels. If the audio meter is regularly showing red, and the red number above it is not changing, then you should reduce the audio level to avoid audio distortion. After adjusting the audio level, you may wish to reset the red number by clicking on it once. Observe the new number to make sure it changes for a while and does not immediately shoot up and become stuck on a red number. If it does, you may need to reduce the audio level even further.

Audio Balance

The audio mixer supports stereo audio from each audio source. If you wish to change the left/right audio channel balance for a camera or other audio source, adjust the knob to the desired balance point.

The audio meter for Cam1 is shown in gray to indicate that its audio will not be used as neither of its ON or AFV buttons are enabled. Cam2 has AFV selected but its audio is not currently being used as the camera is not on air as is indicated by its dull yellow tally light. Cam4 and Cam7 have their direct mix set to ON so their mixed audio is always used, and their tally lights remain lit, even if another camera is currently on air. The audio level meters for Cam3, Cam5, Cam6 and Cam8 show that no audio is present on these cameras.

Audio Source Selection

Below each audio level meter, you will find the ON and AFV buttons that select which audio sources are sent to the program output of the switcher.

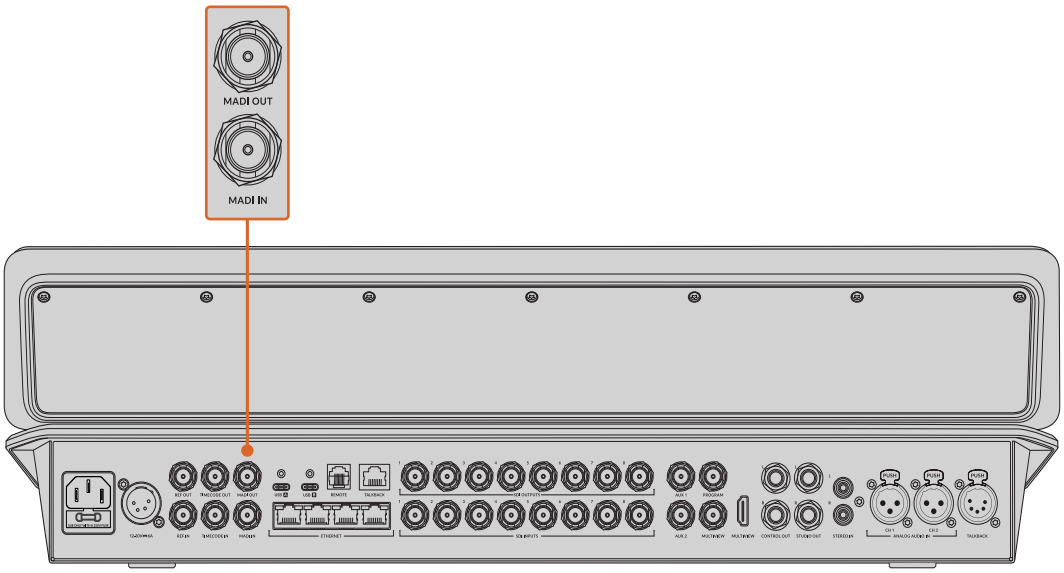
ON	Selecting the direct mix to ON allows an audio input to be permanently mixed into the program output, even when the associated video source is not on air. The red tally light will always be lit because the audio is always on air. Selecting this option automatically disables AFV.
AFV	Audio-follow-video (AFV) allows audio to crossfade when inputs change. The audio will only be sent to the program output when the input is on air, lighting the red tally light above. When off air, the tally light is lit dull yellow. Selecting this option automatically disables the direct mix ON setting.

Master Audio Level Output

The master fader on the right side of the audio mixer is used to set the gain on the audio level on the SDI program outputs and has its own audio level meter. Select the AFV button on the master audio output fader to enable the AFV fade to black feature. This lets you fade your master audio when you click on the Fade to Black button.

Using MADI

Your ATEM switcher supports digital audio with the MADI protocol, also known as Multichannel Audio Digital Interface. MADI is popular with most professional audio manufacturers, broadcasters and high end recording facilities. These MADI ports have robust BNC connectors and transmit audio data over 75 ohm coaxial cables up to 100 meters long.



BNC connectors for MADI audio, plus 1/4” TRS connectors for analog audio in and out.

MADI In

MADI channels 1-32 receive digital audio at 24 bit depth with a sampling rate of 48 kHz. These are connected to an extra 16 stereo channels in the audio mixer that you can mix into the program output with the same EQ and dynamics as the video input audio mixing channels. These additional 16 stereo channel inputs mean you can do very complex audio mixing all within your ATEM switcher.

MADI Out 1

MADI Out 1 sends these sources:

Channels 1-16	Channels 1 and 2 of SDI inputs 1-8
Channels 17/18	Media player 1 audio
Channels 19/20	Media player 2 audio
Channels 20/21	External mic
Channels 22/23	External XLR
Channels 23/24	External RCA
Channels 25/26	Program Mix
Channels 27/28	Monitor Mix
Channels 29/30	Aux mix 1
Channels 31/32	Aux mix 2
Channels 33-48	Channels 3 and 4 of SDI inputs 1-8
Channels 49-64	Not used

Headphones Settings

The headphones settings are used to adjust the audio mix for the headphones. A headset can be connected via the 5 pin XLR connector on the rear panel for communicating with camera operators. However, the headset is not just limited to talkback use as you can also use the headset microphone for doing voice overs and you can use the headset headphones for program audio monitoring.

Headphones settings let you mix the levels of each monitoring output. For example, you may want to increase or decrease the level of the talkback audio against the program audio.

Master

Adjust the master level slider to set the program audio level in the headset and if you don't want to listen to program audio, then slide this control fully to the left.

Talkback

The talkback level slider sets the audio level of camera operators who are talking to you and by setting the master and talkback sliders you can get your preferred balance of talkback and program audio into your headset.

Sidetone

The sidetone level slider lets you mix your voice from your headset mic into the monitor output. This is helpful when wearing a headset that supports noise canceling.

Advanced Fairlight Controls

ATEM Television Studio switchers have advanced Fairlight audio controls that let you enhance and refine the quality of sound on each input and master output, including input level controls, a 6 band parametric equalizer and powerful dynamics settings. This section of the manual shows the different Fairlight audio controls you can use to shape and optimize the audio mix in your live production.

Input Level

Generally, when setting up your audio mix, the first step is to normalize all your inputs. This means adjusting the input level knob on each input so you can optimize all the levels to their highest strength without clipping.

This control is at the top of each track under the tally light. Change the level by clicking on the knob and dragging left to decrease the level, or right to increase. By setting the input control, it brings all the inputs up to a common signal strength so they are all at their strongest without clipping. Then you can start making advanced changes and refinements.

After you have normalized all your input levels, you can now begin optimizing and shaping the qualities in each audio input using the 6 band parametric equalizer and dynamics controls.

6 Band Parametric Equalizer

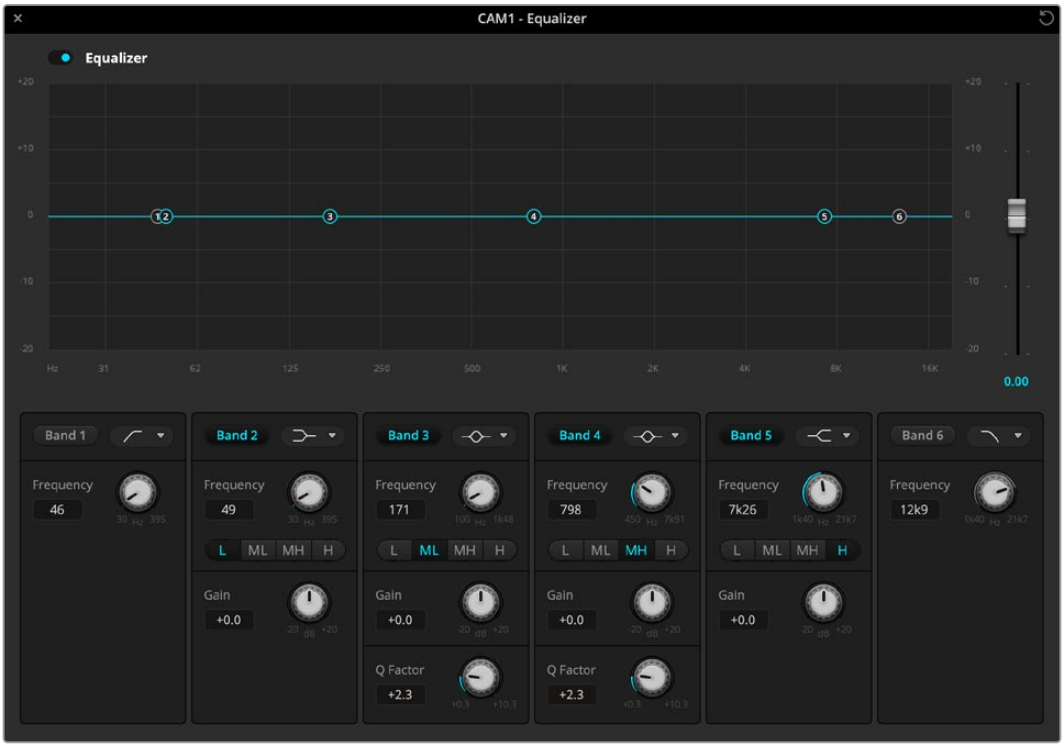
Each input and the master output, has a 6 band parametric equalizer which can be used to control specific frequencies. This could include reducing low frequency hum or noise on a microphone input, or boosting the low frequencies on a thin sounding track, or even to add uniqueness to each input so they are more distinct in the final mix. You have many creative options.

To open the parametric equalizer for an input or the master output, click on the corresponding equalizer indicator.

Click on an input's equalizer indicator to open a 6 band parametric equalizer

The first item you will notice is the graph along the top of the window with numbered indicators from 1 to 6. These numbered indicators are adjustable handles that correspond to bands 1 to 6.

Each band of the 6 band parametric equalizer has a column of settings. These settings will differ based on which band you are controlling and what filter type you are using.



Each audio input has its own 6 band parametric equalizer

If you want to make changes to a setting, you will first need to make sure the band is enabled. Click on a band label to enable it. When enabled, the button label is illuminated blue. Now you can change the settings for that band, or click and drag the handles to make fast adjustments.

TIP You can learn more about band filters later in this section.

Handles

Each band handle is positioned along the line curve displayed in the graph. You can click and drag each handle to choose the frequency you wish to adjust for that band and the gain you want to set. When moving a handle with your mouse, both the frequency and gain settings are affected simultaneously, which gives you a fast way to make quick adjustments to each band across the entire range of frequencies.

NOTE To make changes using a handle, ensure the band is enabled. Simply click on the band you want to adjust. The band label will illuminate blue when enabled.

As you drag a handle left or right, you will notice the frequency and decibels update in the band settings. This will also be reflected by the frequency range preset buttons for low, medium low, medium high and high.

Frequency Knobs

Alternatively, you can use the frequency knobs for each band to select a specific frequency to adjust.

Range Presets

The frequency range for each band is defined by the range preset buttons. For example, low is labeled 'L' and covers the frequency range from 30 to 395 Hz.

As a quick example of how the range presets define the frequency range, select a notch filter from the band filter list and then click on each range preset. You will see the filter effect move to a position along the graph curve that corresponds to the range preset you choose. This lets you quickly define a specific range of frequencies you want the filter to affect.

Below is a table showing the range of frequencies for each range preset setting.

Range Preset	Frequency Range
Low	30 Hz to 395 Hz
Mid Low	100 Hz to 1.48 kHz
Mid High	450 Hz to 7.91 kHz
High	1.4 kHz to 21.7 kHz

Gain Knobs

Click and drag the gain knob left or right to decrease or increase the volume level for the selected frequency.

Q Factor

The Q factor control is available when the bell filter is applied to bands 2, 3, 4 and 5. This sets the range of frequencies the filter will affect. For example, setting the minimum will allow the filter to affect a wide range of surrounding frequencies and the maximum setting will narrow the effect down to a tiny point. This is important if you have sound qualities in surrounding frequencies that you want to either include or exclude from the change you are making.

As you adjust the Q factor, watch the shape of the effect on the line curve change from a broad, rounded edge to a sharp point. This is a visual representation showing how the regions of frequencies surrounding the target frequency are affected.

TIP Compare the audio with changes against the original unaltered audio by clicking on the bypass button at the very top of the equalizer window. This lets you turn the equalizer on or off.

Band Filters

There are six different types of band filters you can choose from. These filters include bell, high shelf, low shelf, notch, high pass and low pass. These filters let you control specific zones within the frequency range. For example, a low shelf filter lets you increase or decrease the level of volume for lower frequencies on the graph, and a high shelf filter controls the higher frequencies.

Try setting a low shelf filter to band 3 and make changes to the gain setting. You will see the changes are weighted towards the low end frequencies on the graph.

A description for each filter type is provided below.

Bell

This filter is used to increase or decrease a range of frequencies surrounding a defined frequency.

High Shelf

Lets you increase or decrease the level of volume for higher frequencies along the graph.

Low Shelf

Lets you increase or decrease the level of volume for lower frequencies along the graph.

Notch

This filter lets you remove, or cut, a defined frequency.

High Pass

Smoothly removes extreme low end frequencies, allowing the high end frequencies to pass unaffected.

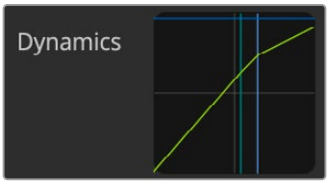
Low Pass

Smoothly removes extreme high end frequencies, allowing the low end frequencies to pass unaffected.

TIP It's not uncommon to have filters on each band overlapping on the graph curve with adjustments working together. For example, you may have a low shelf filter applied to band 4 and a notch filter on band 5 reducing a frequency within the same range.

Dynamics Controls

In addition to the 6 band parametric equalizer, you can also enhance and finesse the input and master output audio using dynamics controls. Where the equalizer lets you control the frequencies within a signal, dynamics controls let you set how various levels behave. Levels within the signal can be adjusted including expanding the dynamic range between low levels and high levels, gating an input so you can choose what is stronger or softer within a signal, or you can even use the compressor and limiter so that audio can be generally lifted and made stronger without clipping.



The dynamics controls can be opened for each input and the master output by clicking on its corresponding dynamics indicator

Combined with equalizer controls, these features are extremely powerful, giving you the ability to precisely shape and define the audio to generally optimize the sound of the master output.

This section describes the expander, gate, compressor and limiter controls.

Common Dynamics Settings

The expander/gate, compressor and limiter share common settings that let you shape how each function affects the audio. For example the level at which the function initiates, how long the function is applied, the strength of the function, etc. The settings available differ depending on the dynamics control you are using.

Threshold	Sets the sound level at which the function activates. For example, setting the threshold for the compressor to -20dB tells your switcher to activate compression when the signal rises above -20dB. Alternatively, setting the expander to -40dB means the switcher will only initiate the expander once the signal level drops below -40dB.
Range	This setting defines the range of decibels affected by the function.
Ratio	Defines the maximum strength of the function once initiated.
Attack	Sets the smoothness of the function when it initiates. For example, a long attack will allow the function to fade into the signal, blending in better without drawing too much attention, whereas a short attack may be better for complex sound activity with many quick variations where a longer attack may cause artifacts.
Hold	Sustains the dynamics function over an adjustable period of time.
Release	Similar to attack but occurs at the end of the function activity. For example, lets the dynamics function ease out gradually, or fall away rapidly, once the level moves out of the threshold.

Expander/Gate

The first set of dynamics parameters can be switched between expansion and gating.

Expansion emphasizes differences in volume by lowering the level of soft parts of the signal relative to the level of louder parts. You can use an expander to emphasize the differences between quiet and loud parts of a track, or to increase the dynamic range of a signal and minimize unwanted noise.

Gating is like an exaggerated expander, reducing the level or even silencing parts of a signal that fall below a certain level in order to reduce or eliminate noise in quiet parts of a recording. For example, a range of 15 to 20 dB can reduce breathing in a vocal track but leaves just enough to sound natural.

Gating is extremely effective, but it's also very powerful so requires careful attention. If the gate threshold is set too high it can cause artifacts, such as cutting off the start of a syllable or the quiet end of a word. You can compensate by reducing the threshold slightly, or by increasing the attack or release time.

Compressor

Compression lets you reduce peaks in an audio signal, reducing the dynamic range of a signal, so you can boost the overall level without clipping. This is helpful when you want to make sure the loud elements in a signal don't diminish the strength of quieter sounds, or to smoothen changes in audio levels within the signal.

TIP It's a good idea to apply the compressor after you have set the EQ controls.

Make Up

The make up setting lets you increase the overall signal in combination with compression settings. With loud parts of the audio reduced using compression, you can now use the make up control to boost the overall sound without clipping.

Limiter

The limiter prevents peaks of the signal from exceeding a set maximum level. A limiter is helpful to prevent hard clipping. For example, if you set the limiter to -8 dB, the input signal will never exceed that level. Adjusting the attack, hold and release settings will set how gentle the limiter affects the signal.

Dynamics Controls Characteristics

Control	Minimum	Default	Maximum
Expander/Gate			
Expander Controls*			
Threshold	-50dB	-45dB**	0dB
Range	0dB	18dB	60dB
Ratio	1.0:1	1.1:1	10:1
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Gate Controls*			
Threshold	-50dB	-45dB**	0dB
Range	0dB	18dB	60dB
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Compressor			
Compressor Controls			
Threshold	-50dB	-35dB	0dB
Ratio	1.0:1	2.0:1	10:1
Attack	0.7ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Limiter			
Limiter Controls			
Threshold	-50dB	-12dB	0dB
Attack	0.7ms	0.7ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s

* Master Dynamics expander/gate controls are unused in Master Dynamics.

** Master Dynamics expander/gate threshold default is -35dB. Mic Dynamics and XLR Dynamics expander/gate threshold default is -45dB.

Using Camera Control

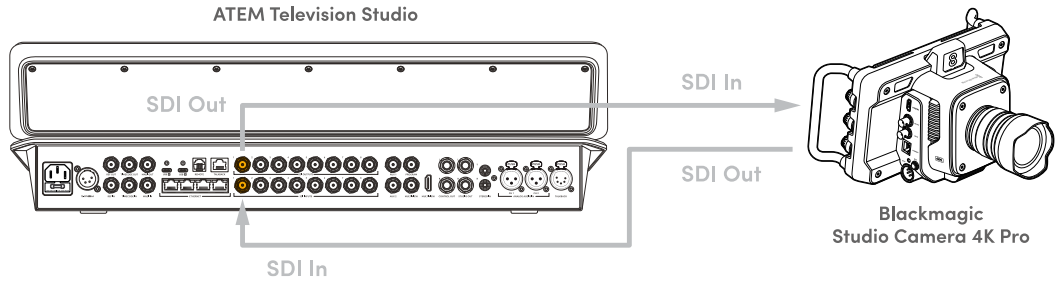
Clicking on the ‘camera’ button in ATEM Software Control opens the camera control feature that lets you control Blackmagic cameras including Blackmagic Studio Camera 6K Pro and URSA Broadcast G2 from your ATEM switcher. Blackmagic camera settings such as iris, gain, focus, detail and zoom control are easily adjusted using compatible lenses, plus you can color balance cameras and create unique looks using the DaVinci Resolve primary color corrector that’s built into the camera.

ATEM camera control works by broadcasting camera control packets via all the non down converted SDI outputs of your ATEM switcher. This means you can connect an SDI output from your switcher to your camera’s SDI return input and the camera will detect the control packets in the SDI link and allow you to control features in the camera itself.

ATEM Camera Control.

To connect cameras:

1. Connect your Blackmagic camera’s SDI output to any SDI input on your ATEM switcher.
2. Connect any one of your ATEM switcher’s SDI outputs, except multiview outputs, to your camera’s program SDI input. Camera control signals are not sent via the multiview outputs.
3. In your camera’s settings, set the camera ID number to match your switcher input. For example, if studio camera 1 is connected to ‘input 1’ on your ATEM switcher, the camera number in your camera settings must also be set to 1. This ensures tally is sent to the correct camera.



Camera Control Panel

Launch ATEM Software Control and click on the ‘camera’ button located at the bottom of the software window. You’ll see a row of labeled Blackmagic camera controllers containing tools to adjust and refine each camera’s image. The controllers are easy to use. Simply click the buttons using your mouse, or click and drag to adjust.

Camera Control Selection

The button row at the top of the camera control page lets you select the camera number you would like to control. If you have more cameras that fit onto the window size, or you are running the color corrector window, then you can use these buttons to select between which camera you would like to control. If you are using an output for monitoring your camera control, pushing these buttons to change the camera to control will also send that camera’s video output to the output setup in the switcher preferences.

Channel Status

The channel status at the top of each camera controller displays the camera label, On Air indicator and lock button. Press the lock button to lock all the controls for a specific camera. When on air, the channel status illuminates red and displays the On Air alert.

Camera Settings

The camera settings button near the bottom left of the master wheel lets you turn on the color bars setting on Blackmagic Studio Camera, URSA Mini and URSA Broadcast, plus adjust detail settings for each camera’s picture signal.

Each camera controller displays the channel status so you know which camera is on air. Use the color wheels to adjust each YRGB channel’s lift, gamma and gain settings.

Show/Hide Color Bars

Blackmagic cameras have a color bars setting built in which you can turn on or off by selecting ‘show’ or ‘hide’ color bars. This feature can be very useful for visually identifying individual cameras while setting up for your live production. Color bars also provide an audio tone so you can easily check and set the audio levels from each camera.

Detail

Use this setting to sharpen the image from your cameras live. Decrease or increase the level of sharpening by selecting: Detail off, detail default for low sharpening, medium detail and high detail.

Color Wheel

The color wheel is a powerful feature of the DaVinci Resolve color corrector and used to make color adjustments to each YRGB channel’s lift, gamma and gain settings. You can select which setting to adjust by clicking on the three selection buttons above the color wheel.

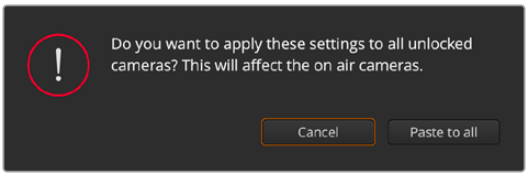
Master Wheel

Use the master wheel below the color wheel to make contrast adjustments to all YRGB channels at once, or luminance only for each lift, gamma or gain setting.

Reset Buttons

The reset button near the bottom right of each camera controller lets you easily choose color correction settings to reset, copy or paste. Each color wheel also has its own reset button. Press to restore a setting to its default state, or copy/paste a setting. Locked controllers are not affected by the Paste feature.

The master reset button on the bottom right corner of the color corrector panel lets you reset lift, gamma and gain color wheels plus Contrast, Hue, Saturation and Lum Mix settings. You can paste color correction settings to camera controllers individually, or all cameras at once for a unified look. Iris, focus, coarse and pedestal settings are not affected by the Paste feature. When applying Paste to all, a warning message will appear asking you to confirm your action. This is so you don't accidentally paste new settings to any unlocked cameras that are currently on air.



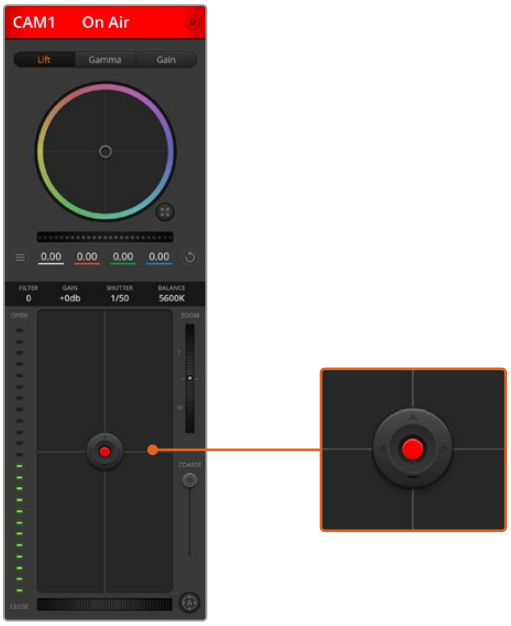
When applying 'paste to all', a warning message will appear asking you to confirm your action. This is so you don't accidentally paste new settings to any unlocked cameras that are currently on air.

Iris/Pedestal Control

The iris/pedestal control is located within the cross hairs of each camera controller. The control illuminates red when its camera is on air.

To open or close the iris, drag the control up or down. Holding the shift key allows only iris adjustments.

To darken or lift the pedestal, drag the control left or right. Holding the command key on a Mac, or the Control key on Windows, allows only pedestal adjustments.



The iris/pedestal control illuminates red when its respective camera is on air.

Zoom Control

When using compatible lenses with an electronic zoom feature, you can zoom your lens in and out using the Zoom control. The controller works just like the zoom rocker on a lens, with telephoto on one end and wide angle on the other. Click on the zoom control, located above the Coarse slider and drag up to zoom in, or drag down to zoom out.

Coarse Setting

The coarse setting is located to the right of the iris/pedestal control and is used to limit the iris range. This feature helps you prevent over exposed images from going to air.

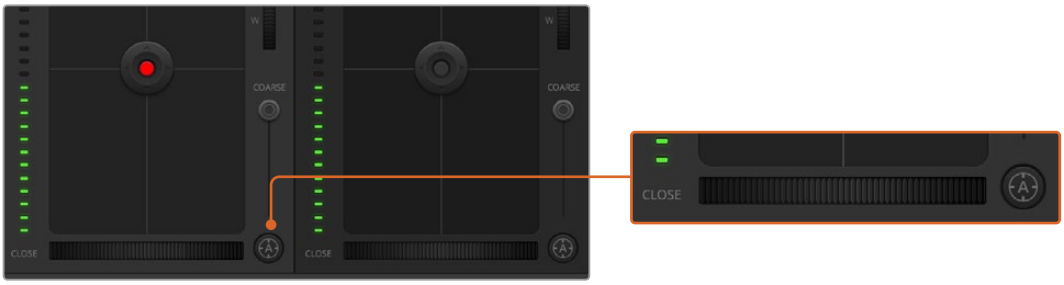
To set your coarse threshold, completely open the iris using the iris control, then drag the coarse setting up or down to set optimum exposure. Now when you adjust the iris, the coarse threshold will prevent it from going above optimum exposure.

Iris Indicator

The iris indicator is located to the left of the iris/pedestal control and displays a visual reference so you can easily see how open or closed the lens aperture is. The iris indicator is affected by the coarse setting.

Auto Focus Button

The auto focus button is located at the bottom right corner of each camera controller. Press to automatically set the focus when you have an active lens that supports electronic focus adjustments. It's important to know that while most lenses support electronic focus, some lenses can be set to manual or auto focus modes and so you need to ensure your lens is set to auto focus mode. Sometimes this is set by sliding the focus ring on the lens forward or backward.



Click on the auto focus button or drag the manual focus adjustment left or right to focus a compatible lens.

Manual Focus Adjustment

When you want to adjust the focus on your camera manually, you can use the focus adjustment located at the bottom of each camera controller. Drag the wheel control left or right to manually adjust focus while viewing the video feed from the camera to ensure your image is nice and sharp.

Camera Gain

The camera gain setting allows you to turn on additional gain in the camera. This is important when you are operating in low light conditions and need extra gain in the front end of the camera to avoid your images being under exposed. You can decrease or increase gain by clicking on the left or right arrows on the dB gain setting.

You can turn on some gain when you need it, such as outdoor shoots when the light fades at sunset and you need to increase your image brightness. It's worth noting that adding gain will increase noise in your images.

Shutter Speed Control

The shutter speed control is located in the section between the color wheel and the iris/pedestal control. Decrease or increase the shutter speed by hovering your mouse pointer over the shutter speed indicator and then clicking on the left or right arrows.

If you see flicker in lights you can decrease your shutter speed to eliminate it. Decreasing shutter speed is a good way to brighten your images without using camera gain because you are

increasing the exposure time of the image sensor. Increasing shutter speed will reduce motion blur so can be used when you want action shots to be sharp and clean with minimal motion blur.

White Balance

The white balance setting next to the shutter speed control can be adjusted by clicking on the left or right arrows on each side of the color temperature indicator. Different light sources emit warm or cool colors, so you can compensate by adjusting the white balance. This ensures the whites in your image stay white.

DaVinci Resolve Primary Color Corrector

If you have a color correction background, then you can change your camera control from a switcher style CCU interface to a user interface that's more like a primary color corrector on a post production color grading system.

Blackmagic cameras feature a DaVinci Resolve primary color corrector built in. If you have used DaVinci Resolve, then creatively, grading in the Blackmagic camera will be identical so you can use your color grading experience for live production. The color corrector panel can be expanded out of any camera controller and provides expanded color correction control with extra settings and a full primary color corrector interface.

Click on the DaVinci Resolve primary color corrector button to expand the color correction window and adjust settings.

You have color wheels and settings such as saturation available and you can see shadows, mid tones and highlight settings all at the same time. Simply switch between cameras using the camera selection controls at the top of the window as you need.

Lift, gamma and gain color wheels in the color corrector panel.

Color Wheels

Click and drag anywhere within the color ring
Note that you don't need to drag the color balance indicator itself. As the color balance indicator moves, the RGB parameters underneath change to reflect the adjustments being made to each channel.

Shift-Click and drag within the color ring
Jumps the color balance indicator to the absolute position of the pointer, letting you make faster and more extreme adjustments.

Double-click within the color ring
Resets the color adjustment without resetting the master wheel adjustment for that control.

Click the reset control at the upper-right of a color ring
Resets both the color balance control and its corresponding master wheel.

Master Wheels

Use the master wheels below the color wheels to adjust each YRGB channels' lift, gamma and gain controls.

Dragging to the left darkens the selected parameter of the image, dragging to the right lightens that parameter. As you make an adjustment, the YRGB parameters underneath change to reflect the adjustment you're making. To make a Y-only adjustment, hold down the ALT or Command key and drag left or right. Because the color corrector uses YRGB processing, you can get quite creative and create unique affects by adjusting the Y channel only. Y channel adjustments work best when the Lum Mix setting is set to the right side to use YRGB processing vs the left side to use regular RGB processing. Normally, most DaVinci Resolve colorists use the YRGB color corrector as you get a lot more control of color balance without affecting overall gain, so you spend less time getting the look you want.

Contrast Setting

The Contrast setting gives you control over the distance between the darkest and lightest values of an image. The effect is similar to making opposing adjustments using the lift and gain master wheels. The default setting is 50%.

Pivot Setting

Once the contrast setting is adjusted, modifying the pivot value will adjust the midpoint of the contrast. The Pivot control establishes the contrast balance by placing more or less priority on either side of the luminance scale. By lifting the control, you will increase the overall brightness and clarity of the image, although at the inverse expense of the shadows, which will be reduced.

Saturation Setting

The Saturation setting increases or decreases the amount of color in the image. The default setting is 50%.

Lum Mix Setting

The color corrector built into Blackmagic cameras is based on the DaVinci Resolve primary color corrector. DaVinci has been building color correctors since the early 1980's and most Hollywood films are color graded on DaVinci Resolve than any other method.

This means that your color corrector built into the camera has some unique and creatively powerful features. The YRGB processing is one of those features.

When color grading, you can choose to use RGB processing, or YRGB processing. High end colorists use YRGB processing because you have more precise control over color and you can independently adjust the channels with better separation and more creative options.

When the Lum Mix control is set to the right side, you have the 100% output of the YRGB color corrector. When you have the Lum Mix control set to the left side, you get 100% output of the RGB corrector. You can set the Lum Mix to any position between the left and right to get a blend of output from both the RGB and YRGB correctors.

Which is the correct setting to use? That's up to you, as color correction is a pure creative process and there is no right and wrong. The best setting is what you like the most and what you think looks good!

Hue Setting

The Hue setting rotates all hues of the image around the full perimeter of the color wheel. The default setting of 180 degrees shows the original distribution of hues. Raising or lowering this value rotates all hues forward or backward along the hue distribution as seen on a color wheel.

Tint Setting

Adjusting the tint setting will add green or magenta to the image to help balance the color. This can assist when filming with artificial lighting sources such as fluorescent and sodium vapor lighting fixtures.

Drag the sliders left or right to adjust Contrast, Saturation, Hue and Lum Mix settings.

Synchronizing Settings

When connected, camera control signals are sent from your ATEM switcher to the Blackmagic camera. If a setting is accidentally adjusted from your camera, camera control will automatically reset that setting to maintain synchronization.

Operating your ATEM Switcher

Internal Video Sources

In addition to the SDI inputs, the switcher also has 8 internal sources that can be used in a production. The internal source names are represented on the software control panel using both long and short names. On the ATEM switcher, a long name is used to represent the internal sources and the labels represent what the sources are, so they are easy to understand.

Black

Internally generated black is available as a source and can be used as a black matte in the production.

Color Bars

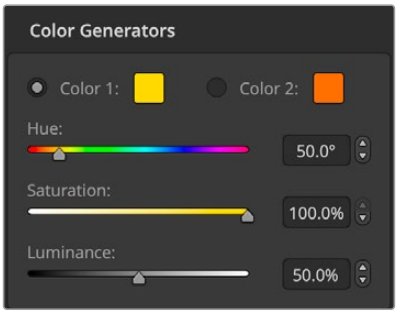
Internally generated color bars are available as a source. Color bars can be useful for verifying signals going out of the switcher and can also be useful when setting up a chroma key with a vectorscope monitor.

Color Generators

ATEM switchers have two color sources that can be customized to generate any color matte for use in the production. Color sources can be used to add color borders for wipe transitions or as dip through colors for a dip transition such as dip through white.

To adjust a color source on the software control panel, simply go to the color palette and click the color chip and the color picker will appear and you can select colors. On the ATEM switcher, select color on the system control and adjust hue, saturation and luminance.

It's important to know that the deepest colors are set at 50% luminance.



ATEM switchers have two color sources that can be customized to generate any color matte for use in the production

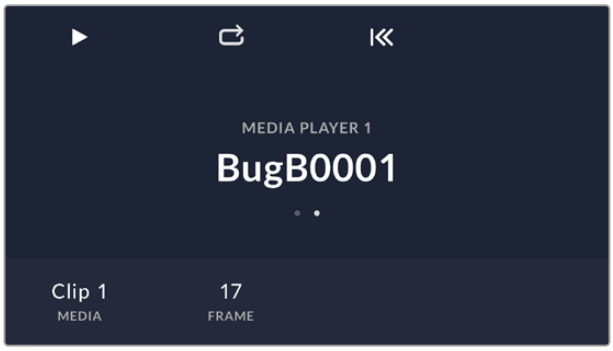
Media Players

Each source has a fill and key (cut) output. Media player fill sources are called media player 1 or 2. Media player key sources are called media player 1 key, media player 2 key, etc.

The media player sources are used to play stills and clips from the media pool. The fill sources show the color channels of the selected clip or still while the key sources show the black and white alpha channel of the selected clip or still. Media players can be used in many parts of the production.

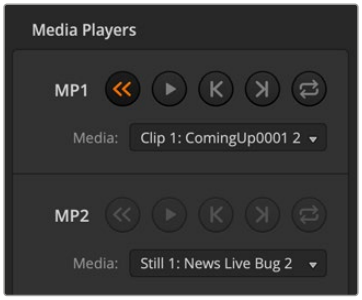
To control media players on ATEM Television Studio switchers:

1. From the system control menu buttons, navigate to the media player menu by pressing the ‘media players’ button.
2. Select the media player you want to control from the soft buttons above the LCD.
3. Use the control knob to select the clip or still from the media pool.
4. If you have selected a motion clip, press the right arrow button. The play/stop, loop, step back and frame controls will be enabled for controlling the clip.



To control media players on the software control panel:

1. From the switcher window, select the media player palette.
2. Use the select media drop down list to select a clip or still from the media pool.
3. If you have selected a motion clip, the begin, step back, play/pause, step forward and loop transport controls will be enabled for controlling the clip. If you want to loop a clip, then select the loop button and press play. The media player will keep looping until selected to stop.



Media players showing a clip loaded into each on ATEM software control

All Transition Types

One of the primary functions of a broadcast switcher is performing transitions from one video source to another. The combinations of transition effects and styles provide endless creative options that can enhance your production in just the right way for the right moment.

You can perform transitions using the ATEM switcher hardware or ATEM Software Control. This section shows you how to perform the various transitions available on your switcher.

Cut Transitions

The cut is the most basic transition that can be performed on the switcher. In a cut transition the program output is immediately changed from one source to another.

Program output for a cut transition.

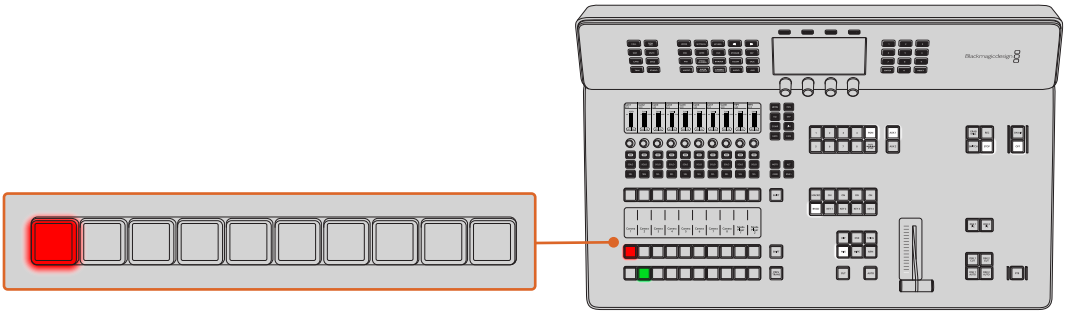
A cut transition can be performed directly from the program bus, or using the CUT button in the transition control block.

Program Bus

When a cut transition is performed from the program bus, only the background will be changed and all upstream and downstream keys will maintain their current state.

To perform a cut transition from the program bus on ATEM Television Studio:

On the program bus, select the video source that you want on the program output. The program output will immediately change to the new source.



Press any of the source buttons on the program row to perform a cut transition from the program bus

To perform a cut transition from the program bus on the software control panel:

On the program bus, select the video source that you want on the program output next. The program output will immediately change to the new source.

To perform a cut transition on the software control panel using a keyboard:

1. Enable <caps lock> or press and hold the <shift> key.
2. Press the number key on the keyboard corresponding to the video source that you want on the program output. The program output will immediately change to the new source.

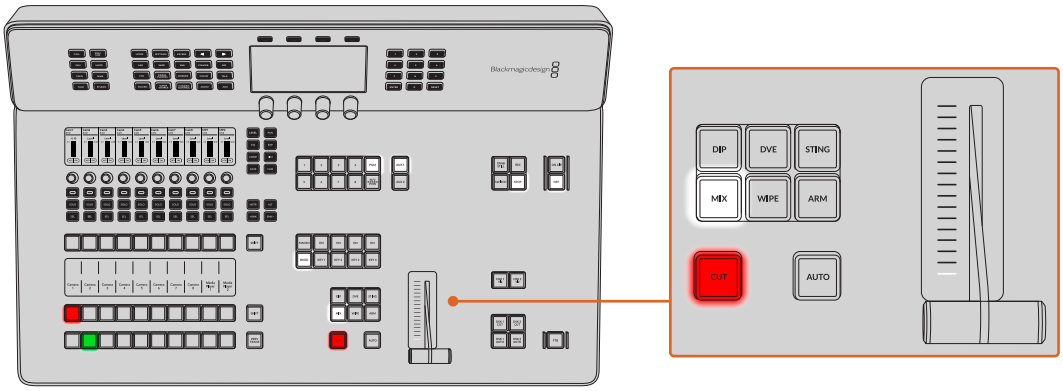
CUT Button

When a cut transition is performed using the CUT button, any upstream keys that were selected in the next transition and any downstream keys that were tied to the transition control will also change state. For example, a downstream key tied to the transition control will cut ON if off air, or cut OFF if on air. Similarly, any upstream keys selected in the next transition will be cut on if they were off air, or cut off if they were on air.

To perform a cut transition using the CUT button on ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output. The program output will remain unchanged.
2. In the transition control block, press the CUT button. The sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

It's recommended to use the transition control block to perform transitions because it provides the opportunity to verify the video content on the preview output before sending it to the program output, for example to verify that a camera is in focus.



To perform a cut transition using the CUT button on the software control panel:

1. On the preview bus, select the video source that you want on the program output. The program output will remain unchanged.
2. In the transition control block, press the CUT button. The sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

The Cut transition button is part of the Transitions Style group

To perform a cut transition on the software control panel using a keyboard:

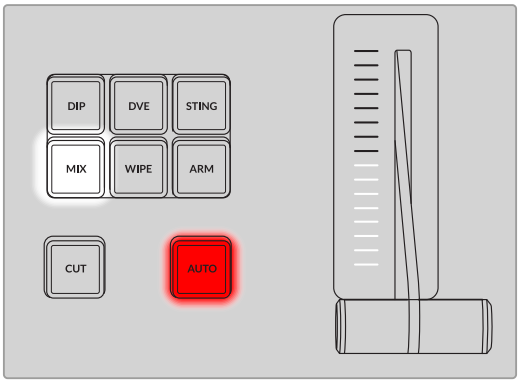
1. Ensure that <caps lock> is off.
2. Press the number key on the keyboard corresponding to the video source that you want on the program output. The source will be selected on preview and the program output will remain unchanged.
3. Press <spacebar>. The sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

Auto Transitions

An auto transition allows you to automatically transition between program and preview sources at a predetermined rate. Any upstream keys that were selected in the next transition and any downstream keys that were tied to the transition control will also change state. Auto transitions are performed using the auto button in the transition control block. Mix, dip, wipe, DVE and stinger transitions can all be performed as an AUTO transition.

To perform an auto transition on ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output.
2. Select the transition type using the transition type buttons in the transition control block.
3. In the system control, set the transition rate and adjust any other parameter for the transition as needed.
4. Press the AUTO button in the transition control block to initiate the transition.



Transition types, for example dip, mix and wipe, have their own independent selection button

During the transition, the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. The fader bar indicator displays the position and progress of the transition and the transition rate display updates to indicate the number of frames remaining as the transition progresses.

At the end of the transition, sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

Each transition type has its own independent transition rate allowing the operator to perform faster transitions by simply selecting the transition type and pressing the AUTO button. The previously used transition rate is remembered for that transition type until it is changed.

A production switcher provides multiple methods of transitioning from one shot to another. Generally, you use a simple cut transition to move from one background source to another. Mix, dip, wipe and DVE transitions allow you to transition between two background sources by gradually phasing out one and phasing in another. Stinger and Graphic Wipe are special transitions which will be covered in a later section. Mix, dip, wipe and DVE transitions are performed as an auto transition or manual transition using the transition control block.

The Auto transition button is part of the Transitions Style group

To perform an auto transition on the software control panel:

1. On the preview bus, select the video source that you want on the program output.
2. Select the transition type using the transition style buttons in the transition control block.
3. In the transition palette, select the settings tab for the same transition type as the transition control block.
4. Set the transition rate and adjust any other parameter for the transition as needed.
5. Press the AUTO button in the transition control block to initiate the transition.
6. During the transition, the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. The virtual fader bar automatically follows the progress of the transition and the rate display updates to indicate the number of frames remaining as the transition progresses.
7. At the end of the transition, sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

To perform an auto transition on the software control panel using a keyboard:

1. Ensure that <caps lock> is off.
2. Press the number key on the keyboard corresponding to the video source that you want on the program output. The source will be selected on preview and the program output will remain unchanged.
3. Select the transition type using the transition style buttons in the transition control block.
4. In the transition palette, select the settings tab for the same transition type as the transition control block.
5. Set the transition rate and adjust any other parameter for the transition as needed.
6. Press the <return> or <enter> key to initiate the transition.

During the transition, the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. The virtual fader bar automatically follows the progress of the transition and the rate display updates to indicate the number of frames remaining as the transition progresses.

At the end of the transition, sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

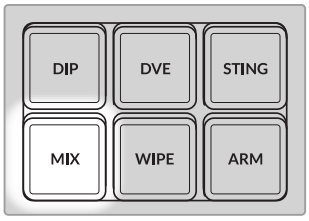
Mix Transitions

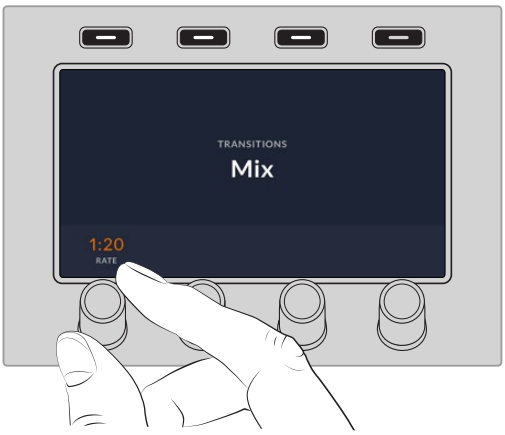
A mix is a gradual transition from one source to another and is achieved by interpolating gradually between two sources, effectively overlapping the sources for the duration of the effect. The length of the transition or length of the overlap can be adjusted by changing the mix rate.

Program output for a mix transition.

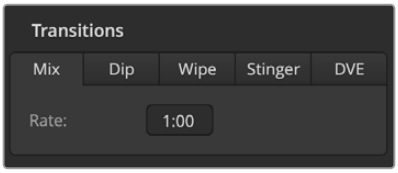
To perform a mix transition on ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output.
2. Press the DIP/MIX or MIX button to select the mix transition type. The system control automatically navigates to the transition menu.
3. Using the LCD panel, use the soft control knob to adjust the mix rate. The transition rate display in the switcher's transition control block will update dynamically. You can also enter a rate duration using the number pad.
4. Perform the transition as an auto transition or manual transition from the transition control block.





Press the 'mix' button and set the transition rate using the LCD menu and control knob



Mix Transition rate setting

To perform a mix transition on the software control panel:

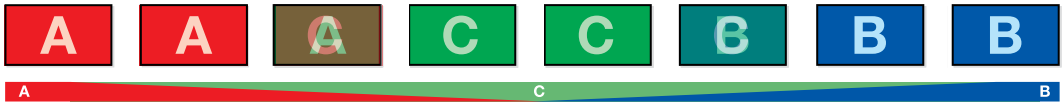
1. On the preview bus, select the video source that you want on the program output.
2. Select the mix transition style in the transition control block.
3. Expand the transition palette and select mix from the transition types bar.
4. Adjust the mix rate by entering a number in the rate window. The rate display in the transition control block will update.
5. Perform the transition as an auto transition or manual transition from the transition control block.

Mix Transition Parameters

Rate	The mix transition rate in seconds : frames.

Dip Transitions

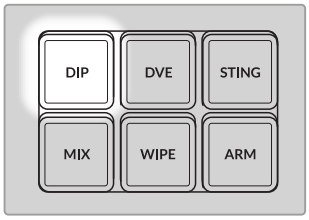
A DIP is similar to a mix in that it is a gradual transition that transitions from one source to another. However, a dip transition gradually mixes through a third source, the dip source. For example, the dip transition can be used for a transition that calls for a white flash or a transition that quickly flashes the sponsor logo. The length of the dip transition and the dip source can both be customized.



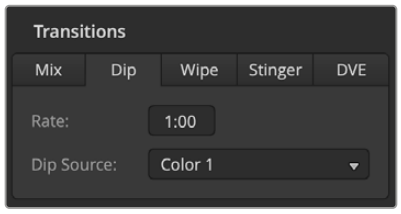
Program output for a dip transition.

To perform a dip transition on ATEM Television Studio:

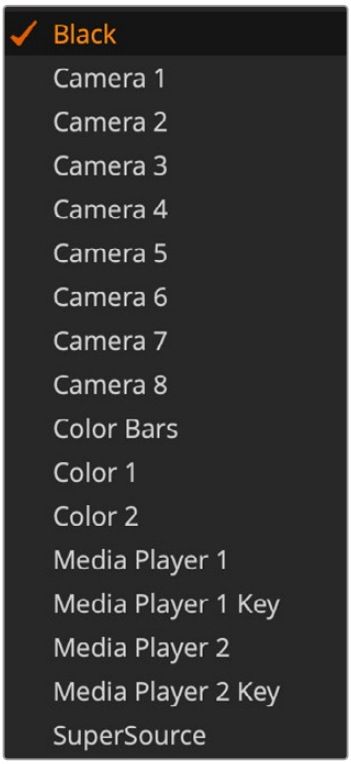
1. On the preview bus, select the video source that you want on the program output.
2. Press the DIP button to select the dip transition type. The LCD menu will automatically display the transition settings.
3. Under the LCD use the control knob to adjust the dip rate. You can also enter a rate duration using the number pad.
4. Use the corresponding control knob to select the dip source. You can also use the select bus to select a dip source.
5. Perform the transition as an auto transition or manual transition from the transition control block.



Press the 'dip' button in the transition control block, then set the dip source and transition rate using the LCD menu and control knobs



Dip Transition Settings



Dip Source Menu

To perform a dip transition on the software control panel:

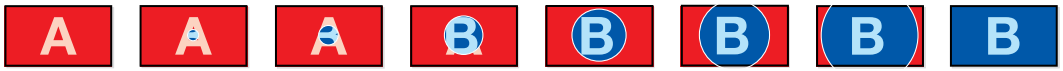
1. On the preview bus, select the video source that you want on the program output.
2. Select the DIP transition style in the transition control block.
3. Expand the transition palette and select dip from the transition types bar.
4. Adjust the dip rate by entering a number in the rate window. The rate display in the transition control block will update.
5. Select the dip source.
6. Perform the transition as an auto transition or manual transition from the transition control block.

Dip Transition Parameters

Rate	The dip transition rate in seconds and frames.
Dip Source	The dip source is any video signal in the switcher that will be used as the intermediate picture for the dip transition, usually a color generator or media player.

Wipe Transitions

A wipe is a transition from one source to another and is achieved by replacing the current source by another source with a pattern that forms a shape. For example an expanding circle or diamond.

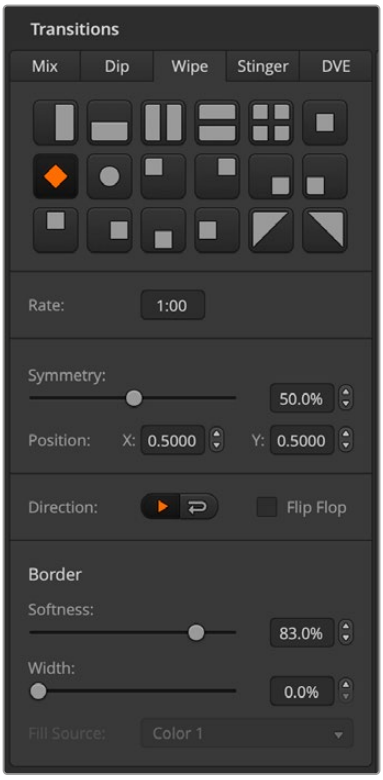


Program output for a wipe transition.

To perform a wipe transition on ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output.
2. Press the WIPE button to select the wipe transition type. The LCD menu will automatically display the transition settings.
3. Use the system control knob to select the wipe pattern and rate. The buttons can be used to select the wipe direction.
4. Use the arrow buttons to the left of the LCD button to navigate all the available wipe properties including position, symmetry and border source.

5 Perform the transition as an auto transition or manual transition from the transition control block.



Wipe Transition Settings

To perform a wipe transition on the software control panel:

1 On the preview bus, select the video source that you want on the program output.

2 Select the WIPE transition style in the transition control block.

3 Expand the transition palette and select wipe from the transition types bar.

4 Use the settings in the wipe palette to customize the wipe transition.

5 Perform the transition as an auto transition or manual transition from the transition control block.

Wipe Transition Parameters

Rate	The length of the wipe transition in seconds and frames.
Symmetry	Symmetry can be used to control the aspect ratio of the pattern. For example, adjusting the symmetry will allow you to change a circle into an ellipse. On the ATEM switcher symmetry can be adjusted using the control knob.
Position	If the wipe pattern has positioning then the control knobs on the switcher or the x position: and y position: boxes in the transition palette of the software control panel can be used to move the center of the pattern.
Reverse Direction	Reverse changes the progression of closed patterns such as circles, diamonds and boxes so that the pattern closes in from the edges of the screen toward the center. The text will illuminate orange when selected.
Flip Flop	When flip flop mode is toggled on, the transition changes between normal to reverse every time the transition is executed. The text will illuminate orange when selected.
Border Softness	The edges of the wipe pattern can be adjusted between sharp and fuzzy by adjusting the softness parameter.
Border	Width of the border.
Border Fill Source	The border source used in a wipe transition can be any source in the switcher. For example, a thick border with the media player as its source can be used for sponsorship or branding.

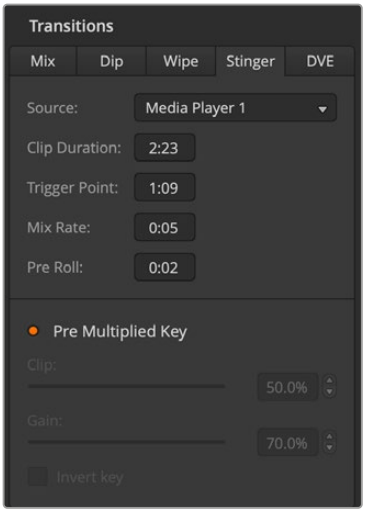
Stinger Transitions

The stinger transition uses a clip from the media player to perform a transition. The clip is normally a graphic animation that is keyed over the background. As the animation plays, when it is full screen, a cut or mix of the background is performed under the animation. For example, this type of transition is very popular in sports productions for transitioning in and out of instant replays. The stinger transition takes advantage of a special keyer that is built into the transition block, leaving all of the upstream and downstream keyers available for compositing your output. The following section explains how to build and perform stinger transitions.

Performing a Stinger Transition

To perform a stinger transition on ATEM Television Studio:

1. Press the ‘sting’ transition type button in transition control block.
2. Rotate the LCD menu soft control knob labeled ‘source’ to select the desired media player. Use the arrow buttons to reveal the additional settings to adjust the preroll, trigger, mix and duration times as needed.
3. Now that you have set the stinger transition to use the correct media player, press the ‘media players’ button in the system control menu buttons next to the LCD to configure the media player.
4. In the media players menu, select the still or clip you want to use from the media pool by rotating the ‘media’ soft control knob. If required, set which frame you want to start the clip from using the corresponding ‘frame’ soft control knob.
5. Perform the transition as an auto transition from the transition control block.



Stinger Transition Settings

To perform a stinger transition on the software control panel:

1. Select the STING transition style button in the transition control block.
2. From the source menu select the media player for the transition. Make sure the media player source has the clip you plan to use.
3. Adjust the clip duration, trigger point, mix rate and pre roll parameters if required.
4. Perform the transition as an auto transition from the transition control block.

   You cannot perform a manual stinger transition using the fader bar.

Stinger Transition Parameters

Source	The media player which will be used to play the clip for the animated transition.
Clip Duration	Clip duration refers to the length of the animation. The duration should normally match the length of the animation. It can also be used to trim out the end of the clip.
Trigger Point	Trigger point is the time at which the switcher will start the background mix transition, which will occur under the animation. Usually, this is the point when the animation is full screen.
Mix Rate	The mix rate specifies the duration of the mix that will occur between preview and program under the animation. To specify a cut instead of a mix simply set the rate to 1 frame.
Pre Roll	Pre roll is a trim in that can be used to trim the beginning of the clip. The maximum preroll time is 3:00 seconds.
Pre Multiplied Key	Identifies the key signal of the media player clip as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole into the clip that is playing back through the media player. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too low.
Gain	The gain adjustment electronically modifies the value which allows the softening of the edges of the key in the clip that is playing back on the media player. Adjust the gain value until the edge softness is desirable but the background video luminance (brightness) is not affected.
Invert Key	Inverts the key.

It is important to understand that the trigger, mix and duration times are dependent on one another. For example the trigger + mix rate cannot be larger than the overall duration. Note also that the time displayed in the transition rate window is equal to the overall duration + preroll.

DVE Transitions

Your switcher includes a powerful digital video effects processor for DVE transitions. A DVE transition displaces the image in various ways to transition from one picture to another. For example, a DVE transition can be used to squeeze the current picture off screen revealing a new video under it.

To perform a DVE transition on ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output.
2. Press the DVE transition type button to select the DVE transition. The DVE settings will appear on the LCD menu.

> **NOTE** If the DVE is already being used in an upstream key, the DVE transition type will not be available for selection until the key is taken off air and off next transition. Refer to ‘sharing DVE resources’ later in this section for more information.

3. In the DVE LCD menu, use the soft control knobs and buttons to configure the DVE parameters. For example, select the DVE pattern, movement, direction and adjust the DVE transition rate. Use the ‘left’ and ‘right’ arrow buttons to the side of the LCD to navigate to the additional settings.

4 Perform the transition as an auto or manual transition using the auto button or fader bar.

DVE Transition Settings

To perform a DVE transition on the software control panel:

1 On the preview bus, select the video source that you want on the program output.

2 Select the DVE transition style in the transition control block.

3 Expand the transition palette and select DVE from the transition types bar.

If the DVE is being used in an upstream key, the DVE transition style button will be unavailable for selection until the key is taken off air and off next transition. Refer to sharing DVE resources below for more information.

Use the settings in the DVE palette to customize the transition.

4 Perform the transition as an auto transition or manual transition from the transition control block.

DVE Transition Parameters

Pattern	Select between push and squeeze for the DVE pattern
Movement	Movement lets you set the direction for the pattern transition.
DVE Rate	The duration of the DVE transition in seconds and frames. On ATEM Television Studio switchers rotate the DVE rate knob to adjust the DVE transition rate. The new rate is immediately displayed in the transition rate window in the transition control block.
Direction	The normal direction applies the DVE effect on program, revealing the preview channel.
Reverse Direction	Reverse changes the direction so that the DVE effect is applied on the preview channel. In the case of reverse, program is covered by a DVE effect with the preview video.
Flip Flop	When flip flop mode is toggled on, the transition changes between normal and reverse every time the transition is executed.

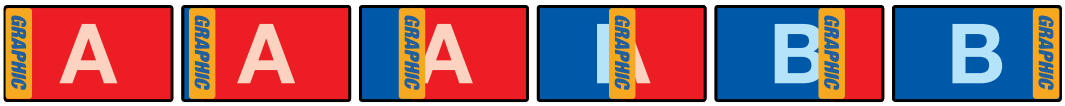
DVE key parameters

Enable key	Enables/disables the DVE key. The DVE key is enabled when the button is illuminated.
PreMult	Selects the DVE key as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too low.
Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance (brightness) is not affected.
Invert Key	When the key is not pre-multiplied, inverts the key signal.

Sharing DVE resources

ATEM features DVE channels which can be used to perform DVE transitions or used in an upstream keyer. When you select a DVE transition, if the DVE is used elsewhere in the system, the DVE transition type will not be available and, on the switcher the DVE button will be disabled. In order to use the DVE transition you must free the DVE from where it is currently used. Verify that the upstream keys currently on program or preview are not DVE keys and do not have flying key enabled. To free DVE from the upstream keyer, change the key type to anything other than DVE or disable flying key. The DVE will be released and therefore available for use as a DVE transition.

The graphic transition is a popular transition that uses the DVE and moves a graphic across the screen over a background transition. For example, the graphic wipe moves a graphic over a horizontal wipe, essentially replacing the wipe border. A graphic mix spins the graphic across the screen over a mix transition. Graphic transitions are perfect for wiping the station logo or spinning a football across the screen revealing a new background. Graphic transitions use a special keyer built into the transition block, leaving all of the upstream and downstream keyers available for compositing the output. The following section explains how to build and perform graphic transitions.



The above image sequence provides an example of the program output for a graphic wipe transition.

Performing a Graphic Transition

To perform a graphic transition on ATEM Television Studio:

1. Press the DVE transition type button in the transition control block. The DVE settings menu will appear on the LCD.

   If the DVE is already being used in an upstream key, the DVE transition type will not be available for selection until the key is taken off air and off next transition. Refer to ‘sharing DVE resources’ in this section for more information.

2. Press the ‘effect’ soft button in the LCD menu to open the effect settings.

   The default direction is left to right, but you can change the direction by selecting ‘reverse direction’. You can also enable ‘flip flop’ which will let the effect move forwards

and backwards with each performance of the transition, rather than repeating the same movement direction.

3 Press the right arrow in the system control buttons to adjust the key settings. Enable the key and select the fill and key source. If you need to make adjustments to the key, for example adjusting clip and gain settings, press the right arrow in the system control buttons to access the key parameters.

TIP Typically, for a graphic transition, the source would normally be a graphic loaded in a media player. By default, when you select a media player for the fill source, the key source will automatically select the media player key channel and set pre multiplied key to 'on'. This means a graphic with a key matte embedded in the alpha channel will automatically be selected by the switcher. You can disable pre multiplied key and change the key source if you want to use a separate media file on a different media player, or a different input source.

4 Press the auto button to perform the transition as an auto transition, or use the fader bar for a manual transition.

To perform a graphic transition on the software control panel:

1 Select the DVE transition style button in the transition control block.

If the DVE is being used in an upstream key, the DVE transition style button will be unavailable for selection until the key is taken off air and off next transition. Refer to sharing DVE resources in the next section for more information.

2 Expand the transition palette and select the DVE transition type. Use the previous or next arrows to select a different DVE type.

3 From the effects options select the graphic wipe transition.

4 Select the fill source and key source for the graphic from the drop down list.

5 Adjust the key parameters if required.

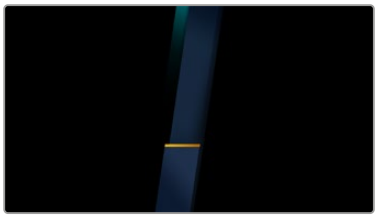
6 Perform the transition as an auto transition or manual transition from the transition control block.

Description of Graphic Wipe Parameters

Rate	Rate specifies the length of the transition in seconds and frames. The rate can be adjusted using the rate knob or by entering a number on the number pad and pressing the enter button.
Normal	The normal direction moves the graphic from left to right. On the switcher system control, normal is indicated by a white 'reverse direction' setting.
Reverse Direction	Reverse changes the direction so that it moves the graphic from right to left. On the ATEM switcher, reverse direction will be orange to indicate it is enabled.
Flip Flop	When flip flop mode is toggled on, the transition changes between normal and reverse every time the transition is executed. The 'Normal' or 'Reverse' light indicates the direction of the next transition.
Fill Source	The fill signal is the graphic used to move across the top of the transition.
Key Source	The key signal is a grayscale image that defines the region in the graphic that will be removed so that the fill signal can be correctly stacked on top of the wipe.

Graphic wipe images

The graphic wipe feature requires a static graphic that is used as a moving border for a horizontal wipe. This graphic should be a vertical 'banner' type graphic that is no more than 16% of the total screen width.



Graphic Wipe Screen Width Requirements

2160p	If ATEM Television Studio 4K8 models are operating at 2160p then the graphic should be no wider than 230 pixels.
1080i	If the switcher is operating at 1080i then the graphic should be no wider than 116 pixels.
720p	If the switcher is operating at 720p than the graphic should be no wider than 77 pixels.

Manual Transitions

Manual transitions let you manually transition between program and preview sources using the fader bar in the transition control block. Mix, dip, wipe and DVE transitions can all be performed as a manual transition.

To perform a manual transition on the software control panel or ATEM Television Studio:

1. On the preview bus, select the video source that you want on the program output.
2. Select the transition type using the transition type buttons in the transition control block.
3. Manually move the fader bar from one end to the other to execute the transition. The next fader bar move will begin a new transition.

4 During the transition the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. On the switcher, the fader bar indicator also displays the position and progress of the transition. On the software control panel, the virtual fader bar displays the position and progress of the transition.

5 At the end of the transition sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

Preview Transition

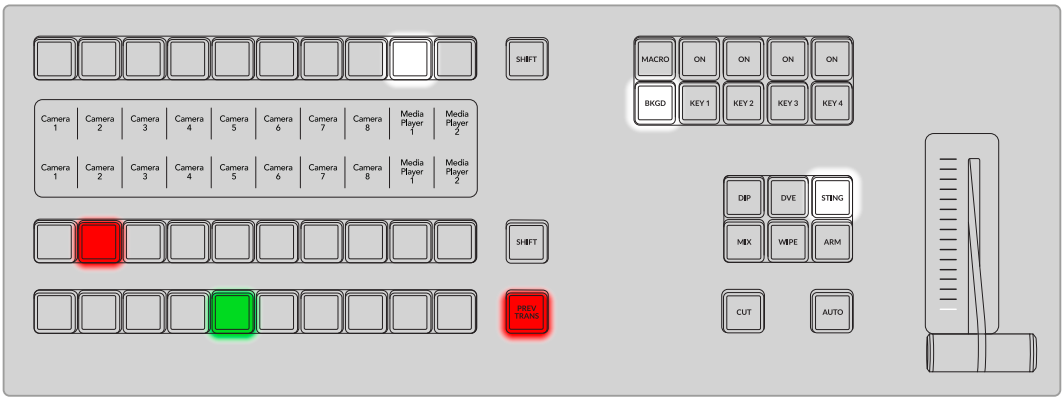
ATEM switchers have a powerful feature which allows you to review and adjust a transition on the preview output. The preview transition mode lets you verify a transition before actually performing it on air.

To preview a transition on the software control panel or ATEM Television Studio:

1 On the preview bus, select the video source that you want on the program output.

2 Select the transition type using the transition type buttons in the transition control block.

3 Press the PREV TRANS button to put the switcher into preview transition mode. The PREV TRANS button will illuminate red and the preview output will change so that it is a copy of the program output.



4 Manually move the fader bar from one end to the other to preview the transition on the preview output. The program output will remain unchanged.

5 Press the PREV TRANS button to turn off preview transition mode.

Keying using ATEM Switchers

Keyers are a powerful production tool that allow the arrangement of visual elements from different sources on the same video image.

To do this, multiple layers of video or graphics are stacked on top of the background video. Altering the transparency of various parts of these layers allows the background layer to be visible. This process is called keying. Various techniques are used to create this selective transparency and these correspond to the different types of keyers available on your switcher.

The following section explains luma and linear keyers, which are available either upstream or downstream. It also explains chroma, pattern and DVE keys, which are upstream keyers.

Understanding Keying

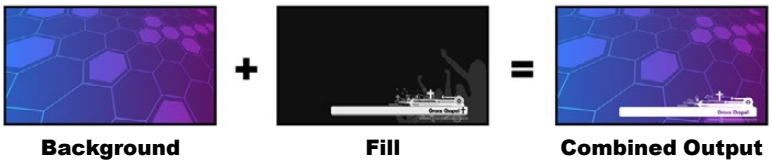
A key requires two video sources; the fill signal and the key or cut signal. The fill signal contains a video image which is to be stacked on top of the background, while the key signal is used to select regions of the fill signal to be made transparent. The fill and key signals can be selected from any of the switcher's external inputs or internal sources, allowing both still and moving images to be used as fill or key sources.

Fill and key signals are selected on the software control panel from drop down lists in the upstream and downstream key palettes. On the ATEM switcher, fill and key signals are selected using the select bus.

There are two types of keyers used in the switcher; upstream keyers and downstream keyers. Four upstream keyers, also known as effects keyers, are available in the switcher's M/E block. Each upstream keyer can be set up as a luma, linear, pre-multiplied, chroma, pattern or DVE key. Two downstream keyers are available in the dedicated DSK block. Each downstream keyer can be set up as a luma or linear key.

Luma Key

A luma key or self key consists of one video source containing the video image that will be stacked on top of the background. All of the black areas defined by the luminance in the video signal will be made transparent so that the background can be revealed underneath. Since only one image is used to define the areas to be cut out, a luma key uses the same signal for fill and key. The following images are an example of what background, luma key signals and the resulting combined image might look like.



Combining a background and fill/key in a luma key

Background

A full screen image, often a camera source.

Fill

The graphic you plan to display on top of your background video. Notice that the final composition does not retain any black from the graphic because all of the black parts have been cut out of the image.

Linear Key

A linear key consists of two video sources; the fill signal and the key or cut signal. The fill signal contains a video image which is to be stacked on top of the background, while the key signal contains a grayscale mask that is used to define regions of the fill signal to be made transparent. Since both the fill and key signals are video inputs, both signals can be in motion while on screen. The following images are examples of what background, fill, key signals and the resulting combined image might look like.

Combining a background, fill and key in a linear key

Background

A full screen image, often a camera source.

Fill

The graphic you plan to display on top of your background video. Notice that the black parts of the graphic remain intact because the key signal is used to determine the transparency of the fill signal. The fill signal is often provided by a graphics system.

Key

A grayscale image that defines the region in the image that will be removed so that the fill signal can be correctly stacked on top of the background. The key signal is often provided by a graphics system.

Pre multiplied Key

A modern graphics system or character generator that offers fill and key outputs will most likely provide what is known as a pre-multiplied or shaped key. A pre-multiplied key is a special combination of the fill and key signal where the fill signal has been pre-multiplied with the key signal over a black background. Photoshop generated images that contain an alpha channel are pre-multiplied.

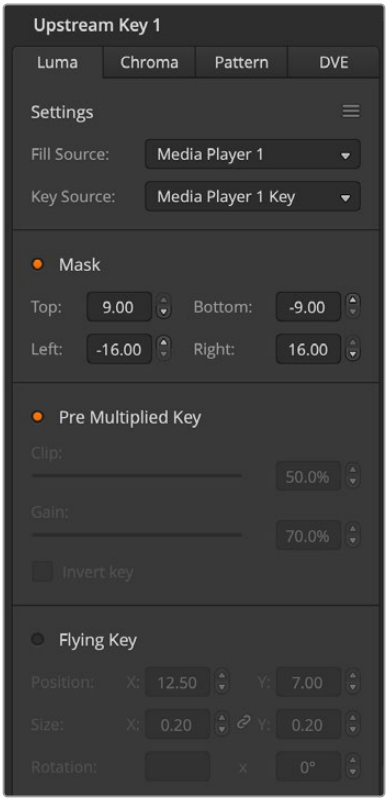
ATEM switchers have an auto key adjustment for pre-multiplied keys so that when the pre-multiplied key setting is enabled, the clip and gain parameters are automatically set by the system.

When using a Photoshop generated image, generate graphics over a black background layer and place all content on the upper layers. Add an alpha channel in your Photoshop document that the ATEM can use for blending the graphic over the live video. Then, when saved as a Targa image file, or downloaded direct to the media pool, you can select pre-multiplied in the keyer and you should have a great key!

Photoshop documents are pre-multiplied by nature, so you should always use the pre-multiplied settings on the ATEM switcher when keying them.

Performing an Upstream Luma/Linear Key

Since luma and linear keys use the same parameters, they are set up on the software control panel and the ATEM switcher using a common menu, called the luma key menu. What defines the key as being either luma or linear is in the selection of fill and key sources. In a luma key, fill and key sources are the same. For a linear key, fill and key sources are different.



The Upstream Key palette has a menu for resetting parameters at the top of each tab. Select the sections you wish to reset from the menu.

To set up a luma/linear key on upstream keyer 1 on ATEM Television Studio:

1. Press the 'key 1' button to enable the keyer on the preview output. This automatically selects the keyers menu on the system control LCD, but you can also press the 'keyers' button to enter the menu directly.
2. Use the control knob underneath the 'key type' indicator to choose the 'luma' key.
3. Rotate the 'fill source' and 'key source' control knobs to choose a fill and key source.

> **TIP** You can also press the corresponding buttons on the source select bus to select the fill and key source.

4. Once you have chosen a key type, fill and source, press the 'right' arrow button to scroll through to the next menu item and use the control knobs to adjust key parameters such as mask, gain, clip, enable or disable pre multiplied key, etc.

To set up a luma/linear key on upstream keyer 1 on the software control panel:

1. Expand the upstream key 1 palette and select luma tab.
2. Select the fill source and key source.

If performing a luma key, select the same source for both fill and key.

Adjust the key parameters to refine the key. For a description of luma key parameters, refer to the table below.

Upstream key luma/linear key parameters include:

Mask	Enables a rectangular mask that can then be adjusted using the top, bottom, left and right parameters.
Pre-Mult	Identifies the key signal as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too low.

Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance or brightness is not affected.
Invert Key	Inverts the key signal.
Flying Key	Enables/disables DVE effects.

Performing a Downstream Luma/Linear Key

To set up a luma/linear key on downstream keyer 1 on ATEM Television Studio:

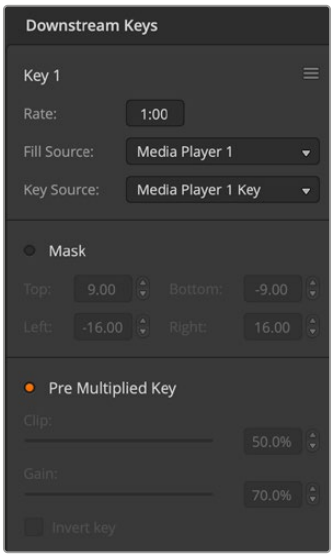
1. Press the 'DSK 1 tie' button to enable the downstream keyer on the preview output. This automatically selects the downstream key menu on the system control LCD, but you can also press the 'keyers' button and press the right arrow to enter the menu directly.
2. Press the 'DSK 1' or 'DSK 2' soft button to select which downstream keyer you wish to use.

> **TIP** You don't have to select the key type as the downstream keyer is always a luma key.

3. Use the control knobs under the LCD menu to select the fill source and key source. You can also use the corresponding source select buttons to select the fill and key source.
4. Once you have chosen the fill source and key source, use the 'left' and 'right' control buttons to scroll through additional menu screens containing key parameters such as mask, gain, clip, pre multiplied key settings and more.

To set up a luma/linear key on downstream keyer 1 on the software control panel:

1. Select the downstream key 1 palette.
2. Use the drop down controls labeled fill source and key source to specify the fill and key sources. If performing a luma key, select the same source for both fill and key.
3. Adjust the key parameters to refine the key.

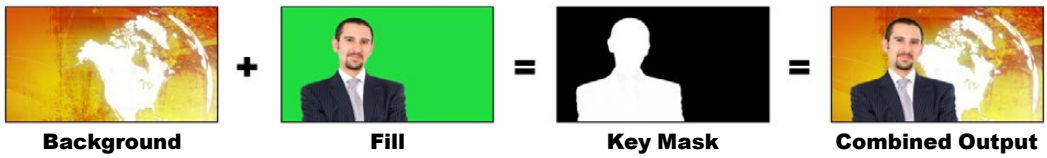


Downstream Keyer Settings

Chroma Key

Chroma key is commonly used for weather broadcasts, where the meteorologist appears to be standing in front of a large map. In the studio the presenter is actually standing in front of a blue or green background. In a chroma key two images are combined using a special technique and a color from one image is removed, revealing another image behind it. This technique is also referred to as color keying, color-separation overlay, green screen, or blue screen.

A very common use for chroma keys for backgrounds is computer generated graphics. It's simple to connect an external computer to your ATEM switcher using the HDMI output of the computer or a video card such as the Blackmagic Design DeckLink or Intensity range and then play back video clips to your ATEM switcher. If you render a green background on your animations, you can then key this green to create fast and clean animations of any length. Keying is easy as the green is computer generated so it's a very flat color that's easy to key.



Combining a background with a fill and chroma key/cut

Background

A full screen image; in the case of a chroma key it is often a weather map.

Fill

The image you plan to display on top of your background video. In the case of a chroma key, this is video of the meteorologist in front of the green screen.

Key/Cut

In the case of a chroma key the key/cut signal is generated from the fill signal.

Performing an Advanced Chroma Key

Your ATEM switcher features advanced chroma keying, with more detailed chroma sampling and adjustment options. These controls help you achieve the best key, improving the blend of foreground and background so you can create a more convincing visual effect.

To set up a chroma key on upstream keyer 1 on ATEM Television Studio:

1. Press the 'key 1' button to enable keyer 1 on the preview output. This automatically selects the keyers menu on the system control LCD, but you can also press the 'keyers' button to enter the menu directly.
2. Select the 'chroma' key type using the corresponding 'key type' control knob.
3. Select your fill source by turning the corresponding LCD control knob. Typically, this source would be from a camera facing a presenter in front of a green screen, or a graphic loaded in a media player. You can also select a fill source by pressing the corresponding button in the source select bus.
4. Use the 'right' arrow buttons to access the chroma adjustments screen.
5. Click the 'sample chroma' button.

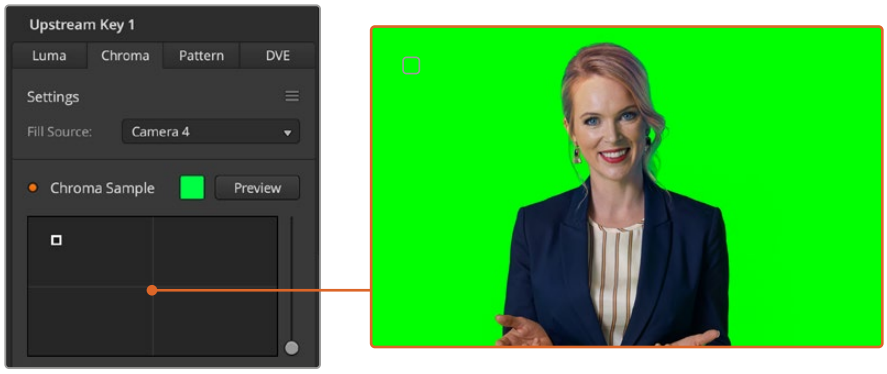
To set up a chroma key on upstream key 1 on the software control panel:

1 Expand the upstream key 1 palette and select ‘chroma’ from the key types bar.

2 Select the fill source. Typically, this source would be from a camera facing a presenter in front of a green screen, or a graphic loaded in a media player.

3 Click the ‘chroma sample’ button.

With the chroma sample selected, you’ll see a new panel appear with a box cursor. This cursor is also visible on the preview output.



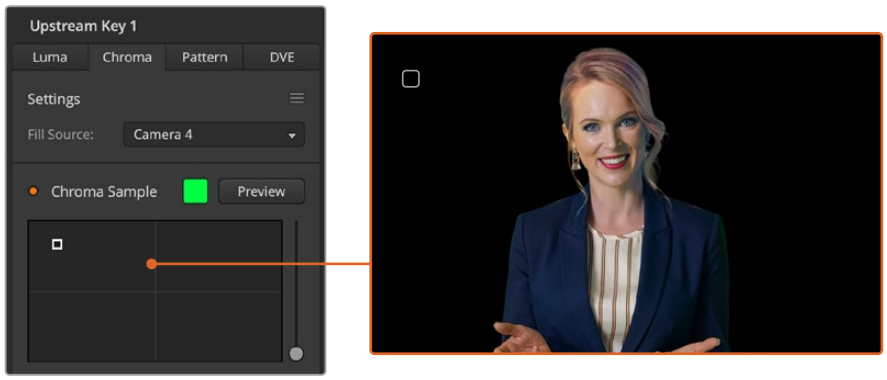
The chroma sample setting lets you position a cursor over the screen area you want to sample

4 Click and drag on the box cursor to move it to the position you want to sample.

Choose a representative area of your green screen that covers as much of the luminance range of the screen as possible. The default size of the box cursor is well suited to most green screens that are relatively evenly lit, however if there is a lot of variance in your green screen, you can adjust the size of the box by clicking on the slider to the right of the sample window and dragging it up or down. On the switcher, use the corresponding knobs to move the position of the box and the z axis to increase or decrease the size.

TIP When sampling uneven green screens, we recommend sampling the darkest area first before increasing the size of the sample box. This can give you a more accurate key.

You can preview your key at any time by clicking the ‘preview’ button above the chroma sample panel or by pressing the ‘preview chroma’ button above the LCD screen on the system control.



Use the preview button to check what your key will look like in the preview output

Fine Tuning your Key using Key Adjustments

Once you have achieved a good chroma sample that removes most of your green screen while generally retaining foreground elements, it is time to fine tune your key with the 'key adjustments' controls. On ATEM Television Studio switchers, press the right arrow to navigate to the 'chroma adjustments' menu.

Foreground

Use the 'foreground' slider or control knob to adjust how opaque the foreground mask is. This determines the strength of the foreground against the background. By increasing the slider, you can fill in any small areas of transparency inside your foreground image. We recommend moving this slider and stopping as soon as the foreground becomes solid.

Background

The 'background' slider and control knob adjusts the opacity of the keyed area. Use this slider to fill in any small foreground artifacts left over in the area of the image you want to remove. We recommend moving the slider until your keyed area is consistently opaque.

Key Edge

The 'key edge' slider and control knob moves the edge of your keyed area in or out, helping to remove background elements from the very edge of your foreground or extending the foreground out a little if your key is too aggressive. This can be especially useful with fine details like hair. We recommend moving this slider until the edge of your key is generally clean, without any background artifacts visible.

Using the key or chroma adjustment controls, your foreground elements should be cleanly separated from the background.

Chroma Correction using Color Spill and Flare Suppression

Light bouncing off a green screen can create a green edge to foreground elements as well as a general tint to the foreground, or fill image. This is called color spill and flare. The 'chroma correction' settings let you improve the areas of the foreground that are affected by color spill and flare. You can correct these areas in the key using the 'chroma correction' settings.

Spill

Adjust the spill slider to remove colored tint from the edges of foreground elements. For example, green reflections bouncing off a green screen.

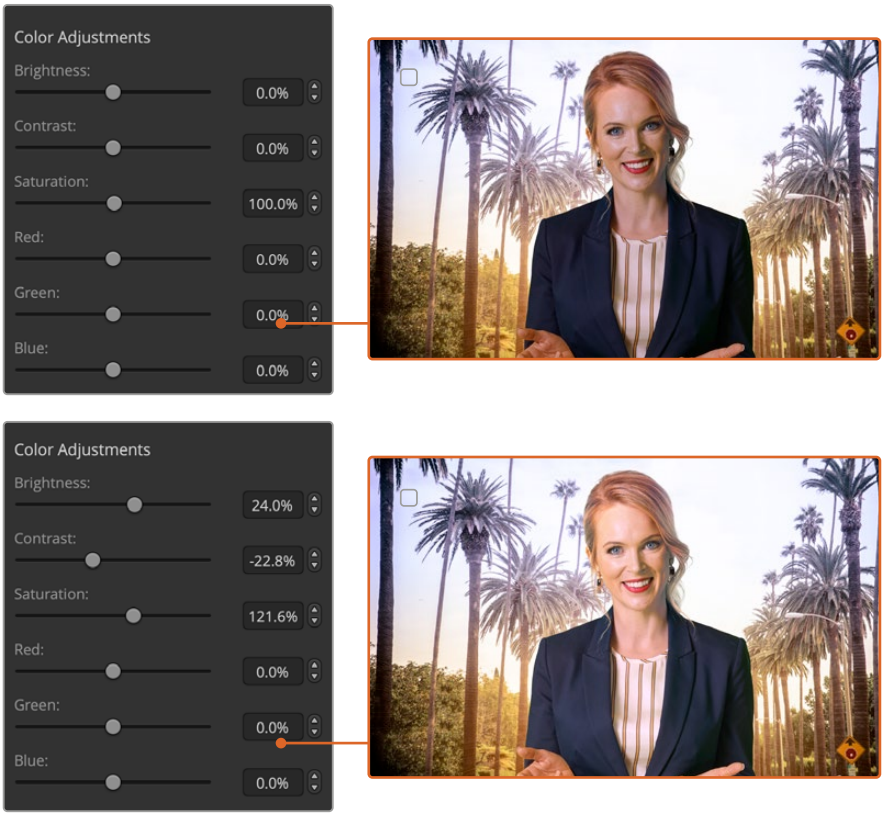
Flare Suppression

Flare suppression removes overall green tint evenly across all foreground elements.

Matching your foreground and background

Once your foreground is properly separated from your green screen and you have adjusted spill and flare suppression, use the 'color adjustments' controls to match your foreground with the background.

Adjusting the brightness, contrast, saturation and color balance of your foreground image will help blend it with the background so the effect is more convincing.



Use the color adjustments controls to match your foreground with the background

Pattern Key

A pattern key is used to display a geometric cut out of one image on top of another image. In a pattern key the key or cut signal is generated using the switcher's internal pattern generator. The internal pattern generator can create 18 shapes that can be sized and positioned to produce the desired key signal.

Combining a background with a fill and pattern key

Background

A full screen image.

Fill

Another full screen image you wish to overlay on top of the background.

Key/Cut

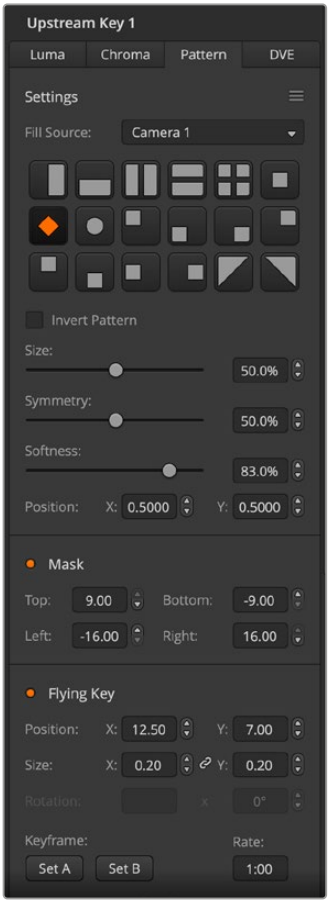
In the case of a pattern key the key/cut signal is generated by the switcher's internal pattern generator.

Performing an Upstream Pattern Key

To set up a pattern key on upstream keyer 1 on ATEM Television Studio:

1. Press the KEY 1 next transition button to enable the key on the preview output. This automatically selects the keyers menu on the system control LCD. Pressing the KEY 1 next transition button ties the key to the next transition so it will transition to air when the next transition is performed.
2. In the keyers LCD menu, select the ‘pattern’ key type using the corresponding ‘key type’ control knob.
3. Select the fill source using the corresponding soft control knob or by pressing a source button on the source select bus.
4. Turn the corresponding soft control knobs to choose the ‘pattern’ you want for the pattern key and set the ‘size’ of the pattern.
5. Press the system control left and right arrow buttons to navigate through the pattern key parameters and adjust settings using the control knobs. Watch the preview output as you refine the key.

TIP Some patterns can have their center point repositioned. Use the corresponding control knobs to move the position of the pattern. If you need to reset the position, navigate to the ‘pattern type’ setting, change it to another pattern and then return to your chosen pattern to reset the position to its default.



Pattern Key Settings

To set up a pattern key on upstream keyer 1 on the software control panel:

1. Expand the upstream key 1 palette and select pattern from the key types bar.
2. Select the fill source.
3. Select the key pattern.
4. Adjust the key parameters to refine the key. For a description of pattern key parameters, refer to the table below.

Size	Increases and decreases the size of the selected pattern.
Symmetry	Some patterns may have their symmetry or aspect ratio adjusted. Circle patterns may be adjusted to become horizontal or vertical ellipses.
Softness	Changes the softness of the edge of the key signal.
Invert Pattern	This button inverts which the region filled with the fill source. For example, fill a region outside of a circle by positioning the circle wipe as desired and then selecting inverse.
Flying Key	Enables/disables DVE effects

Adjusting the X/Y Position of a Pattern

Some of the patterns may have their center point repositioned. To position a pattern, navigate to the pattern selection page of the keyer you are setting up. Use the control knobs to move the pattern vertically and horizontally. To re-center the pattern, press the pattern select button of the current pattern in the menu. This will reset the position and symmetry of the pattern.

DVE Key

DVEs (digital video effects) are used to create picture-in-picture boxes with borders.
Most models have 1 channel of 2D DVE that allows scaling, borders and offers a drop shadow.

Combining a background, DVE fill and DVE key/cut

Background

A full screen image.

Fill

Another full screen that has been scaled or has added borders and will be overlaid on top of the background.

Key/Cut

In the case of a DVE key, the key/cut signal is generated by the switcher's internal DVE processor.

Performing an Upstream DVE Key

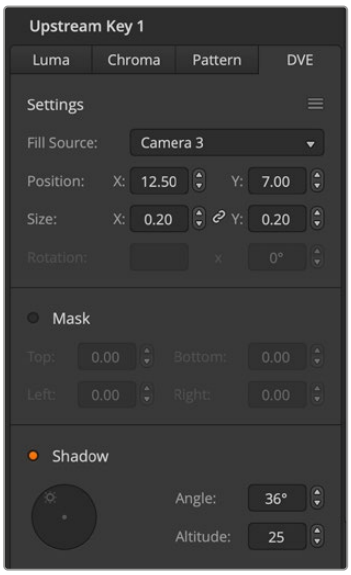
To set up a DVE key on upstream keyer 1 on ATEM Television Studio:

1. Press the KEY 1 next transition button to enable the keyer on the preview output.
2. In the keyers LCD menu, select the DVE key type using the corresponding soft control knob.
3. Select the fill source using the corresponding control knob or via the a source button on the source select bus.
4. Press the system control left and right arrow buttons to navigate through the DVE parameters and use the soft control knobs to adjust settings, such as position, size, mask settings, light source, border and key frames for movement.

TIP When using the number pad to enter numeric values for settings, hold the 'reset' button down for several seconds to enable negative values. Hold down again to return to standard values.

To set up a DVE key on upstream keyer 1 on the software control panel:

1. Expand the upstream key 1 palette and select DVE from the key types bar.
2. Select the fill source.
3. Adjust the key parameters to refine the key. For a description of DVE key parameters, refer to the table below.

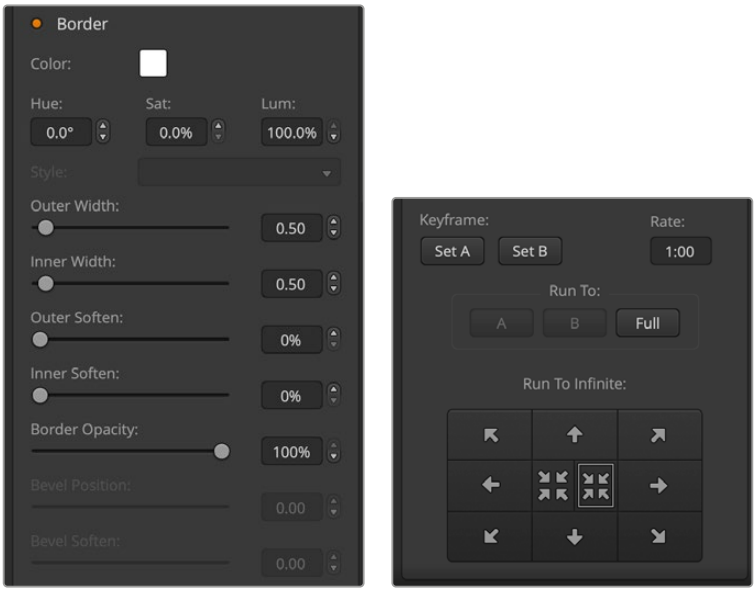


DVE Key Settings

DVE parameters

Fill Source	The source for the DVE to be adjusted.
Size	X and Y values adjust horizontal and vertical size of the DVE.
Mask	Enables a rectangular mask that can then be adjusted using the top, bottom, left and right parameters.
Shadow	Adjusts the direction of the light source on the DVE or picture in picture. Both the border and drop shadow, if available, are affected by changes to this setting.

Adding DVE Borders



DVE border parameters

The knobs and soft buttons in the system control are used to adjust the border parameters. There are multiple parameters, each requiring an adjustment, therefore the soft/color button and SHIFT button is used to toggle the parameters that each knob adjusts.

Border	Enables or disables the border.
Color	Adjusts the color of the border.
Hue	Changes the border color. The hue value is a location on the color wheel.
Sat	Changes the intensity of the border color.
Luma	Change the brightness of the border color.
Outer Width	Adjusts the outside width of the border.
Inner Width	Adjusts the inside width of the border.
Outer Soften	Outside softness adjusts the outside edge of the border, the edge that touches the background video.
Inner Soften	Adjusts inside softness. This softness parameter adjusts the inside edge of the border, the edge that touches the video.
Border Opacity	Opacity adjusts the transparency of the border, use this setting to create interesting colored glass borders.

Key Masking

Both upstream and downstream keyers have an adjustable rectangular mask that can be used to crop out harsh edges and other artifacts in the video signal. The mask consists of left, right, top and bottom crop controls. Masking can also be used as a creative tool to build rectangular cut outs on screen.

On the hardware panel the mask is set up for each upstream and downstream key from the system control mask menu which is available from the EFFECTS KEYS or DSK KEYS menus.

On the software control panel the mask is set up for each upstream or downstream key from the palettes in the settings tab.

Flying Key

Luma, chroma and pattern upstream key types include a flying key setting. If a DVE channel is available the Flying Key setting allows DVE effects to be applied to the key.

Performing Upstream Keyer Transitions

The upstream keyers are accessible from the transition control block or the system control. The upstream keyers are taken on and off the program output using the next transition buttons or ON buttons.

ON buttons

Take the upstream keyers on or off the program output using the ON (on air) buttons as follows:

1. Press the ON button above the corresponding next transition KEY button to immediately turn on or turn off the upstream key on the program output.
2. The ON button also indicates if the upstream keyer is currently on or off the program output.

Next transition buttons

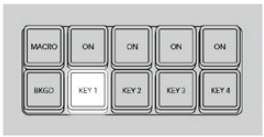
Take the upstream keyers on or off the program output using the next transition buttons as follows:

1. Select the elements you wish to transition using the BKGD, KEY 1, KEY 2, KEY 3 and KEY 4 next transition buttons.
2. Verify the preview output, which will show you exactly what your program output will look like after you perform the transition.
3. Press CUT, AUTO, or use the fader bar to perform the transition.

In order to help you understand the various ways in which multiple keys can be taken on and off the program output, we have provided a few examples. In the examples below KEY 1 contains a live bug on the top left of the screen while KEY 2 contains a bug at the bottom right hand side of the screen.

Example 1:

In this example none of the upstream keyers are currently on-air. The next transition has key 1 selected, therefore the next transition will change the state of key 1 and turn it ON so that it is visible on the program output.



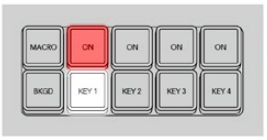
Control panel next transition buttons before transition.

Program output before transition.

Program output after transition.

Example 2:

In this example, key 1 is currently on air, indicated by the illuminated ON button. The next transition has Key 1 selected, therefore the next transition will change the state of key 1 and turn it OFF so that it is not visible on the program output.



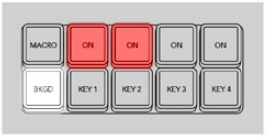
Control panel next transition buttons before transition.

Program output before transition.

Program output after transition.

Example 3:

In this example, key 1 and key 2 are on-air, indicated by the illuminated ON buttons. The next transition has the background selected, indicated by the illuminated BKGD button, therefore the next transition will only transition the background leaving both key 1 and key 2 on-air.



Control panel next transition buttons before transition.

Program output before transition.

Program output after transition.

Example 4:

In this example, key 1 and key 2 are on-air. The next transition has the background and key 2 selected, therefore the next transition will transition the background and change the state of key 2 turning it OFF so that it is not visible on the program output.

Control panel next transition buttons before transition.

Program output before transition.

Program output after transition.

There are multiple ways to transition a key to the program output. The key can be cut on or off, it can be mixed on or off, or it can be mixed along with a background transition. Upstream keys are transitioned to the program output using the next transition block. Downstream keyers can be transitioned using their own transition buttons or by using the DSK TIE button to link the transition with the main transition control block.

Performing Downstream Keyer Transitions

The downstream keyers have their own transition buttons and transition rate windows. Once a downstream keyer is configured it can be easily taken on and off the program output using one of the following three methods:

1. Press the DSK CUT button to immediately turn on or turn off the downstream key on the program output.
2. Use the DSK AUTO button to gradually transition the downstream key on or off the program output at the rate displayed in the DSK rate window.
3. Use the DSK TIE button to link the downstream key with the main transition control block. Once linked the DSK will be mixed on or off along with any transition type selected in the main transition control block at the rate specified by the transition control block.

   Pressing the DSK TIE button shows the downstream keyer on the preview output.

   It is not possible to preview a downstream keyer transition when linked with the main transition block. If the DSK TIE button is on when you switch to preview transition mode the tie functionality will be ignored until the preview transition mode is turned off.

DSK parameters

Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too high.
Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance (brightness) is not affected.
Rate	The mix rate at which the downstream keyer transitions on or off.
Invert Key	Inverts the key signal.
Pre-Mult	Identifies the key signal as a pre-multiplied key.

Streaming

Your ATEM switcher lets you stream directly to platforms including YouTube and Twitch using the dedicated buttons on the control panel. To start streaming you will first need to set up the stream key in ATEM Software Control.

Getting a Stream Key

You can select which platform you want to use in ATEM Software Control and set all the relevant settings for your stream. If you are setting up a broadcast on your channel that you will regularly use, these settings will be stored in your switcher and you can then plug into any internet connection at any time and broadcast directly from the unit.

This section includes how to configure settings for YouTube Studio and Twitch.

TIP As you're setting up your broadcast, it's worth loading a standby graphic into ATEM Software Control's media player and switching it to the program output so you can perform a quick test broadcast before actually going live.

Configuring Settings for Blackmagic Cloud

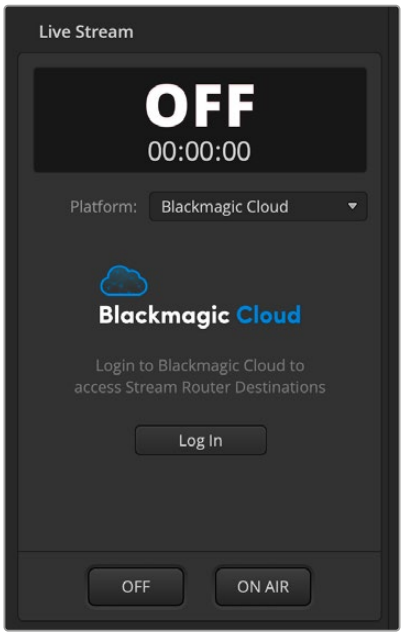
Blackmagic Cloud Stream Router is a virtual video router that lets you connect and route live SRT and RTMP video streams via Blackmagic Cloud.

Before you can start streaming you will need a stream router source assigned to you in Blackmagic Cloud. This could be using a personal or organization profile in your Blackmagic Cloud account or assigned to you from another Blackmagic Cloud user.

Once a source input has been configured you can start streaming.

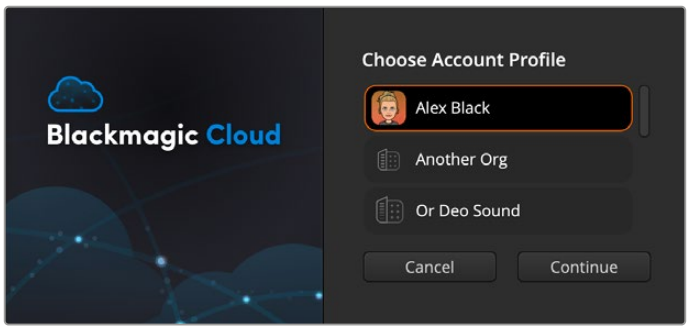
To stream to Blackmagic Cloud:

1. Open the live stream palettes and click on the 'platform' menu.
2. Select 'Blackmagic Cloud' from the list. If you haven't logged into Blackmagic Cloud before, click the 'log in' button.



3 In the login window enter your credentials into the email and password fields and click ‘log in’. Alternatively, click the ‘login via web’ option in the upper right hand corner and log in via a web browser.

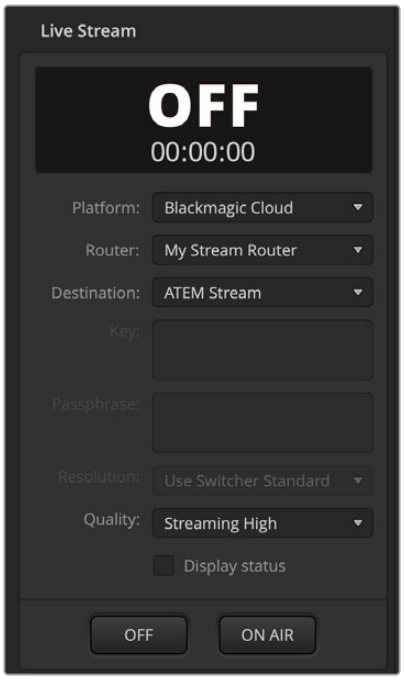
4 Choose the Blackmagic account profile you wish to stream to, this could be a personal or organization profile.



5 Click ‘Continue’ to close the settings window and return to the live stream palette.

Once you’ve logged in available stream router destinations will be available in the list.

6 Select the router and destination to stream to from the menus. If you’ve only been assigned to one stream router destination the menu will default to that destination.



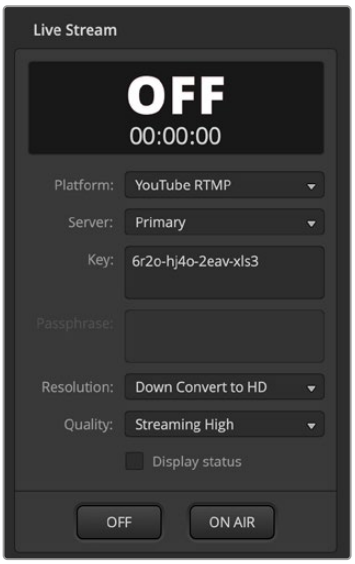
To start streaming click ‘on air’ or press the on air button on the switcher. When your production has finished, click ‘off’ or press the off button on your switcher to stop your broadcast. Once you have selected a stream router input, the connection will remain in place even if your live stream is set to off. If you want to free up the stream router input at the end of your production, select ‘none’ from the router or destination list.

TIP As you’re setting up your broadcast, it’s worth loading a standby graphic into ATEM Software Control’s media player and switching it to the program output so you can perform a quick test broadcast before actually going live.

Configuring Settings for YouTube Studio

1. Log into your YouTube account. Click ‘go live’ from the ‘create’ menu.
2. If prompted, choose to start your stream ‘right now’ or at a ‘later date’ and select ‘streaming software’ from the options.
3. Click ‘edit’ beside the stream title to edit stream details including name and description along with setting your audience.
4. Set the audience to the appropriate setting and press save.
5. An auto generated stream key will appear in the upper right corner of the preview window, click the icon to copy the stream key.

Now you have copied the stream key for your broadcast, you will need to paste it into the stream details in ATEM Software Control.



1. In ATEM Software Control’s processing palettes, click on the ‘output’ tab. Open the ‘live stream’ palette.
2. Set the platform to YouTube by clicking in the menu and selecting YouTube from the menu list. Set the server to ‘primary’.
3. In the ‘key’ setting, paste the stream key you copied from YouTube.
4. Set the streaming quality to low, medium, or high. This will also set the quality for the recording output via USB-C.
5. With all the streaming details now set, it’s worth performing a quick test broadcast to make sure everything is working. Press the ‘on air’ button on your switcher, or click on the on air button in the live stream palette.

YouTube Studio is now ready to start broadcasting. It may take a few moments for the memory buffer to initiate. When the buffering is complete, the ‘go live’ button will appear in the YouTube Studio manager and all you need to do is click ‘go live’.

You are now broadcasting!

To test that everything is working properly, click the ‘share’ icon, copy the link and paste it into a new window or tab in your internet browser. You can now monitor your live stream just like a member of your audience.

When your production has finished, press the ‘off’ streaming button on your switcher to stop your broadcast.

Configuring Settings for Twitch

1. Log into your Twitch account. Click on your account avatar in the top right corner.
2. Click on ‘creator dashboard’.
3. In the settings options, select ‘stream’.
4. A primary stream key will be automatically generated. Click ‘copy’.

Now you have copied the stream key for your broadcast, you will need to paste it into the stream details in ATEM Software Control.

1. In ATEM Software Control's processing palettes, click on the 'output' tab. Open the 'live stream' palette.
2. Set the platform to Twitch by clicking in the menu and selecting Twitch from the menu list.
3. Click on the 'server' setting menu list and select the server nearest to your location.
4. In the 'key' setting, paste the stream key you copied from Twitch.
5. Set the streaming quality to low, medium, or high. This will also set the quality for the recording output via USB-C.
6. With all the streaming details now set, it's worth performing a quick test broadcast to make sure everything is working. Press the 'on air' button on your ATEM switcher, or click on the on air button in the live stream palette.

You are now on air! To check your broadcast, click on your account avatar and select 'back to Twitch'. Once in the main Twitch window, click your avatar icon again and select 'channel'. You will now see your broadcast on your channel and the live indicator will appear at the top of the window.

Direct Streaming by Sharing Your Computer Internet

With ATEM Software Control now connected to your switcher, you can set up a direct stream via your computer's internet connection. This means you can use your computers wireless internet connection if a wired connection is not available.

To set up your ATEM switcher for software control and direct streaming:

1. Plug your ATEM into your computer's spare Ethernet port. It may take a moment for DHCP to find the unit and assign an IP address.
2. Launch ATEM Software Control.
3. You will see your ATEM Television Studio switcher listed as a connected ATEM switcher on your network. Simply select your switcher from the list.
4. Click 'connect'.
5. Configure your computer to share its internet connection through its Ethernet port.

To configure Internet sharing on a Mac computer: In System Preferences, click 'sharing' then select 'internet sharing' from the 'service' list. In the 'share your connection from' menu, choose 'wi-fi' if your Mac is connected to the internet over wifi. In the 'to computers using' list, select 'ethernet'. In the 'service' list, tick the 'internet sharing' checkbox. When you are asked if you are sure you want to turn on internet sharing, click 'start'.

To configure Internet sharing on a Windows computer: In the Windows search box, type 'view network connections' and press enter. Right click on the internet connection and select 'properties'. On the 'sharing' tab, tick 'allow other network users to connect through this computer's internet connection'. Select a network connection in the menu then click 'OK'.

ATEM Software Control will now appear with buttons and indicators illuminated. You can now operate your switcher the same way you would via USB-C. Your ATEM switcher is now setup for direct streaming via your computer.

Smartphone Tethering

Once you have set up your ATEM switcher to stream to YouTube, Twitch or other platforms, you can now direct stream using your smartphone. This means you can set up fast and be streaming to the world in any location where your smartphone has a 4G or 5G cellular connection or is capable of reverse tethering your WiFi connection.

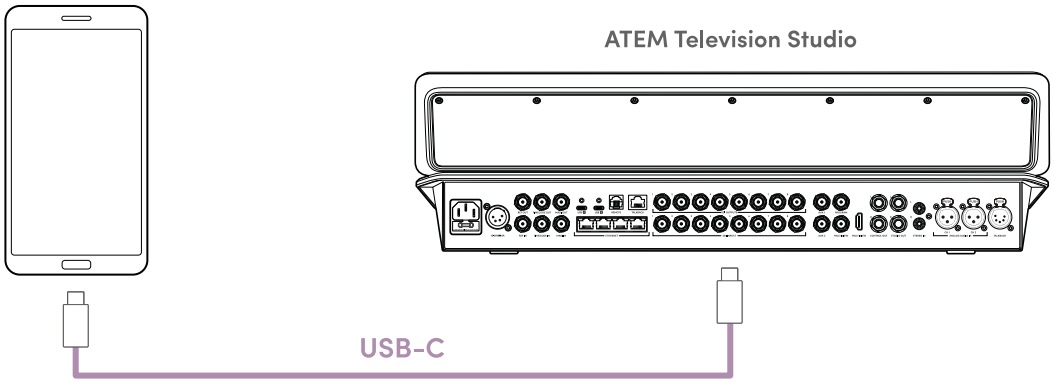
1 Simply connect a cable from your smartphone to one of the USB-C ports on your switcher.

2 Once connected, make sure your smartphone device has hotspot activated.

On your iOS device open settings> personal hotspot and make sure 'allow others to join' option is on.

For Android devices, swipe the screen to display the quick menu. Press and hold the hotspot icon and then turn on USB tethering.

Now you can press the On Air button on your ATEM switcher to go live!



If you have both Ethernet and a smartphone connected to your ATEM switcher, you can use the connection priority in ATEM Setup to choose which connection will be used for streaming.

Additional Features on ISO Models

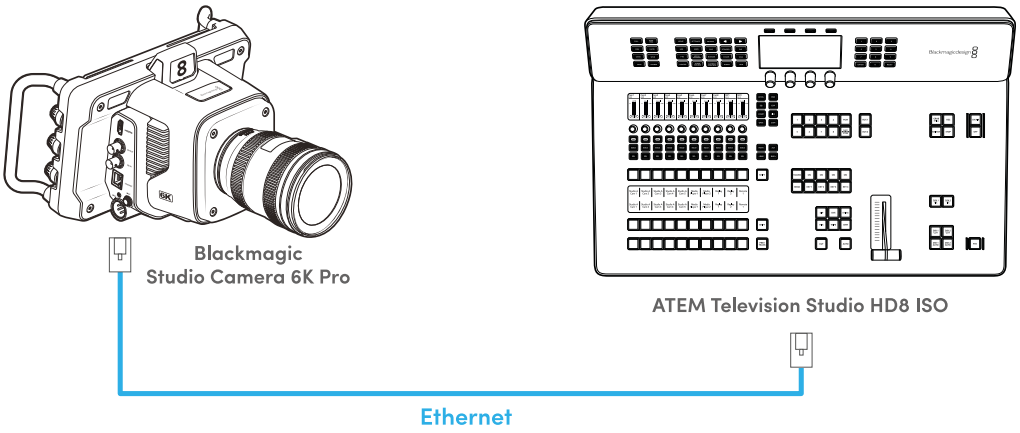
ATEM Television Studio HD8 ISO switchers have additional features giving you more options for your broadcast including ISO recording each input and connecting to remote sources when streaming via Ethernet. This means you can add cameras on your local network or from across the world.

Some Blackmagic Design cameras such as Blackmagic Studio Camera 6K Pro and URSA Broadcast G2 feature a built in streaming engine that enables the camera to stream directly to ATEM Television Studio HD8 ISO.

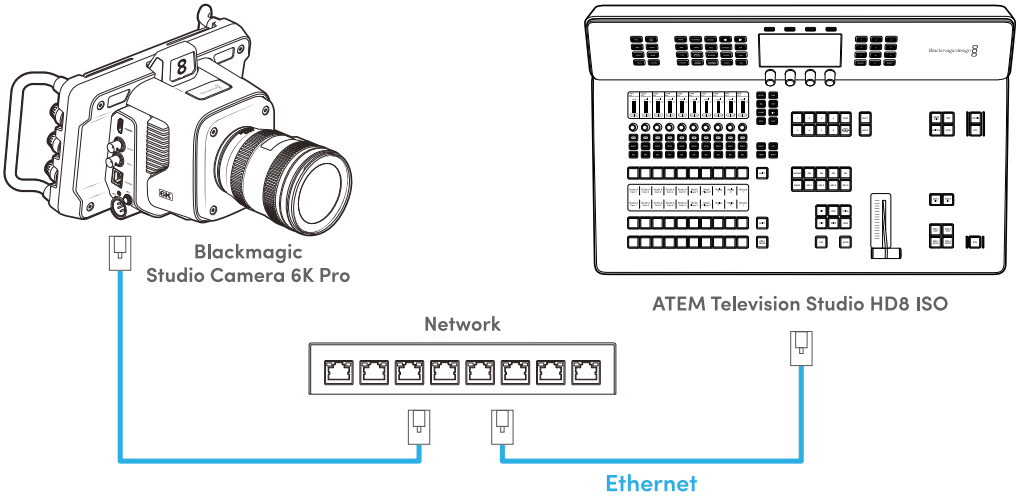
Connecting Remote Sources over a Local Network

ATEM Television Studio HD8 ISO and Blackmagic Studio Camera 6K Pro are both set to DHCP by default, so once you connect them via Ethernet there are only a few steps to start streaming.

Connecting Directly



Connecting via a Network Switch

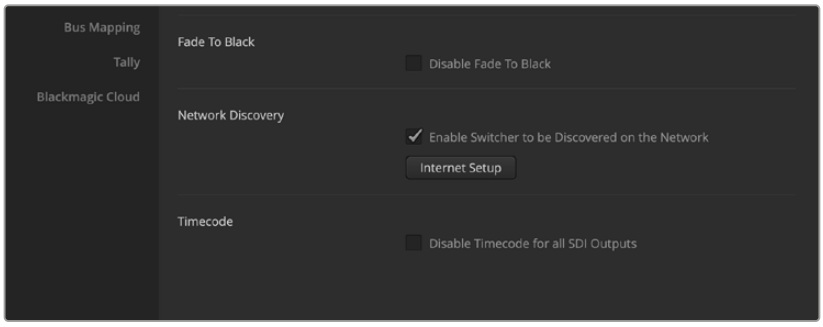


Firstly, you want to make sure your switcher is visible on the network by checking the general settings in ATEM Software Control.

1 Launch ATEM Software Control.

2 Open the ‘settings’ menu by clicking the gear icon in the lower left corner.

3 Go to the ‘network discovery’ setting in the ‘general’ tab and make sure you’ve ticked the option to enable the switcher to be discovered on the network.

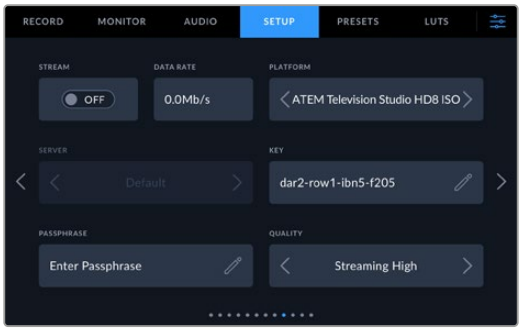


Once you’ve made sure your switcher is visible over the network, you can set your cameras up. When using a local network, each camera will be identified by the switcher using the camera name on the digital slate. This means if you are connecting more than one source it’s worth setting each camera with a different camera name, for instance, A, B, C or Cam 1, Cam 2 etc so they’re easier to identify on the switcher end. For more information on setting a camera name, refer to the ‘entering metadata’ section in your camera manual.

To start streaming from the camera:

1 Using your camera press the ‘menu’ button and tap on the ‘setup’ tab.

2 Once in the ‘setup’ tab navigate to the livestream settings and select the ATEM Television Studio HD8 ISO switcher from the platform setting.



3 Tap the ‘stream’ button to start streaming. ‘Live’ will illuminate blue over the setting to indicate you are streaming. If you’ve enabled stream information on your camera, you will see the data rate information appear on the HUD.

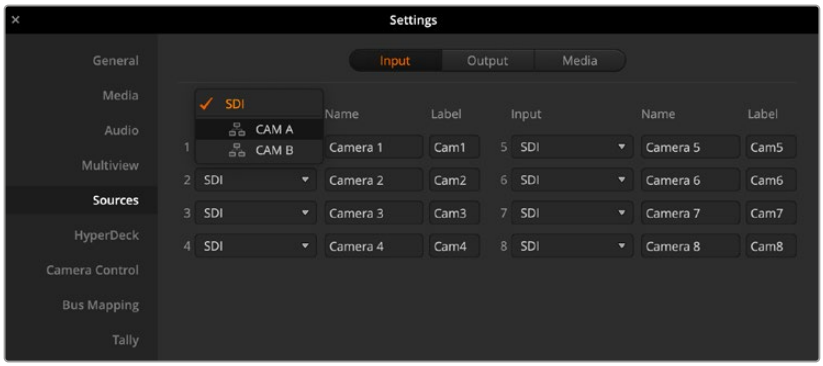
Selecting the Input

Once you’ve started streaming from a camera, you can select it as an input using the sources tab in ATEM Software Control.

To select the remote source as an input:

1 In the settings menu of ATEM Software Control select the ‘sources’ tab.

2 Click the menu beside input 1. The camera will appear in the list using the camera ID in the digital slate.

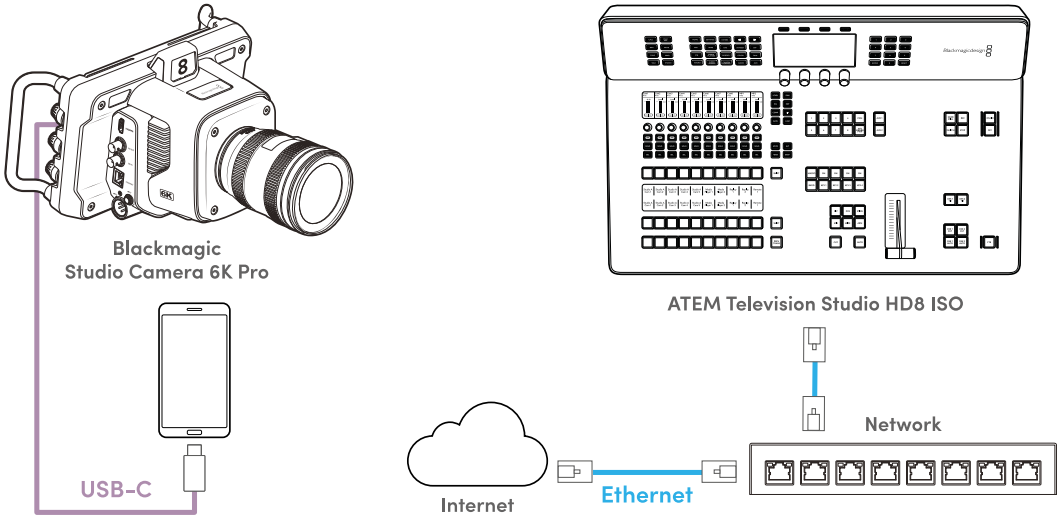


3 Select the source. Once you've selected the input, the camera signal should appear in your multiview. You can now treat the input as you would any SDI input.

To enable tally and camera control the ATEM camera ID on the camera needs to be set to the same number as the input you've assigned on the switcher. This way the camera will detect tally for the input and you can use the camera control settings on the switcher or in ATEM Software Control to make adjustments. Blackmagic Studio cameras will set the camera ID to match the input once the camera starts streaming and the input is assigned. For other cameras, the ATEM camera ID can only be adjusted when the camera is not streaming, so the operator may need to stop and restart once the correct ID is set. For more information on setting the ATEM camera ID, refer to your Blackmagic Design camera manual.

Connecting Remote Sources via the Internet

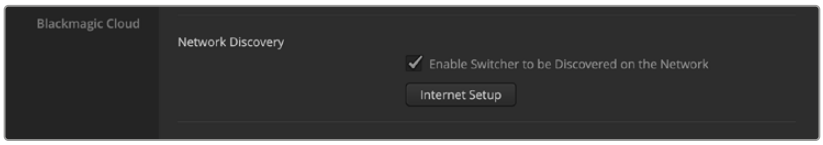
With ATEM Television Studio HD8 ISO switchers you can also add remote sources from anywhere in the world. This means a remote user can stream their camera signal over the Internet using either a fixed Ethernet connection or tethering their smartphone connection. Using ATEM Software Control to generate a key, you can export an XML file containing the all the connection information needed. Email the XML file to the camera operator, then after they import the file into their camera they can start streaming straight away.



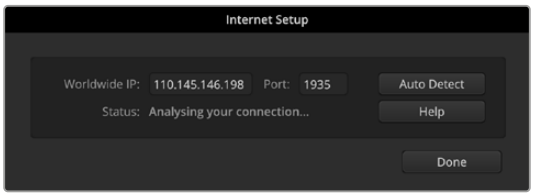
The first step to generate a streaming key is to confirm your switcher can is visible to external networks.

1 Launch ATEM Software Control and open ‘settings’ using the cog icon in the lower left hand corner.

2 Select the ‘general’ tab and click on ‘internet setup’ under the network discovery settings.

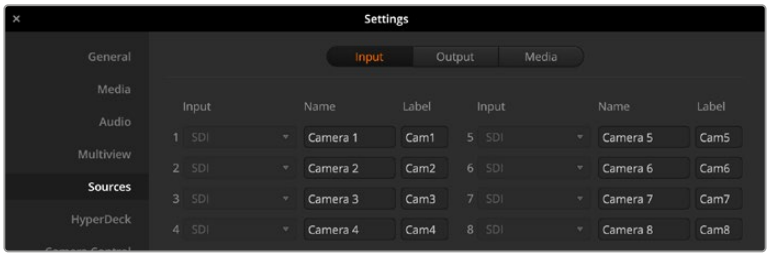


3 Click on ‘auto detect’. Your ATEM Television Studio HD8 ISO will analyze the internet connection and display the switchers public IP address, selected port and internet status. If you can see the ‘visible worldwide’ you are ready to proceed. If ‘port forwarding error’ appears in the Internet status indicator, there may be further configuration needed with your network or Internet service provider. What this means is you need to ask an Internet provider, or your network administrator to set up port forwarding on your Internet connection to “TCP port 1935”. They will know what that means!

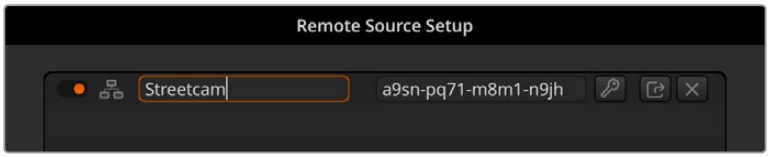


4 Once your status displays ‘visible worldwide’ click ‘done’. Now you can generate a streaming key using the sources tab of the settings window.

5 Select ‘sources’ on the left hand side and click ‘remote source setup’ at the bottom of the window.

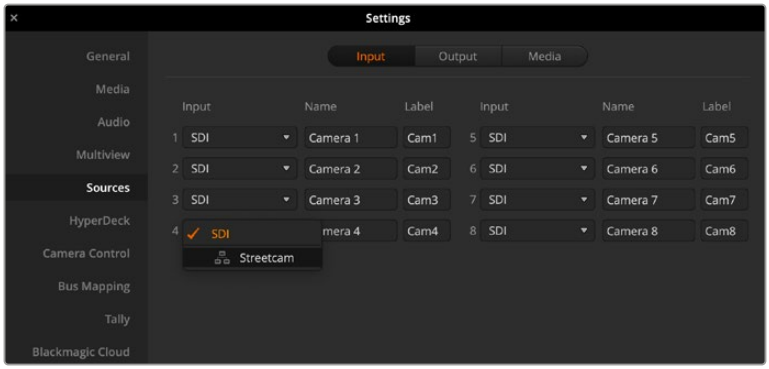


6 Click ‘add source manually’ at the bottom of the window. A key will appear in the setup window. You can modify the source name by clicking in the text field. Changing the name from the default can assist in identifying the input when selecting the remote source in the sources tab. Clicking on the key icon will generate a new password.



7 Click on the ‘share’ button and follow the prompts to save the settings to an XML file. Once you have saved the XML file, send the file to the camera operator via email. The camera operator can then copy the file to USB media or an SD card and then import it into the camera.

8 Once a streaming key has been generated you can select the source using the input menu. This means you can assign the input before the remote camera has started streaming. Once the camera starts streaming it will appear on your multiview. In the input tab of the sources window select an input and from the menu click on the source name corresponding to the streaming key you have just exported.



9 Along with emailing the streaming key you can let the operator know which input you've assigned so they can set the ATEM camera ID to the corresponding number. When the ATEM camera ID corresponds to the switcher's input number, your camera will detect tally data for that input and the tally light will work correctly on the camera. You will also be able to make adjustments using the camera control settings on the switcher or via ATEM Software Control. The ATEM camera ID on Blackmagic Studio Cameras will update automatically once the camera is assigned to an input and begins streaming.

For information on setting the ATEM camera ID or importing an XML, refer to the Blackmagic camera manual for the particular model.

Connecting Sources from Stream Router

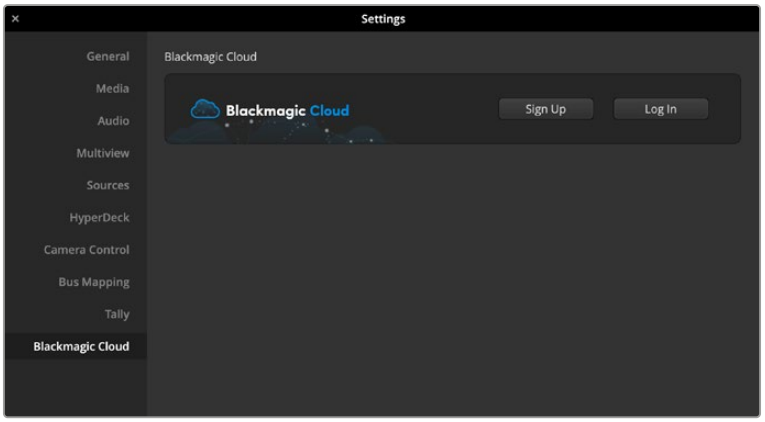
Blackmagic Cloud Stream Router is a virtual video router that lets you connect and route live SRT and RTMP video streams via Blackmagic Cloud. Stream Router supports camera control and tally.

Before you can connect a source you will need a stream router output assigned to you in Blackmagic Cloud. This could be using a personal or organization profile in your Blackmagic Cloud account or assigned to you from another Blackmagic Cloud user.

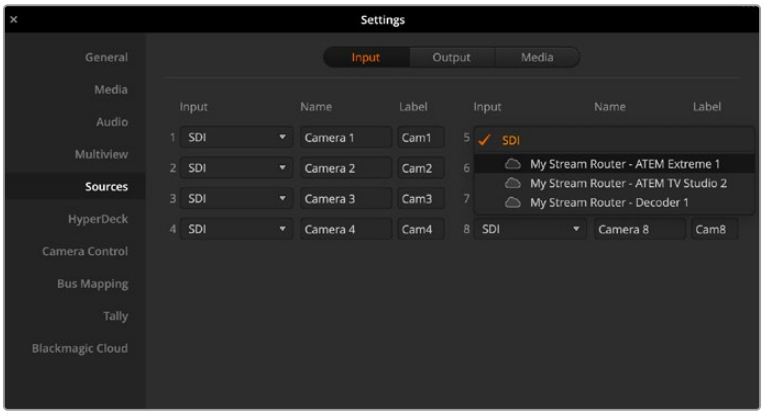
Once a stream router output has been configured it can be added via the sources tab.

Adding a source from stream router:

1 The first step to adding a stream router source is to make sure you are logged in to Blackmagic Cloud.



2 Once logged in, select the ‘sources’ tab. Click the menu beside the input you want to connect to, in this example it is input 5. Any stream router outputs assigned to you will appear in the list with a cloud icon to the left of the name. This is followed by the name of the stream router and the output name.



3 You should now be able to see the stream in your multiview. If nothing appears you may need to confirm the stream router has a source routed to it in Blackmagic Cloud. The connected input will appear above the output name.

Repeat the steps to add up to 8 streaming sources to ATEM Television Studio HD8 ISO.

TIP When you choose a source from the stream router, that connection stays in place even after you log out. So the next time you sign back into Blackmagic Cloud on the same switcher, your stream router input will already be set.

If you want to free up that stream router output so that other Blackmagic equipment can use it, for example a Blackmagic Streaming Decoder or an ATEM Mini Extreme ISO G2 switcher, just switch your input over to any HDMI source. That’s all it takes to release it.

If you forgot to change the input before logging out, log into Blackmagic Cloud via a web browser and toggle the stream router user assignment to ‘unassigned’ and then back to ‘myself’.

If someone else originally assigned the output to you, you’ll just need to reach out to your Blackmagic Cloud admin or user with configure permissions to reassign it.

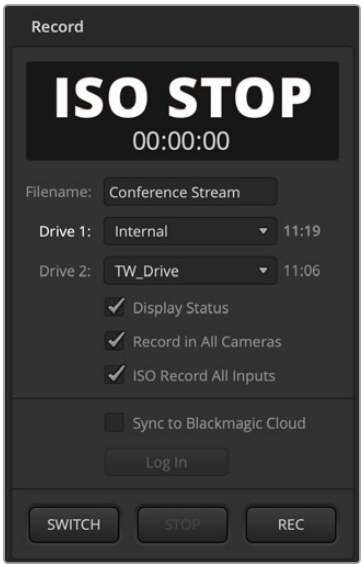
Recording ISO Files

ATEM Television Studio HD8 ISO can record video files from each of the video inputs and these are called isolated input files or “ISO” files.

By default, ATEM ISO model switchers will record a video file of the program output. However if you select to record the ISO files, it will change to recording a whole folder of content that includes the input video files as well as audio files, plus a DaVinci Resolve project file.

How to Record ISO Files

To record a folder of ISO files and other items, simply go to the record palette in ATEM Software Control and select the setting “ISO record all inputs”. Now your switcher will record the folder of contents when you press record in the palette or on the front panel.



To enable ISO recordings, check the ‘ISO record all inputs’ checkbox in the record palette.

It’s important to use a disk that’s fast enough. A good flash disk is recommended as often mechanical disks cannot work fast enough to record the 9 streams of H.264 HD video. For the most up to date list of recommended USB-C flash disks please go to www.blackmagicdesign.com/support.

NOTE If the video standard on your switcher is set to an interlaced format such as 1080i60, ISO recording will be disabled.

What's in the ISO Folder?

The record folder will take the name of the record palette. Even though this folder will have multiple ISO files, it also has the main program recording. But when ISO recording, it will be placed inside this folder with the other items.

The ISO video files are recorded from each input and placed into a sub folder called Video ISO Files. Each video file is recorded from each input and is an exact recording of the video connected to that specific SDI input. The ISO files also have synced timecode and camera number metadata, so you can use any edit software's multi-cam feature. To make editing simpler, all ISO files have program audio, the same as the master video file.

Because the ISO files include camera number metadata and synced timecode, you can also use the DaVinci Resolve Sync Bin to quickly select between views and build an edit.

It's worth noting that if you use any graphic from the media pool, these will be automatically saved into a sub folder called Media Files that's located inside the Video ISO Files folder. This allows you to rebuild the titles in your edit that were used during your live program.

Audio input files from each input as well as the microphone inputs are also recorded. These are placed into a sub folder called Audio Source Files. These files are in broadcast WAV format and are professional stereo audio files that exclude any processing or EQ from the built in audio mixer.

So this means the files are clean and you can use them to create a whole new audio mix using professional audio software. The audio tiles also include timecode so they are synchronized to the video files.

The most exciting item to be saved into the project folder is the DaVinci Resolve project file. This file will have been built based on the switcher actions that occurred since you started recording. It currently allows several switcher functions to be recorded and then when you double click this file, it will open up DaVinci Resolve with a full timeline of all these edits.

ATEM switcher functions that are currently supported include cut and mix edits between all video inputs and the media player, downstream titles and fade to black. These are the most used functions and these will be restored as the video edit in DaVinci Resolve. Further functions will be added in future updates.

Append Recording

If you don't change the project name, when you record, it will append the edit to the DaVinci Resolve project file you have previously recorded on disk. This is very useful as it means you can stop for mistakes, or lunch, and then start recording again. Both recordings will then open into the same timeline and you can knit the recordings together so they appear seamless to the viewer. If you don't want to append record, be sure to change the project name, or use a new blank USB disk.

Benefits of Editing a Live Project

There are multiple benefits of editing a live event. Some of the edits you might need to do can be completed very quickly and then you can render out a new master file before uploading. It means you don't have to accept the live edit you did while streaming, as now you can make changes to it before uploading it.

You can also use the ISO recording features and editing to create programs faster, because you can just use ATEM Television Studio HD8 ISO model switchers as a multi track recorder to feed edit stations with multiple camera views!

If you are importing the DaVinci Resolve project, then you are going to see your live production rebuilt as an edit almost instantly. Now you can make some fast creative adjustments to your event before uploading.

What's on the Layers?

The processing in a switcher normally progresses from the switcher inputs on the left of the control panel to the right where the output features are. That's because a switcher is a live processing pipeline from the video inputs, through all the switcher features and then out to the video output.

Editing works very differently. You get a stack of layers in editing software. The lowest layer is covered by layers above. So this means any clip on layer 2 will cover any clip on layer 1. Normally people edit with cuts and dissolves on layer 1, however then other items are placed on layers above. Any clip placed on layer 3 would cover any clips on layers 1 and 2. You can have dozens of layers in complex edits.

So to understand what DaVinci Resolve does when it imports your project file, just look at the project after it's been imported. You can see the various types of processing that have been placed on different edit layers.

Layer 1	Layer 1 has all the main editing between your sources. You will see the clips end to end and sometimes the edit points are cuts and sometimes you can see dissolves. This layer was created from your main input switching. All the edits with the video inputs and the still frame source will be placed on layer 1.
Layer 2	Layer 2 is for the downstream keyer. In the ATEM switcher, the downstream keyer is located after the transition block. In editing this means it's on layer 2 so it can override the main switching that's been placed on layer 1. If you place a graphic with an alpha channel in the downstream keyer and put it on air, it will have added this title to the video output. Now this layer is on layer 2 and it overlays the same graphic with alpha channel over layer 1.
Layer 3	Layer 3 is for fade to black. Fade to black is the last processing in the switcher and it fades all layers in the switcher to black. This is commonly used at the end of the program, or to lead into commercial breaks. Fade to black is on layer 3 because it will override all the layers below it, just like it does in the switcher. Fade to black is a black video generator with a dissolve applied to the front and end.

Shifting Edit Points

An advantage of editing is you can shift your edit points around. When you do a live production, the action can get very fast and it can be difficult to keep up. Imagine an interview program where multiple people are rapidly talking and interrupting each other. The live switch may have struggled to keep up as the conversation moves from person to person.

So rolling the edit points will allow you to move the edits to before a person starts talking. In a live switch you need to keep up so your edits lag behind the person starting to talk. However now you can shift them back in time and the edit will cut to the person just before they start talking. This will transform the feel of the program.

To roll the edit forward, scroll to the edit point in the timeline and then move your mouse to the edit point in the lower timeline. You will see a double bar tool appear. If you click and drag to the left, the edit point will move to earlier in time. If you click and drag to the right, your edit point will move later in time.

Be sure not to click the half bar tools with the little arrows. These are the trim in and trim out tools. As you move the mouse around the edit point the tools automatically change. So if you use the trim in and trim out tools, you will increase or reduce the duration of your whole video track and the audio will become out of sync with the green audio track below.

Replacing Shots

The sync bin will let you find shots that sync to the point on the timeline where you are currently positioned. This means you can fix situations where you cut to the wrong camera, or you can search for better shots because you have more time to see what alternatives you had.

To use the sync bin, just select it from the top left of the cut page. Once selected, you will see your media pool at the top left and your viewer will change. The media pool will now show a timeline of available clips and the viewer will show a multiview of the shots you have. These are only the shots that sync to the point in the timeline you are positioned on. If you move the timeline, these shots will also track in sync.

Think of the sync bin as an assistant editor that looks for shots for you and displays them in a multiview, so you can use them for editing.

Because ATEM Television Studio HD8 ISO model switchers know what input you have connected, plus it's recording those inputs into video files, it will have placed the camera

number metadata into the files for you. This means camera 1 in the sync bin is really the video input you had connected to input 1 on the switcher. Camera 2 is input 2 and so on.

To select an alternative edit, you need to follow 2 steps. First you need to select the shot you want and set its in and out point. The next step is to edit it into your timeline, over the shot you currently have.

So scroll to the position in the timeline that has the start of the shot you want to replace. You are going to edit over the top of this clip. You should see the alternative shots displayed in the multiview. These are the other options you have and you see all the input video files that were recorded from the ISO switcher's inputs.

Now click the shot you want. You will see it display full screen. It will also have an in point set for you, and it will be located at the current timeline position. There is an out point also placed at a clip duration of 4 seconds. It's unlikely you want this exact out point, so now all you need to do is scroll along the timeline to find the point you want the new shot to end and press O. The out point will move to this position.

If you did not select the correct shot, just press escape and it will return you to the multiview and you can select another shot.

Now you have your shot selected, you want to place it in the timeline. This is where you need to use the source overwrite edit mode. The edit modes are centered below the media pool, and the right most one is called source overwrite. You can see which edit mode is which, by hovering your mouse over the buttons to display the tool tips with the edit label.

The source overwrite is intelligent, and it will look at the clip you have selected, then look at the timeline and it will edit that clip into the timeline at the exact timecode match. This means all the shots you are editing into the timeline with source overwrite will stay in sync. Not only that, you don't need to set any in and out points in the timeline, as you can just scroll along, look for shots, and add them into the timeline as cutaways.

The source overwrite edit mode will always place the clip on the layer above the current clip in the timeline. If there is no layer, it will add the layer and then place it. This means it's easy to find your cutaways as they will be on the layers above your original edit.

Simply scroll along your timeline, select your cutaways from the sync bin multiview and replace as many shots as you need.

Adding Dissolves

Another great feature for editing is you can add extra dissolves to your timeline. Often when streaming at low bandwidth, dissolves can look blocky. So this means you might not use them for the live stream. But when you upload your program you might want to add more dissolves to make the feel of the program gentler and more elegant.

You can now add the dissolves to smooth out the flow. DaVinci lets you drag transitions from the transition palette onto each edit point, however there is a faster way to add dissolves. At the bottom right of the media pool on the cut page are 3 transition buttons. One will remove any transition and make the edit point a cut, but the middle button will add a dissolve. You can just scroll along and press the middle button and add dissolves.

If you watch the timeline ruler you will see a little triangle marker bouncing up and down. This will show you the edit point that DaVinci thinks you want to add the dissolve to. This means you don't even need to add in points to the timeline as when you press the dissolve button, it will add it to the marked edit for you. It's very fast and you can just scroll along and add dissolves where you need them.

Cutting Out Boring Bits or Mistakes

Sometimes you might have parts of your show that are a bit slow, or you could have stopped because of a mistake. You can cut out these sections by using the split tool. Below the media pool there is a tool on the left side that looks like a pair of scissors. Click this tool and you will split all the layers in your timeline. Now if you click the clips between the cuts, you can just press delete to remove those clips and the gap in the timeline will close up automatically.

You can see how easy it is to do common fixes to your live event. Now select quick export on the top right of the cut page window and you can get a new master file with all these changes applied.

Editing in DaVinci Resolve

To understand how to use DaVinci Resolve, it's best to watch some tutorial videos online and download the free version to use for training. DaVinci Resolve is very sophisticated and is used by high end Hollywood studios on feature films, however the cut page is a lot simpler and is easy to learn. Check online for more information.

Recording in Camera

ATEM Television Studio HD8 ISO switchers can control Blackmagic Studio Camera 4K Pro, URSA Mini Pro and URSA Broadcast G2 over SDI, using a second SDI cable connected to the camera input from one of the switcher's outputs. ATEM Television Studio HD8 ISO switchers can also control remote cameras connected via Ethernet over a local network or the internet.

This means you can do color correction and adjust lens settings via the camera control panel in the ATEM Software Control app. Please check the section in this manual that describes how this works.

Another advantage of this control is you can select the record in camera setting in the record palette so you can record in the cameras while recording to a USB disk.

The advantage of recording in camera is that the cameras will record in Blackmagic RAW, which is a film gamma file that's perfect for applying advanced color correction. However even more exciting is that the files in camera are 4K, so by using these files you can master your live production in Ultra HD. Even though these are HD switchers, you can still deliver Ultra HD masters for upload or broadcast.

The connections to the camera will upload timecode as well as camera number and filename information. This means the Blackmagic RAW files will be in sync with the switcher timecode. This makes using them easy.

To use Blackmagic RAW files from the cameras, be sure to select the record in camera setting in the record palette. Then once you have completed recording, be sure to copy the camera files into the Video ISO files folder from the switcher. It's important you do this as DaVinci Resolve needs to see these files when you first open the DaVinci Resolve project file.

However one problem with using both ISO files from the switcher and the Blackmagic RAW files from the camera is they will clash. Both files have the same timecode and the same camera number. This is not an issue because DaVinci Resolve, by default will use the ISO files.

To change to use the higher resolution Blackmagic RAW files in your project, just select the camera originals button on the top right of the cut page window. The icon that looks like a little camera. Once you select this icon, you should see your timeline change as it's now selected the Blackmagic RAW files, which are film gamma.

You might need to add color correction to these files to make your cut look good. Blackmagic RAW files are clean without color correction, so you can use the powerful color correction tools in DaVinci Resolve to create an amazingly graded master.

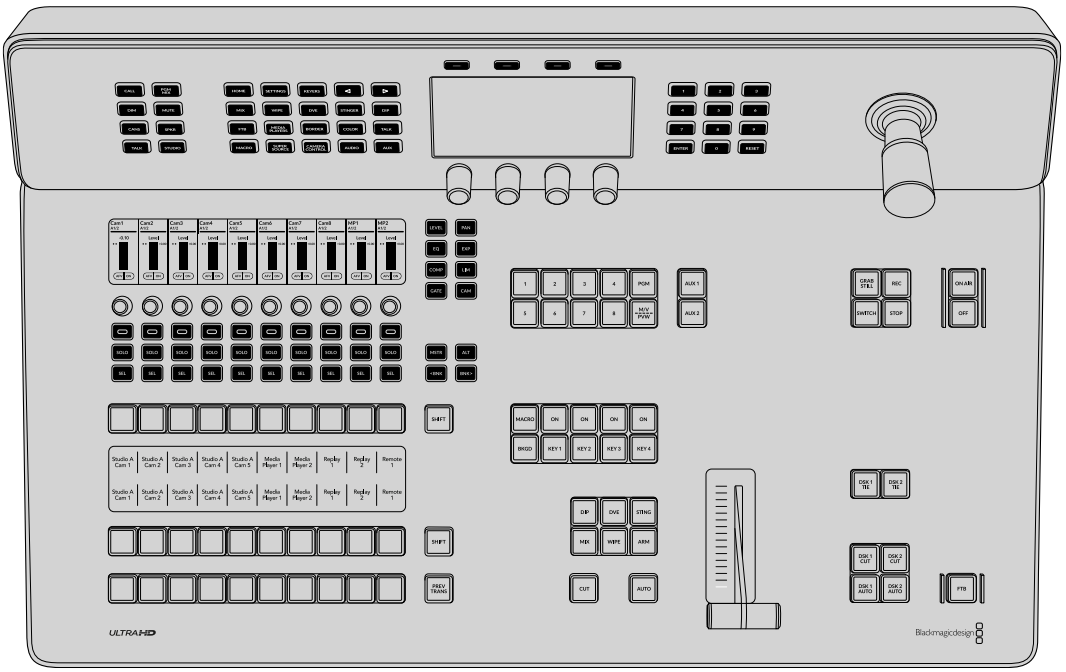
If you want to deliver in Ultra HD, just select the resolution menu next to the camera originals icon and it allows you to select various resolutions and aspect ratios. The top setting is for Ultra HD. Once you select this, your whole project will be changed over to Ultra HD and you should see your images become sharper.

Any non camera inputs such as slide shows from a computer will be upscaled automatically. HD images from the media pool will also be upscaled automatically. You can replace these images in the media folder if you want them to be replaced by higher resolution versions of your media pool graphics.

Now when you do quick export, you will be exporting an Ultra HD master, all from an HD switcher!

Joystick on ATEM Television Studio 4K8

The Joystick is a 3-axis joystick that is used to size and position keys, DVEs and other elements. You can also use the joystick to control VISCA PTZ remote cameras.



Joystick Control

Controlling Cameras using the Joystick

The joystick can also be used to control a remote camera head using the common VISCA protocol when connected to your switcher.

PTZ, or ‘pan, tilt, zoom’, control is an extremely powerful tool for controlling pan, tilt and zoom on remote cameras. You can easily control a bank of cameras one at a time by pressing the camera control button and then selecting each camera via the ‘camera’ soft control knob. Make your pan and tilt adjustments with the joystick.

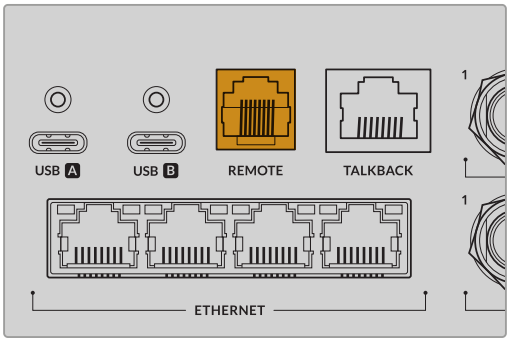
You can also choose the tilt direction of your joystick by selecting ‘inverted’ or ‘normal’ in the ‘camera control tilt’ page of the panel settings menu. Selecting ‘inverted’ will reverse the tilt action of your joystick.

Connecting a Remote Head

ATEM Television Studio 4K8 communicates with remote heads via the RS-422 port labeled ‘remote’. The RS-422 port on ATEM Television Studio 4K8 model switchers is an RJ12 connector that look similar to a standard landline phone connector.

You’ll also need to make sure the remote behavior for your switcher’s RS-422 port is set to ‘VISCA’ or ‘GVG’ using the ‘serial port’ settings menu on the LCD.

When connecting more than one remote head, they will normally be daisy chained together via the RS-422 outputs and inputs between each head.



PTZ Setup for Remote Heads

All PTZ setup options are set using the ‘settings’ LCD menu. Press the arrow buttons or the ‘8’ on the keypad to display the serial port settings menu and set the ‘port controls’ to VISCA. Set the baud rate to match the rate used by your PTZ camera. Refer to your camera’s support documentation to confirm the appropriate baud rate.

Pressing the camera control button opens the camera settings, where you can select VISCA control and choose the camera you want to adjust. But first, you will need to make sure the connected cameras are detected.

To detect the connected serial devices:

1. Press the ‘settings’ button and use the arrow buttons to navigate to the ‘serial port’ settings.
2. Press the ‘detect’ soft button.

The first camera connected to your switcher will appear on the LCD as ‘camera 1’. If you have more than one camera connected, they can each be selected by turning the ‘camera’ soft control knob. Camera numbering is based on consecutive order from the first remote head connected, through to the last in the chain.

If the number of connected cameras that appear on the LCD menu don’t match the physical number you have connected, check that all your camera heads are powered and their RS-422 ports are plugged in correctly. Once all your camera heads are visible on your ATEM Television Studio 4K8 switcher, select each camera using the ‘camera’ soft control knob and make some quick adjustments with the joystick to check they are all working properly.

TIP Camera control defaults to SDI for general camera control via SDI, so when using VISCA control, make sure you press the VISCA soft button to access VISCA PTZ cameras.

PTZ Control via SDI

You can also control PTZ camera heads via SDI. For example, by connecting the program return feed from your switcher to a camera, then connecting the SDI output from the camera’s expansion cable to your PTZ head, you can control the head via the SDI signal.

Joystick PTZ Controls

Joystick PTZ controls are very intuitive. Turn the joystick knob clockwise or counter clockwise to zoom in and out. Push up and down to tilt the camera and push left and right to pan. The controls are sensitive to the degree of movement of the joystick, letting you ease in and out of your camera moves. The amount of sensitivity may vary between remote heads.

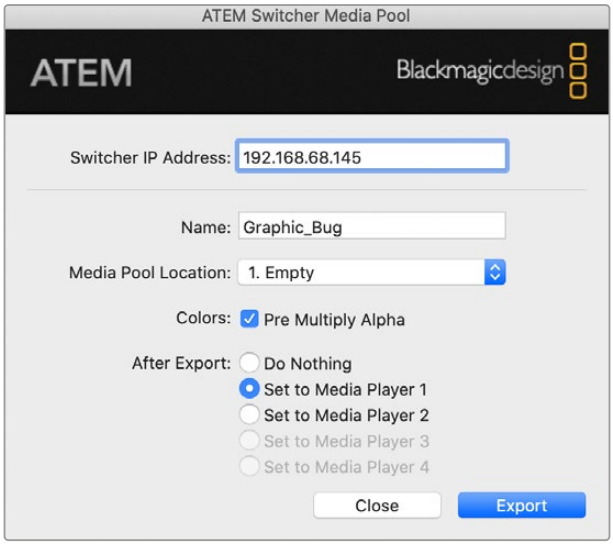
If you want to wire a custom built PTZ unit using a standard RS-422 port DB-9 connector, refer to the section labeled ‘Serial Port Pin Connections for Control Cables’.

Using Adobe Photoshop with ATEM

Installing the ATEM software on your computer also installs a Photoshop plug-in that lets you download Photoshop graphics direct to the ATEM media pool.

This means you can accept graphics from designers in the application that 100% of the world's designers use, Adobe Photoshop! You can even use the layers in a Photoshop image to keep variations of graphics, such as different titles in a graphic, then select the layers in Photoshop you want and then simply download them at the press of a button. When downloading the layers are automatically flattened in real time before download. This happens in the background and your document in Photoshop is unchanged by the export.

The ATEM export plug-in requires Adobe Photoshop. Install or reinstall the ATEM software after Photoshop is installed, to ensure the ATEM export plug-in is installed.



ATEM export plug-in

Setting up Plug-in Switcher Location

The first time the Photoshop export plug-in is run, it will ask you to select your switcher location. This is the IP address of the switcher so the plug-in can find the switcher to communicate with. By default, the IP is set to 192.168.10.240, which is what the switcher IP address is originally set to when first sold. If you want to export several versions of the same Photoshop file, you can use the export plug-in window to name each exported file and also choose whether to set the files to a Media Player after export.

Preparing Graphics for Download

For best results, you will want to use a Photoshop document resolution that matches the video standard you're using with your ATEM switcher. For 1080 HD you should use 1920 x 1080 pixels in resolution. For 720p HD formats you should use 1280 x 720 pixels.

When working with Photoshop documents for ATEM, you should not put any content on the background layer, but add all content to the layers above. The background layer should always be plain full frame black and you should use a pre-multiplied key setting in the ATEM keyers for keying graphics from Photoshop.

To help you get started, we've included a guide and some graphic template files in the Example Graphics folder which was installed on your computer along with the ATEM Switchers software.

To download the graphic to the ATEM media pool, simply select the export menu in Photoshop and then select ATEM Switcher Media Pool to export. A window will appear asking you to choose which position in the media pool you want to download to. The list includes all the file names of graphics currently loaded in the media pool. Select which position you would like to download to and then select export.

If you're in a hurry to get your graphics on air, then you can select to automatically copy this graphic to any of the media players after export. This lets you get images to air fast! If you don't want to interfere with the media player graphic sources, simply select not to copy the media players to this graphic.

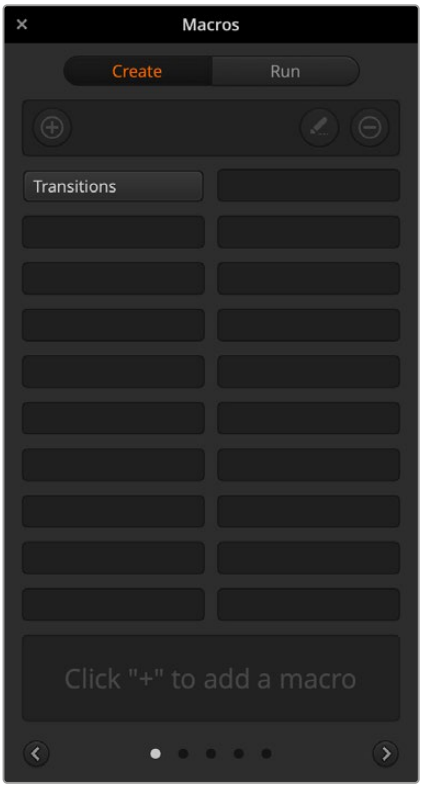
Pre Multiply Alpha should almost always be enabled and requires that you also switch on the Pre Multiplied Key setting on the switcher or via ATEM Software Control. Premultiplying mixes the graphic color with its alpha channel when exporting to ensure your graphic has smooth edges which blend in to the video.

Using Macros

What is a Macro?

A macro is an easy way to automate a sequence of switcher actions so you can repeat the sequence at the press, or click, of a button. For example, you can record a sequence of transitions between several video sources, including key effects, audio mixer adjustments, camera control settings and more. Record all your actions to a macro button, then when you press that button all your recorded actions will be instantly performed. Macros are recorded using the macros window in ATEM Software Control, system control on ATEM Television Studio switchers, or a combination of the two and are stored inside your ATEM switcher. Macros are common to all control panels, they can be triggered using any control panel you like.

The Macros Window in ATEM Software Control



To open the macros window in ATEM Software Control, click on macros in the title bar, or you can also press shift/command/M for Mac, or shift/control/M for Windows. The macros window is a floating window you can move freely about your desktop. This is so you can always access the window when moving between the switcher, media, audio and camera pages. While recording a macro, you can even reduce the size of the window by clicking on the minimize icon at the top right corner.

Macros can be recorded to any of the 100 macro slots. Up to 20 macro slots are visible on each page. Move forwards and backwards through pages by clicking on the arrows on the bottom sides of the window. Clicking on the create and run buttons lets you swap between the create and run pages so you can record your macros and then run them during your live production.

Recording Macros

Macros need to be recorded comprehensively, in clearly defined sequences from start to finish without error. This is because your macro will record every setting, press of a button and switcher action you perform. When you run a macro, all the switcher actions you recorded in that macro will be repeated precisely.

It's worth highlighting that a macro will only record the settings you change. For example, if you want a 3:00 second transition and your switcher's transition rate is already set to 3:00 seconds, you'll need to change the duration, then set it back to 3:00 seconds to record the setting. If not, your desired transition rate will not be recorded and when the macro is run it will simply use the transition rate your switcher was last set to. So you can see why precision is important!

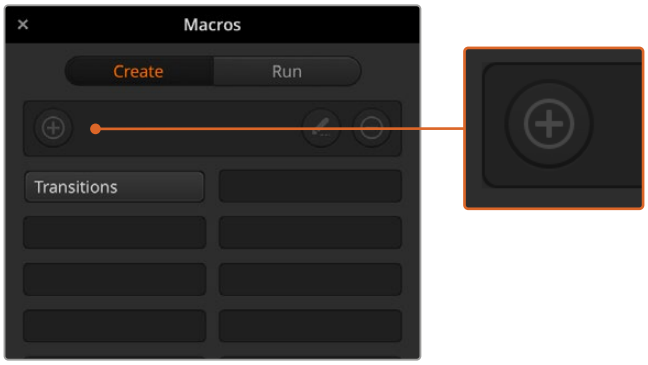
If settings are changed while recording a macro and you want them restored to a particular state, simply restore those settings while recording the final steps of the macro. You can even record macros to restore settings for various projects. You have lots of choices. The important thing to remember when recording a macro is that you change all the settings you need to so you can create the specific effects you want.

Recording a Macro using ATEM Software Control

In the example below, we're going to create a macro that will set your ATEM switcher to perform a 3 second mix transition from color bars to color 1, pause for 2 seconds, then perform a 3 second mix transition to black. Try building this macro on your ATEM switcher so you can learn the steps in creating macros.

1. Launch ATEM Software Control and open the macros window.
2. Click on the create button in the macros window to select the create page.
3. Click on a macro slot you want to record your macro to. In this example, click on macro slot 1. An orange border will appear around the slot you have selected.
4. Click on the create macro button ('plus' icon) to open the create macro popup window.

   If you want to, you can enter the name of your macro and type a description. This lets you easily keep track of your macros and quickly see what each macro does. When you click on a macro, your notes will appear in the status window.

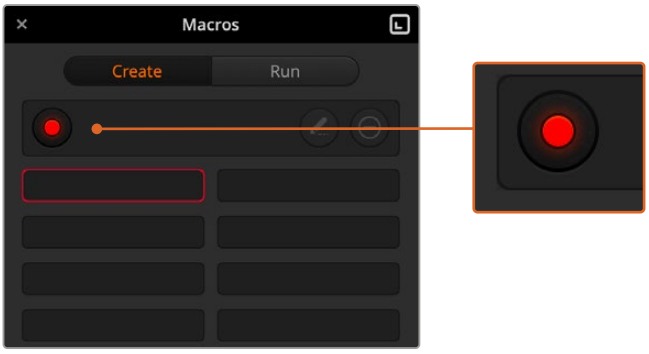


To start recording a macro, select a macro slot, then click on the create macro button. Type in your notes and click 'record'.

5. Click the 'record' button.

   The popup window will close and a red border will appear around your ATEM Software Control panel indicating your macro is now recording. Notice the red 'add pause' button at the top of the border.

   Now that your macro is recording, you can start performing your switcher actions.



While recording, the create macro button will change to a 'record' button. When you have completed your switcher actions, click on the 'record' button to stop recording.

6 Click on the bars button in the program panel on the switcher page. This sets bars to your switcher's program output.

7 Select color 1 on the preview panel.

8 Open the transitions palette and set it to mix.

If mix is already selected, make sure your macro records the setting by selecting a different transition type, for example the wipe transition, then clicking on mix again.

9 Now change the transition Rate to 3:00. This sets the mix transition duration to 3 seconds.

10 Click on the auto button in the transition style panel. Your switcher will perform a mix transition from color bars to color 1.

11 To set the switcher to wait for 2 seconds before applying another transition, click on the add pause button at the top of the red border. The 'insert pause' window will open. Set the pause to 5 seconds and 0 frames and click 'add pause' to confirm.

Why set a 5 second pause when you only want a 2 second pause? That's because when the mix transition occurs, it takes 3 seconds to complete. So if you want to add a pause, you need to consider the transition duration, plus the pause you want to happen before the next transition occurs.

In this example, it takes 3 seconds for the transition to complete, then 2 seconds for your 2 second pause, so you should enter a pause of 5 seconds. Another way is to add two separate pauses, one for the duration of the transition and then another for the pause you want. It's up to you.

12 Now select black on the preview panel and click the auto button in the transition style panel. Your ATEM switcher will perform a mix transition to black.

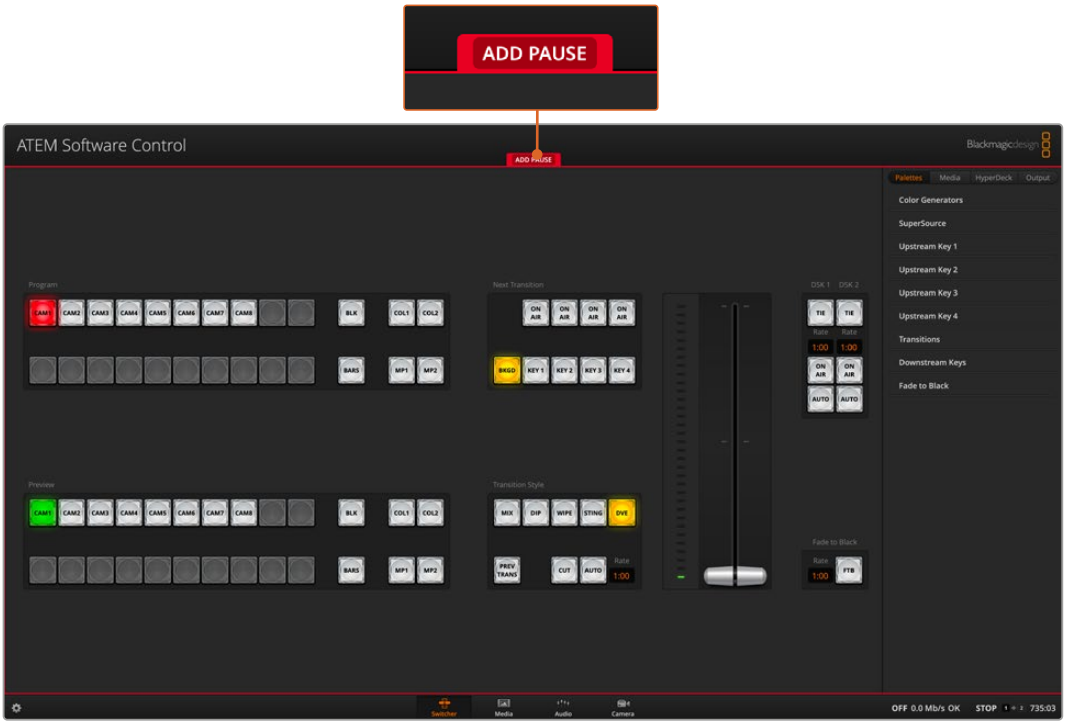
13 Click the record icon in the macros window to stop recording your macro.

The macro you just recorded will now appear as a button in your selected macro slot. To preview your macro, click the run button in the macros window to enter the run page. Select recall and run, which sets the macros window to run a macro as soon as you click on a macro button. Now click on your new macro button, named 'Transitions'.

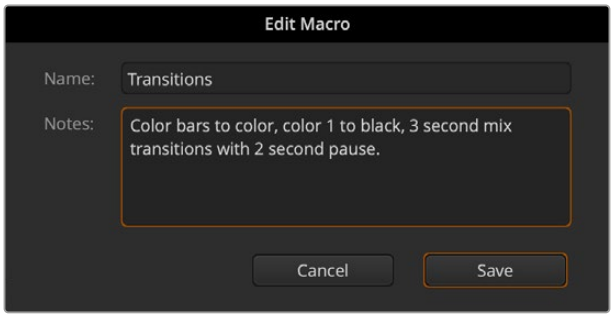
14 If you want your macro to instantly run as soon as you select it, click on the 'recall and run' button. By enabling this feature you can load and play your macros with only one click of a button.

If your macro was successful, you should see your ATEM switcher perform a mix from color bars to color 1 using a 3 second transition, pause for 2 seconds, then perform another 3 second mix transition to black, all by clicking one button in the macros window! Your ATEM switcher will also display an orange border around your software control panel to indicate a macro is playing.

If your macro doesn't perform the way you expect it to, simply rerecord the macro you just created following the previous steps.



ATEM Software Control displays a red border to indicate when you are recording a macro. The 'add pause' button located at the top of the red border lets you enter durations for pauses between switcher actions.



Enter a name for your macro and a description so you can keep track of the switcher actions recorded in the macro.

Building Large Macros

Macros can even include triggering other macros as part of recording a macro. This lets you easily build larger macros from multiple smaller macros, i.e., recording macros with limited actions, then compiling them into a large macro. This is because if there are any mistakes while recording a large macro in one complete sequence, you'll need to go back to the start of your sequence and rerecord it. It's a lot easier to work with segments containing a small number of actions.

By recording a large macro using small macros, you can also edit your large macro by rerecording only the small macros you want to change, then compiling your small macros back into your large macro.

To compile small macros into a large macro:

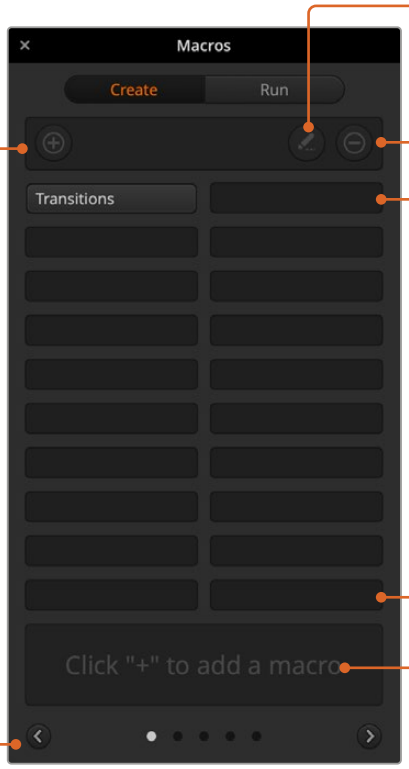
1. Start recording a new macro, then while the macro is recording, click on the ‘run’ button to enter the run page.
2. Select ‘recall and run’ to automatically run macros at the push or click of a button, or deselect to load a macro and play it manually.
3. Run your sequence of small macros, with pauses between each one to cover the duration of each small macro, until you’ve completed the large macro.
4. Stop recording. You now have a complex, powerful large macro built from small macros you can easily change later if you need to.

There is no limit to the amount of actions you can perform. You can easily build complex transitions, create unique repeatable effects using keyers, or set up frequently used Blackmagic Studio Camera settings, graphic overlays and DVEs so you don’t have to reconstruct them every time you start a new program. Macros are fun and will save you a lot of time!

Macros Window Create Page

Create macro button:
Click this button to open the create macro popup window. From here you can name a new macro to be recorded, write a description of your macro in the notes section, and click record to start recording your macro.

Arrow buttons and page Icons:
To access or record more than 20 macros, simply click on the right arrow at the bottom corner of the macros window to open a new page of macros. To move to the previous page of macros, click on the left arrow. You can see which page of macros you are viewing by observing the page icons between the arrows.



Edit macro button:
First select the macro you want to edit, then click on the edit macro button to edit the name and description of the macro.

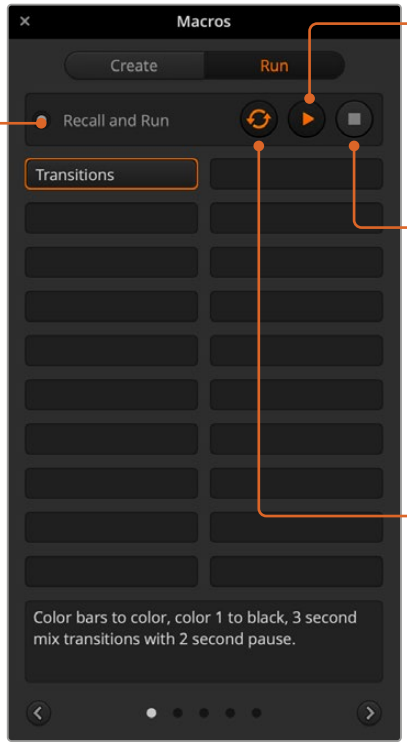
Delete macro button: Select the macro you want to delete, then click on the delete macro button to delete the selected macro.

Macro buttons:
After recording a macro to a selected macro slot, your macro will appear as a macro button. 20 macro buttons can be displayed on one page. If a macro is unnamed when recording, the number of the selected macro slot will be used.

Status window:
This window provides helpful prompts and status messages to help you get started recording and running your macros. When a macro is selected, it also displays any notes you have included.

Macros Window Run Page

Recall and Run:
Selecting the Recall and Run feature lets you instantly run a macro by clicking a macro button. Deselecting the Recall and Run feature lets you load a macro by clicking on your macro button. Run the macro by clicking the play button.



Play:
When Recall and Run is deselected and you have loaded a macro by clicking on a macro button, click the play icon to start playing the macro.

Stop:
Clicking the stop button will stop the playback of a macro, but will complete the current action first. For example, if you press stop half way into a transition, the switcher will finish the transition and then stop.

Loop:
When the loop button is selected and you run a macro, your macro will run continuously until you click the stop button. When loop is deselected, your macro will run until it is completed.

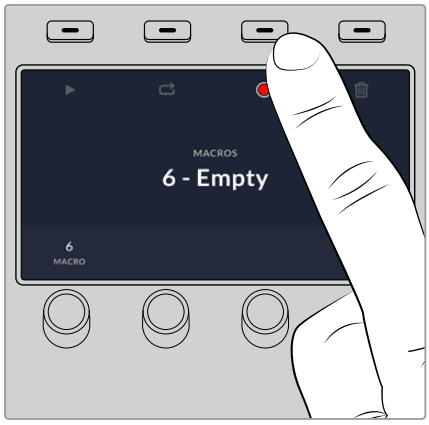
Recording Macros using ATEM Television Studio

You can record and run macros using the ATEM Television Studio switchers independently of ATEM Software Control. All actions on the ATEM Software Control switcher page can be performed using your switcher's panel. If you need to arrange graphics in the media pool, or adjust camera settings, simply access those settings using ATEM Software Control.

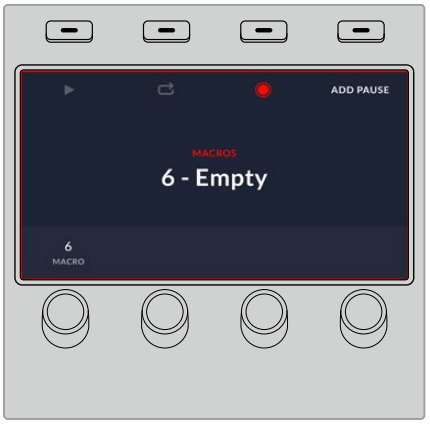
The buttons used to record and run macros on ATEM Television Studio are located in the system control buttons. The names of your macro buttons are displayed in the source select names display.

Follow the steps below to create the 'transitions' macro demonstrated earlier using ATEM Software Control. This time you will create a macro in macro slot 6.

1. Press the 'macro' soft button to open the macros LCD menu.
2. Using the 'macro' knob under the LCD, select the macro slot you want to record to. For this example, select slot '6 Empty'.
3. Press the 'record' soft button at the top of the LCD to start recording. The record icon appears as a red circle. When recording, this icon becomes a red square and a red border will appear around the LCD.



Press the ‘record’ soft button to start recording your macro



While recording, a red border will appear around the LCD

4 Shift select ‘color bars’ on the program bus. The button will flash indicating it’s a shifted source.

5 Shift select ‘color 1’ on the preview bus. If you wish, you can map buttons such as color bars, black and color generators to any of the main 10 buttons of the program and preview bus for easier access. See the ‘button mapping’ section of this manual for instructions.

6 Press the wipe button in transition control to ensure the macro records the wipe transition selection.

7 In the ‘wipe’ LCD menu, set the rate to 2:00 seconds.

8 Press the ‘auto’ button in transition control to perform the wipe transition from color bars to color 1.

9 Press the ‘macro’ button to return to the macro screen.

10 To set the macro to wait for 2 seconds before applying the next transition, press the ‘add pause’ soft button in the LCD menu and set the duration to 2 seconds by rotating the ‘seconds’ knob. Press the ‘confirm’ soft button to record the pause.

11 Now shift select ‘black’ on the preview bus , press the ‘mix’ button in transition control and press the ‘auto’ transition button. Your ATEM switcher will perform a mix transition to black.

12 Press the Macro button to navigate back to the Macro menu, then press the ’stop’ soft button to stop recording.

You have just recorded a macro using an ATEM Television Studio. The macro will appear as a macro button named ‘Macro 6’ because it is located in macro slot 6. You can name your macro and add notes by clicking on the ‘edit macro’ button in ATEM Software Control.

To run the macro, press the macro button to set your panel’s source select row to macro mode. The buttons will illuminate blue when in macro mode. Now press the macro 6 button. You can easily see when a macro is running because the macro button will flash green and an orange border appears around the LCD menu.

If your macro was successful, you should see your ATEM switcher mix from color bars to color 1 using a 2 second mix transition, pause for 2 seconds, then perform another 2 second mix transition to black, all by pressing one button on your ATEM switcher. If you want the macro to loop so it keeps running, press the ‘loop’ soft button to enable loop. Press again to disable loop.

It’s worth frequently testing your macros using different switcher settings to make sure the macro performs all the specific functions you intended and doesn’t miss any instructions or produce something unexpected.

HyperDeck Control

Introducing HyperDeck Control

You can connect up to 10 HyperDeck disk recorders to your switcher and control them using the system control buttons on the ATEM switcher or using the HyperDecks palette in ATEM Software Control. This is a very powerful feature! With ten HyperDecks connected to your switcher, it's like having a portable videotape department able to record outputs from your switcher, play back graphics, or you can even set your switcher to roll prerecorded segments at the press of a button!

Transport controls are located in the system control menu on an ATEM Television Studio and in the HyperDecks palette in ATEM Software Control, which lets you play back video, jog and shuttle, skip clips, pause and more. You can also record video.

When you combine this feature with ATEM's powerful macros feature, it opens up a world of creative possibilities that can really enhance your live production!

HyperDeck Studio HD Plus

Connecting HyperDecks

Connecting HyperDecks to your switcher is very similar to connecting cameras and other video sources via your switcher's SDI inputs. The only additional connection is Ethernet which lets your ATEM switcher communicate with the HyperDeck disk recorder.

1. Using the Ethernet connector, connect your HyperDeck disk recorder to the same network your ATEM switcher is connected to.
2. Press the remote button marked 'REM' on the HyperDeck's control panel. The 'REM' button will illuminate which means the HyperDeck has remote control enabled. If you are using a HyperDeck Studio HD Mini, turn remote on via the settings tab on the LCD menu.
3. Plug the SDI output of your HyperDeck into the SDI inputs of your ATEM switcher.
4. If you want to record your ATEM switcher's program output with your HyperDeck, plug one of the switcher's SDI outputs into the SDI input of your HyperDeck.
5. Repeat the process for each HyperDeck you want to connect.

Once you have connected your HyperDeck to your switcher use the system control and LCD soft buttons to setup and control your HyperDecks.

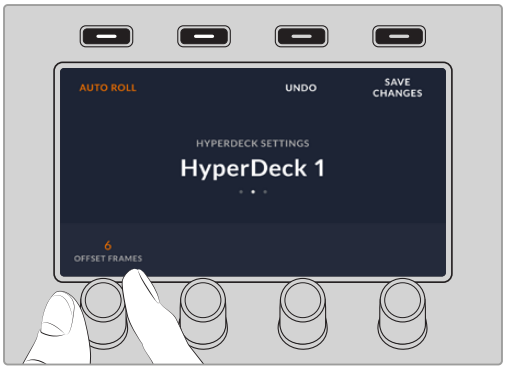
To begin, press the system control ‘settings’ button.

Press the LCD soft button above ‘HyperDecks’ to enter the ‘HyperDeck settings’ menu. In the first menu page, you’ll see the ‘HyperDeck’ indicator in the bottom left corner and an ‘input’ indicator. Use the control knob under the ‘HyperDeck’ indicator to cycle through the available HyperDecks.

Once you have selected a HyperDeck, rotate the knob under the ‘input’ indicator to select which input that HyperDeck is connected to on your switcher. For example, if HyperDeck 1 is connected to SDI In 4 on your switcher, rotate the knob under the ‘input’ indicator to select ‘camera 4.’ Press the ‘input’ knob to confirm your selection.

Using the second page you can turn enable or disable the auto roll feature and set a value for frame offset. When auto roll is enabled, the HyperDeck disk recorder will automatically roll video when it is switched to the program output. For example, you can cue a HyperDeck to the point you want your source to begin, then roll the source by pressing its input button on the mix effects program row. If you want to cue to a still frame of video or manually trigger video playback on your HyperDeck, you can also deselect the ‘auto roll’ feature.

As HyperDecks must buffer a couple of frames before commencing playback, the actual cut will be delayed a preset number of frames to ensure a clean transition. This is just like setting a preroll on a videotape machine. You can adjust the length of this delay by changing the number in the ‘offset’ box. We’ve found that five frames usually ensures a clean cut.



Once you've assigned an input to a HyperDeck, you'll need to enter its IP address. This allows ATEM Television Studio switchers to control the HyperDeck via Ethernet.

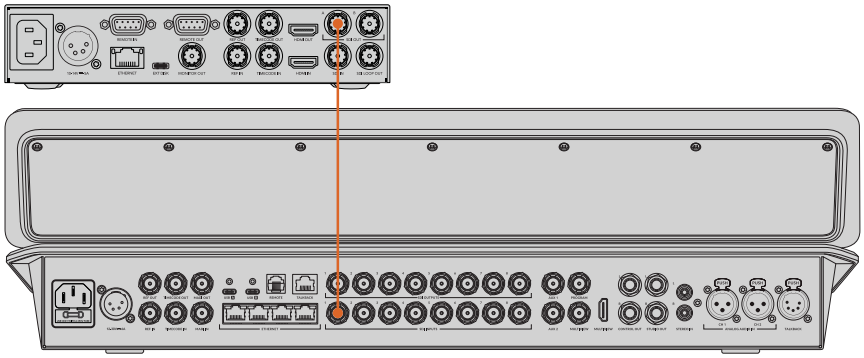
To enter a HyperDeck's IP address, navigate to the third HyperDeck settings page with the 'left' or 'right' arrow buttons, or pressing '3' on the numeric keypad while in the HyperDeck settings menu.

In this page, you'll see an IP address for the currently selected HyperDeck. Each IP address number corresponds to a rotary knob below it. To change these numbers, you can rotate the corresponding knob, or press the knob once and enter a number using the numeric keypad. Do this for each number in the IP address.

Once you've entered the IP address for your HyperDeck, press the soft button corresponding to the 'save changes' indicator to confirm the address. To cancel, press 'undo'.

To enter the IP address for subsequent HyperDecks, you'll need to select the HyperDeck using the first page of the HyperDeck settings menu.

You can control HyperDecks via the switcher using the 'media players' button. For more information, refer to 'HyperDeck control' later in this manual.



Plugging the SDI output from HyperDeck Studio HD Plus into an SDI input on ATEM Television Studio

Now all you have to do is tell your ATEM switcher which input and IP address each HyperDeck is using. You can do this in the HyperDeck tab in ATEM Software Control switcher settings, or using the system control soft buttons on ATEM Television Studio switchers.

HyperDeck Settings

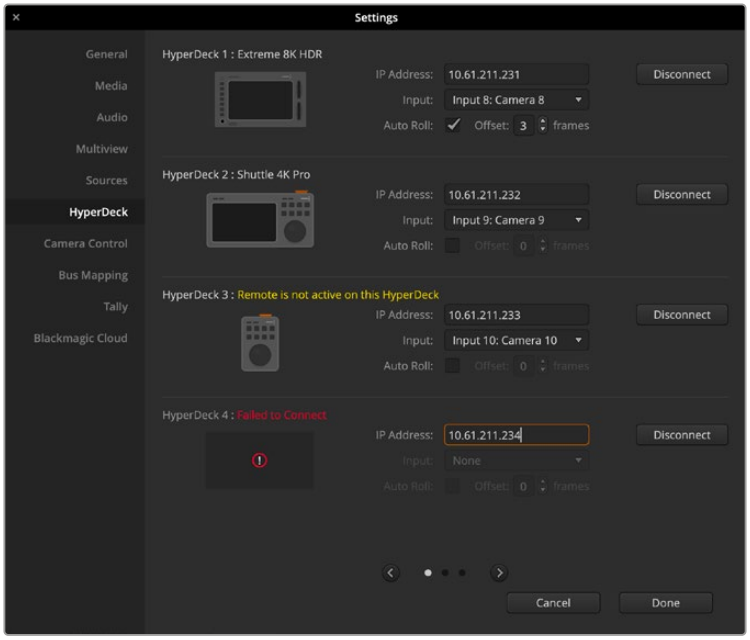
HyperDeck connection settings are located in the ‘HyperDeck’ tab of the ATEM Software Control switcher settings. Here you’ll see setup options for up to ten HyperDecks.

Entering the necessary details is as easy as typing in your HyperDeck’s IP address in the ‘IP Address’ box and choosing the source it’s plugged into from the ‘input’ menu. Click ‘connect’ and your HyperDeck is ready to be controlled.

Status indicators appear above and below each HyperDeck icon to let you know the connection status. A green tick means your HyperDeck is connected, in remote and ready to go.

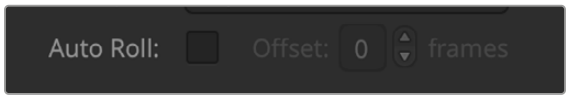
If your HyperDeck is connected and recognized, but does not have its remote button enabled, you will see an indicator letting you know remote is not active.

If your HyperDeck is not recognized, you will see a ‘failed to connect’ indicator. If you see this indicator, check the HyperDeck’s Ethernet port is connected to your network and the IP address is entered correctly.



cAuto Roll

You can set a HyperDeck disk recorder to automatically roll video when it is switched to the program output. For example, you can cue a HyperDeck to the point you want your source to begin, then roll the source by pressing its input button on the mix effects program row.



As HyperDecks must buffer a couple of frames before commencing playback, the actual cut will be delayed a preset number of frames to ensure a clean transition. This is just like setting a preroll on a videotape machine. You can adjust the length of this delay by changing the number in the ‘offset’ box. We’ve found that five frames usually ensures a clean cut.

If you want to cue to a still frame of video or manually trigger video playback on your HyperDeck, you can also deselect the ‘auto roll’ feature.

Controlling HyperDecks with ATEM Software Control

To control the HyperDecks connected to your switcher, click the ‘media players’ tab in the software control panel and choose the ‘HyperDecks’ palette.

Here you can choose between each of the HyperDecks connected to your system by clicking one of the buttons along the top of the panel. These are named according to the labels entered in ATEM settings. Available HyperDecks are shown with white text, while the HyperDeck you are currently controlling is shown in orange.

Choose from up to ten HyperDecks by clicking their selection buttons in the HyperDecks palette.

In addition to the text color, each HyperDeck's selection button also has a tally indicator.

Green Outline	Indicates a HyperDeck that is currently switched to the preview output.
Red Outline	Indicates a HyperDeck that is currently switched to the program output, meaning it is currently live to air. You may also see one of the following status indicators above the selection buttons for your HyperDecks.
Ready	HyperDeck is set to remote and a disk is inserted. It is ready for playback and recording if space is available.
Record	HyperDeck is currently recording.
No Disk	HyperDeck has no disk inserted.
Local	HyperDeck is not set to 'remote' and cannot currently be controlled by your ATEM switcher.

When you select a HyperDeck, you'll see information about the currently selected clip such as the name and length, as well as time elapsed and time remaining. Below this you'll see the control buttons.

	**Record** Click on this button to start recording on your HyperDeck. Click again to stop recording.
	**Previous Clip** Moves to the previous clip in your HyperDeck's media list.
	**Play** Clicking 'play' once initiates playback, clicking it again stops playback. If you have 'auto roll' enabled in your HyperDeck settings, playback will commence automatically when your HyperDeck is switched to the program output.
	**Next Clip** Moves to the next clip in your HyperDeck's media list.
	**Loop** Click 'loop' once to loop the currently selected clip and again to loop all of the clips in your HyperDeck's media list.

To move through a clip use the shuttle/jog slider underneath your HyperDeck's control buttons. This lets you move quickly, or shuttle through a selected clip, or jog frame by frame. You can switch between these modes with the buttons next to the shuttle/jog slider.

Choose between shuttle and jog transport controls with the buttons to the left of the transport slider. Adjust the slider left and right to move forward or backwards through your clip.

The clip list below the transport control shows all of the clips currently available on the selected HyperDeck. You can expand or collapse the list by pressing the arrow to the right of the clip list.

Playback

Playing media on your HyperDeck is easy. Switch your HyperDeck to the preview output and select the clip you want to show. Use the transport controls to cue to the preferred point in your clip. When you switch your HyperDeck to program output, the ‘auto roll’ feature will automatically start playback from this point.

If you want to manually trigger the playback, for example holding on a still frame then rolling, disable the respective HyperDeck’s auto roll checkbox in the ’HyperDeck’ tab in ATEM software’s ‘settings’ menu.

Recording

To record to a HyperDeck with a formatted disk inserted, press the ‘record’ button in the HyperDeck palette transport controls. The ‘time remaining’ indicator in the HyperDeck palette will let you know the approximate recording time remaining in the SSD.

Controlling HyperDecks with ATEM Television Studio

Once you have connected your HyperDecks to your switcher as described in the ‘connecting HyperDecks’ section, you can use the system control buttons and LED menu on your panel to set up and control each HyperDeck.

Controlling HyperDecks with ATEM Television Studio

HyperDeck controls are available in the ‘media players’ menu in system control. To access this menu, press the ‘media players’ control panel button and press the soft button above the ‘HyperDecks’ indicator to access HyperDeck control. If your switcher has more than two media players, you may need to navigate to the next menu page to access HyperDeck controls.

You can now use the rotating knobs below the ‘hyperdeck,’ ‘clip,’ ‘jog’ and ‘shuttle’ indicators to select HyperDecks, select clips and jog and shuttle these clips.

The text in the center of the HyperDeck control menu will change to reflect the HyperDeck and clip that you have selected.

Use the second and third pages of the ‘media players’ LCD menu for more HyperDeck controls, including play, stop, loop playback and forward and reverse skip for moving between clips.

TIP To play all clips, hold down the shift button and press the ‘play’ soft button.

In the third menu page, press the ‘record’ button to record the program output of your switcher to your HyperDeck. Use the ‘jog’ and ‘shuttle’ commands to scrub through recorded footage.

Using Tally

Sending Tally Signals via a GPI and Tally Interface

Your ATEM switcher can send tally signals to monitors and cameras to make it clear which source is on the program output, i.e. which source is on air.

Tally is commonly used to light the red light on top of a camera or monitor so the talent knows they are on air. Tally can also illuminate a border on a monitor such as a Blackmagic SmartView 4K. The border allows production staff to know which camera is on air.

The GPI and Tally Interface by Blackmagic Design, is an Ethernet device which provides eight mechanical relay contact closures to ground that can be used for tally. Tally signals are sent from the Ethernet port of your ATEM switcher to a GPI and Tally Interface on the same network as the switcher. By following the wiring guide on the back of the GPI and Tally Interface, a breakout cable can be connected to video equipment that supports contact closure tally signals, such as Blackmagic SmartView Duo and SmartView HD. Up to 8 tally receiving devices can be supported with a single GPI and Tally Interface. Only one GPI and Tally Interface unit is needed when used with ATEM Television Studio.

GPI and Tally Interface

The GPI inputs are optical isolators which are triggered by connection to ground with a maximum of 5V at 14mA.

The tally outputs are mechanical relay contact closures to ground with a maximum of 30V at 1A.

Changing the Network and Tally Settings

ATEM Setup is used to configure the network settings in the GPI and Tally Interface so it will communicate with your ATEM switcher. The GPI and Tally Interface must be connected via USB in order to configure its settings with ATEM Setup.

1. Connect the GPI and Tally Interface to the same Ethernet network as your ATEM switcher.
2. Connect the GPI and Tally Interface to a USB port on your computer and also connect the included power supply.
3. Launch ATEM Setup.
4. If your ATEM switcher connects directly to your computer without an Ethernet network switch, choose to “Configure Address Using Static IP”. The GPI and Tally Interface defaults to a fixed IP address of 192.168.10.2 when shipped and we suggest you use this number for simplicity.

If you want to choose a different static IP address, you can set it to anything you like that's in the same range as the ATEM switcher, so long as it's not already in use by another device on your network. Default IP addresses for ATEM products are best avoided for this reason, including: 192.168.10.1, 192.168.10.2, 192.168.10.3, 192.168.10.10, 192.168.10.50, 192.168.10.60 and 192.168.10.240.

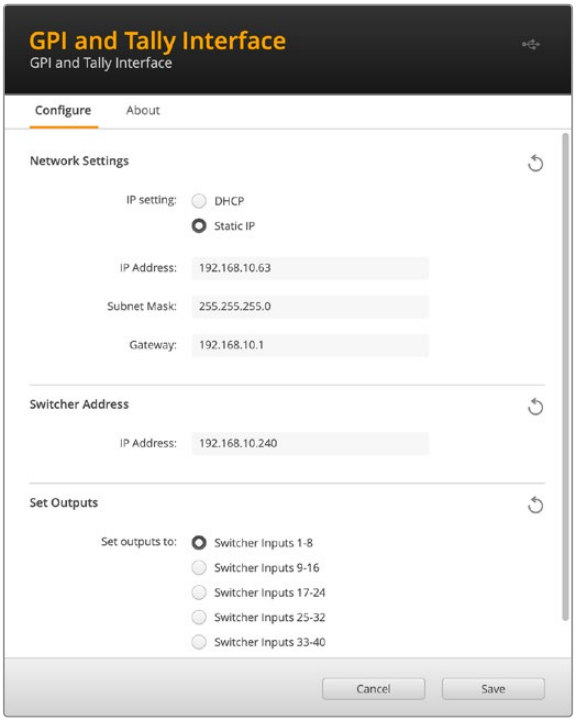
If your ATEM switcher connects via an existing Ethernet network switch, you may wish to choose "Configure Address Using DHCP" as this setting automatically obtains the IP Address, Subnet Mask and Gateway information from your DHCP server.

5 Type in the IP address of your ATEM switcher in the "Switcher Address" field. Your ATEM switcher defaults to DHCP when shipped or you can set it to a static IP address.

6 "Set tally outputs" should be set to "Switcher Inputs 1-8".

7 Click "Apply". The white LED to the right of the USB port should stop flashing and remain on to indicate it has successfully found the ATEM switcher. The GPI and Tally Interface is now ready.

8 Close ATEM Setup and disconnect your USB cable.



Network and output settings for the GPI and Tally Interface

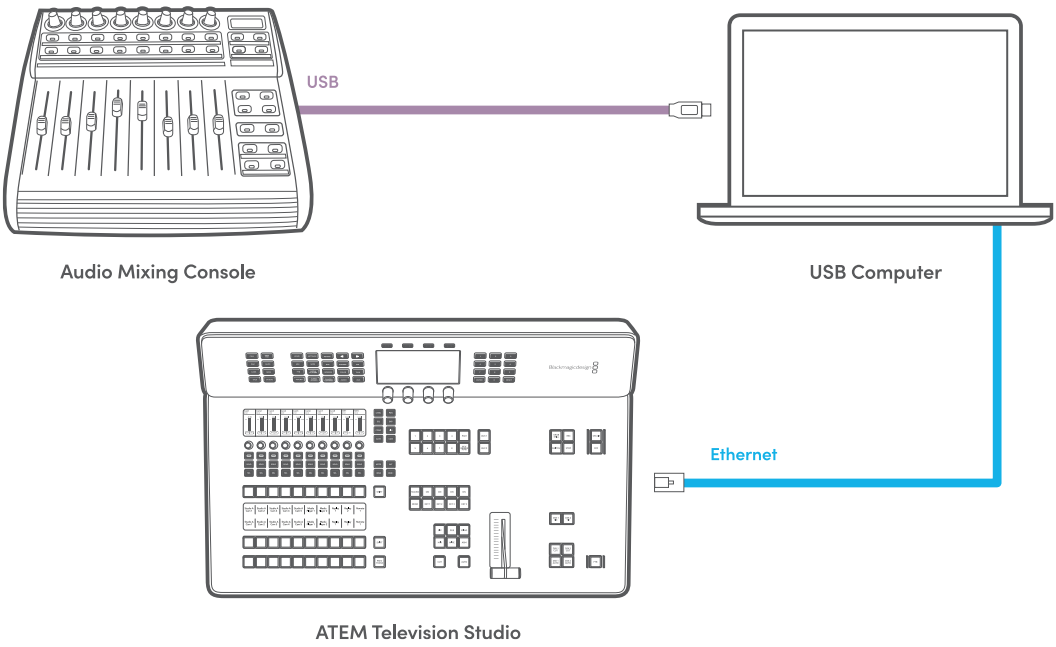
Using a Third Party Audio Mixer Control Surface

Using an Audio Mixer Control Surface

In the fast-paced world of live TV production, using a mouse to make adjustments can sometimes feel too slow! If you need to mix more than one audio source at a time on your ATEM switcher then here's an idea that can really help. Connecting a hardware audio mixer control surface to your ATEM switcher provides you with the ability to use both hands and adjust multiple audio levels at the same time.

An audio mixer control surface can be connected to your Mac or PC as a MIDI device using Mackie Control commands to communicate with the ATEM switcher.

Many third party MIDI control surfaces are compatible with your ATEM switcher but please check with the manufacturer of your control surface if in doubt.



You can adjust multiple audio levels at the same time by connecting a hardware audio mixer to the computer which is running ATEM Software Control.

Connecting Your Audio Mixer Control Surface

1. Connect your compatible MIDI control surface to your Mac or PC. Most modern control surfaces use USB.
2. Verify your control surface is recognized by your computer as a MIDI device.

   For Mac computers, go to Applications/Utilities/Audio MIDI Setup and launch the application. Go to the Window menu and choose Show MIDI Window. Ensure your control surface appears as a MIDI device in this window.

   For Windows computers, go to Device Manager/Sound, Video and Game Controllers and ensure your control surface appears in the list of icons.
3. The ATEM audio mixer is designed to communicate with your control surface using Mackie Control commands so your control surface will need to support Mackie Control. You'll also need to make sure your control surface is configured to use native Mackie Control or Mackie Control emulation. Please refer to your control surface's user manual for configuration details.

   Some control surfaces offer several types of Mackie Control emulation and you should choose the one that activates the most features on your control surface. For example, with the Behringer BCF 2000, choosing "Mackie Control Mapping for Cakewalk Sonar 3 [MCSo]" enables level faders, bank selectors, balance control, AFV and ON/MUTE functions and also activates the LED screen which displays which bank of faders you have selected for your audio mix. The LED screen will not activate if you choose another Mackie Control emulation.
4. Launch ATEM Software Control and it will automatically look for your control surface using the first port on the first MIDI device that it finds. Click on the Audio tab in ATEM Software Control to display the ATEM audio mixer. Try sliding the gain faders up and down on your hardware control surface and verify that the audio mixer faders show a corresponding increase and decrease in the software on your computer screen. If so, you have successfully configured your control surface to work with the ATEM switcher.

The MUTE button

In the ATEM audio mixer interface, audio is always on, or present in the mix, when the ON button is selected. When the ON button is deselected, audio is not present or is muted. To match the software interface, you'll find the MUTE button on your audio mixer control surface will be lit when audio is always on or present in the mix. The MUTE button will be unlit when audio is not present or is muted.

Decibel Scales

All hardware mixers are made differently and the scale printed on your control surface may not match the scale in the ATEM audio mixer interface. Always refer to the ATEM audio mixer levels for the true decibel scales.

Using a DaVinci Resolve Micro Panel

The DaVinci Resolve primary color corrector in each camera controller can be controlled using a DaVinci Resolve Micro panel. This lets you make fast and precise color adjustments using a hardware control panel.

To set up the panel:

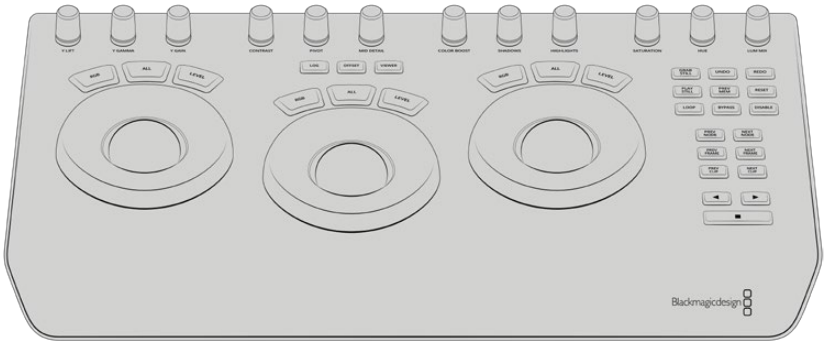
1. Connect the DaVinci Resolve Micro Panel to your computer via USB-C and launch ATEM Software Control.
2. Click on the 'camera' tab and select a camera by clicking anywhere in the desired camera controller.
3. On the DaVinci Resolve Micro Panel, rotate the trackballs and turn the knobs to adjust the corresponding controls in the primary color corrector.

Making Color Correction Adjustments

The DaVinci Resolve Micro panel is primarily designed for use with DaVinci Resolve software, but you can also use it to make adjustments in the color corrector panel of ATEM Software Control in the following way:

The Trackballs

The three trackballs control the lift, gamma and gain color wheels in the color corrector panel. The ring surrounding each trackball adjusts the corresponding master wheels beneath the color wheels.



DaVinci Resolve Micro Panel

Control Knobs

As you change settings with the hardware panel, you will see the corresponding settings on the software panel change as well. Use the following control knobs to make adjustments.

Y Lift	Allows you to modify image contrast via a Y-only adjustment for the black level.
Y Gamma	Allows you to modify image contrast via a Y-only adjustment for gamma.
Y Gain	Allows you to modify image contrast via a Y-only adjustment for highlights.
Contrast	Rotate clockwise to increase contrast and counterclockwise to reduce contrast.
Highlights	The ‘highlights’ knob controls the iris on your selected camera. Rotate the knob clockwise to open the iris and counterclockwise to close.
Saturation	Rotate clockwise or counterclockwise to increase or decrease color saturation.
Hue	Adjust the hue along the hue distribution as seen on a color wheel by rotating the ‘hue’ knob clockwise or counterclockwise.
Lum Mix	Rotate clockwise or counterclockwise to set the output blend between the RGB and YRGB correctors.

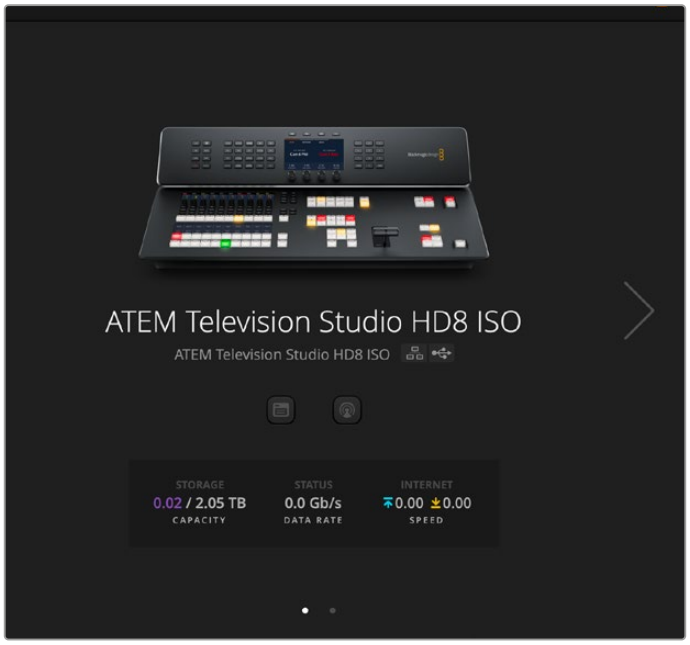
Control Buttons

Left Arrow	Select the previous camera number
Right Arrow	Select the next camera number

For more information on how each control affects the image, refer to the details provided earlier in this section.

Using ATEM Setup

When ATEM Software Control is installed on your computer, a setup utility called ATEM Setup will also be installed. This setup utility lets you update your ATEM Television Studio switcher, name the unit, change network settings and provides panel settings including program preview and cut bus switching modes, plus keyer related switching settings.



When you launch ATEM Setup the first screen you will see is the home screen. If you have more than one ATEM switcher connected via USB or on your network they will all be available by clicking on the left or right arrows.

If you have internal cloud storage installed the indicators at the bottom of the home screen display the total storage capacity, amount of space used, the network connection status, plus the current maximum data rate. If the number representing space used is purple you can read and write to the storage. If the number is blue then storage access is set to ‘read only’.

Click on the left icon above the storage indicators to open the setup page. Click on the right icon to launch ATEM Software Control.

Setup Tab

Name

If you want to rename your switcher, type a new name into the box and click ‘save’.

Software

Displays the current software version installed on your ATEM Television Studio.

Date and Time

Set your date and time on ATEM Television Studio automatically by ticking the box.

When setting the date and time automatically, your ATEM switcher will use the network time protocol server set in the NTP field. The default NTP server is time.cloudflare.com, but you can also manually enter an alternate NTP server and then click on ‘set’.

If you are entering your date and time manually, use the fields to enter your date, time and time zone. Setting the date and time correctly ensures your recordings have the same time and date information as your network and also prevents conflicts that can occur with some network storage systems.

Network Settings

These settings allow you to configure options such as choosing between connecting to a network over DHCP or using a static IP address. For more information on connecting your ATEM switcher to a network, refer to the ‘connecting to a network’ section.

Allow Utility Administration

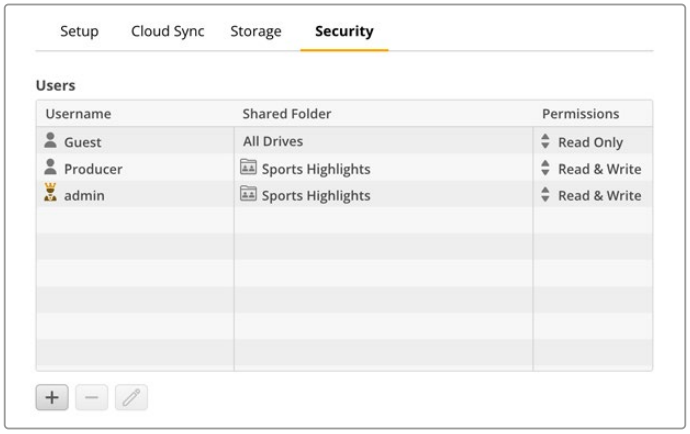
ATEM Setup can be accessed when your ATEM switcher is connected via the network or via USB. To prevent users having access via the network, select USB only.

Connection Priority

When Ethernet and a mobile phone are both connected to ATEM Television Studio this setting lets you choose which connection will be used for streaming. For more information on mobile tethering, refer to the ‘smartphone tethering’ section.

Security Tab

The ‘security’ tab contains the user authentication settings, plus options for creating users, allocating shared folders and assigning folder permissions.

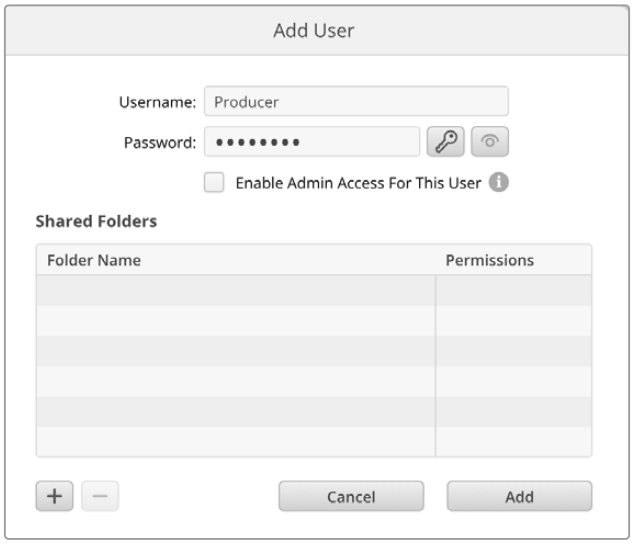


Adding Users

Use these settings to create users, allocate shared folders and set folder permissions. This applies when users connect via a locally stored password. For example, you can assign a project supervisor read and write permissions to a shared folder and then assign read only permissions to users who just need to view files. A shared folder can be any folder on your ATEM switcher's external USB storage or optional internal cloud storage.

1 Click the '+' button near the bottom left of the 'security' tab to open the 'add user' window.

2 In the 'add user' window, enter a username for the new user. If you are creating a user who will connect via SMB using a locally stored password, enter a password in the 'password' field. You can automatically generate a secure password by pressing the 'key' icon.



If you want to give the new user admin access, check the 'enable admin access for this user' checkbox. This option allows the user to access ATEM Setup via Ethernet and make settings changes.

3 Click the '+' button to open the shared folder window.

A list of all the folders on the top level of your ATEM Television Studio switcher's internal storage will be displayed. Double click a folder to view sub folders, the menu located at the top of the window displays the name of the folder you are currently viewing and lets you navigate back through folder levels. Select the shared folder you want the new user to access and press 'set'.

4 The shared folder will be displayed in the ‘shared folders’ list in the ‘add users’ window.

To allocate another folder, click the ‘+’ button or to remove access to the shared folder click the ‘-’ button. To close the ‘add user’ window and return to the security tab, click ‘add’ and then click ‘save’.

The new user can now log into the ATEM switcher and access their allocated shared folders.

To access shared folders on a Mac computer:

1 Open Finder and click on ‘network’ in the sidebar menu.

2 Click on your ATEM switcher in the list.

3 Click ‘connect as’, enter your username and password and click ‘connect’.

Your ATEM switcher will now appear in the locations sidebar, click on your switcher to view your shared folders.

To access shared folders on a Windows computer:

1 Click on the ‘network’ menu item in File Explorer sidebar. You will see your ATEM switcher listed.

2 Double click on your ATEM switcher and a Windows security dialog box will appear asking for network credentials.

3 Enter your username and password.

4 Click ‘OK’.

You will now see your ATEM switcher in the File Explorer window and can access the storage like any other network drive.

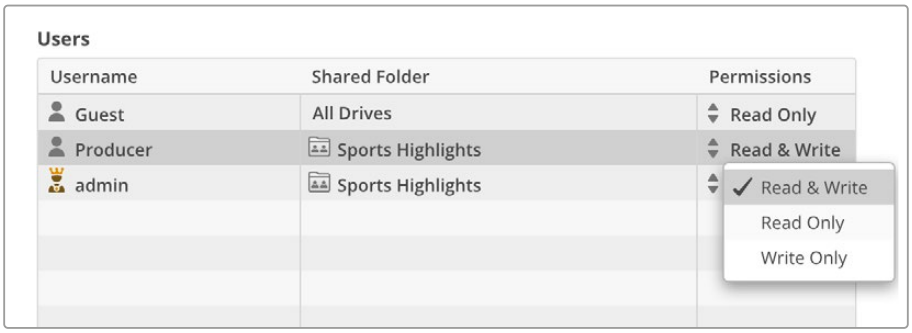
Permissions

Permissions let you control the level of access a user has within a shared folder. When you first allocate a folder to a user, they are given ‘read & write’ permissions that lets them add, move, modify or delete the contents of the shared folder. You can change the shared folder permissions to ‘read only’ or ‘write only’. When set to ‘read only’ the user can see the contents of the folder but won’t be able to add, delete or modify files. Setting the permissions to ‘write only’ will allow the user to copy files into the folder, but not see the contents.

To change permissions:

1 Select a user from the ‘users’ list in the ‘security’ tab.

2 In the ‘permissions’ column, click the user’s current permissions and select an option from the list.



3 Click ‘save’ to confirm your selection.

TIP The ‘guest’ user is created by default and automatically has read and write access to all the shared folders on your ATEM switcher’s storage. You can change the guest user permissions from the ‘permissions’ section of the security tab to ‘read & write’, ‘write only’, ‘read only’ or ‘no access’.

Managing Users

Use the ‘manage user’ options to change a user’s folder allocations, username or password as well as enable or disable admin access.

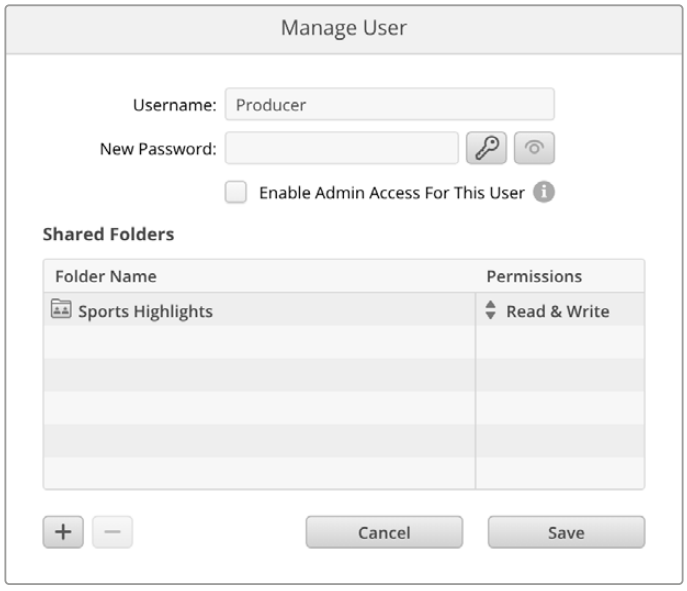
Settings

To manage a user:

1 In the ‘security’ tab, select the user you want to manage from the ‘users’ list.

2 Click the ‘pencil’ icon.

3 In the ‘manage user’ window, update the user’s information.



4 Click ‘save’ to confirm your changes.

Deleting Users

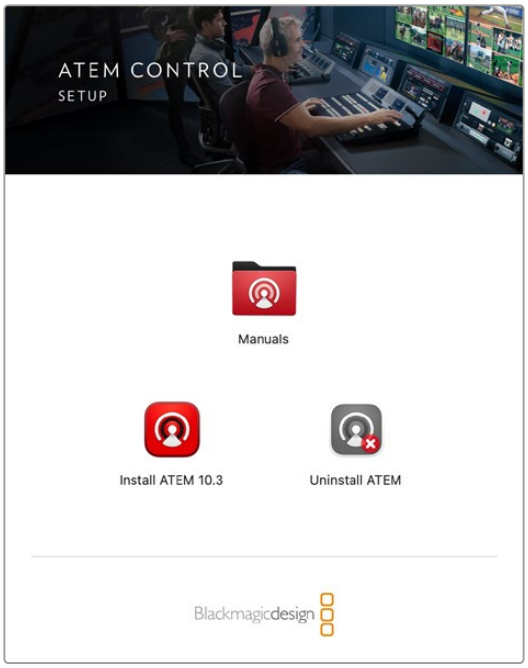
To delete a user, select the username you want to delete in the ‘users’ list of the ‘security’ tab and click the ‘-’ button. Click ‘delete’ to confirm your choice. Deleting a user will remove their access to any allocated shared folders.

How to update the ATEM Software

From time to time Blackmagic Design will release new software for your ATEM switcher and hardware panel, with new features, bug fixes, and increased compatibility with third party software and video devices.

To update your ATEM switcher with new software, you need to use ATEM Setup to connect to the ATEM switcher and hardware panels. ATEM Setup will check your switcher’s internal software and will ask if you wish to update if you have a newer version installed on your computer.

Always update all your equipment at the same time so it’s all running the same version of software.



ATEM Software Installer

To perform an update, you can directly connect your ATEM switcher to the computer via USB.

Alternatively, if you already have your switcher connected to your computer via Ethernet, you can simply update via the Ethernet connection.

First, download the latest Blackmagic ATEM Switcher software and install it on your Mac or PC using the instructions listed previously in the Installing Software section of this manual. Once installed, the new software for your ATEM switcher will be included in the ATEM Setup utility.

Updating the Switcher Software

1. Connect the switcher via the USB port.

   If you already have your switcher connected to your computer via Ethernet, you can update via the Ethernet connection.

   When upgrading software via USB, make sure the switcher is the only ATEM device connected via USB to the computer running the setup utility software. If more than one ATEM device is connected, the switcher may not be recognized.

2. Launch ATEM Setup.
3. If the switcher software requires updating, you will be prompted by a window asking if you would like to update the software. Click 'update' to initiate the update process, which may take a few minutes. It's important you don't unplug the power from the switcher during the software update.
4. Once the software update is complete, a window will prompt you to cycle power on the switcher. Turn your switcher off and on, then 'close' the dialog box.

Updating via Ethernet

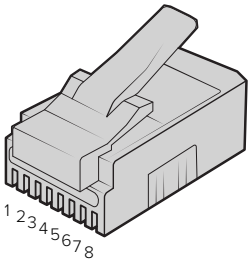
Updating your ATEM switcher via Ethernet is generally faster and easier, however there are some instances, such as those below, where it may not be possible and you will need to update via USB:

- Updating the internal software for the first time.
- Your ATEM network settings are already configured to work straight away, however if your are connecting to a network with other video equipment, there may be potential IP address conflicts which may prevent communication between your computer and your switcher. Network settings can only be set via USB.

Adapter Cables for Talkback and Camera Control

Talkback Pin Connections

The 'talkback' connector on the back panel of ATEM Television Studio switcher is for routing engineering talkback and production talkback. You can make an adapter cable with an RJ45 connector using this pinout diagram.



Eng TX+	Eng TX-	Prod TX+	Prod RX+	Prod RX-	Prod TX-	Eng RX+	Eng RX-
1	2	3	4	5	6	7	8

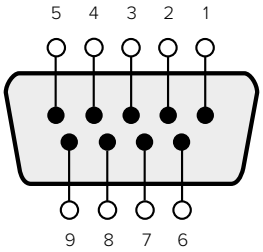
RJ45 pinout for 'talkback' connector on the back panel of ATEM Television Studio.

Serial Port Pin Connections for Control Cables

RS-422 Pin Connections for Control Cables

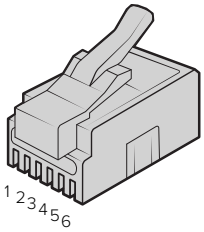
RS-422 is a broadcast standard using a common DE 9 or RJ12 connector. You can easily rewire these types of connectors in a custom built PTZ control unit if you want to design one yourself.

A pinout diagram of the RS-422 DE 9 and RJ12 connector is provided below.



Receive (–)	Receive (+)	Transmit (–)	Transmit (+)	Ground Pins
8	3	2	7	1, 4, 6, 9

RS-422 PTZ pin connections.



TX+	TX-	GND	GND	RX-	RX+
1	2	3	4	5	6

RJ12 Pinout for PTZ remote on ATEM Television Studio.

5 Pin XLR Talkback Headset Connector Pinout Diagram

External views	Pins	Signal	I/O	Description
 5 pin XLR 'talkback' headset connector	1	Intercom MIC (Y)	In -	The intercom mic input supports dynamic mics, which can be balanced or unbalanced. Pin 1 is the mic signal common, and pin 2 is the mic signal input for both types. With electret mics, an external DC bias supply adapter is required which allows for aviation headsets to be used.
	2	Intercom MIC (X)	In +	
	3	GND	GND	GND
	4	Intercom left	Out	
	5	Intercom right	Out	

Developer Information

Blackmagic SDI Camera Control Protocol

Version 1.3

If you are a software developer you can use the SDI Camera Control Protocol to construct devices that integrate with our products. Here at Blackmagic Design our approach is to open up our protocols and we eagerly look forward to seeing what you come up with!

Overview

The Blackmagic SDI Camera Control Protocol is used by ATEM switchers, Blackmagic 3G-SDI Shield for Arduino and the Blackmagic Camera Control app to provide Camera Control functionality with supported Blackmagic Design cameras. Please refer to the 'Understanding Studio Camera Control' chapter section of this manual, or the ATEM Switchers Manual and SDK manual for more information. These can be downloaded at www.blackmagicdesign.com/support.

This document describes an extensible protocol for sending a uni directional stream of small control messages embedded in the non-active picture region of a digital video stream. The video stream containing the protocol stream may be broadcast to a number of devices. Device addressing is used to allow the sender to specify which device each message is directed to.

Assumptions

Alignment and padding constraints are explicitly described in the protocol document. Bit fields are packed from LSB first. Message groups, individual messages and command headers are defined as, and can be assumed to be, 32 bit aligned.

Blanking Encoding

A message group is encoded into a SMPTE 291M packet with DID/SDID x51/x53 in the active region of VANC line 16.

Message Grouping

Up to 32 messages may be concatenated and transmitted in one blanking packet up to a maximum of 255 bytes payload. Under most circumstances, this should allow all messages to be sent with a maximum of one frame latency.

If the transmitting device queues more bytes of message packets than can be sent in a single frame, it should use heuristics to determine which packets to prioritize and send immediately. Lower priority messages can be delayed to later frames, or dropped entirely as appropriate.

Abstract Message Packet Format

Every message packet consists of a three byte header followed by an optional variable length data block. The maximum packet size is 64 bytes.

Destination device (uint8)	Device addresses are represented as an 8 bit unsigned integer. Individual devices are numbered 0 through 254 with the value 255 reserved to indicate a broadcast message to all devices.
Command length (uint8)	The command length is an 8 bit unsigned integer which specifies the length of the included command data. The length does NOT include the length of the header or any trailing padding bytes.

Command id (uint8)	The command id is an 8 bit unsigned integer which indicates the message type being sent. Receiving devices should ignore any commands that they do not understand. Commands 0 through 127 are reserved for commands that apply to multiple types of devices. Commands 128 through 255 are device specific.
Reserved (uint8)	This byte is reserved for alignment and expansion purposes. It should be set to zero.
Command data (uint8[])	The command data may contain between 0 and 60 bytes of data. The format of the data section is defined by the command itself.
Padding (uint8[])	Messages must be padded up to a 32 bit boundary with 0x0 bytes. Any padding bytes are NOT included in the command length.

Receiving devices should use the destination device address and or the command identifier to determine which messages to process. The receiver should use the command length to skip irrelevant or unknown commands and should be careful to skip the implicit padding as well.

Defined Commands

Command 0 : change configuration

Category (uint8)	The category number specifies one of up to 256 configuration categories available on the device.
Parameter (uint8)	The parameter number specifies one of 256 potential configuration parameters available on the device. Parameters 0 through 127 are device specific parameters. Parameters 128 though 255 are reserved for parameters that apply to multiple types of devices.
Data type (uint8)	The data type specifies the type of the remaining data. The packet length is used to determine the number of elements in the message. Each message must contain an integral number of data elements.

Currently defined values are:

0: void / boolean	A void value is represented as a boolean array of length zero. The data field is a 8 bit value with 0 meaning false and all other values meaning true.
1: signed byte	Data elements are signed bytes
2: signed 16 bit integer	Data elements are signed 16 bit values
3: signed 32 bit integer	Data elements are signed 32 bit values
4: signed 64 bit integer	Data elements are signed 64 bit values
5: UTF-8 string	Data elements represent a UTF-8 string with no terminating character.

Data types 6 through 127 are reserved.

128: signed 5.11 fixed point	Data elements are signed 16 bit integers representing a real number with 5 bits for the integer component and 11 bits for the fractional component. The fixed point representation is equal to the real value multiplied by 2^11. The representable range is from -16.0 to 15.9995 (15 + 2047/2048).

Data types 129 through 255 are available for device specific purposes.

Operation type (uint8)	The operation type specifies what action to perform on the specified parameter. Currently defined values are:
0: assign value	The supplied values are assigned to the specified parameter. Each element will be clamped according to its valid range. A void parameter may only be 'assigned' an empty list of boolean type. This operation will trigger the action associated with that parameter. A boolean value may be assigned the value zero for false, and any other value for true.
1: offset / toggle value	Each value specifies signed offsets of the same type to be added to the current parameter values. The resulting parameter value will be clamped according to their valid range. It is not valid to apply an offset to a void value. Applying any offset other than zero to a boolean value will invert that value.
Operation types 2 through 127 are reserved.	
Operation types 128 through 255 are available for device specific purposes.	
Data (void)	The data field is 0 or more bytes as determined by the data type and number of elements.

The category, parameter, data type and operation type partition a 24 bit operation space.

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Lens	0.0	Focus	fixed16	–	0	1	0.0 = near, 1.0 = far
	0.1	Instantaneous autofocus	void	–	–	–	trigger instantaneous autofocus
	0.2	Aperture (f-stop)	fixed16	–	-1	16	Aperture Value (where fnumber = sqrt(2^AV))
	0.3	Aperture (normalised)	fixed16	–	0	1	0.0 = smallest, 1.0 = largest
	0.4	Aperture (ordinal)	int16	–	0	n	Steps through available aperture values from minimum (0) to maximum (n)
	0.5	Instantaneous auto aperture	void	–	–	–	trigger instantaneous auto aperture
	0.6	Optical image stabilisation	boolean	–	–	–	true = enabled, false = disabled
	0.7	Set absolute zoom (mm)	int16	–	0	max	Move to specified focal length in mm, from minimum (0) to maximum (max)
	0.8	Set absolute zoom (normalised)	fixed16	–	0	1	Move to specified focal length: 0.0 = wide, 1.0 = tele
	0.9	Set continuous zoom (speed)	fixed16	–	-1	+1.0	Start/stop zooming at specified rate: -1.0 = zoom wider fast, 0.0 = stop, +1 = zoom tele fast

Blackmagic Embedded Tally Control Protocol

Version 1.0 (30/04/14)

This section is for third party developers or users who may wish to add support for the Blackmagic Embedded Tally Control Protocol to their products or system. It describes the protocol for sending tally information embedded in the non-active picture region of a digital video stream.

Data Flow

A master device such as a broadcast switcher embeds tally information into its program feed which is broadcast to a number of slave devices such as cameras or camera controllers. The output from the slave devices is typically fed back to the master device, but may also be sent to a video monitor.

The primary flow of tally information is from the master device to the slaves. Each slave device may use its device id to extract and display the relevant tally information.

Slave devices pass through the tally packet on their output and update the monitor tally status, so that monitor devices connected to that individual output may display tally status without knowledge of the device id they are monitoring.

Assumptions

Any data alignment / padding is explicit in the protocol. Bit fields are packed from LSB first.

Blanking Encoding

One tally control packet may be sent per video frame. Packets are encoded as a SMPTE 291M packet with DID/SDID x51/x52 in the active region of VANC line 15. A tally control packet may contain up to 256 bytes of tally information.

Packet Format

Each tally status consists of 4 bits of information:

uint4

bit 0:	program tally status (0=off, 1=on)
bit 1:	preview tally status (0=off, 1=on)
bit 2-3:	reserved (0x0)

The first byte of the tally packet contains the monitor device tally status and a version number.

Subsequent bytes of the tally packet contain tally status for pairs of slave devices. The master device sends tally status for the number of devices configured/supported, up to a maximum of 510.

struct tally

uint8

bit 0: monitor device program tally status (0=off, 1=on)

bit 1: monitor device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4-7: protocol version (0b0000)

uint8[0]

bit 0: slave device 1 program tally status (0=off, 1=on)

bit 1: slave device 1 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 2 program tally status (0=off, 1=on)

bit 5: slave device 2 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

uint8[1]

bit 0: slave device 3 program tally status (0=off, 1=on)

bit 1: slave device 3 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 4 program tally status (0=off, 1=on)

bit 5: slave device 4 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

Help

Getting Help

The fastest way to obtain help is to go to the Blackmagic Design online support pages and check the latest support material available for your ATEM switcher.

Blackmagic Design online support pages

The latest manual, software and support notes can be found at the Blackmagic Design support center at www.blackmagicdesign.com/support.

Contacting Blackmagic Design support

If you can't find the help you need in our support material, please use the "Send us an email" button on the support page to email a support request. Alternatively, click on the "Find your local support team" button on the support page and call your nearest Blackmagic Design support office.

Checking the version currently installed

To check which version of ATEM software is installed on your computer, open the About ATEM Software Control window.

- On Mac, open ATEM Software Control from the Applications folder. Select About ATEM Software Control from the application menu to reveal the version number.
- On Windows, open ATEM Software Control from your 'start' menu. Click on 'help' in the menu bar and select 'about' to reveal the version number.

How to get the latest updates

After checking the version of ATEM software installed on your computer, please visit the Blackmagic Design support center at www.blackmagicdesign.com/support to check for the latest updates. While it is usually a good idea to run the latest updates, it is a wise practice to avoid updating any software if you are in the middle of an important project.

Regulatory Notices

Disposal of Waste of Electrical and Electronic Equipment Within the European Union.

The symbol on the product indicates that this equipment must not be disposed of with other waste materials. In order to dispose of your waste equipment, it must be handed over to a designated collection point for recycling. The separate collection and recycling of your waste equipment at the time of disposal will help conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city recycling office or the dealer from whom you purchased the product.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this product in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at personal expense.

Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

R-R-BMD-20220729001
R-R-BMD-20220729002
R-R-BMD-20230316001
R-REM-BMD-201805002

ISED Canada Statement

This device complies with Canadian standards for Class A digital apparatus.

Any modifications or use of this product outside its intended use could void compliance to these standards.

Connection to HDMI interfaces must be made with high quality shielded HDMI cables.

This equipment has been tested for compliance with the intended use in a commercial environment. If the equipment is used in a domestic environment, it may cause radio interference.

Safety Information

For protection against electric shock, the equipment must be connected to a mains socket outlet with a protective earth connection. In case of doubt contact a qualified electrician.

To reduce the risk of electric shock, do not expose this equipment to dripping or splashing.

Ensure any DC power source connected to the units is compatible with the input voltage and current rating marked at the DC IN connector.

Product is suitable for use in tropical locations with an ambient temperature of up to 40°C.

Ensure that adequate ventilation is provided around the product and that it is not restricted.

No operator serviceable parts inside product. Refer servicing to your local Blackmagic Design service center.

Use only at altitudes not more than 2000m above sea level.

State of California statement

This product can expose you to chemicals such as trace amounts of polybrominated biphenyls within plastic parts, which is known to the state of California to cause cancer and birth defect or other reproductive harm.

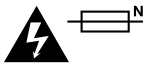
For more information go to www.P65Warnings.ca.gov.

European Office

Blackmagic Design B.V, Amsterdam Sloterdijk Teleport Towers Office 2.17,
Kingsfordweg 151, Amsterdam, 1043GR.

Warning for Authorized Service Personnel

Disconnect power from both power inlets before servicing!



Caution — Double Pole/ Neutral Fusing

The power supply contained in this equipment has a fuse in both line and neutral conductors and is suitable for connection to the IT power distribution system in Norway.

Warranty

12 Month Limited Warranty

Blackmagic Design warrants that this product will be free from defects in materials and workmanship for a period of 12 months from the date of purchase. If a product proves to be defective during this warranty period, Blackmagic Design, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, you the Customer, must notify Blackmagic Design of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. The Customer shall be responsible for packaging and shipping the defective product to a designated service center nominated by Blackmagic Design, with shipping charges pre paid. Customer shall be responsible for paying all shipping charges, insurance, duties, taxes and any other charges for products returned to us for any reason.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Blackmagic Design shall not be obligated to furnish service under this warranty: a) to repair damage resulting from attempts by personnel other than Blackmagic Design representatives to install, repair or service the product, b) to repair damage resulting from improper use or connection to incompatible equipment, c) to repair any damage or malfunction caused by the use of non Blackmagic Design parts or supplies, or d) to service a product that has been modified or integrated with other products when the effect of such a modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY BLACKMAGIC DESIGN IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. BLACKMAGIC DESIGN AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. BLACKMAGIC DESIGN'S RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE WHOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR ANY INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER BLACKMAGIC DESIGN OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES. BLACKMAGIC DESIGN IS NOT LIABLE FOR ANY ILLEGAL USE OF EQUIPMENT BY CUSTOMER. BLACKMAGIC IS NOT LIABLE FOR ANY DAMAGES RESULTING FROM USE OF THIS PRODUCT. USER OPERATES THIS PRODUCT AT OWN RISK.

ATEM Television Studioスイッチャー

ATEM Television Studio HD8
ATEM Television Studio HD8 ISO
ATEM Television Studio 4K8

ようこそ

このたびはATEM Television Studioスイッチャーをお買い求めいただき誠にありがとうございました。

これまでにライブプロダクションの経験がない方は、今まさに、テレビ業界の中で最もエキサイティングな分野に足を踏み入れようとしています。ライブプロダクションほど面白い分野はありません！目の前で展開されているライブイベントをリアルタイムで編集するという興奮は、あなたを虜にすることでしょう。これが本来、テレビのあるべき姿ではないでしょうか。

従来、放送品質のライブプロダクションは非常に高価で、大多数の人にとって手の届かないものでした。その一方で、低価格のスイッチャーは機能、品質ともに放送局クラスとかけ離れたものでした。ATEM Television Studioスイッチャーはこのような状況を変える機器であり、誰もが最高品質かつプロ仕様のライブプロダクションを実現できるようになります。皆様が今後このスイッチャーを使用して、ライブプロダクションを楽しまれることを心より願っております。

このマニュアルには、ATEM Television Studioスイッチャーをインストールする際に必要な情報がすべて記載されています。

弊社のウェブサイトwww.blackmagicdesign.com/jpのサポートページで、使用されているATEMスイッチャーの最新バージョンのソフトウェアを確認してください。コンピューターをUSB経由でATEMスイッチャーとハードウェアコントロールパネルに接続し、ソフトウェアをアップデートすれば、常に最新の機能を使用できます。ソフトウェアをダウンロードする際にユーザー登録していただければ、新しいソフトウェアのリリース時にお知らせいたします。私たちは、常に新機能の開発および製品の改善に努めていますので、ユーザーの皆様からご意見をいただければ幸いです。

グラント・ペティ

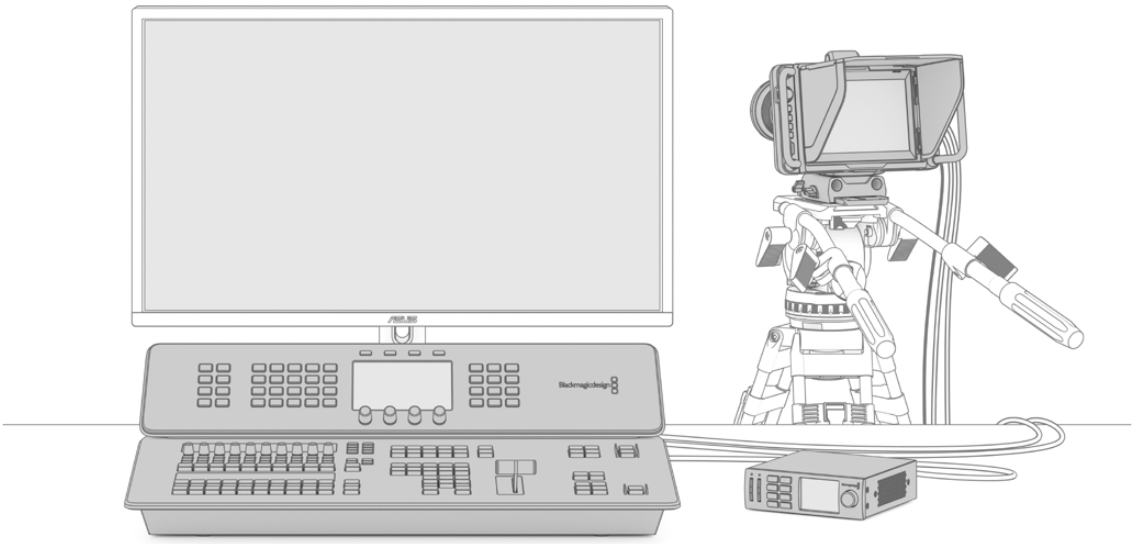
ATEM Television Studio

ATEM Television Studioスイッチャーは、放送局クラスのプロ仕様デジタルプロダクションスイッチャーで、ライブの映像制作および放送環境において、様々なビデオソースのスイッチングや処理が可能です。このスイッチャーは、従来型のミックスエフェクトベースのデザインを採用しており、ソフトウェアあるいはハードウェアコントロールを選択できます。直感的ですばやく簡単なワークフローで、プログラム/プレビューを切り替えられます。旧式のA/Bスイッチャーに慣れている場合、ATEMスイッチャーはA/B切り替えにも対応しているので、簡単に使い始められます。

ATEMスイッチャーはコントロールパネルを内蔵しているため、スイッチャーだけでライブプロダクションのスイッチングが行えます。しかし、スイッチャーをより柔軟にコントロールする必要がある場合、ATEM Software Controlも使用できます。また、さらに高度なソリューションが必要な場合には、1台または複数のハードウェアコントロールパネルを追加することもできます。



ATEM Television Studioスイッチャーの設定は非常に簡単です。マルチビュー出力をモニターに接続し、カメラへの接続後、プログラム出力を収録デッキに接続します。

M/Eスイッチャーとは？

これまで低価格のスイッチャーを使用していた場合、そのスイッチャーはおそらく、一般的にM/Eスタイルと呼ばれるミックスエフェクト・スタイルのオペレーションではないでしょう。M/Eスタイルのスイッチャーを使用したことがある人は、インストールのページへ飛んで早速ATEMスイッチャーを使用してください。

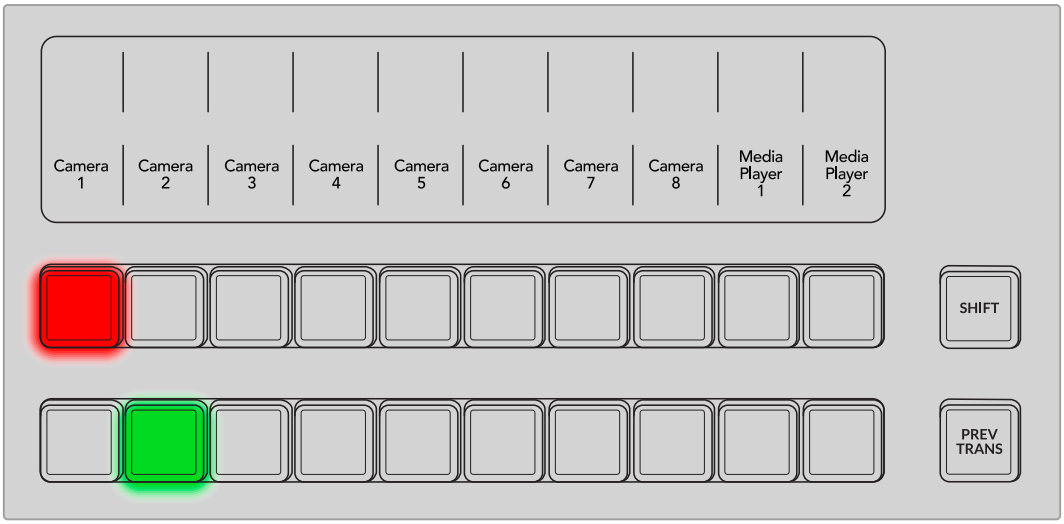
これまでスイッチャーを使用したことがない場合、多くのボタンやノブを搭載したATEMは複雑で扱いづらい機器に見えるかもしれませんが、これらはすべて論理的に配置されており、使い方は至って簡単です。

ハイエンドの放送スイッチャーであるATEMは、放送業界で一般的に使用されているM/Eワークフローを採用しています。ATEMのオペレーションを習得すれば、今日、放送業界で使用されているあらゆるスイッチャーをすぐに操作できるようになるでしょう。

M/Eスタイルのオペレーションは、ライブイベントのスイッチングエラーをなくすために数十年にわたって開発が続けられ、現在では放送業界のスタンダードとなっています。M/Eスタイルは、常に状況を簡単に確認できるので、混乱によりエラーが生じることはありません。オンエアするソースを確認したり、オンエア前にエフェクトを試せます。各キーヤー、トランジションにボタンが割り当てられているので、現在の状況と次のステップを瞬時に把握できます。

ATEMの操作を習得する最善の方法は、このマニュアルを見ながら、実際にスイッチャーをいろいろと触ってみることです。この章を読み飛ばして早くスイッチャーをインストールしたいと、うずうずしている人もいることでしょう。

まず、M/Eベースのコントロールパネルで最も目につくのは、Tバーまたはスライダーの形状のトランジションフェーダー、プログラム/プレビューソースボタンの列です。



プログラムおよびプレビューのボタン列を使用すると、オンエアソースを切り替える前にプレビューできます。

複数のタイプのトランジションが使用でき、選択はLCDの左にあるシステムコントロールボタンか、パネルの特定のトランジションボタンを押して実行できます。多様なワイプパターンやDVEエフェクトから選択でき、トランジションレートやその他のトランジション設定はLCDメニューで調整できます。

ATEMなど、M/Eスタイルのスイッチャーを理解する上で、もう1つ重要なコンセプトは、プログラム列/プレビュー列の映像が「バックグラウンド映像」と呼ばれることです。これは、アップストリーム（エフェクト）キーヤー、ダウンストリームキーヤーが、これらのソースの上にオーバーレイされるためです。グラフィックをキーヤーにロードしてプレビュー映像で確認し、キーをオンにしてプログラム映像にオーバーレイします。これは非常にパワフルな機能で、マルチレイヤーにも対応します。

ATEM M/Eスイッチャーのもう1つの大きなメリットは、キーヤーとトランジションを結びつけられることです。つまり、ミックストランジションを行う際、同時にキーヤーをフェードオン/オフできるのです。これにより、合成した画面のすべての要素を同時にオンエアできます。これは、ネクスト・トランジションボタンで実行します。通常のトランジションのバックグラウンドを選択したり、複数のキーヤーをオンエアで使用することも可能です。

ATEM Television Studioスイッチャーのコントロールパネルで複数のボタンを押して、複数のキーとバックグラウンドを同時に結合することもできます。また、専用のダウンストリームキー連結ボタンで、ダウンストリームキーヤーをトランジションに結合させることもできます。ダウンストリームキーは専用のカット、ミックスボタンがついているのでフレキシブルな対応が可能です。ダウンストリームキーヤーは常にトランジションを含むすべてのソースの一番上にレイヤーされるので、ウォーターマークやロゴに最適です。

ライブプロダクションの終了時に、専用のフェード・トゥ・ブラック（FTB）コントロールを使えば、すべてを黒画面にフェードできます。フェード・トゥ・ブラック・コントロールはスイッチャーの右下にあります。この機能を使えばすべての要素をブラックにフェードでき、レイヤーが残ることはありません。FTBを作業の最終段階に使用すると、すべてのソースをクリーンにフェードできます。

最後に、M/Eスタイルのスイッチャーの選択バスについて紹介します。これはプログラム列の上部にあり、エフェクト処理やその他の用途に使用するソースを選択します。ボタンにはラベルが付いているので、スイッチングしているソースを把握できます。選択バスは、一般的にキー入力の選択に使用します。また、コントロールパネルから直接マクロを実行することもできます。

概要に目を通しただけでも、M/Eスタイルのオペレーションは、プロダクションやスイッチャーの状況に関して適切なフィードバックが得られ、プロダクションの最中でもプログラミングが可能なため、ライブプロダクションに適していることが分かると思います。一度M/Eスタイルのオペレーションを習得すれば、他のスイッチャーもほぼ同じなので、他のモデルもすぐに操作できるようになるでしょう。

A/Bスイッチャーとは？

ビデオスイッチャーを長年使用している人は、旧式のA/Bスイッチャーに慣れているかもしれません。

A/Bスタイルのスイッチャーには、AバスおよびBバスがあります。1つはプログラムバスで、現在出力されているプログラムは赤く光ります。もう1つはプレビューバスで、プレビュービデオは緑に光ります。フェーダーバーを上下させるたびにバスが切り替わり、赤いプログラムボタンはフェーダーバーの動きに合わせて切り替わります。光っているボタンの位置は変更しませんが、緑と赤が入れ替わります。

フェーダーコントロールを使用せずにスイッチングする場合、A/Bスタイルの操作はやや複雑になります。カットトランジションやオートトランジションでプレビュー映像をオンエアする場合や、1台のスイッチャーに複数のコントロールパネルを接続している場合には、使用しているコントロールパネル上でフェーダーコントロールを操作する必要がありません。赤いプログラム出力は常にフェーダーコントロールの動きに同調するので、フェーダーコントロールを動かさない場合は同じ列内で別ボタンに移動します。緑のプレビューボタンも同様に同じ列内で移動します。

スイッチングにフェーダーコントロールを使ったり使わなかったりすると、プレビューボタンとプログラムボタンを含む列が切り替わったり、そのままになったりするので、混乱を招き、ミスが発生する可能性があります。

このような理由から、M/Eスタイルのスイッチングがより好まれています。M/Eスタイルでは、緑のプレビューボタンはプレビュー列にあり、赤いプログラムボタンは常にプログラム列にあります。このような一貫性があるため、M/Eスタイルのスイッチングはより安心です。

ATEMスイッチャーとは

ATEM Television Studioスイッチャーは、あらゆるビデオ処理を行い、あらゆるビデオ入出力コネクターを搭載しています。

このスイッチャーは、ボタンやノブの付いたコントロールパネルを内蔵しているので、スイッチャーから直接スイッチングができます。あるいは、イーサネット経由でコンピューターに接続して、ソフトウェアパネルと同じコントロールをエミュレートしたATEM Software Controlを使用することもできます。ソフトウェアパネルと内蔵コントロールパネルを使用して、複数のスタッフでプロダクションのスイッチングを行うことも可能です。例えば、1人のスタッフが内蔵パネルでカメラをスイッチングし、別のスタッフがソフトウェアパネルでカメラおよびオーディオレベルをコントロールできます。あらゆる形態での操作が可能です。

ATEM Television Studioスイッチャーの3G-SDIは、1080p60までのHDビデオをサポートしています。ATEM Television Studio 4K8スイッチャーは、2160p60までの4Kビデオもサポートしています。スイッチャーの全入力には、再同期機能およびフォーマットコンバーターが内蔵されているので、異なるフォーマットを接続しても、スイッチャーの設定した出力フォーマットに自動的に変換されます。

各スイッチャーには、Advanced Chroma Keyer、Fairlightオーディオミキサー、カメラコントロール調整機能、スチルをメディアプールにロードする機能が搭載されています。ネットワークに接続すると、配信入力を選択したり、ネットワークストレージに直接収録できます。

ATEM Television StudioスイッチャーはAux出力を搭載しており、内部/外部ビデオソースを使用できます。external video sources. 例えば、プログラム出力が複数必要な場合はプログラム出力を選択できます。あるいはダウンストリームキーを含まないプログラム出力や、特定のビデオ入力などを選択することもできます。ATEM Television Studio HD8シリーズは2系統、ATEM Television Studio 4K8モデルは10系統のAux出力を搭載しています。ATEM Television Studio 4K8モデルの追加Aux出力にHyperDeckディスクレコーダーを接続すれば、全ビデオ入力を収録して後から編集できます。これらのビデオ入力の収録は、各入力を個別に収録するため、個別収録（ISO収録）と呼ばれます。

ATEM Television Studio HD8 ISO

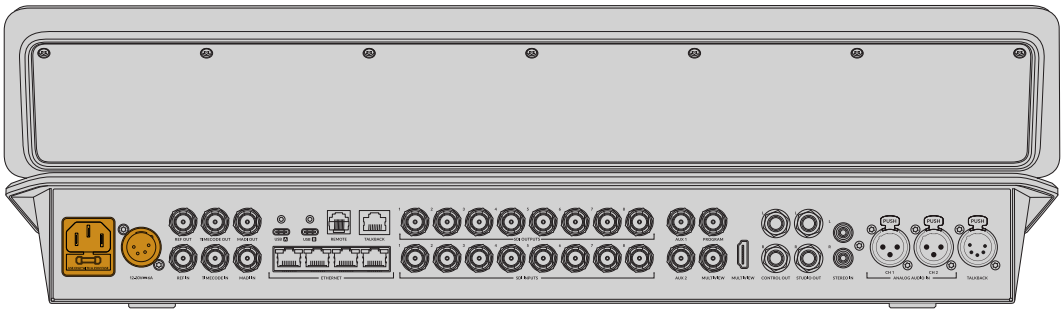
ATEM Television Studio HD8　　ATEM Television Studio 4K8

始めに

ATEM Television Studioは、電源、SDIビデオソース、マルチビューを接続し、内蔵コントロールパネルで入力を確認するだけで簡単に使用を開始できます。

電源の接続

ATEM Television Studioスイッチャーに電源を供給するには、リアパネルの電源入力に標準のIECケーブルを接続します。ATEM Television Studioシリーズは、DC入力も搭載しているので、外部の12Vバッテリーを接続できます。電源が入ったら、コントロールパネルのLCDがオンになり、カメラボタンが点灯します。



ATEM Television Studioは、IEC経由またはDC入力で電源に接続

マルチビューの接続

入力を確認するには、SDI/HDMIマルチビュー接続のどちらかを使用して、マルチビュー出力にディスプレイを接続します。

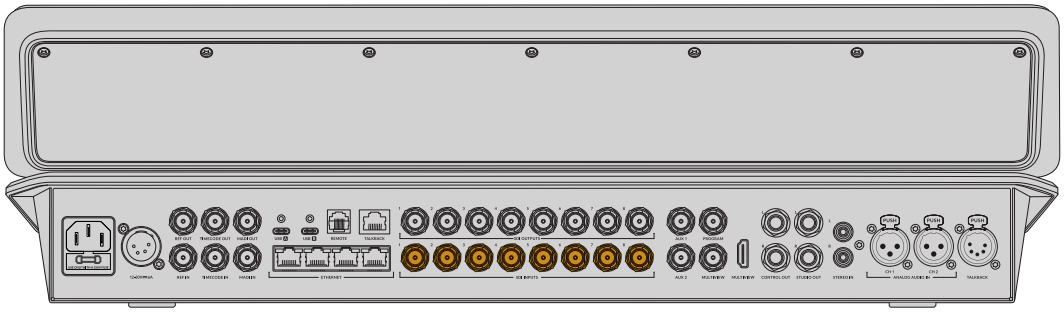
接続したら、8つの小さいボックスと2つの大きいボックスがディスプレイに表示されます。各ボックスには別々のビューが表示されます。ソースを追加するとそれらが各ビューに表示されます。ATEM Software Controlを使ってマルチビューのルックをカスタマイズすると、最大16のビューを表示できます。詳細は、このマニュアルの「マルチビューの使用」セクションを参照してください。

マルチビューを確認できたら、ATEMスイッチャーが正常に起動しているので、ソースを接続できます。

ATEM Television Studioスイッチャーをモニターに接続し、マルチビュー出力を確認

ソースの接続

SDIカメラや、その他のソースをATEM Television StudioのSDI入力に接続します。これらのSDI接続は、フォーマットコンバーターおよびフレーム同期機能に対応しているので、スイッチャーで設定したビデオフォーマットにすべてのソースが一致します。



ATEM Television StudioのSDI入力

ATEM Television Studio HD8 ISOスイッチャーでは、イーサネットポート経由でBlackmagic Studio Camera 6K Proなどの配信ソースに接続できます。イーサネット経由でのソース選択に関する詳細は、後述の「ISOシリーズの追加機能」セクションを参照してください。

オーディオの接続

ATEM Television Studioシリーズにはオーディオミキサーが搭載されており、カメラ映像のエンベデッドSDIオーディオだけでなく、XLRおよびRCA入力、MADI BNC入力からの外部オーディオも扱えます。これらの追加オーディオ入力では、カメラのマイクや事前に収録したオーディオなど、他のオーディオソースも使用できます。

ATEM Television Studioのオーディオ入力

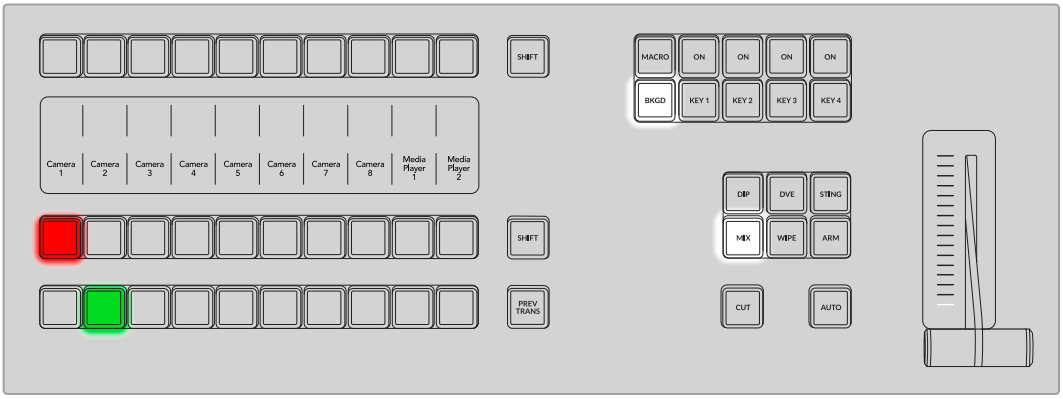
オーディオを接続したら、コントロールパネルのオーディオミキサーのレベルをチェックして、各チャンネルの信号を確認できます。

Fairlightオーディオミキサーのメーターでオーディオレベルを確認

詳細は、このマニュアルの「オーディオミキサー」のセクションを参照してください。

トランジションの実行

まず、M/Eベースのコントロールパネルで最も目につくのは、Tバーまたはスライダーの形状のトランジションフェーダー、プログラム/プレビューソースボタンの列です。

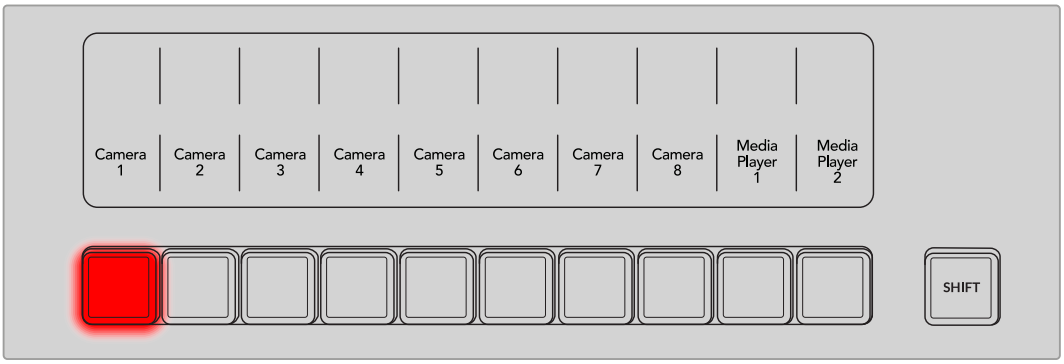


セットアップの確認中、最初に試してみたいのがトランジションでしょう。

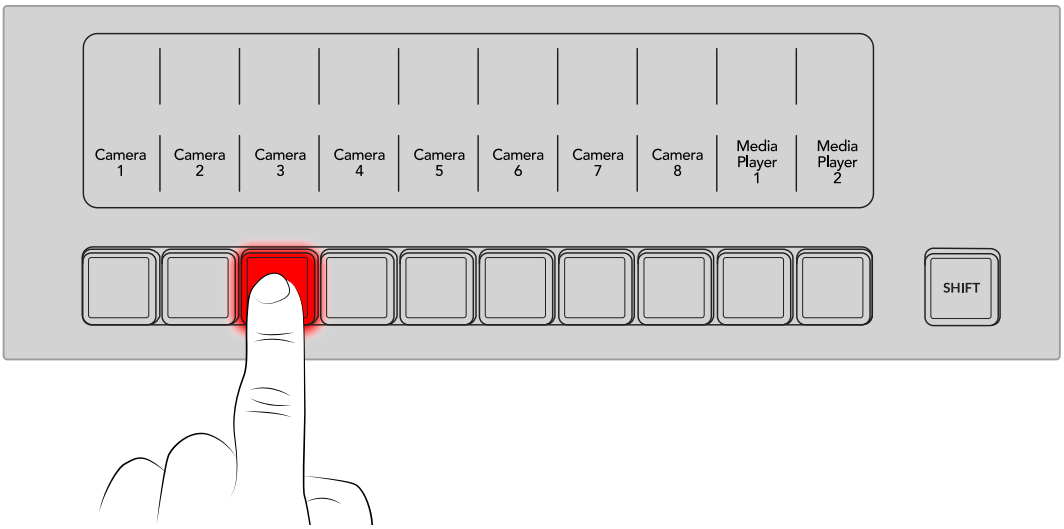
ATEM Television Studioスイッチャーには2つの切り替えモードがあります。デフォルトの「プログラム/プレビュー」では、オンエアソースを切り替える前にプレビューできます。しかし、プログラムバス上段のソース選択ボタンでは、ソースをプログラム出力にホットスイッチできます。ボタンを押すとすぐにオンエアソースが切り替わるので、この列でソースを選択する場合はくれぐれも慎重に行ってください。

プログラム列を使用して入力1から入力3にカットで切り替える：

1 「1」の入力ボタンが赤く光り、現在ライブでオンエアされていることを示しています。



2 プログラム列で入力3を押します。



入力1から入力3に瞬時に切り替わります。「3」の入力ボタンが赤く光り、入力3が現在ライブでオンエアされていることを示します。これが、1つのソースから別のソースへと直接切り替える「カット」と呼ばれる手法です。

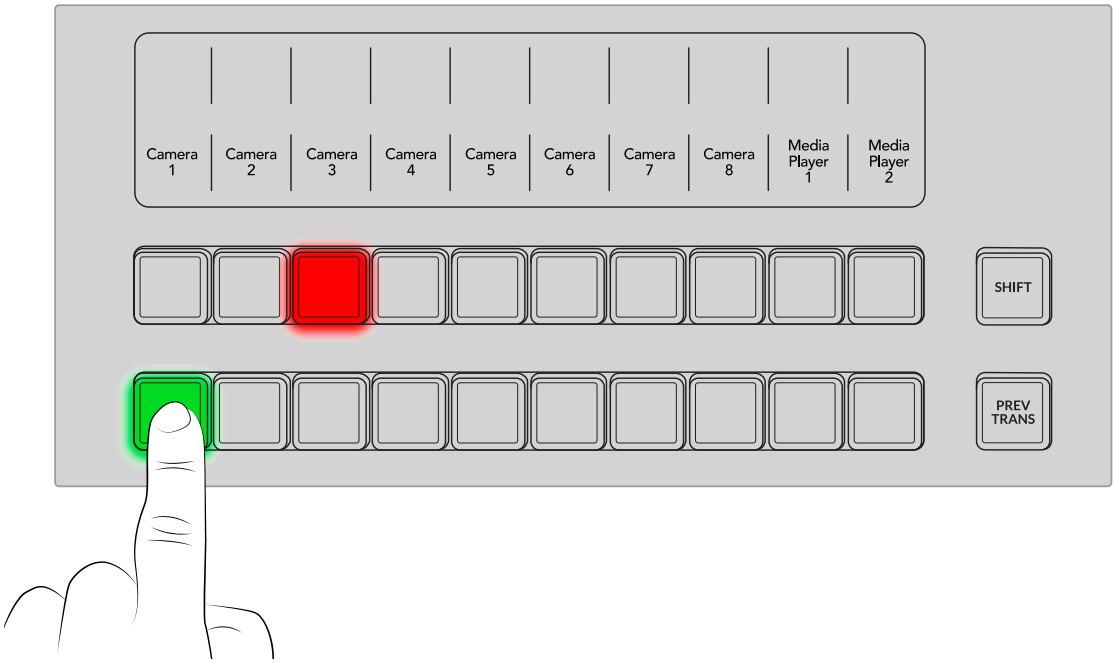
より順序立った優れたトランジションを行うには、切り替えるソースを予めプレビュー列で選択してから、カット、トランジションでオンエアソースを切り替えます。

ATEMのようなパワフルなスイッチャーでは、プレビュー列で選択したソースが正しいかどうかを、トランジションを行う前にプレビュー画面で確認することができます。すべてのステップを把握できるので、エラーが生じる可能性は非常に低いと言えます。このようにプログラム、プレビューをそれぞれ確認できるのは、M/Eスタイルのオペレーションだけです。

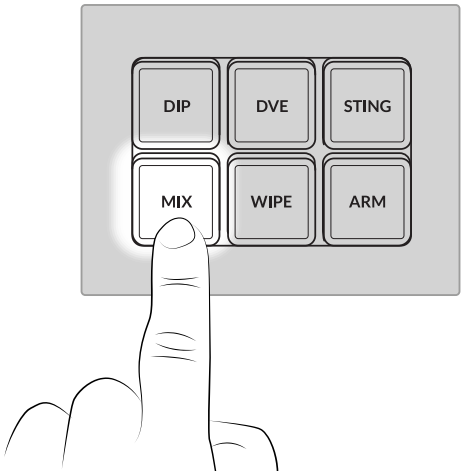
下部のボタン列は、プレビューバスのソース選択ボタンです。多くの場合、これらのボタンを使って次にオンエアするソースを選択します。ここで選択したソースが次のトランジション後にプログラム出力へと送信されます。次のトランジションは、「CUT」ボタンまたは「AUTO」ボタンを押すか、トランジションフェーダーを上下に動かすことで実行できます。トランジションコントロール・セクションで、ミックス、ディップ、ワイプ、DVE、あるいはその他のトランジションを選択できます。

次の例では、ソース3からソース1へ戻すのに、ミックストランジションを使用します。

1 プレビュー列でボタン1を押して、次のソースを選択します。押したボタンは緑に光り、プレビューバスに選択されていることを示します。

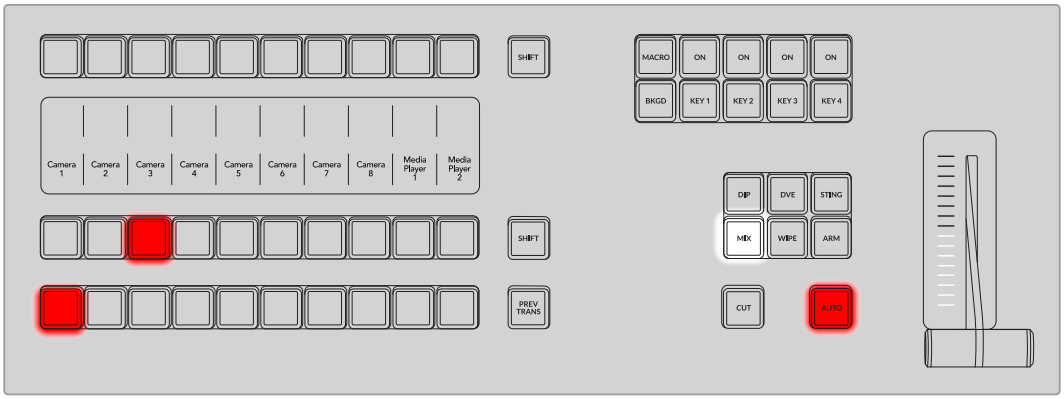


2　「MIX」のトランジションボタンを押します。

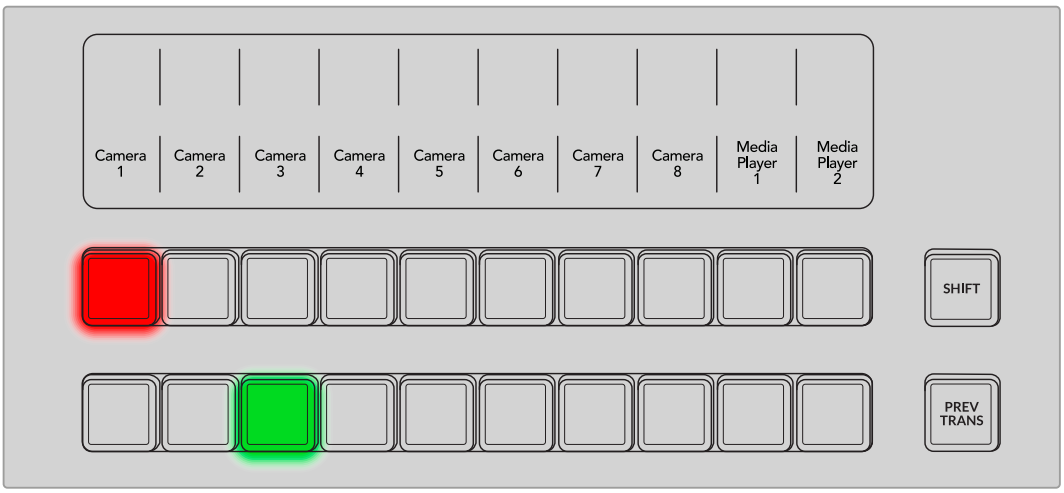


3　「AUTO」ボタンを押してトランジションを実行します。

トランジションの実行中、プログラムおよびプレビュー列の入力ボタンは両方赤くなり、両方のソースがオンエアされていることを示します。フェーダーバーのインジケーターも点灯します。



トランジションが完了すると、プレビュー列とプログラム列で選択したソースが入れ替わっていることに気付くでしょう。これは、プレビュー列で選択したソースがオンエア状態になったためで、トランジションが完了するとプログラム列で選択されている状態になります。プログラム列でオンエアされているソースを常に確認できます。



ネットワークの設定

ATEMスイッチャーは、工場出荷時には、イーサネットケーブルでハードウェアコントロールパネルに接続できるよう設定されています。しかし、ATEMはイーサネットIPプロトコルをフルサポートしているので、ATEM Television Studioスイッチャーおよび外付けのATEMハードウェアパネルをネットワークに接続でき、インターネットがあれば世界中どこでも使用できます。ネットワークに接続することで、スイッチャーをさらに柔軟にコントロール可能です。例えば、ATEM Camera Control Panelをスイッチャーと同じネットワークに接続すると、1人がコンテンツをスイッチングして、もう1人がカメラを調整できます。さらに、コンピューターのソフトウェアパネルも使用できるため、3人目のスタッフがソフトウェアパネルでオーディオやメディアの管理を行うこともできます。

ATEM Television Studioシリーズは、デフォルトでDHCPに設定されているので、ネットワーク情報を自動的に取得できます。固定IPアドレスをマニュアルで設定することも可能です。

1 ホームメニュー以外にいる場合は、「HOME」ボタンを押してメインメニューに戻ります。

2 LCDスクリーン上部の「ネットワーク」ソフトボタンを押して、右矢印ボタンで「IPアドレス」に進みます。スイッチャーがネットワークを認識すると、割り当てられたIPアドレスが画面の下に表示されます。

3 IPアドレスをマニュアルで設定する場合は、LCD上部の「DHCPオン」ソフトボタンを押して、DHCPをオフにします。LCDの下にある対応するノブを使って、IPアドレスをマニュアルで設定します。固定IPアドレスを使用する場合、スイッチャーは、HyperDeckなど、接続するデバイスと同じIPアドレスのサブネットを共有する必要があります。一般的には、IPアドレスの最初の3フィールドが一致する必要があります。

4 IPアドレスを入力できたら、「変更を保存」ボタンを押します。

これでスイッチャーがネットワークに接続されました。ATEM Software Controlで配信プラットフォームを選択して、「オンエア」ボタンを押すと配信を開始できます。

配信プラットフォームの選択に関する詳細は、後述の「出力タブ」セクションを参照してください。

スイッチャーを使い始めるのに必要な作業はこれだけです！ATEM Television Studioシリーズのあらゆる機能およびコントロールに関する詳細は、このマニュアルに後述されています。

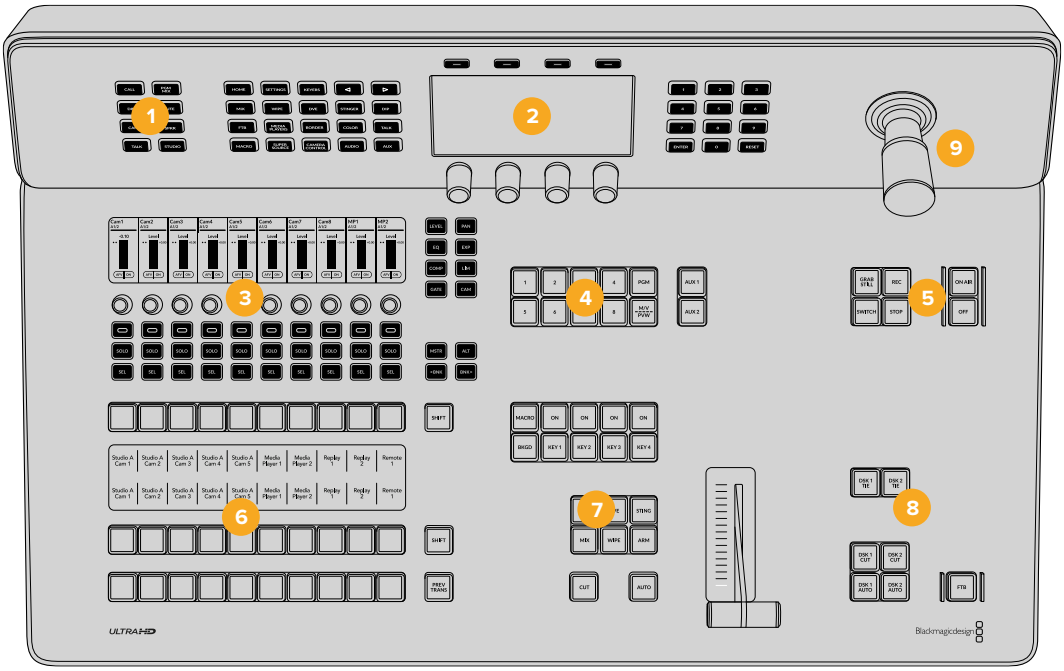
ATEM Television Studioの使用

ATEM Television Studioスイッチャーの高度なコントロールパネルには、プログラムおよびプレビュー列、ミックスエフェクトパネル、トークバックコントロール、Fairlightオーディオミキサーおよびカメラコントロールの専用ボタン、LCDメニュー、トランジションコントロールを正確に実行するTバーが含まれています。

内蔵パネルと同梱のソフトウェアパネルは連動しており、どちらかのパネルで設定を変更すると、もう一方のパネルにも設定が反映されるので、これらのパネルを同時に使用できます。カメラコントロールを担当するアシスタントスタッフがいる場合、ATEM Camera Control Panelなどのハードウェアコントロールパネルを追加して使用することも可能です。

コントロールパネル概要

このセクションでは、メインのシステムコントロール、LCDメニュー、プログラムおよびプレビューボタン、トランジションボタン、キーヤーボタン、Fairlightオーディオコントロールなど、コントロールパネルの基本的な機能を紹介します。



ATEM Television Studio 4K8

1 トークバックボタンおよび「CALL」ボタン
2 システムコントロール
3 オーディオミキサー
4 Aux選択ボタン
5 配信および収録ボタン
6 プログラム、プレビュー、ソース選択
7 DVEおよびトランジション
8 ダウンストリームキーヤーとフェード・トゥ・ブラック
9 ジョイスティック（ATEM Television Studio 4K8スイッチャー）

システムコントロール

コントロールパネルの上部にあるLCDとその周りにあるボタンはシステムコントロールと呼ばれ、スイッチャーのミッション管制センターの役割を果たします。重要な設定を変更したり、スイッチャーの一般的な設定を行うための中心的なアクセスメニューとなります。

システムコントロール

LCDメニューのナビゲート

「HOME」など、システムコントロールボタンを押すと、LCD画面に関連するコントロールや設定が表示されます。LCDスクリーンの上下にあるソフトボタンやノブを使用して設定を変更します。

各LCDメニューには、1ページ以上の設定があり、メニュー名の下にドットで表示されます。これらのページは、左右の矢印ボタンや、LCDの右にあるテンキーパッドを使ってナビゲートできます。

例えば、切り替えモードを「プログラム/プレビュー」と「A/B切り替え」から選択できます：

1 「SETTINGS」ボタンを押します。設定が選択されると、左右の矢印ボタンと数字ボタンが点灯します。

LCDの右にある数字ボタンが点灯し、各メニューページにすばやくアクセスできます。

2 右矢印を何度か押して切り替えモードのオプションを表示させるか、「6」の数字ボタンを押して切り替えモードメニューにすばやくアクセスします。

テンキーパッドをメニューのナビゲーションに使用

3 LCD上部のソフト選択ボタンで、「プログラム/プレビュー」または「A/B切り替え」を選択します。

LCD上部のソフト選択ボタンで切り替えモードを選択

4 「HOME」ボタンを押して設定メニューから出ます。

テンキーパッドを使用して直接数値を入力することもできます。例えば、ホームスクリーンでオートトランジションの時間を変更する場合、「自動レート」ノブを押すと、キーパッドボタンが点灯します。

新しい長さの数値を入力して「ENTER」を押します。

ENTERを押して変更を確定

設定の変更

LCDに最初に表示されるホームスクリーンには、ネットワーク設定とユーザープロファイルが含まれます。「HOME」ボタンを押すと、いつでもホームスクリーンに戻ります。

「ボタンマッピング」の上にあるLCDソフトボタンを押して、ボタンマッピングメニューを開きます。

ホーム

ホームメニューには、現在の入力およびトランジションレートの他に、ネットワーク設定、ソフトウェアバージョンの情報、プロファイルの保存などのサブメニューが表示されます。

ホーム	メインのLCDディスプレイ
ネットワーク	スイッチャーをDHCPあるいはアドレスのマニュアル入力に設定します。
パネル情報	ソフトウェアバージョンを表示します。
プロファイル	お気に入りのパネル設定およびマクロを保存しておき、次にパネルを使用する際に復元できます。複数のユーザーがスイッチャーを使用している場合に最適です。

設定

「SETTINGS」ボタンを押すと、「設定」、「HyperDeck」、「ボタンマッピング」などのメニューが表示され、LCD上部のソフトボタンで選択できます。

設定の変更

ノブ、ソフトボタン、テンキーパッドを使って設定メニューのオプションを調整できます。

スイッチャーのビデオフォーマット設定	ビデオ設定は、ATEMスイッチャーで扱うビデオフォーマットの選択に使用します。ビデオフォーマットが変更されると、メディアプールにロードしたフレームが削除されます。
マルチビューのビデオフォーマットを設定	プロダクションのビデオフォーマットが1080p25以上に設定されている場合、マルチビュー出力をそれより低いフレームレートに設定できます。マルチビュー出力がダウンコンバートされるよう設定することで、より幅広いモニターとの互換性が得られます。
明度設定	明度設定でノブを使用して、ボタン、ラベル、スクリーンの明るさをカスタマイズできます。この設定は、暗い環境で作業する場合に便利です。

スイッチャータイムコード	タイムコードジェネレーターは、スイッチャーを起動した瞬間から、時刻タイムコードのカウントを開始します。しかし、カウンターをゼロにリセットしたり、新しいタイムコードの数値をマニュアルで入力して、そこから開始することも可能です。
切替モード	ATEMはデフォルトで、M/Eスイッチャーの現在の標準である「プログラム/プレビュー」切り替え方式に設定されています。旧式のA/B方式で使用したい場合、この設定を「A/B切替」に変更できます。
シリアルポート設定	ATEM Television Studioスイッチャーシリーズは、リアパネルにRS-422コントロール用のRJ12リモートポートを搭載しています。シリアルポートメニューで、このポートの使用方法を選択できます。
カメラコントロール設定	ATEM Television Studioスイッチャーシリーズは、リアパネルにRS-422コントロール用のRJ12リモートポートを搭載しています。リモートポートのメニューでこのポートの使用方法を選択できます。
カメラコントロール	ATEM Television Studio 4K8モデルでは、「反転」および「標準」を選択することで、ジョイスティックのティルト方向を変更できます。モニタリングノブを使って、カメラコントロールのモニタリング用にSDI出力を選択できます。
言語を選択	ATEM Television Studioスイッチャーシリーズの言語設定は、日本語、英語、ドイツ語、スペイン語、フランス語、イタリア語、韓国語、ポーランド語、ポルトガル語、ロシア語、トルコ語、ウクライナ語、中国語（簡体字）から選択できます。
メディアフォーマット	設定メニューの最後のページでは、内部ストレージをフォーマットできます。オプションのストレージを接続していないスイッチャーでは、この設定は無効になります。詳細は、このマニュアルの「ストレージメディア」のセクションを参照してください。
起動時の状態	すべてのプロダクションでATEM Television Studioスイッチャーの同じ設定を使用する場合、デフォルトの起動時の状態を保存できます。一度保存すると、スイッチャーを起動するたびにすべてのプリセットおよび環境設定がロードされます。これらの設定は、「起動時の状態をクリア」でリセットできます。

HyperDeck設定

最大10台までのHyperDeckディスクレコーダーを接続して、システムコントロールで操作できます。HyperDeckを接続する際は、これらの設定を使用して、入力の選択、自動再生のオン/オフの切り替えおよびフレームオフセット設定、IPアドレスのコンフィギュレーションが可能です。HyperDeckの設定に関する詳細は、このマニュアルの「HyperDeckコントロール」のセクションを参照してください。

ボタンマッピング

ボタンマッピング設定にアクセスするには、「SETTINGS」ボタンを押して一般的なスイッチャー設定のLCDメニューを開き、「ボタンマッピング」ソフトボタンを押します。

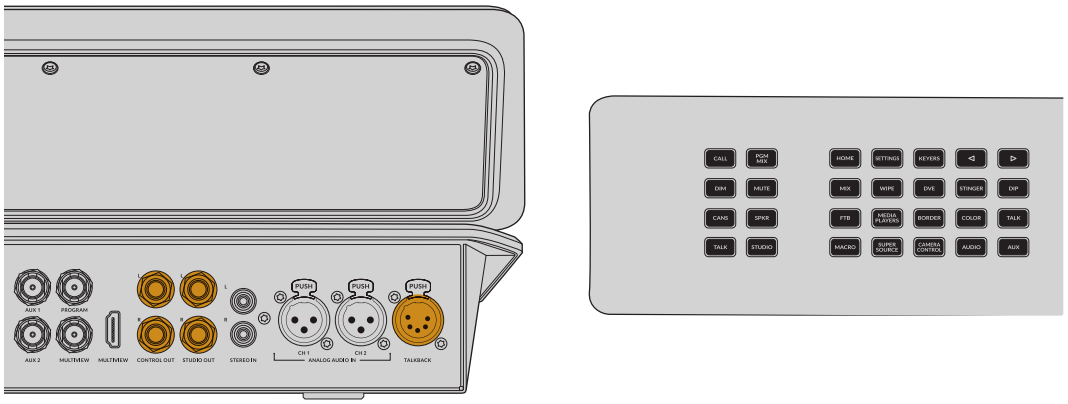
各LCD設定の下にあるコントロールノブを使用して、マッピングしたいボタンとそのボタンに設定したい入力を選択します。また、特定のソースをハイライトしたい場合、ボタンの色やパネルに表示されるラベルの色も変更できます。例えば、再生ソースを異なる色でハイライトすれば、パネル上で瞬時に認識できます。プレビュー列/プログラム列のどちらも変更した色になりますが、該当のソースがプレビュー出力/プログラム出力に切り替えられると、ボタンの色はそれぞれ緑/赤になります。

色を設定すると即座に変更されます。変更を保存する必要はありません。「HOME」ボタンを押してホームメニューに戻ります。

ボタンの明るさを変更するには、「設定」ボタンを押してスイッチャーの一般設定のLCDメニューを開き、矢印ボタンを使うか、テンキーパッドで4を押して4ページ目へ行きます。対応するノブを使用して、ラベルおよびボタンを適切な明るさに調整します。すべてのボタン設定を変更したら「HOME」ボタンを押してホームページに戻ります。詳細は、このマニュアルの「明度設定」のセクションを参照してください。

トークバックボタンおよび「CALL」ボタン

パネルの左上にあるトークバックボタンおよび「CALL」ボタンを使用すると、トークバック機能に直接アクセスできるので、追加のハードウェアは必要ありません。マイク付きのインターコムヘッドセットを、スイッチャー背面の5ピンのトークバック用XLRソケットに接続します。



CALLボタン

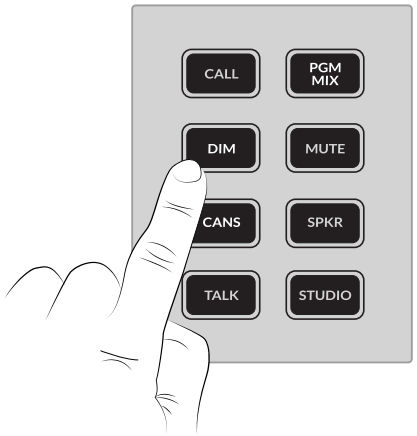
「CALL」ボタンを長押しすると、接続しているすべてのカメラのタリーライトが点滅します。カメラマンの注意を引きたい場合や、カメラマンに担当のカメラがオンエアになることを知らせたい場合などに便利です。

プログラムミックス

「PGM MIX」を押すと、プログラムミックスを聴くことができます。「CANS」または「SPKR」が選択されている場合、トークバックXLRおよびコントロール出力に接続されたスピーカーで、プログラムミックスを聴くことができます。

DIM

「DIM」ボタンを押すと、フェーダーを調整せずにプログラムミックスのレベルを一時的に下げることができます。再度「DIM」ボタンを押すと、元のレベルに戻ります。



MUTE

「MUTE」を選択すると、フェーダーを調整せずにプログラムミックス出力を一時的にミュートできます。

CANS

スイッチャー背面の5ピンのトークバック用XLR接続でヘッドセットを使用する場合、「CANS」ボタンを押すと同接続の音声が有効になります。このボタンが選択されている時に「PGM MIX」を押すと、プログラムミックスを聴くことができます。

スピーカー

「SPKR」ボタンを選択すると、スイッチャー背面のコントロール出力のオーディオが有効になります。

TALK

インターコムヘッドセットを使用する場合、「TALK」ボタンを押すとマイク出力が有効になります。「STUDIO」ボタンを長押しするか2度押しでホールドすると、スタジオ出力からのみ聴くことができます。

「TALK」ボタンを2度押しすると、マイクが常にオンになり、ボタンが点灯したままになります。ボタンを再度2度押しするとオフになります。「STUDIO」ボタンと「SPKR」ボタンが両方選択されていると、マイクは全トークバックチャンネルで常にオンになります。

STUDIO

「STUDIO」ボタンは、パネル背面の「STUDIO OUT」とラベルされている出力を有効にします。この出力は、出演者に聞こえるようにスタジオ内のスピーカーに接続できます。「TALK」ボタンが選択されている場合、「STUDIO」ボタンを一時的に長押しするか、2度押しでホールドして会話できます。

ヘッドセット出力、コントロール出力、スタジオ出力のレベルは、システムコントロールの「AUDIO」および「TALK」ボタンで調整できます。

1 「TALK」ボタンを押します。ヘッドフォン設定は、パネル背面の5ピンXLRヘッドフォン出力のオーディオミックスを調整します。この設定は2ページ目に続きます。

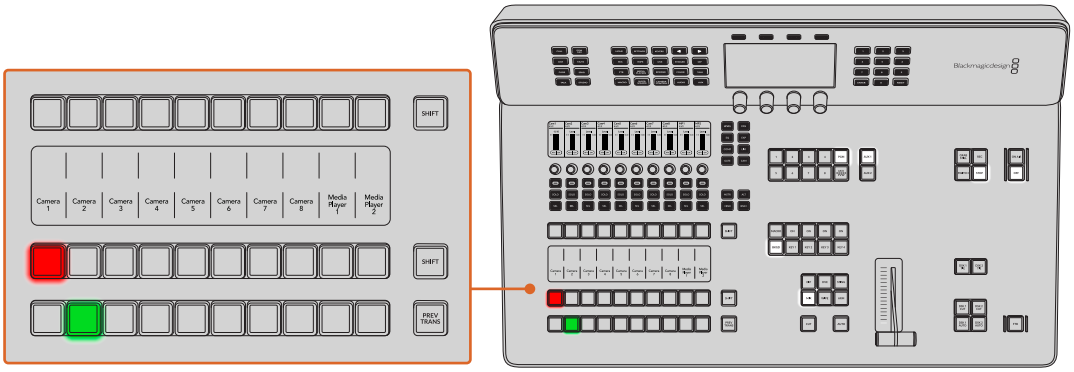
2 対応するノブを回してレベルを調整します。

3 3〜4ページ目で、「コントロール出力」および「スタジオ出力」のレベルを調整します。

設定	
レベル	ヘッドフォン出力、スタジオ出力、コントロール出力の全体的な出力レベルを調整。
プログラムミックス	プログラムのオーディオレベルを設定。
プロダクション	各出力のプロダクショントークバックのレベルを増減。
エンジニア	各出力のエンジニアトークバックのレベルを増減。
サイドトーン ヘッドフォンのみ	ヘッドフォンのみで使用可能。サイドトーンレベルは、ヘッドセットのマイクからの声をモニター出力にミックスします。 これは、ノイズキャンセリング機能のついたヘッドセットを使用している場合、便利な機能です。
MICゲイン ヘッドフォンのみ	トークバックヘッドセットの中には、マイクレベルが低く、聞き取りにくいものがあります。MICゲイン設定を調整することで、マイクレベルを増減できます。

ミックスエフェクト

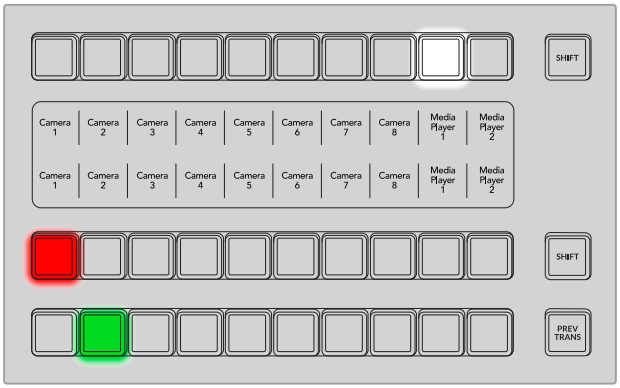
プログラムバス、プレビューバス、ソース名ディスプレイは、プログラム出力およびプレビュー出力のソースをスイッチングする際に使用します。



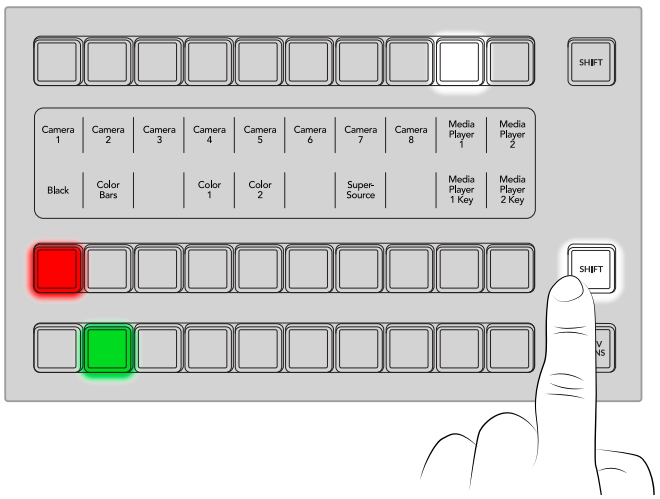
ソース名ディスプレイ

ソース名ディスプレイは、スイッチャーの外部入力および内部ソースのラベルを表示します。外部入力のラベルは、ソフトウェアコントロールパネルの設定ウィンドウで編集できます。内部ソースのラベルは固定されており変更できません。

ソース選択列、プログラム列、プレビュー列の各ボタン列のラベルを表示します。



「SHIFT」ボタンを押すと、ソース名ディスプレイが変更され、シフトソースと呼ばれる追加ソースが表示されます。これで最大20個の異なるソースを選択できます。



ソース選択列とプログラム列の横にある2つのSHIFTボタンを同時に押すと、ソース名ディスプレイが変更され、保護ソースが表示されます。これらのソースはキーヤーおよびAux出力へのルーティング用のソース選択列で使用できます。保護ソースはプログラム出力、プレビュー出力、クリーンフィード1&2です。

プログラムバス（PROGRAM）

「PROGRAM」バスは、バックグラウンドソースをプログラム出力にホットスイッチする際に使用します。現在オンエアされているソースのボタンは赤く光ります。ボタンが赤く点滅している場合は、シフトソースがオンエアされています。「SHIFT」ボタンを押すと、シフトソースが表示されます。

プレビューバス（PREVIEW）

「PREVIEW」バスは、プレビュー出力のソース選択に使用します。ここで選択したソースが次のトランジション後にプログラム出力へと送信されます。選択されているソースのボタンは緑に光ります。ボタンが緑に点滅している場合は、シフトソースがプレビューされています。「SHIFT」ボタンを押すと、シフトソースが表示されます。

シフト（SHIFT）

「SHIFT」ボタンはプログラムバス、プレビューバス、選択バス、ラベルを全体的にシフトするのに使用します。また同ボタンは、トランジションタイプやその他のメニュー機能のシフトにも使用されます。

プレビューバス、選択バスのボタン、トランジションタイプのボタンの2度押しは、これらのボタンをシフト選択することと同じ機能で、よりスピーディなシフト選択ができます。プログラムバスでは、ボタンを押すとすぐにプログラムソースが切り替わるため、ボタンの2度押しはできません。

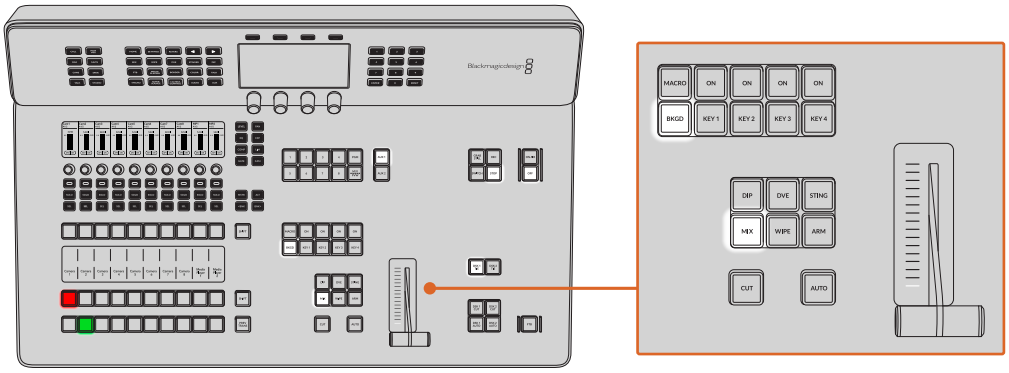
ソース選択バス

ソース選択バスは、ソース名ディスプレイと連動して動作し、Aux出力およびキーヤーへのソース選択に使用します。マクロボタンが有効になっている場合、このボタン列は、対応するスロットに記録されたマクロのロード/実行にも使用されます。マクロボタンが有効になっている場合、青く点灯します。

送信先ディスプレイと選択バスは、Aux出力およびキーヤーへのルーティングを表示します。現在選択されているソースは光ります。ボタンが点滅している場合は、シフトソースが選択されています。ボタンが緑に光っている場合は、保護ソースが選択されています。

保護ソースはプログラム出力、プレビュー出力、クリーンフィード1&2です。

トランジションコントロールと アップストリームキーヤー



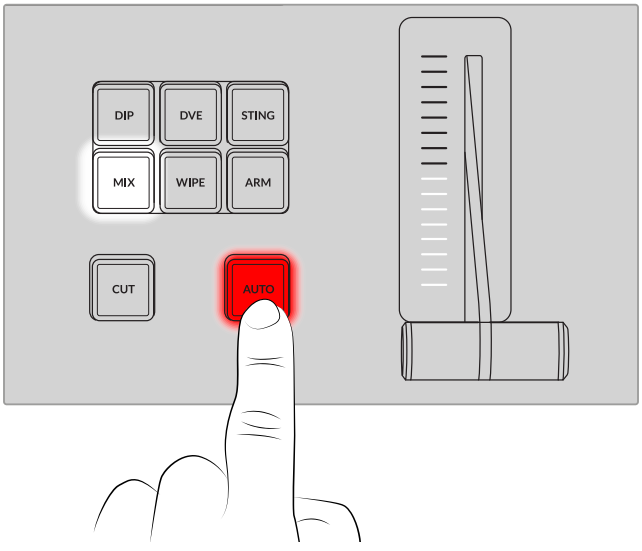
CUT

「CUT」ボタンは、選択したトランジションタイプに関わらず、プログラム出力からプレビュー出力へ直接トランジションします。

AUTO

「AUTO」ボタンは、選択したトランジションを、LCDの「ホーム」メニューにあるレート設定で設定されたレートで実行します。各トランジションタイプのレートは、LCDメニューで設定します。設定したレートは、対応するトランジションタイプのボタンを選択した際に表示されます。

トランジションの実行中、AUTOボタンが赤く光り、フェーダーバーインジケーターのLEDはトランジション処理の進行に合わせて光ります。ソフトウェアコントロールパネルを使用している場合、ソフトウェア上のフェーダーバーもトランジションの進行に合わせてアップデートされ、視覚的なフィードバックが得られます。



フェーダーバーとフェーダーバーインジケーター

フェーダーバーはAUTOボタンの代わりに使用して、トランジションをマニュアルでコントロールします。フェーダーバーの隣にあるフェーダーバーインジケーターは、トランジションの進行を視覚的にフィードバックします。

トランジションの実行中、AUTOボタンが赤く光り、フェーダーバーインジケーターはトランジション処理の進行に合わせて光ります。ソフトウェアコントロールパネルを使用している場合、ソフトウェア上のフェーダーバーも連動します。

トランジションタイプボタン

トランジションタイプボタンで、ミックス、ワイプ、ディップ、DVE、スティンガートランジションの5種類の中からトランジションを選択できます。トランジションタイプを選択するには、使用したいトランジションタイプが表示されたボタンを押します。これらのボタンは、選択されていると点灯します。

トランジションタイプを選択すると、LCDメニューにトランジションレートが表示され、該当のトランジションタイプのすべての設定にアクセスできます。ソフトボタンやノブを使用して設定/変更します。

「ARM」ボタンは現在使用できませんが、将来的なアップデートで使用できるようになる予定です。

アーム

「ARM」ボタンは、トランジションの後に、プレビューバスで選択した接続済みのHyperDeckからの自動再生を有効にします。これは自動再生機能と似ており、トランジションを開始するために「CUT」または「AUTO」ボタンを押すと、プレビューバスで選択したHyperDeckが再生を開始します。アーム機能を使用するには、「ARM」ボタンを押すと、選択したHyperDeckの入力が次のトランジション時にのみ自動再生されます。アームを継続的に有効な状態にするには、「ARM」ボタンを二度押しすると、ボタンが緑になり、有効になったことを示します。

アームが有効になっていると、HyperDeckタブで設定されたプリロールは無効になります。

プレビュートランジション

「PREV TRANS」ボタンは、プレビュートランジションモードをオンにします。このモードでは、フェーダーバーを使ってプレビュー出力画面でトランジションを確認できます。このボタンを押すとプレビュートランジション機能が有効になり、トランジションを何度でもプレビューできます。オンエア前にトランジションを確認でき、必要に応じて変更/修正できます。スティンガートランジションのプレビューも可能です。調整が終わったら、再度ボタンを押してプレビュートランジションをオフにしてください。これでトランジションをオンエアできます。

ネクスト・トランジション

ネクスト・トランジションは、BKGD、KEY 1、KEY 2、KEY 3、KEY 4ボタンで、オンエア/オフエアするエレメントを選択できる機能です。複数のボタンを同時に押すことで、バックグラウンドおよびキーをあらゆる組み合わせで選択できます。「BKGD」ボタンを2度押しすると、現在オンエアされているすべてのネクスト・トランジションのアップストリームキーヤーを選択して、これらの設定をネクスト・トランジションボタンにコピーできます。

ネクスト・トランジションのいずれかのボタンを押すと、他のすべての選択がオフになります。ネクスト・トランジションのエレメントを選択する際、プレビュー出力を確認してください。トランジションが完了した後のプログラム出力の状態をプレビュー出力で正確に確認できます。「BKGD」ボタンだけを選択している場合、プログラムバスで現在選択されているソースからプレビューバスで選択されている次のソースへのトランジションが実行されます。

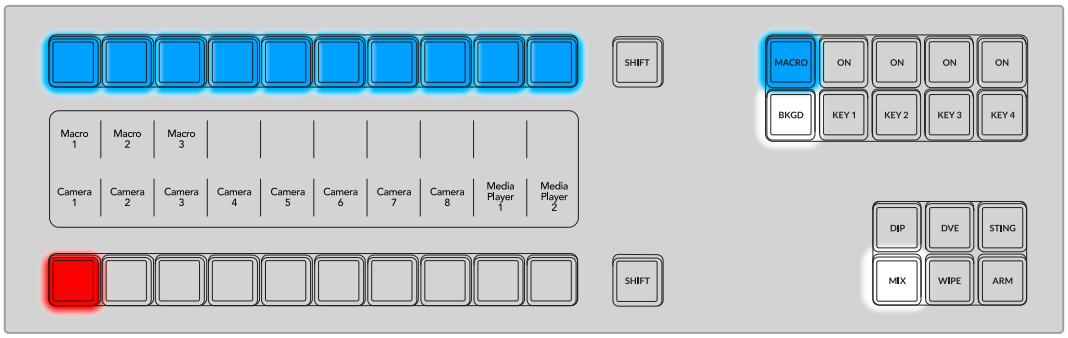
ON AIR

各キーヤーの上にあるオンエアインジケーターボタン（「ON」ボタン）は、どのアップストリームキーが現在オンエアされているかを表示します。キーを即座にカットしてオンエア/オフエアする際にも使用できます。

マクロ

「MACRO」ボタンは、マクロ機能を有効にします。ソース選択列のボタンが、マクロスロットに対応するマクロボタンに変わります。

ソース選択列には10個のマクロボタンがあります。10以上のスロットにマクロを記録している場合、LCDメニューでマクロ設定を開き、コントロールノブを使ってマクログループを変更することで、これらのマクロにアクセスできます。

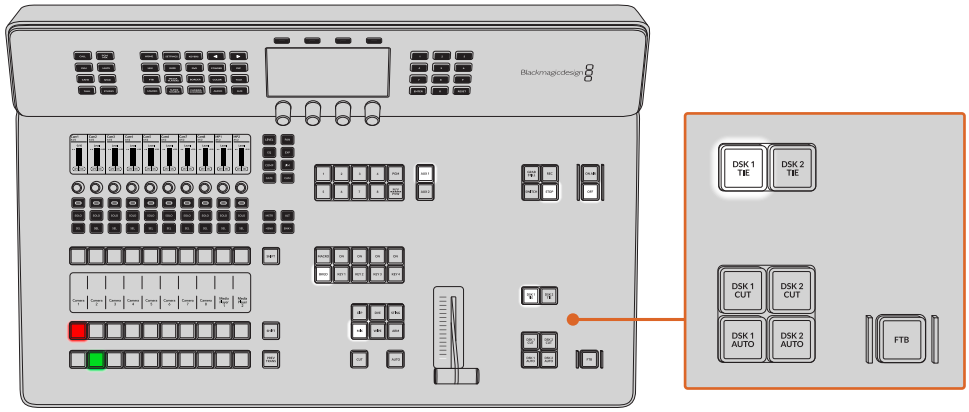


ATEM Television Studioを使用したマクロの記録/実行に関する詳細は、このマニュアルの「マクロの使用」のセクションを参照してください。

ダウンストリームキーヤー

ダウンストリームキーの連結

「DSK TIE」ボタンは、プレビュー出力で、ネクスト・トランジションとダウンストリームキーヤー（DSK）をオンにし、DSKをバックグラウンドトランジションコントロールに連結（tie）するので、DSKは、ネクスト・トランジションとともにオンエアされます。



ダウンストリームキーヤーがメインのトランジションに連結されているため、トランジションはLCDの「ホーム」メニューのレート設定で指定されたレートで実行されます。DSKが連結されていても、クリーンフィード 1に送信される信号は影響を受けません。

ダウンストリームキーの切り替え

「DSK CUT」ボタンは、DSKのオンエア/オフエア切り替えに使用します。同ボタンはDSKの現在の状態を表示し、オンエア中に点灯します。

ダウンストリームキーのミックス

「DSK AUTO」ボタンは、DSKのオンエア/オフエアをDSKレートのLCDメニューで指定されたレートでミックスします。

フェード・トゥ・ブラック

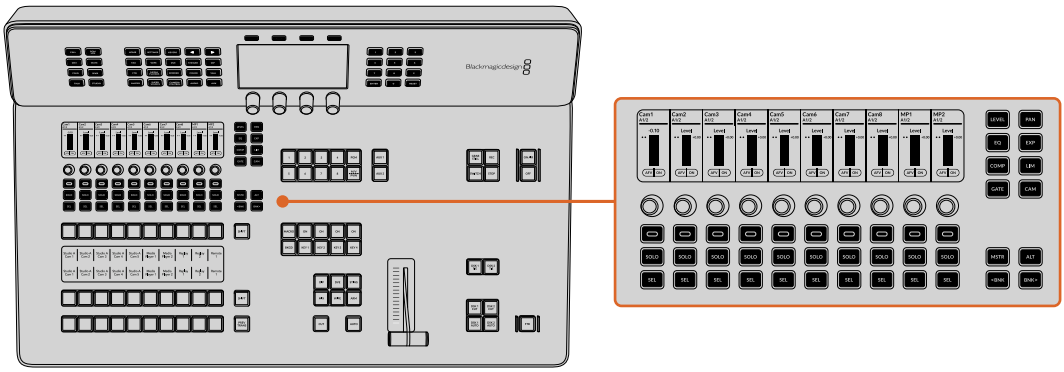
「FTB」ボタンは、FTBレートのLCDメニューで設定されたレートで、プログラム出力を黒画面へとフェードします。プログラム出力が黒画面へとフェードすると、もう一度ボタンを押して黒画面から再び同じレートでフェードアップするまで、FTBボタンは赤く点滅し続けます。フェード・トゥ・ブラックはプレビューできません。

FTBのLCDメニューで「AFV オン」に設定すれば、フェード・トゥ・ブラックに合わせてオーディオも一緒にフェードできます。これにより、フェード・トゥ・ブラックと同じレートでオーディオが音量ゼロにフェードします。フェード・トゥ・ブラックの実行中および実行後もオーディオを残したい場合は「AFV オフ」に設定します。

オーディオミキサー

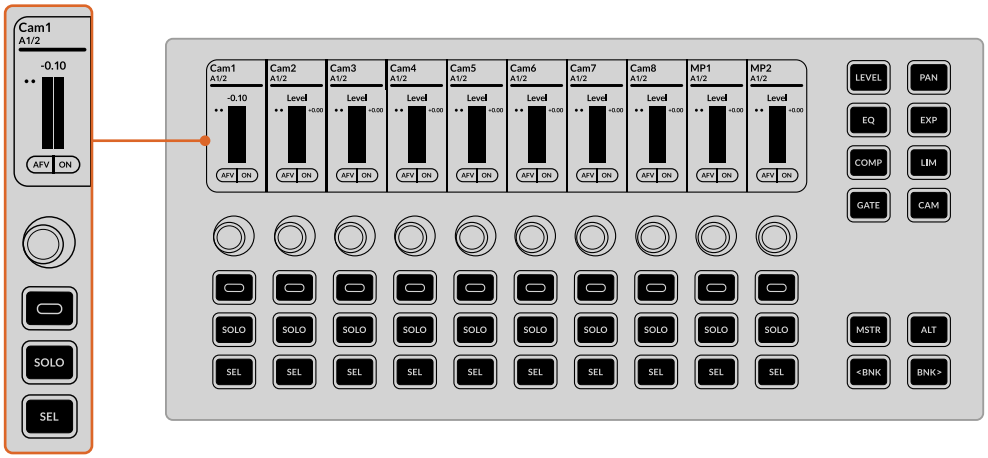
ATEM Television Studioスイッチャーシリーズは、高度なオーディオコントロールを搭載しており、各入力およびマスター出力のサウンドの品質を向上、洗練させることができます。これには、入力レベルコントロール、6バンドのパラメトリックEQ、パワフルなダイナミクス設定が含まれます。このセクションでは、異なるオーディオコントロールを使用して、ライブプロダクションのオーディオミックスを調整、最適化する方法を紹介します。オーディオの調整だけでなく、同じノブやボタンを使用して、カメラコントロールやスイッチャーのオーディオ出力の調整も可能です。

オーディオミキサーには、ライブプロダクションのモニタリングやミキシングに使用できる物理的なコントロールが数多く搭載されています。単一の目的に使用されるボタンもあれば、複数の機能を有するボタンもあります。そのため、特定のボタンやノブの詳細を説明する前に、コントロールの種類を理解しておくと良いでしょう。



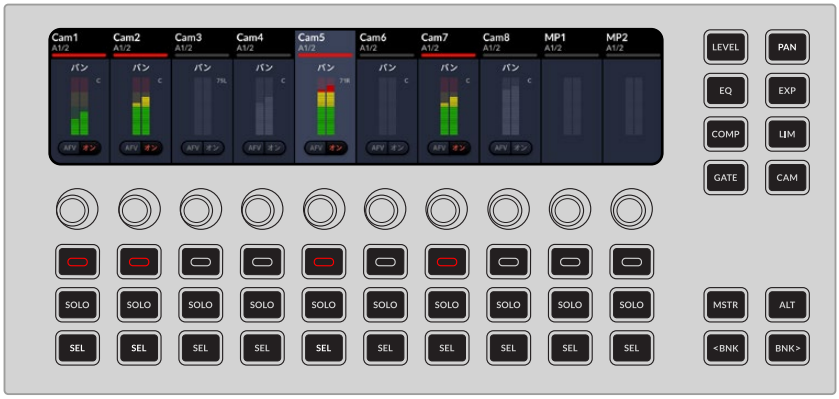
チャンネルストリップ

オーディオミキサーで最も目立っているのが、チャンネルストリップのセクションです。コンソールのデフォルトの操作モードは、10chのチャンネルストリップに対応しており、それぞれにオンボタン、「SOLO」ボタン、「SEL」ボタン、調整用の回転コントロールノブ、チャンネルの情報を表示するLCDスクリーンが搭載されています。チャンネルストリップのコントロールに適用された変更は、すべてATEM Software Controlのオーディオページに反映されます。



LCD

ATEM Television Studioを初めて起動すると、各チャンネルストリップの上にあるLCDに入力名およびレベルメーターが表示されます。LCDには、チャンネルストリップの右側にあるボタンで選択した現在のモードに応じて、異なる情報が表示されます。例えば、「PAN」が選択されていると10の入力のオーディオメーターが表示されます。入力のいずれかがモノ分割に設定されている場合、それぞれのモノ入力に独自のチャンネルストリップが割り当てられます。

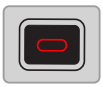


LCDの右側にあるボタンで別のモードを選択すると、LCDディスプレイがそれに応じて更新されます。例えば、「EQ」ボタンを押すと、LCDが切り替わり、中低および高フィルターを表示します。ボタンおよびノブは、オーディオを使用したEQコントロールと同様に、特定のEQパラメーターをコントロールします。

回転ノブ

特定のパラメーターをすばやく調整したい場合、エンコーダーとも呼ばれるこれらの多用途ノブで精度の高い回転コントロールが可能です。特定の入力のレベルを上げたい場合は、「LEVEL」ボタンを押して右にノブを回します。

オンボタン



このソフトコントロールボタンは、LCDに表示するボタンを選択できます。例えば、「LEVEL」が選択されている場合、このボタンでオーディオの挙動を、オーディオ・フォロー・ビデオとオン/オフで切り替えられます。「LEVEL」または「PAN」が選択されている場合、ボタンが赤く光り、入力がオンエアされていることを示します。

SOLOボタン

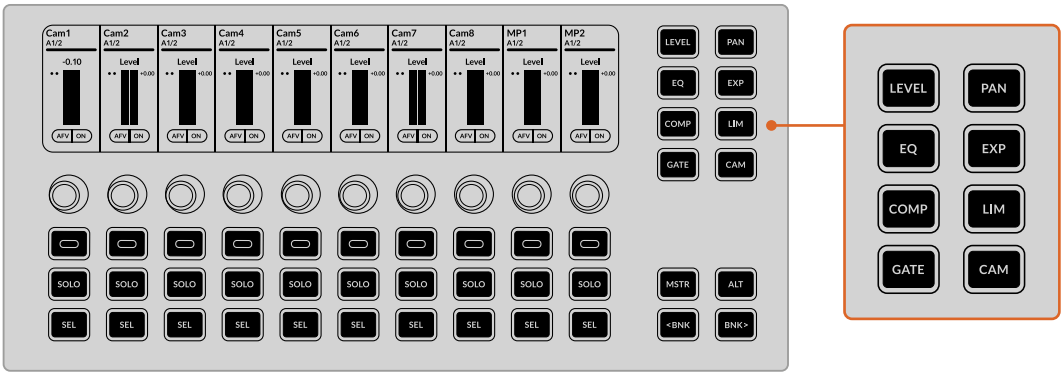
「SOLO」を押すと、該当のチャンネルのみを聴くことができます。これにより、オーディオの調整を洗練させることができます。このボタンを選択すると、選択したチャンネルのLCDにヘッドセットアイコンが表示されます。

SELボタン

「SEL」を押すとチャンネルを選択/選択解除できます。

モードボタン

コントロールボタンを使って、対応する設定をチャンネルストリップに割り当てられます。



「EQ」を2回押すとハイパス/ローパスコントロールが表示されます。

一部の設定にはコントロールのページが複数あり、最初のチャンネルストリップに表示されます。追加のコントロールを表示するには、該当のモードボタンを再度押します。例えば、ハイパス/ローパスフィルターにアクセスするには「EQ」を2回押します。

モード

スイッチャーのフロントパネルのオーディオミキサーで使用できるオーディオモードは、ATEM Software Controlの設定を反映します。また、カメラコントロール設定を使用して、Blackmagic Studio Camera 6K Pro、URSA Broadcast G2などのBlackmagicカメラをATEMスイッチャーからコントロールすることもできます。

レベル	対応するノブを使用して、各チャンネルのオーディオ出力レベルを調整します。各チャンネルストリップのソフトボタンで、オーディオの挙動を、オーディオ・フォロー・ビデオとオン/オフで切り替えられます。「ALT」が選択されている場合、各チャンネルのゲインを調整できます。ゲインを調整すると、選択した入力のボリュームを増減できます。
イコライザー	「EQ」コントロールには、2ページのコントロールがあります。「EQ」ボタンを押すと、1ページ目のコントロールがロードされ、エンコーダーと「SEL」ボタンに左から右にマッピングされます。 再度「EQ」ボタンを押すと、2ページ目に切り替わります。このEQコントロールは、バンド1および6のハイパス/ローパスフィルター用です。対応するソフトボタンでフィルターのオン/オフを切り替えたり、シェイプを選択できます。再度「EQ」ボタンを押すと、1ページ目に戻るので、必要に応じてページを切り替えられます。 このEQコントロールは、ATEM Software Controlのオーディオページで使用できるすべてのパラメーターコントロールを反映します。
コンプレッサー	コンプレッサーコントロールには、ダイナミクスウィンドウで使用可能なすべてのコンプレッサーパラメーターが含まれています。他のコントロールと同様に、チャンネル1の位置に、ソフトボタンに割り当てられたオン/オフスイッチがあります。
ゲート	ゲートコントロールには、ATEM Software Controlのオーディオページで使用できるゲートパラメーターコントロールがすべて含まれています。「SEL」ボタンで調整するトラックを選択できます。ゲートはエクスパンダーを増強した機能です。レベルを弱めたり、信号内で特定のレベルに満たない部分を無音にすることで、音の弱い部分のノイズを低減/除去します。
パン	各オーディオチャンネルは、シンプルなステレオ・パンコントロールに対応しており、該当の入力をパンできます。対応するチャンネルノブを回して、チャンネルを左右にパンできます。各ノブを調整すると、「SEL」ボタンが光って該当のチャンネルが選択されることを示します。
エクスパンダー	エクスパンダーコントロールには、ATEM Software Controlのオーディオページで使用できるエクスパンダーパラメーターコントロールがすべて含まれています。「SEL」ボタンで調整するトラックを選択できます。続く7つのチャンネルストリップには、ダイナミクスウィンドウに表示される順でエクスパンダーパラメーターのノブコントロールが含まれます。
リミッター	他のダイナミクスコントロールと同様に、リミッターコントロールには、リミッターパラメーターコントロールがすべて含まれており、ダイナミクスウィンドウに表示される順でエンコーダーノブに割り当てられています。
カメラコントロール	オーディオミキサーは、カメラコントロールの機能にも対応しているので、ATEMスイッチャーの同じノブやボタンを使用して、Blackmagicカメラをコントロールできます。 「CAM」ボタンを押して設定を表示します。カメラコントロール設定は、3ページのメニューに分かれており、「CAM」ボタンを再度押すとページを切り替えられます。カメラコントロール設定は、システムコントロールの「CAMERA CONTROL」ボタンからも調整できます。カメラコントロールに関する詳細は、このマニュアルの「カメラコントロールの使用」のセクションを参照してください。

チャンネルおよび修飾ボタン

モードボタンの下には、チャンネルおよび修飾ボタンがあります。

マスター（MSTR）

「MSTR」ボタンを押すと、ヘッドセット、コントロール、スタジオ出力など、スイッチャーのリアパネルのオーディオ出力に関連するコントロールが表示されます。マスター出力のレベルを調整することもできます。

ALT

「ALT」ボタンは、別のパラメーターまたは機能を表示します。例えば、レベルコントロールを調整する際に「ALT」ボタンを押すとゲインコントロールが表示されます。

「ALT」ボタンを押してゲインコントロールを表示

バンク（BNK）

「BNK」ボタンを押すと、次の入力グループがLCDに表示されます。「BNK>」は、チャンネルストリップを10chのグループごとに右にバンクします。「BNK<」は、ひとつ前の10chのグループに戻します。

オーディオコントロール・ワークフローガイド

このセクションでは、オーディオミキサーを使用してオーディオミックスを洗練、向上させるための基本的なワークフローについて説明します。

1. 一般的に、ミックスを最適化する最初のステップは、すべての入力をノーマライズして、クリッピングを発生させずに音量を最大限にすることです。各入力の入力ゲインレベルを調整して、チャンネルストリップのレベルインジケーター上で信号のピークが0dBをわずかに下回るように調整します。
2. モノ入力をステレオ出力用に2つのチャンネルに分割したい場合、スイッチャーの一般設定からオーディオタブへ行きます。ステレオに変更したいモノ入力のチェックボックスを有効にして 「完了」をクリックします。

> **作業のこつ** モノ入力を2つのチャンネルに分割する場合は、ステップ 1（入力のノーマライズ）の前に行うことを推奨します。そうすることで、分割後の両方のチャンネルをノーマライズできます。

3. 「EQ」ボタンを押して、各入力でイコライザーを変更します。
4. EQを設定したら、「EXP」および「GATE」ボタンを使用して、ダイナミクスコントロールを開きます。必要に応じてダイナミクスを変更し、入力オーディオを大まかに調整します。

5 各入力でEQとダイナミクスを設定したら、ATEM Software Controlでマスター出力のEQコントロールを開いて、最終的なオーディオミックスのスイートニングを行います。

6 マスター出力のダイナミクスコントロールを開き、必要に応じて変更を施して最終出力を調整します。

すべてのオーディオミキサーコントロールを設定したら、オーディオミキサーでライブミックスを最適なレベルに設定し、プロダクション中に必要に応じて調整できます。各設定は、戻って再調整できますが、上述のステップの流れに従った方が、各ステップでより良い結果を得られます。例えば、スイッチャーの処理チェーンではイコライゼーションの後にダイナミクスを適用するので、ダイナミクスを変更する前にEQコントロールを設定することが重要です。

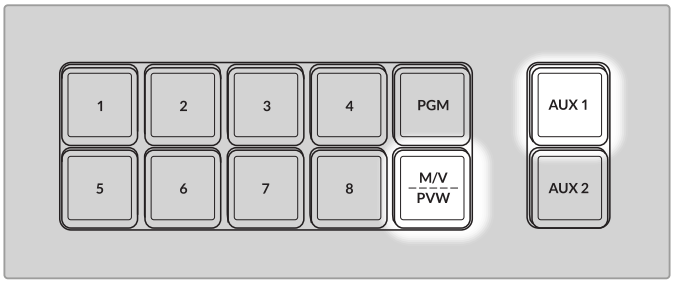
最も重要なのは、サウンドがエキサイティングかつ自然に聞こえるよう、エフェクトを慎重に適用することです。

Fairlightコントロールに関する詳細は、このマニュアルの「高度なFairlightコントロール」セクションを参照してください。

メモ USB接続がUSBデジタルオーディオに設定され、Fairlight LiveなどのUSBオーディオミキサーからのオーディオリターンをスイッチャーが検出すると、オーディオミキサーは自動的に無効になることに注意してください。

選択ボタン

ATEM Television Studioスイッチャーシリーズは、リアパネルにAux出力を搭載しており、様々な入力信号および内部ソースをルーティングして出力できます。Aux出力はルーター出力とよく似ており、すべてのビデオ入力、カラージェネレーター、メディアプレーヤー、プログラム、プレビュー、さらにはカラーバーを出力できます。フロントパネルにある10個の専用ボタンで、8つの入力、プログラム、そしてマルチビュー/プレビュー（切り替え可能）をショートカットで選択できます。



マルチビュー/プレビューのボタンは、マルチビューが選択されている場合は白く光り、プレビューが選択されている場合は緑に光ります。

カラーバーなど、その他の内部ソースおよびメディアプレーヤーは、システムコントロールのAuxメニューで選択できます。ダウンストリームキーヤーの前の状態のクリーンフィードが必要な場合は、それらの信号を出力することもできます。これにより、ロゴやウォーターマークの付いていないプログラムフィードが得られ、これを放送用マスターとしてキャプチャーし、後からポストプロダクションや放送に使用できます。

Aux1でクリーンフィードを選択する：

1. システムコントロールで「AUX」ボタンを押します。
2. 出力1の下にあるノブを回して、クリーンフィードを表示します。

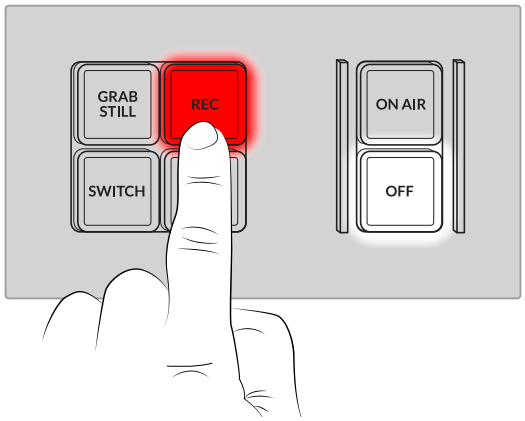
ATEM Television Studio HD8の3つのAux出力をルーティング

ATEMスイッチャーでは、Aux出力のソースを変更する際に、常にクリーンな切り替えが可能です。この機能によって、Aux出力のソース間をグリッチなしでクリーンにカットできます。

これらの出力は非常にパワフルで、ソフトウェアコントロールパネルでもルーティングできます。出力メニューはATEM Software Controlパネル上部のメニューバーにあります。このメニューは選択されているウィンドウに関わらず使用できるため、常に操作が可能です。ATEM Software Controlを使用した出力設定に関する詳細は、このマニュアルの「Aux出力」セクションを参照してください。

配信および収録ボタン

ATEM Television Studioスイッチャーシリーズは、パネル上の専用ボタンを使用して、プロダクションの配信および収録が可能です。



パネル上の専用ボタンを使用して、プロダクションを配信・収録。

GRAB STILL	映像からスチルイメージをキャプチャーするには、「GRAB STILL」ボタンを押します。これはスチルストアのように機能し、キャプチャーしたファイルをメディアプールに追加します。これで、スチルを瞬時にメディアプレーヤーにロードして、放送に使用できます。メディアプールをコンピューターに保存することも可能です。
REC	USB-C経由で、外部ディスクまたはフラッシュドライブに配信を収録できます。ISOモデルでは、オプションの内部ストレージに収録できます。「REC」ボタンを押すとプロダクションの収録が開始されます。「STOP」ボタンを押すと収録が終了します。
STOP	
SWITCH	USB経由で2つの外付けドライブを接続している場合、「SWITCH」ボタンで、収録するドライブを切り替えられます。
ON AIR	スイッチャーに配信機能が備わっているため、追加のソフトウェアを使用しなくても直接配信できます。スイッチャーをネットワークに接続して、ATEM Software Controlで配信プラットフォームを選択したら、「ON AIR」ボタンを押すだけで配信を開始できます。配信設定に関する詳細は、このマニュアルの「配信」セクションを参照してください。
OFF	

配信を開始するには、スイッチャーをネットワークに接続する必要があります。スイッチャーをネットワークに接続すると、Blackmagic CloudやYouTube、Twitchなどのプラットフォームに配信できるだけでなく、ATEM Camera Controlなどのハードウェアパネルを使用でき、ATEM Television Studio HD8 ISOスイッチャーを使用している場合はリモートソースに接続できます。

ビデオフォーマットが、1080i60などのインターレースに設定されている場合、収録か配信のどちらかを実行できますが、同時に両方行うことはできません。

ストリームキーの取得に関する詳細は、このマニュアルの「配信」セクションを参照してください。

ストレージメディア

ATEM Television Studioスイッチャーシリーズは、リアパネルの2つのUSB-C出力経由で、外付けドライブやフラッシュディスクにプログラムを収録できます。また、マルチポートのUSB-CハブやMultiDock 10Gを接続すると、1つあるいは複数のSSDを使用して、はるかに大容量のストレージを得られます。

オプションの内部ストレージを使用して、ATEMスイッチャー内部で収録することも可能です。このセクションでは、外部および内部ストレージの準備方法を説明します。

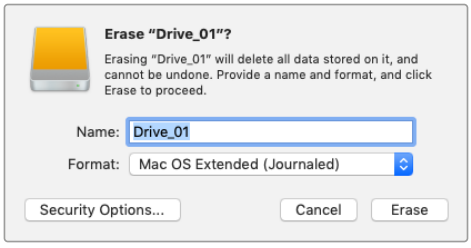
コンピューターでストレージを準備する

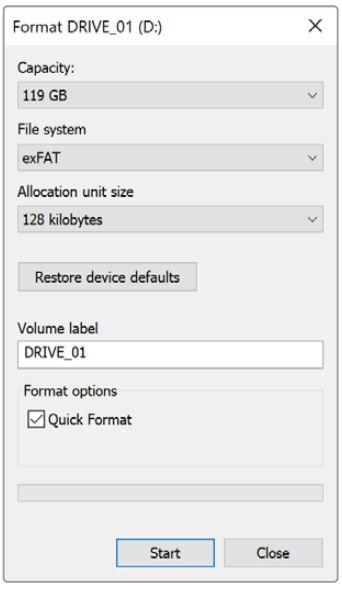
外部ディスクは、Mac/Windowsコンピューターでフォーマットできます。HFS+は「Mac OS X Extended」としても知られており、ジャーナリングをサポートしているため推奨されるフォーマットです。万が一、ストレージメディアが破損した場合、ジャーナリングされたメディアのデータは回復できる可能性があります。HFS+はMacでネイティブサポートされています。exFATはMacおよびWindowsによりネイティブサポートされており、別途のソフトウェアは必要ありませんが、ジャーナリングには対応していません。MacおよびWindowsコンピューターの両方を使ってディスクに読み込み/書き込みする必要がある場合に適しています。

Macコンピューターでメディアをフォーマット

MacのDisk Utilityアプリケーションで、ドライブをHFS+またはexFATでフォーマットできます。ディスクをフォーマットするとすべての情報が消去されるため、重要な情報は必ずバックアップしてください。

1. ディスクを、外付けドック、USBハブ、ケーブルアダプターのいずれかでコンピューターに接続します。ドライブをTime Machineバックアップに使用するというメッセージは拒否します。
2. コンピューターでApplications/Utilityへ行き、Disk Utilityを起動します。
3. 使用するドライブのディスクアイコンをクリックし、「Erase」タブをクリックします。
4. 「Format」を「Mac OS Extended (Journaled)」または「exFAT」に設定します。
5. ボリューム名を入力し、「Erase」をクリックします。メディアがフォーマットされ、収録できる状態になります。





WindowsのFormatダイアログボックス機能を使用して、外部ディスクをexFATにフォーマット。

Windowsコンピューターでメディアをフォーマット

Windowsコンピューターでは、Formatダイアログボックスで、ドライブをexFATでフォーマットできます。ドライブをフォーマットするとすべての情報が消去されるため、重要な情報は必ずバックアップしてください。

1. ドライブを、外付けドック、USBハブ、ケーブルアダプターのいずれかでコンピューターに接続します。
2. 「Start」メニューまたは「Start」画面を開き、コンピューターを選択します。使用するドライブを右クリックします。
3. コンテクストメニューから「Format」を選択します。
4. ファイルシステムを「exFAT」に設定し、ユニットサイズ配分を128キロバイトに設定します。
5. ボリュームラベルを入力して「Quick Format」を選択し、「Start」をクリックします。
6. ドライブがフォーマットされ、収録できる状態になります。

ATEM Television Studioでストレージを準備する

内部ストレージは、フロントパネルのシステムコントロールあるいはATEM Setupユーティリティを使用してフォーマットできます。また、スイッチャーのコントロールパネルを使用して、外付けディスクをMac OS ExtendedあるいはexFATにフォーマットできます。

ATEM Television Studioのシステムコントロールでストレージをフォーマット

「SETTINGS」ボタンを押してフォーマットメニューを開き、矢印ボタンでフォーマット画面に進みます。

「メディアフォーマット」メニューを開いたら、内部ストレージ、あるいはUSBで接続した外付けドライブのフォーマットを選択できます。

1. 内部ストレージの場合は、「メディア」ノブを回して「内部」を選択します。

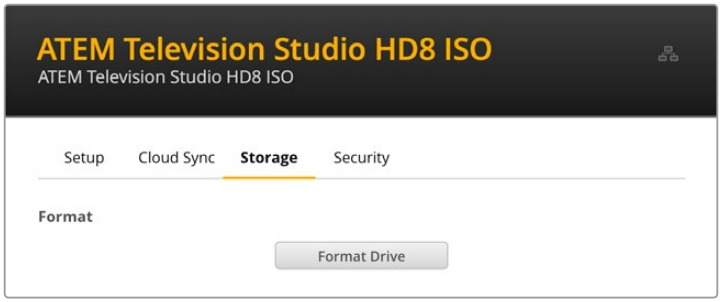
   外付けドライブの場合は、「メディア」ノブを回してドライブを選択し、「フォーマット」ノブを回してMac OS ExtendedかexFATを選択します。

2. LCDの上にある「フォーマット」ボタンを押します。
3. 画面の指示に従って、カウントダウンアイコンにチェックマークが表示されるまで、フォーマットボタンを3秒間長押しします。フォーマットが開始されます。
4. フォーマットが完了すると、ストレージを使用できます。LCDの上にある「OK」ボタンを押して「メディアフォーマット」メニューに戻ります。

ATEM Setupで内部ストレージをフォーマット

ATEMスイッチャーソフトウェアと共にインストールしたATEM Setupユーティリティを使って、ストレージをフォーマット設定することも可能です。ドライブをフォーマットするには、スイッチャーをUSBで接続する必要があります。

1. ATEM Setup Utilityを開きます。Macを使用している場合、Blackmagic ATEM Switcherフォルダーのアプリケーションの中にあります。Windowsコンピューターでは、Start > Programs > Blackmagic DesignでATEM Setupにアクセス可能です。
2. 開いたら、「Storage」をクリックして「Format Drive」を選択します。



3 初めてストレージをフォーマットする場合、フォーマットすると、ストレージ内のすべてのファイルが消去されるというメッセージが表示されます。「Format」をクリックします。

4 確認のために2回目の警告メッセージが表示されます。これは、ユーザーがストレージ上のメディアを誤って削除しないようにするためです。「Erase」をクリックします。

5 フォーマット中はプログレスバーが表示されます。完了すると、内部ストレージを使用できます。

ストレージへのアクセス

外付けドライブを収録に使用している場合、スイッチャーのリアパネルからドライブを取り外し、コンピューターに接続するだけで、ビデオクリップおよびDaVinci Resolveプロジェクトにアクセスできますが、ネットワーク経由でもファイルにアクセス可能です。

Macコンピューターでストレージにアクセスする：

1 Finderを開き、サイドバーメニューで「Network」をクリックします。

2 リストで、ATEM Television Studioスイッチャーをダブルクリックします。

3 内部ストレージをダブルクリックします。

ATEM Television Studioスイッチャーがロケーションのサイドバーに表示されます。Windowsコンピューターでストレージにアクセスする：

1 File Explorerのサイドバーで「Network」メニューをクリックします。ATEM Television Studioスイッチャーがリストに表示されます。

2 ご使用のATEM Television Studioスイッチャーをダブルクリックすると、ネットワーク資格情報を入力するWindowsのセキュリティ・ダイアログボックスが表示されます。

3 ユーザー名とパスワードを入力します。

> **メモ** Windows 11では、ユーザー名とパスワードを必要としない「ゲスト」アカウントでネットワークストレージに接続することができなくなりました。ネットワーク上のATEMスイッチャーのストレージにアクセスする前に、ATEM Setupを使用して新しいユーザーを作成し、パスワードを設定する必要があります。ユーザーの作成および管理に関する詳細は、このマニュアルの「ATEM Setup」セクションの「Security（セキュリティ）」を参照してください。

4 「OK」をクリックします。

これで、File Explorerのウィンドウに、スイッチャーが表示され、他のネットワークドライブと同様にストレージにアクセスできます。

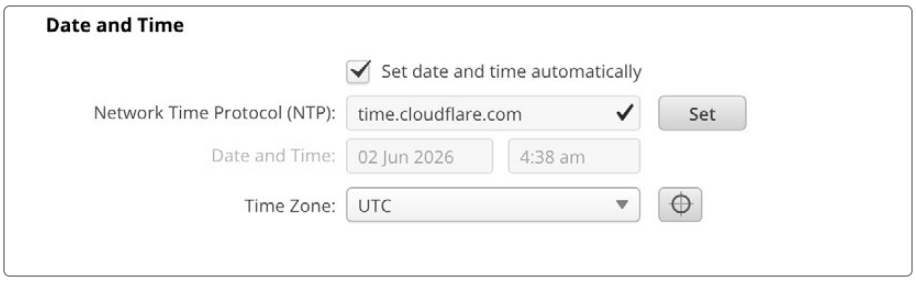
Setup Utilityからストレージにアクセスすることもできます。Macコンピューターでは「Show in Finder」ボタンを押します。Windowsコンピューターでは「Show in File Explorer」ボタンです。

クラウド同期

クラウド同期でメディアにアクセスすることも可能です。ATEM Television Studioスイッチャーシリーズの内部ストレージあるいは外付けドライブをDropboxと同期します。

日付と時刻を設定

Dropboxのようなクラウドサービスを ATEMスイッチャーの内部ストレージと同期するには、正確な日付と時刻が必要です。デフォルトでは、ATEM Television Studioは、Cloudflare NTPサーバーを使用して日付と時刻を自動的に設定します。

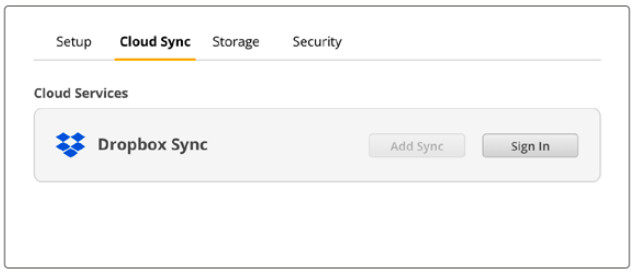


オンラインアカウントをATEM Television Studioに同期させるには、「クラウドとの同期」の設定を使用して、オンラインアカウントにサインインし、同期したいフォルダーと同期の方向を設定するだけです。

Dropboxにサインイン

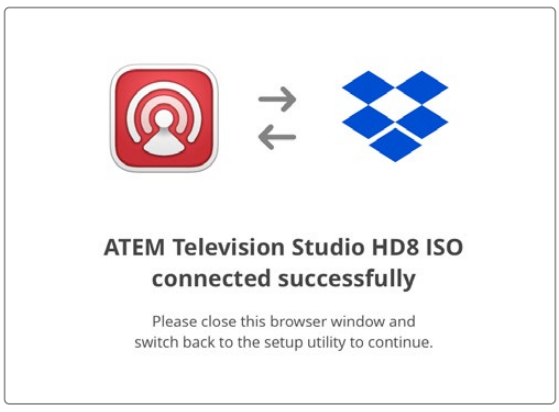
1 Dropboxアカウントのサインインボタンをクリックすると、サインインウィンドウが表示されます。

2 Dropboxにサインインします。



「Allow（許可）」ボタンをクリックして、Blackmagic Cloud Storeに対して、コンテンツへのアクセスと編集を許可します。

接続が成功すると完了メッセージが表示されます。接続に失敗した場合は、コンピューターがインターネットに接続されているか確認してください。

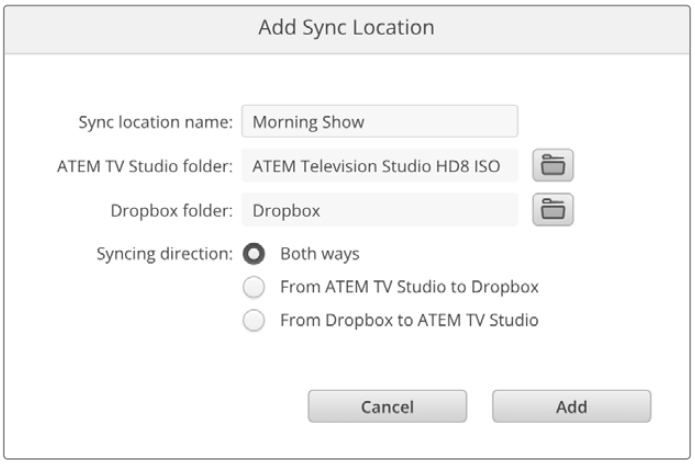


3 「Close」をクリックします。

フォルダーと方向を同期

1 「Add Sync」ボタンが有効になるので、このボタンをクリックして、「Add Sync Location（同期ロケーションの追加）」ウィンドウを開きます。

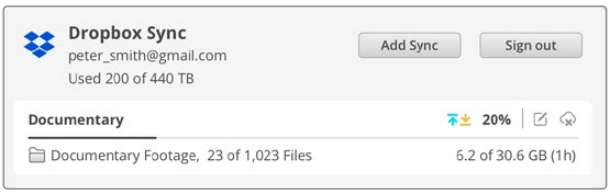
2 同期ロケーションに名前を付け、フォルダーアイコンをクリックして希望の同期フォルダーを指定します。これらは一般的に同じ名前を共有します。



3 同期の方向を選択します。例えば、Dropboxとの同期で、ファイルをスイッチャーからDropboxに同期し、Dropboxからスイッチャーへの同期を無効にしたい場合は、「From ATEM TV Studio to Dropbox（ATEM TV StudioからDropbox）」を選択します。

4 「Add（追加）」をクリックします。

これで、クラウドサービスとATEM Television Studioスイッチャーが同期しました。



ステータスインジケーターは、同期処理に関する情報を表示

同期矢印は、同期の方向を示します。青い矢印は、Cloud Storeからデータが送信されることを意味し、黄色い矢印は、Cloud Storeがデータを受信していることを意味します。データの送受信を同時に行っている場合、青い矢印と黄色い矢印が両方表示されます。矢印がグレーになっている場合、データがその方向に同期されていないことを意味します。

同期矢印の右にあるパーセンテージの表示は、現在の同期の進行状況を示します。

"同期の編集"インジケーターをクリックすると、同期フォルダーの名前とロケーションを変更できます。

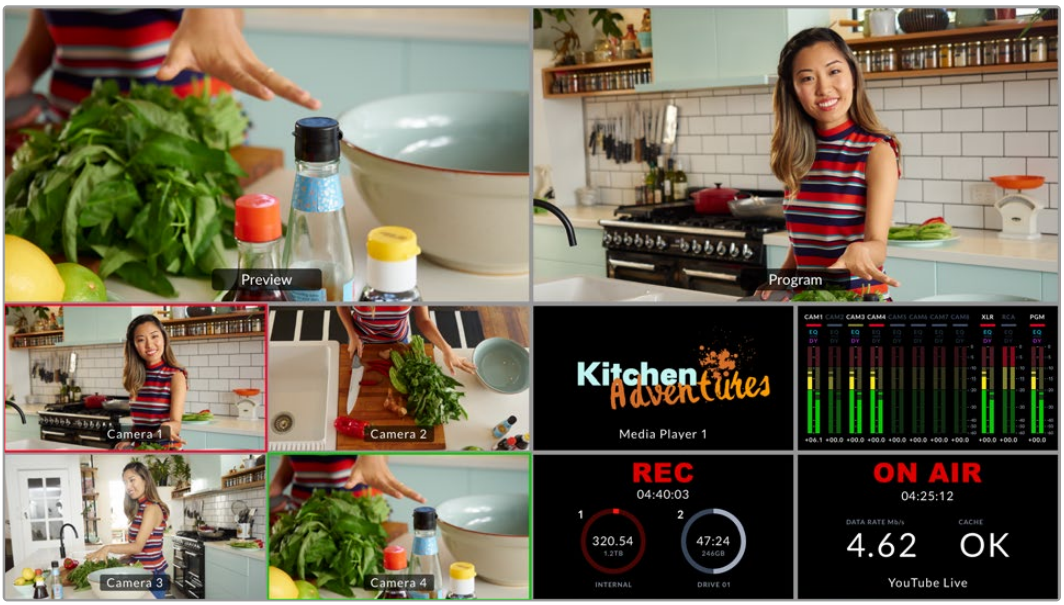
このインジケーターをクリックすると、同期ロケーションを削除できます。確認のダイアログボックスで、「Continue（継続）」をクリックして確定するか、「Cancel（キャンセル）」をクリックして削除を中断します。

Blackmagic Cloud StoreあるいはBlackmagic Cloud Podを所有している場合、Blackmagic Cloud Setupユーティリティ経由で、独自のストレージにこれらの同期を追加して、収録しながらライブコピーを保持できます。

マルチビューの使用

ATEMスイッチャーはパワフルなマルチビュー機能を搭載しており、全SDI入力およびプログラム/プレビュー出力を単一のスクリーンでまとめて確認できます。さらにマルチビューは、メディアプレーヤー、配信ステータス、ディスク収録ステータス、オーディオレベル、Fairlight EQ/ダイナミクスインジケーターも表示します。

マルチビューで包括的な確認が可能なので、放送中の様々な状況を常に正確に把握できます。



パワフルなマルチビュー機能により、すべてのソースおよび出力を同時に確認可能

以下は、各ビューの詳細です。

プレビュー

プレビューは、現在プレビュー出力に選択されているソースをモニタリングできます。試験的にソース間を切り替えてトランジションを確認したり、キーヤーをセットアップしたい場合に、実際にプログラム出力に切り替える前にルックを確認できるため、このビューは便利です。プレビューを使用するには、スイッチャーの操作をプログラム/プレビュースタイルのスイッチングに変更する必要があります。詳細は、このセクションに後述されています。

プログラムビュー

プログラムビューは、現在プログラム出力に選択されているソースを表示します。現在放送されているのと全く同じ映像を確認できます。

入力ビュー

入力ビューは、8つのSDI入力に接続されている全てのソースを表示します。全入力がマルチビューに表示されるので、すべてのカメラからの映像を確認しながら、すばやく決断を下すことができます。これらの入力は、カメラの映像である必要はありません。コンピューターのビデオ出力やHyperDeckディスクレコーダーをスイッチャーの入力に接続すれば、入力ビューでこれらの映像を確認できます。

入力がプレビュー/プログラム出力に送信されると、それぞれのビューの周囲に緑/赤のタリーボーダーが表示されます。緑はプレビュー出力、赤はプログラム出力（オンエア）です。

メディアプレーヤービュー

メディアプレーヤービューは、メディアプレーヤーに現在ロードされているグラフィックを表示します。グラフィックをロードするには、ATEM Software Controlのメディアプールへ行き、スチルをメディアプレーヤーにドラッグします。メディアプレーヤーおよびメディアプールの使用に関する詳細は、「ATEM メディアプール」のセクションを参照してください。

配信ビュー

配信ビューは、放送データレートやキャッシュステータスなど、配信の状況を表示します。また、配信ビューの下部で、現在放送している配信プラットフォームを確認できます。

- **オンエア・インジケーター** 収録前、オンエアステータス・インジケーターは「オフ」と表示して、スイッチャーがスタンバイモードであることを示します。配信が始まると、インジケーターは明るい赤で「ON AIR」と表示します。配信が停止するまで表示はそのままです。

  インターネットの接続速度が遅くなってキャッシュを使い切るなど、配信が中断した場合には、オンエア・インジケーターが点滅します。

- **放送データレート** 放送データレートは、メガビット/秒（Mbps）で測定されます。ATEM Television Studioスイッチャーシリーズで、コマ落ちなしで1080p60ビデオを放送するには、およそ5〜7Mbpsのデータレートが必要です。

- **キャッシュステータス** キャッシュステータスは、スイッチャーの内蔵メモリーバッファの容量を表示します。キャッシュは、小容量の内蔵メモリーで、プログラム出力を継続的に収録/再生します。これは、放送データレートがビデオを持続できるレベルを下回った場合に、安全対策として機能します。インターネットの不安定さは、多くの場合、ネットワークの使用状況やワイヤレス信号の弱さが原因です。そのため、放送データレートが下がった場合、それに応じてバッファデータが増加します。接続速度が、ビデオ配信をサポートできなくなるまで遅くなった場合、キャッシュがビデオフレームを埋め合わせます。しかし、キャッシュが100%フルに達すると、ビデオ配信に影響が出るため、キャッシュがフルになることは可能な限り回避するべきです。配信のセットアップを行う際に接続速度のテストを行うことで、この問題を回避できます。配信のテストを行う際、マルチビューのキャッシュステータスをチェックしてください。キャッシュが頻繁に100%に近づくようであれば、ライブ配信設定で低品質を選択します。
- **テザリングステータス** ATEMスイッチャーが、モバイルテザリングを使用してインターネットに接続されている場合、スマートフォンアイコンが表示されます。このアイコンはオンエア中に赤く光ります。

収録ビュー

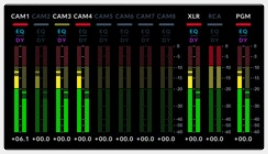
USB-C経由で外付けドライブに収録、あるいは内部ストレージに収録している場合、収録ビューは、現在の収録状況を表示します。

- **収録インジケーター** 収録前、またはディスクが接続されていない場合、インジケーターは「停止」と表示します。ディスクが接続されている場合、インジケーターの下にディスクアイコンが表示されます。

  ディスクへの収録中は、インジケーターは明るい赤に光り、「収録」と表示します。

- **継続時間カウンター** 収録インジケーターの下には、継続時間カウンターがあります。スイッチャーで収録ボタンを押すと、継続時間カウンターがスタートします。
- **収録ステータスインジケーター** これらのインジケーターは、各ドライブの詳細および収録状況を表示します。例えば、2つのドライブを使用している場合、空き容量や録画可能時間に加え、ドライブ名も表示されます。ディスクへの収録中、このインジケーターは赤く光り、ディスクの空き容量を表示します。

  ディスクは、空き容量により順序付けられます。例えば、Blackmagic MultiDock 10G経由で4つのSSDを接続している場合、空き容量が一番多いドライブが「1」になります。ドライブ2は、次に空き容量の多いSSDです。ドライブ1およびドライブ2がフルになると、ドライブ3がディスク1インジケーターを引き継ぎ、ドライブ4がディスク2を引き継ぎます。アイコンの下のディスク名で、各ドライブに割り当てられているディスク番号をいつでも確認できます。



オーディオビュー

オーディオビューでは、配信中に、各ソースのオーディオレベルやプログラム出力のレベルをモニタリングできます。

- オーディオメーター　各入力およびプログラム出力には、独自のオーディオメーターが付いており、すべて同時に確認できます。オーディオレベルが-10dBを越えると、メーターは赤くなり、最大値の0dBに近いことを警告します。レベルが0dBに達すると、オーディオにクリッピングが生じます。クリッピングが生じるとオーディオが歪むため、スイッチャーのオーディオレベルボタンか、ATEM Software Controlのオーディオミキサーを使用して、レベルを下げる必要があります。ATEM Software Controlに関しては、このマニュアルの次のセクションを読み進めてください。

  オーディオレベルをモニタリングすることで、高品質のサウンドを維持できるため、オーディオメーターは重要なツールです。

- Fairlightアイコン　ATEM Software Controlのオーディオページで、EQおよびダイナミクスコントロールが有効になっているかどうかを表示します。

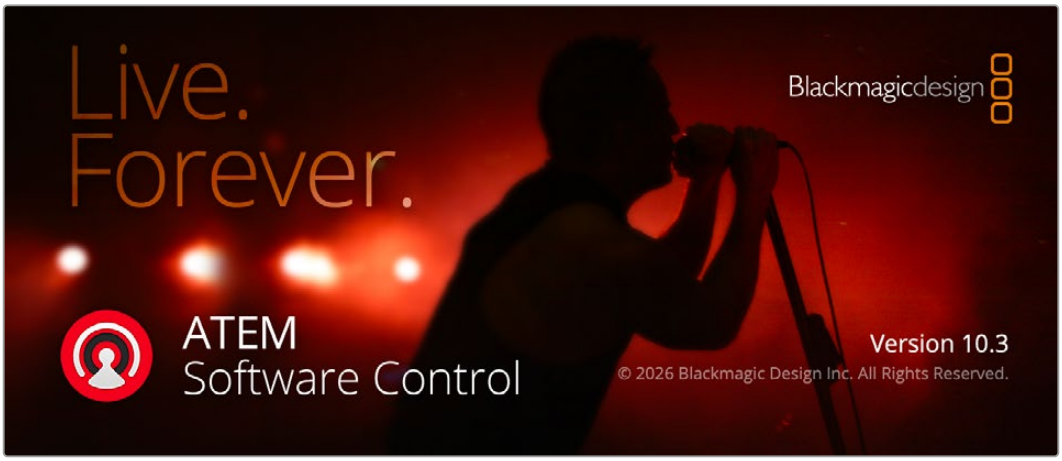
EQ DY	Fairlightアイコンが色付きで点灯している場合は、EQ/ダイナミクスツールが有効になっており、該当の入力がオンエアされています。
EQ DY	アイコンが色付きで無点灯の場合は、ツールが有効な状態ですが、オンエアされていません。
EQ DY	アイコンが色無しで無点灯の場合は、オーディオページでツールが無効になっているか、バイパスされています。

マルチビューは、あらゆるディテールを確認できる優れたツールです。例えば、プレビューをプログラム出力に切り替える前に、プレビューウィンドウでイメージを視覚化できます。また、各SDIソースのモニタリング、それらの切り替えのテスト、クロマキーのセットアップが可能で、トランジションのプレビューもできるので、実際にプログラム出力に切り替える前にルックを確認できます。

ATEM Software Control

ATEMスイッチャーに同梱されているATEM Software Controlを使うと、スイッチャーの内蔵パネルと同様にスイッチャーをコントロールできます。ソフトウェアコントロールでは、メニューボタンの代わりに、右側にある様々なパレットメニューを使用します。これらのパレットメニューにはプロダクションスイッチャーのすべての処理機能が表示されます。これにより、別の場所からスイッチャーをコントロールできるようになります。例えば、スイッチャーがオペレーターとは別の部屋でラックマウントされている場合などです。

ATEM Software Controlを使用するには、ソフトウェアをインストールする必要があります。

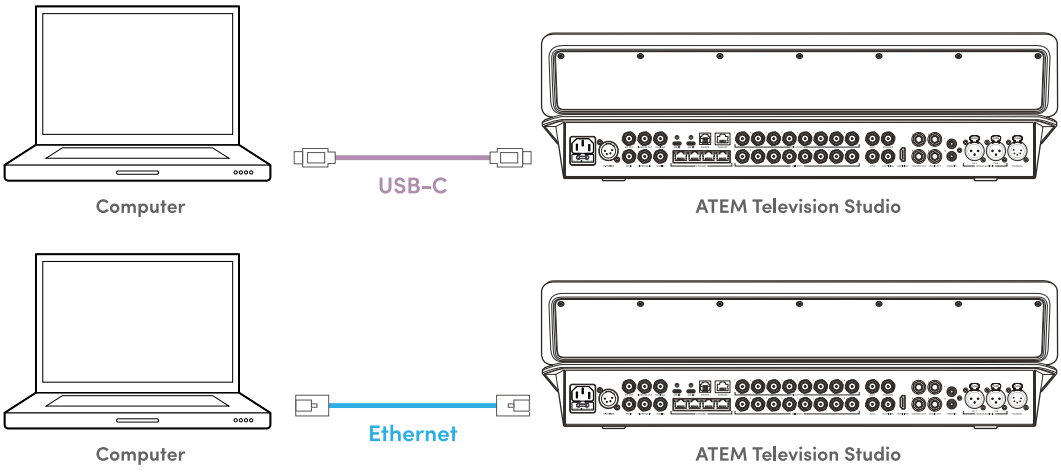


ATEM Software Controlをインストールする：

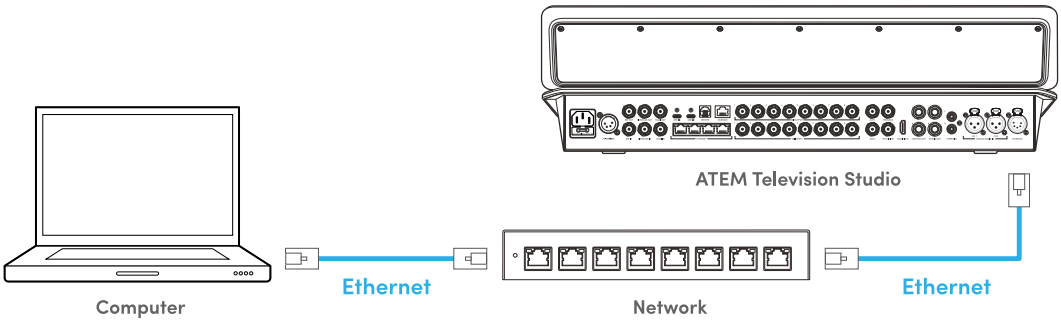
1. ウェブブラウザを起動し、www.blackmagicdesign.com/jp/supportに行き、最新のATEMスイッチャードライバーをダウンロードします。
2. ファイルのダウンロードが完了したら、「Install ATEM」アイコンをクリックして、インストーラーを起動します。画面の指示に従い、「Install」を押してソフトウェアをインストールします。
3. ソフトウェアがインストールされたら、アプリケーションあるいはプログラムフォルダーで「Blackmagic ATEM Switchers」フォルダーへ行き、「ATEM Software Control」をダブルクリックします。

これでソフトウェアがインストールされたので、スイッチャーをコンピューターに接続します。スイッチャーをイーサネットまたはUSB経由で直接接続します。

直接接続



ネットワーク経由で接続



最後に、使用するコンピューターもネットワークに接続していることを確認してください。これで、ATEM Software Controlアプリケーションを起動すると、スイッチャーを選択するよう指示が出ます。ネットワーク上で確認できる場合はリストから選択するか、あるいはIPアドレスを手動で入力します。その場合はスイッチャーに入力したIPアドレスを入力してください。これでATEM Software Controlは、スイッチャーを見つけて通信が可能になります。

スイッチャーコントロールパネル

ATEM Software Controlには、「スイッチャー」、「メディア」、「オーディオ」、「カメラ」の4つのメインコントロールウィンドウがあります。これらのウィンドウは、インターフェースの下にあるボタンをクリックするか、あるいはSHIFTキー＋左右矢印のホットキーで選択できます。一般設定ウィンドウは、インターフェースの左下にあるギアアイコンで開けます。「スイッチャー」、「メディア」、「オーディオ」、「カメラ」ウィンドウには、スイッチャー特有の設定が含まれており、ソフトウェアコントロールパネルからのみ設定が可能です。

スイッチャーパネル

ATEM Software Controlを起動すると、メインのコントロールインターフェースである「スイッチャー」スクリーンが表示されます。ソフトウェアコントロールパネルを使用するには、スイッチャーと接続している必要があります。

ATEM Software Controlのウィンドウ

環境設定

環境設定は、「一般設定」と「マッピング」に分かれています。一般設定には、トランジションコントロール、言語選択、MIDIコントロールのオンオフ切り替えが含まれています。マッピング設定では、プレビュー/プログラム列の特定のボタンに入力を割り当てられます。スクリーン上部のメニューバーに行き、「ATEM Software Control」を選択して、「設定」を開きます。

ATEM Software Controlメニューから環境設定を開けます。

一般設定

ATEMはデフォルトで、M/Eスイッチャーの現在の標準である「プログラム/プレビュー」切り替え方式に設定されています。旧式のA/B方式で使用したい場合、この設定を「A/B切替」に変更できます。

ATEM Software Controlの言語設定は、日本語、英語、ドイツ語、スペイン語、フランス語、イタリア語、韓国語、ポーランド語、ポルトガル語、ロシア語、トルコ語、ウクライナ語、中国語（簡体字）から選択できます。

ATEM Software Controlをインストールして初めて起動する場合は、セットアップダイアログボックスが表示され、ソフトウェアの言語を選択するよう指示されます。ソフトウェアの言語はいつでも変更できます。

言語メニューから任意の言語を選択します。選択した言語を確認するメッセージが表示されます。「変更」をクリックします。

ATEM Software Controlが閉じ、選択した言語で再起動します。

ATEMスイッチャーをMIDIコントローラーで操作する場合は、ボックスにチェックを入れてMIDIコントロールを有効にします。

一般設定の設定

ボタンマッピング

マッピング設定では、プレビュー/プログラム列の特定のボタンに入力を割り当てられます。

ATEMソフトウェアおよびハードウェアコントロールパネルは、ボタンマッピング機能をサポートしているので、カメラ入力などの最も重要なソースを、プログラム列およびプレビュー列の最もアクセスしやすいボタンに割り当て、使用頻度の低いソースはそれ以外のボタンに割り当てることができます。ボタンマッピングは各コントロールパネルで別々に設定できるので、ソフトウェアコントロールパネルで設定したボタンマッピングは、ハードウェアコントロールパネルで設定したボタンマッピングに影響しません。

スイッチャー設定の変更

左下にあるスイッチャー設定のギアアイコンをクリックすると、設定ウィンドウが開きます。このウィンドウで、スイッチャーの一般設定、オーディオ、マルチビュー、ソース、HyperDeck、カメラコントロールなどの設定を変更できます。これらの設定は各タブに分かれています。

ATEM Television Studio HD8 ISOの一般設定

一般設定

一般設定タブには、ビデオフォーマットおよびメディアプールの設定、そしてカメラコントロールモニタリング出力の選択が含まれています。

ビデオ

スイッチャーのビデオフォーマット設定

ビデオ設定は、ATEMスイッチャーで扱うビデオフォーマットの選択に使用します。ビデオフォーマットは、放送を行う地域に応じた設定が可能です。NTSCベースの国で放送する場合は1080i59.94、720p59.94などのフォーマットを選択します。PALベースの国で放送する場合は、1080i50、720p50などのフォーマットを選択します。適切なビデオフォーマットを設定するには、まずカメラのフォーマットを確認してからスイッチャーのビデオフォーマットを設定します。

ビデオフォーマットを設定

ATEM Television Studioスイッチャーシリーズがサポートしているビデオフォーマットは以下の通りです。

HDビデオフォーマット	720p50、720p59.94、720p60 1080p23.98、1080p24、1080p25、1080p29.97、1080p30、1080p50、1080p59.94、1080p60 1080i50、1080i59.94、1080i60

ATEM Television Studio 4K8スイッチャーがサポートしているビデオフォーマットは以下の通りです。

Ultra HDフォーマット	2160p23.98、2160p24、2160p25、2160p29.97、2160p30、2160p50、2160p59.94、2160p60

ビデオフォーマットを設定するには、メニューからビデオフォーマットを選択し、「Set」ボタンを押します。ビデオフォーマットが変更されると、メディアプールにロードしたフレームが削除されます。

マルチビューのビデオフォーマットを設定

プロダクションのビデオフォーマットが1080p25以上に設定されている場合、マルチビュー出力をそれより低いフレームレートに設定できます。マルチビュー出力がダウンコンバートされるよう設定することで、より幅広いモニターとの互換性が得られます。例えば、ビデオフォーマットが1080p60に設定されている場合、マルチビュー出力を1080i60に設定できます。

3G-SDI出力レベルを設定

1080p50以上のHDビデオを3G-SDI機器に出力する際は、機器によって3G-SDI Level AまたはLevel Bのいずれかのみをサポートしている場合があるため、3G-SDI出力のフォーマットをLevel AとLevel Bで切り替える必要がある場合があります。デフォルト設定であるLevel Bは多くの機器にサポートされていますが、「Level A」ボタンでLevel Aに切り替えることができます。

フェード・トゥ・ブラック

スイッチャーのフロントパネルおよびATEM Software ControlでFTBボタンを無効にするには、「フェード・トゥ・ブラックを無効にする」のチェックボックスにチェックを入れます。

ダウンストリームキー

ダウンストリームキーの不透明度が100%の場合、カメラタリーをオーバーライドできます。例えば、DaVinci Resolve Replay Editorを使用したスポーツのリプレイを行っている際などです。これにより、現在リプレイが再生中でカメラがオンエアになっていないことをカメラオペレーターに知らせることができます。しかし、ダウンストリームキーヤーが完全に不透明で無い場合、タリーは引き続きアクティブな状態となります。

ネットワーク検出

ATEM Television Studio HD8 ISOスイッチャーは、デフォルトでローカルネットワーク上で見えるようになっているので、Blackmagic Studio Camera 6K ProまたはURSA Broadcast G2を使ってスイッチャーに直接配信する場合、すぐに配信を開始できます。この設定をオフにするには、「ネットワーク上でスイッチャーを検出できるようにする」のチェックを外します。

メディア設定

メディアプール

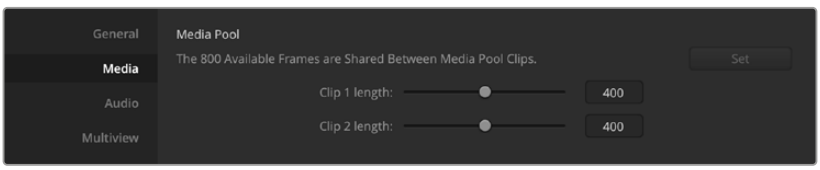
メディアプール内のクリップ・フレーム数を設定

各ATEMスイッチャーモデルには、メディアプールと呼ばれるグラフィック用のメモリがあります。このメモリにアルファチャンネル付きのイメージやビデオクリップを保存して、プロダクションの際にメディアプレーヤーから再生できます。

ATEMスイッチャーモデル	スチルグラフィック	ビデオクリップ	ビデオフォーマット	クリップのフレーム数
ATEM Television Studio HD8	20	2	720p	400フレーム
			1080p	200フレーム
ATEM Television Studio HD8 ISO	20	2	720p	400フレーム
			1080p	200フレーム
ATEM Television Studio 4K8	20	2	720p	1600フレーム
			1080p	800フレーム
			2160p	200フレーム

メディアプールの容量

デフォルトでは、各クリップに使用可能な同量のメモリが振り分けられ、最大フレーム数が決定されます。いずれかのクリップを長くしたい場合は、フレームバランスを調整します。どちらかのクリップを長くすると、もう一方のクリップは短くなります。



メディアプールの共有

オーディオ設定

オーディオタブにはあらゆるオーディオ設定が含まれており、一般設定、オーディオ分割、MADI分割、トークバック、出力またはミックスマイナスの5つのカテゴリーに分類されています。

一般設定

オーディオタブの一般設定では、Audio Follow Videoを設定できます。

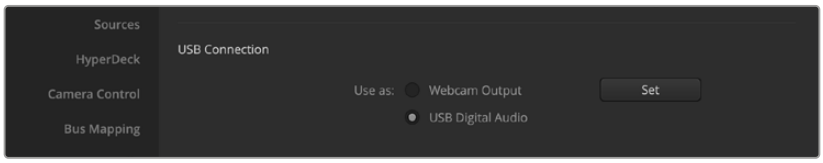
Audio Follow Video設定

AFVでは、ラジオボタンを使用して、トランジションの際のオーディオの挙動を選択できます。入力を変更する際にオーディオをクロスフェードするには、ラジオボタンをチェックしてトランジションを追加します。ビデオ入力がオンエアされている場合にのみオーディオがプログラム出力へ送信されます。

USB接続

ATEM Television Studioスイッチャーの背面にあるUSB接続は、ソフトウェアアップデートのインストールおよびウェブカム出力に使用します。USBポートは、Fairlight Liveと使用するためのUSBデジタルオーディオインターフェースに割り当てることも可能です。Fairlight Liveは、パワフルなソフトウェアベースのライブオーディオミキサーで数百のチャンネルに対応しています。ステレオやサラウンドサウンドなどの標準的なフォーマットから、アンビソニックやイマーシブオーディオのワークフローまで扱えます。

Fairlight Liveを使用するには、「USBデジタルオーディオ」を選択し、「設定」ボタンをクリックします。



USB接続がUSBデジタルオーディオに設定され、USBオーディオミキサーからのオーディオリターンをスイッチャーが検出すると、ATEM Software Controlとスイッチャーのオーディオミキサーは、自動的に無効になります。

Fairlight LiveのATEMショーのテンプレートを使用する場合、ショーが始まるとすぐに無効になります。カスタムのショーテンプレートやその他のUSBオーディオミキシング・インターフェースでは、オーディオ出力をスイッチャーにルーティングした際に無効になります。

Fairlight Liveでは、出力のルーティングは「Patching Matrix（マトリックスのパッチ）」ウィンドウで行います。

オーディオ分割

ATEM Television Studioスイッチャーシリーズでは、ステレオ入力信号を2つのモノチャンネルに分割できます。これは、モノ入力をステレオマスター出力の両方のチャンネルにミックスする際に便利な機能です。全てのオーディオを個別チャンネルに分割するか、あるいは各入力を個別に選択するかを選べます。

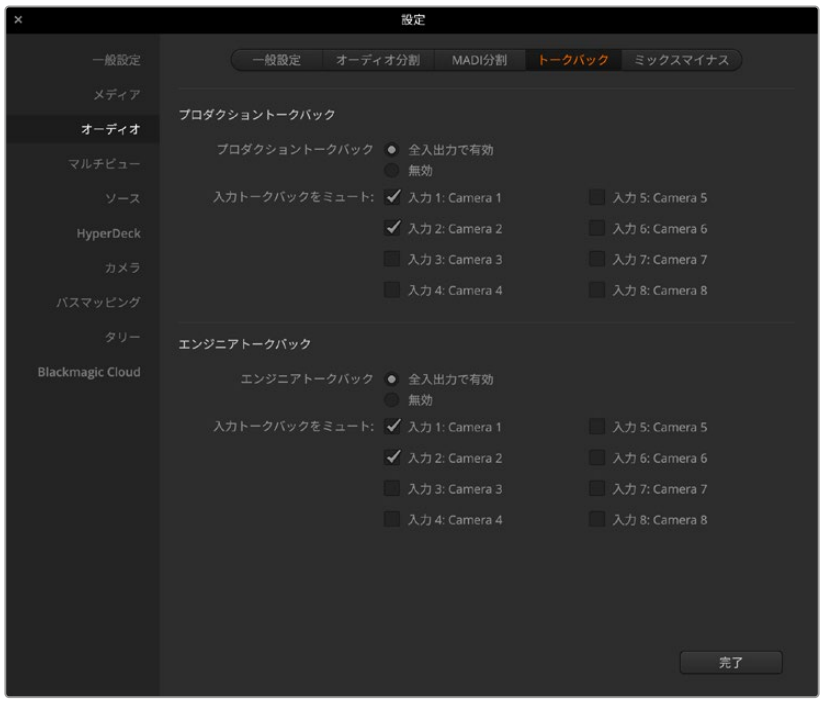
MADIチャンネルを個別のモノチャンネルに分割することもできます。

チェックボックスを使用して、MADIを個別のモノチャンネルに分割

トークバック

トークバックタブでは、トークバックの挙動を設定できます。プロダクショントークバックはSDIチャンネル15&16にエンベッドされ、エンジニアトークバックはSDIチャンネル13&14にエンベッドされます。トークバックはチェックボックスで有効/無効を切り替えられます。

希望通りのエフェクトを得るために、ATEM出力のうち1系統を入力にループさせたい場合があります。これが原因で、SDIトークバックチャンネルでフィードバックループが生じる場合があります。この問題が生じた場合、各入力の横にある「ミュート」チェックボックスをクリックすると、SDIチャンネルをミュートにできます。入力トークバックをミュートしたい場合は、プロダクショントークバックとエンジニアトークバックの両方でボックスをチェックしてください。



入力でプロダクショントークバックをミュート

出力

ATEM Television Studio HD8シリーズの出力メニューを使用して、SDI、リモートソース、Auxのオーディオリターンを調整します。

SDIオーディオ

メニューを使用してオーディオリターンのオプションを選択します。オプションには、プログラムミックス、モニター、プロダクショントークバック、エンジニアトークバック、ミックスマイナスが含まれます。ミックスマイナスを選択する際は、メニューを使用してオーディオソースを選択します。これにより、リターンオーディオから選択したソースが除去されます。

Auxオーディオ

Aux出力をカメラソースにルーティングする際、任意の入力でミックスマイナスをオンにすると、その入力を除くミックス内のすべてのプログラムオーディオが出力されます。

リモートソースオーディオ

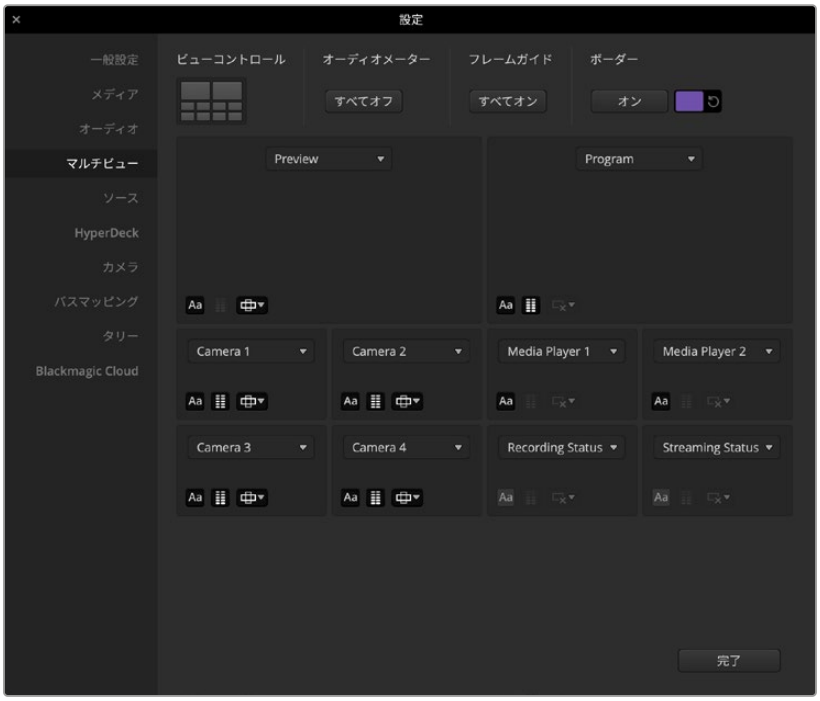
ATEM Television Studio HD8 ISOでリモートソースを使用している場合、「リターン先:」メニューでリターンオーディオを指定できます。ミックスマイナスを選択する際は、メニューを使用してオーディオソースを選択します。これにより、リターンオーディオから選択したソースが除去されます。

ミックスマイナス

ATEM Television Studio 4K8のミックスマイナス設定では、プログラムリターンフィードのオーディオをミュートできます。例えば、ライブクロス（スタジオとリポーターとのやりとり等）中にオーディオ遅延が発生し、リポーターがプログラムリターンフィードに含まれる自分自身の声の遅延フィードに煩わされる場合などです。入力でミックスマイナスをオンにすると、すべてのプログラムオーディオから特定の入力を除いて出力します。

マルチビュー設定

マルチビュー設定では、マルチビュー画面の配置を変更できます。デフォルトのビューは、上部に2つの大きいウィンドウ、下部に8つの小さいウィンドウがあります。マルチビューのクアドラント（1/4画面）は、1つの大きなビューまたは4つの小さなビューに設定できるので、全体を4、7、10、13、16ビューに設定可能です。「ビューコントロール」で各クアドラントをクリックすると、1ビューと4ビューを切り替えられます。



マルチビューのコンフィギュレーション

ソースおよびプログラムビューのオーディオメーター表示のオン/オフは、マルチビュー設定の「すべてオン」ボタンで一斉に切り替えられます。個別にオン/オフしたい場合は、各ビューのオーディオメーターアイコンをクリックします。

各ソースおよびプログラムビューでセーフエリアマーカー機能をオンにすると、あらゆるモニターでプログラムを適切に表示できるか確認できます。横方向のワークフローは16:9、縦方向のワークフローは9:16でフレームガイドが表示されます。「すべて」を選択すると、両方のフレームガイドがオンになります。

マルチビュー画面にはタリーも表示でき、マルチビュー画面のソースがプログラム出力およびプレビュー出力のレイヤーに使用されている場合は、ボーダーが赤/緑に光ります。ボーダーが赤い場合は、該当ソースがプログラム出力に使用されており、ボーダーが緑の場合は、該当ソースがプレビュー出力に使用されています。ボーダー設定を使用してボーダーを無効にしたり、カラーメニューで色を選択したりできます。マルチビューでは、プログラム出力およびプレビュー出力のラベルも赤/緑に変わります。「Aa」アイコンをクリックすることでも、ラベルを無効にできます。

マルチビューには、配信、収録、オーディオのステータスビューが含まれているので、ハードディスクの容量やデータレートを配信中に確認できます。各ビューに関する詳細は、このマニュアルの「マルチビューの使用」セクションを参照してください。

ソース

ソースタブでは、スイッチャーの入力、出力、メディアプレーヤーのラベルを変更できます。各入出力には、長いラベルと短いラベルがあります。

長いラベルは20文字まで入力可能です。これらのラベルはソフトウェアコントロールパネルのソース選択ボックスや、マルチビューウィンドウのオンスクリーンラベル、スイッチャーのLCDディスプレイに使用されます。4文字までの短いラベルは、ソフトウェアコントロールパネルで、ビデオ入力ボタンを識別するために使用されます。

入力名を変更するには、テキストフィールドをクリックして文字を入力します。マルチビュー画面、ソフトウェアコントロールパネル、そしてスイッチャー（接続している場合）で入力名がアップデートされます。長いラベルと短いラベルが常にマッチするように、同時に変更するとよいでしょう。例えば、Camera 1は長いラベルには「Camera 1」と入力し、短いラベルには「CAM1」と入力します。

入出力用の長いラベルと短いラベルを入力

ATEM Television Studio HD8 ISOスイッチャーでは、ソースタブでローカルネットワーク上あるいはインターネット経由のリモートカメラを追加できます。詳細は、このマニュアルの「ISOシリーズの追加機能」セクションを参照してください。

HyperDeck設定

ATEM Television Studioスイッチャーシリーズは、10台までのHyperDeckディスクレコーダーを接続して、ATEM Software Controlでコントロールできます。HyperDeckを接続する際は、これらの設定を使用してIPアドレスのコンフィギュレーション、HyperDeckに接続する入力の選択、各デッキの自動再生のオン/オフの切り替え、クリーンなスイッチングを得るためのフレームオフセットの設定が可能です。

各デッキの上下にステータスインジケーターが表示されるので、それぞれが正しく接続されているか、リモートボタンが有効になっているかを確認できます。

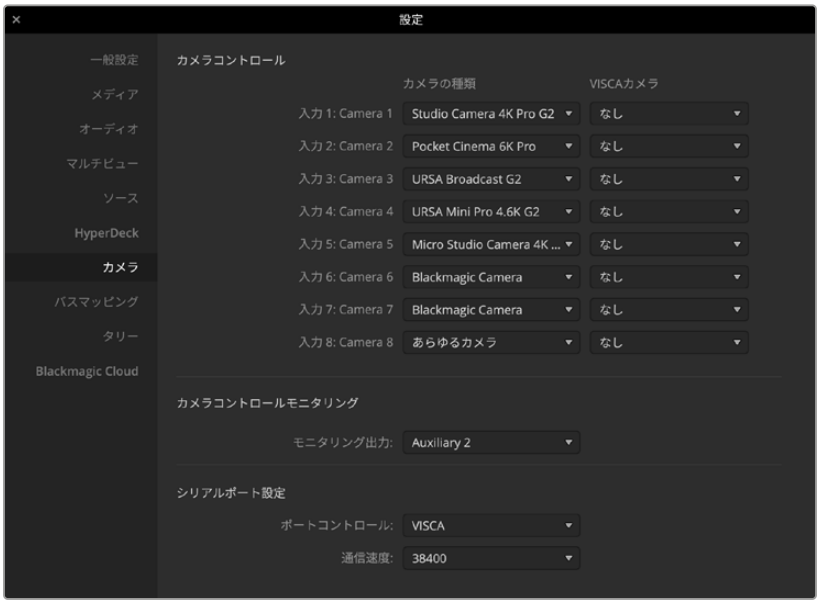
最大10台のHyperDeckを接続

HyperDeck入力のラベルをカスタマイズすると、リストから簡単に選べます。

HyperDeckとATEMスイッチャーのセットアップ、「HyperDeck」コンフィギュレーション設定に関する詳細は、このマニュアルの「HyperDeckコントロール」セクションを参照してください。

カメラコントロール設定

「カメラ」タブでは、カメラを入力に割り当てたり、モニタリング出力を選択できます。



カメラコントロール

「カメラの種類」メニューでは、各入力にBlackmagicカメラを選択できます。サードパーティ製のカメラを使用する場合は、「あらゆるカメラ」を選択します。入力用の正しいカメラを選択することで、該当のカメラのパラメーターすべてが適切に設定されます。

VISCA over IPで制御するPTZカメラおよびPTZカメラヘッドを追加する：

1. 「カメラの種類」メニューで「あらゆるカメラ」を選択します。
2. 対応するVISCAカメラメニューをクリックします。すでにVISCAカメラを追加している場合はリストに表示されます。あるいは「VISCA IPカメラを追加」オプションをクリックします。
3. 「VISCA IPカメラを追加」メニューで、PTZカメラあるいはカメラヘッドのIPアドレスを入力します。カメラのカスタム名を入力することもできます。「追加」をクリックします。

カメラコントロールモニタリング

カメラコントロールモニタリングには、あらゆるSDIやウェブカム出力を選択できます。カメラコントロールパネルでカメラをコントロールしている場合、モニタリング出力で調整をモニタリングできます。メニューをクリックして、使用したい出力を選びます。

シリアルポート設定

ポートコントロールメニューでこのポートの使用方法を選択できます。オプションには「なし」、「VISCA」、「GVG」があります。「GVG」は、リニア編集システムなどの機器と通信する際に一般的なGVG100を使用します。「VISCA」を選択すると、9600または38400の通信速度を選択できます。

リモートのVISCAカメラを検出するには、「VISCAカメラのセットアップ」ボタンをクリックします。

バスマッピング

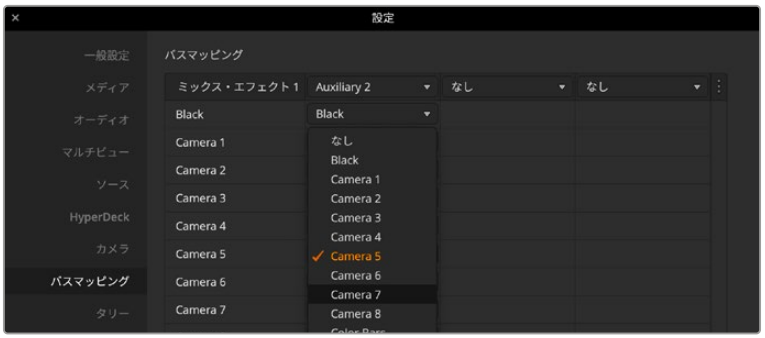
ATEM Television Studioでは、Aux出力およびウェブカム出力をリンクして、プライマリーM/Eの操作をフォロー（追従）できます。これにより、プログラム列でフォロワー出力をコントロールして、同じプログラムの複数の出力を作成できます。

設定のバスマッピングタブを使用して、フォロワーAux出力またはウェブカム出力のソースを置き換えることで、選択した入力をオーバーライドできます。これを設定すると、フォロワーはプログラム列のカットおよびトランジションと同じ操作を行いますが、必要に応じて異なるソースを出力できます。これらは単純なカットのみの出力なので、プログラムで使用するトランジションは含まれません。例えば、各出力のタイトルグラフィックを異なる言語に置き換えることで、プログラムをローカライズできます。フォロワーは、全てのトランジションをプライマリーと同期して実行し、トランジションをシンプルなカットに置き換える一方で、ローカライズしたグラフィックを表示するので、4つまでの異なるプログラム出力を作成できます。

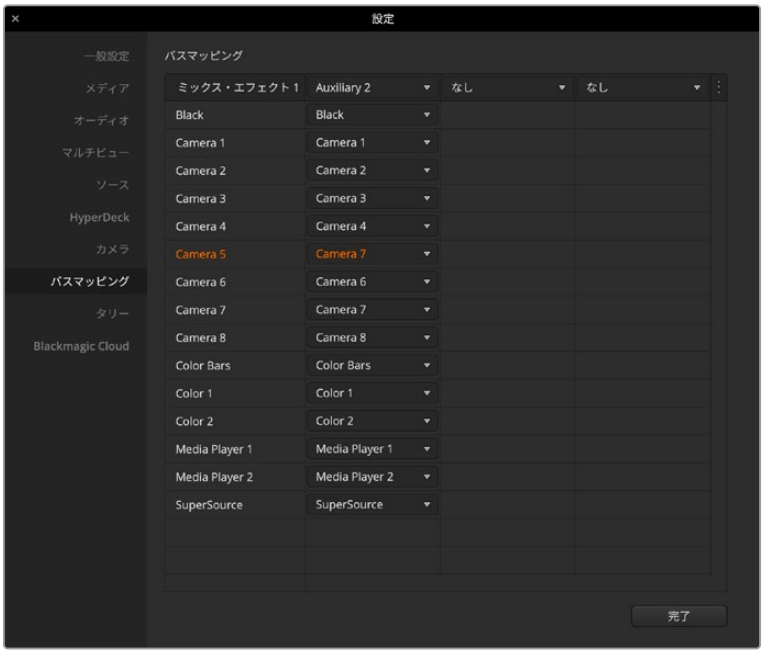
ソースの置き換えを設定する：

1. 2列目の一番上にあるメニューを使用して、フォロワーとして使用するAux出力またはウェブカム出力を選択します。例えば、Aux 2です。ATEM Television Studio HD8シリーズは2系統、ATEM Television Studio 4K8モデルは10系統のAux出力を搭載しています。

2 この例では、Camera 5を置き換えます。Aux 2でCamera 5のソースリストへ行き、リストメニューをクリックします。



3 リストからCamera 7を選択します。ミックスエフェクト1のCamera 5が、オレンジでハイライトされ、置き換えられたことを示します。



ミックスエフェクトプログラムでCamera 5にカットまたはトランジションすると、Aux 2はCamera 7にカットします。実際の操作をすばやくチェックするには、プログラムおよびAux 2の両方をマルチビュー出力にマッピングします。

これらは単純なカットのみの出力なので、プログラムで使用するトランジションは含まれません。

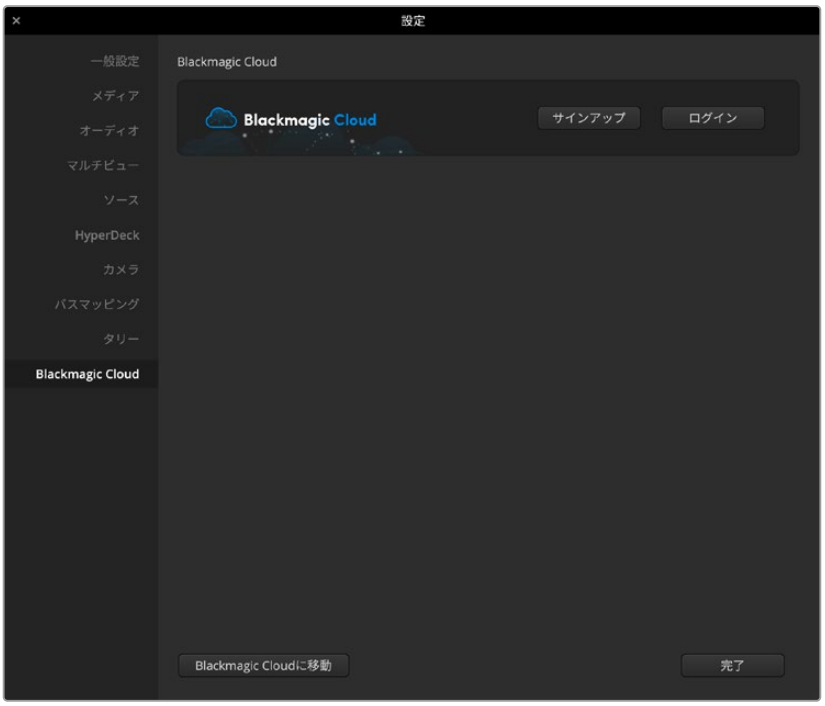
タリー

タリーメニューでは、各M/Eのタリーを有効にできます。これはM/Eごとに設定でき、1つのM/Eを、他のM/Eと異なるタリー出力に設定することもできます。

ダウンストリームキーのオンエア中にタリーを無効にするには、「タリーオーバーライドの有効化」のチェックボックスをクリックします。

Blackmagic Cloud

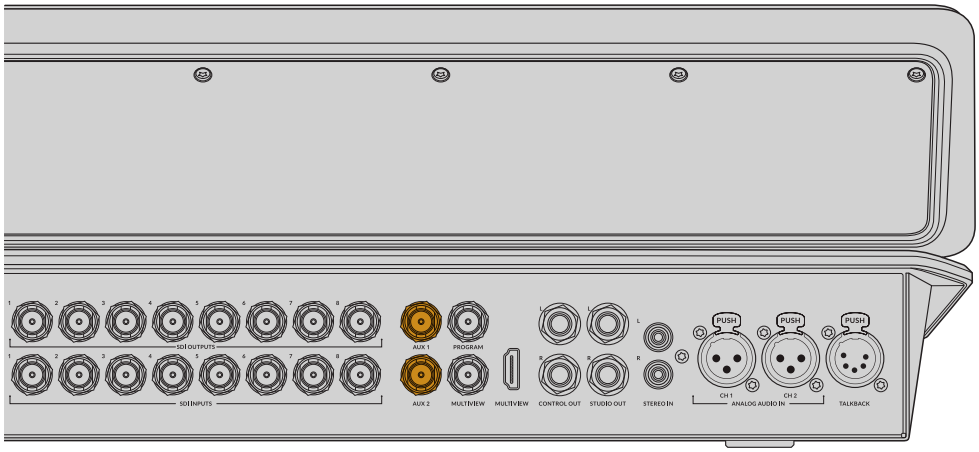
Blackmagic Cloud Stream Routerに配信している場合や、Blackmagic Cloudにプロジェクトを同期している場合、Blackmagic Cloudにログインする必要があります。これは、設定ウィンドウのBlackmagic Cloudメニューまたはライブ配信パレットから実行できます。



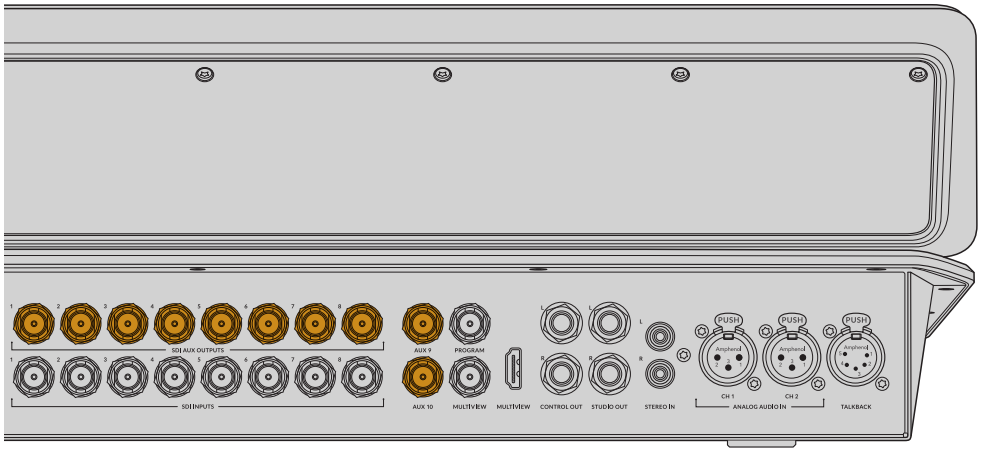
使用可能なシリアルVISCAカメラのリストがウィンドウに表示されます。「＋（プラス）」アイコンをクリックして「VISCA IPカメラ」を追加することもできます。シリアルVISCAカメラが検出されると、「VISCAカメラ」メニューから各入力に選択可能になります。VISCA over IPカメラを削除するには「ー（マイナス）」ボタンを押します。

Aux出力

ATEMスイッチャーの独立したSDI Aux出力とウェブカム出力は、様々な入力信号および内部ソースをルーティングして出力できます。Aux出力はルーター出力とよく似ており、すべてのビデオ入力、カラージェネレーター、メディアプレーヤー、プログラム、プレビュー、さらにはカラーバーを出力できます。ATEM Television Studio HD8シリーズは3系統、ATEM Television Studio 4K8シリーズは11系統のAux出力を搭載しています。



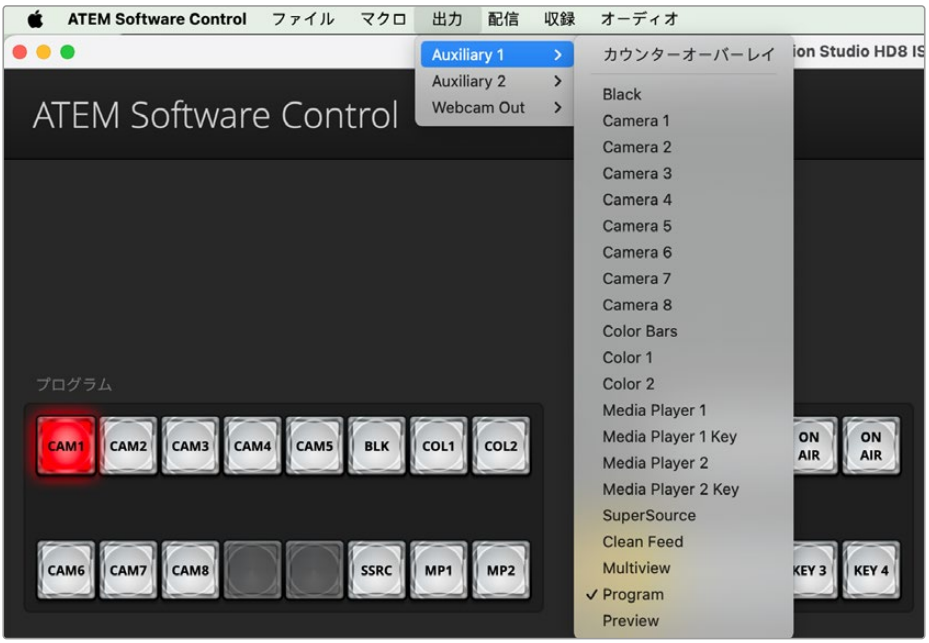
ATEM Television Studio HD8のAux出力



ATEM Television Studio 4K8のAux出力

Aux出力のルーティング

専用のAux出力メニューでAux出力をルーティングできます。メニューを選択し、リストをスクロールして、出力したいソースを選択します。ソースを選択すると、選択したAux出力がすぐに切り替わります。メニューアイテムにチェックが入るので、現在のソースを確認できます。ブラック、すべてのビデオ入力、カラーバー、メディアプレーヤーのフィル信号、メディアプレーヤーのキー出力、プログラム出力、プレビュー出力、クリーンフィードなど、幅広いソースから選択可能です。



ATEM Television Studio HD8の出力メニュー

Aux出力は非常にパワフルな機能で、様々な用途に使用できます。例えば、スイッチャーの代替出力として使用したり、コンサートやライブイベントの最中に、ステージ上のビデオプロジェクターやビデオウォールに使用できます。近代的なライブパフォーマンスは、マルチメディアの側面が非常に複雑化していますが、Aux出力を使用すれば、ATEMからのディスプレイをすべてコントロール可能です。

オーディオ出力のチャンネルマッピング

スイッチャーのビデオ出力のエンベデッドオーディオチャンネルをマッピングできます。つまり、様々なオーディオソースを、SDIビデオ出力のチャンネルにルーティングして、HyperDeckレコーダーで収録できます。

例えば、カメラに繋いだマイクのオーディオ入力を、プログラム出力のエンベデッドオーディオチャンネル3と4にルーティングするなどです。HyperDeckの設定で、4チャンネル以上のオーディオチャンネルの収録を選択すると、オーディオミックスとは別にカメラマイクを収録できます。オーディオエンジニアたちは、ポストプロダクションでオーディオミキシングを行う際に、これらの特定のオーディオソースを使用できます。

このパワフルなオーディオルーティングの機能により、SDIビデオ出力のすべてのエンベデッドオーディオチャンネルをコントロールできます。

ATEMスイッチャーは、オーディオニューからプログラム出力のオーディオチャンネルを個別にルーティングできます。

ATEM Software ControlのATEM Television Studioオーディオルーティング・オプション

プログラムミックスは常にチャンネル1と2、エンジニアトークバックはチャンネル13と14、プロダクショントークバックはチャンネル15と16に割り当てられますが、他のすべてのチャンネルは、あらゆるSDI、MADI、XLR、RCA、マイク入力を使用して、別々にマッピングできます。

ATEM Software Controlでプログラムオーディオをルーティング

1 上部のツールバーで「オーディオ」メニューをクリックします。

2 プログラムオーディオ出力チャンネルのペアを選択し、右側のメニューからオーディオをルーティングしたいSDI入力を選択します。例えば、SDI入力2のチャンネル3と4をプログラム出力のチャンネル3と4にルーティングする場合、最初のリストメニューで「オーディオ出力3/4」を選択し、2つ目のリストで「SDI入力2 オーディオ3/4」を選択します。

SuperSourceの使用

ATEM Television Studioスイッチャーシリーズには、モニター上に複数のソースを同時に配置できる、SuperSourceという機能が搭載されています。例えば、4人の出演者によるディスカッションを放送する場合、1つのバックグラウンドに4人の映像をスーパーインポーズできます。SuperSourceは、ATEMスイッチャー上で1つのビデオ入力として表示されます。

SuperSourceのセットアップ

SuperSourceのセットアップは、ATEM Software Controlの「パレット」タブを使用するか、LCDの左にあるSuperSourceボタンを押すことで実行できます。

SuperSourceの確認

SuperSourceを設定するには、まずはモニターに表示させる必要があります。モニターに表示するには、出力メニューを使用してSDI出力のひとつにSuperSourceを割り当てるか、マルチビューレイアウトのウィンドウのひとつにSuperSourceを配置します。

ソースの配置

SuperSource設定

SuperSourceパレットを開き、4つのプリセットレイアウトの中から希望するルックに近いレイアウトを選択します。これで、ソフトウェアと同じ位置にボックスが自動的に配置されます。コントロールメニューを使用して調整したいボックスを選択すると、各ボックスのサイズやX/Y位置を変更できます。「ボックスを有効化」のチェックを外すと、該当のボックスをSuperSourceビューから削除できます。「クロップ」設定では、ボックスの側面をクロップできます。「クロップ」設定にチェックを入れて、「上」、「下」、「左」、「右」のパラメーターを調整します。ボックスの位置、サイズ、クロップ、あるいは全てのパラメーターをリセットするには、ボックスコントロールの右にあるアイコンをクリックします。

ATEM Television Studioスイッチャーで「SuperSource」ボタンを押すと、システムコントロールの矢印ボタンを使ってSuperSource設定をナビゲートできます。SuperSourceの2ページ目でプリセットノブを回してレイアウトを選択し、LCDの上にある「プリセットを適用」ソフトボタンを押します。ボックスを選択したら、すべての追加設定とジョイスティックコントロールが該当のボックスに適用されます。

ボックスのサイズや位置は、メニュー3ページ目で、LCDの下にあるソフトノブを使って調整できますが、パネルのジョイスティックを使用する方が遥かにスピーディです。ジョイスティックを使用すると、X/Y位置を同時に変更できます。ジョイスティックを時計回りに回すとボックスのサイズが大きくなり、反時計回りに回すと小さくなります。

バックグラウンド/フォアグラウンド・アート

「アート」タブをクリックして設定を表示します。メニューからフィルソースを選択します。スイッチャーパネルを使用している場合は、ソース選択バスでフィルソースを選択できます。選択したソースをバックグラウンドまたはフォアグラウンドに配置します。フォアグラウンドを選択すると、メニューあるいはスイッチャーパネルのソース選択バスからキーソースを選択できるようになります。

アートのバックグラウンドコントロール

フォアグラウンドのラジオボタンを選択している場合、使用するグラフィックがプリマルチプライされているかどうかを選択する必要があります。プリマルチプライされている場合はチェックボックスにチェックを入れます。これで、有効なボックスの前面にアートが表示されます。使用するアートがプリマルチプライされていない場合は、このマニュアルの「キーイング」のセクションに記述されている通り、クリップ/ゲインコントロールを使用して調整できます。キーを反転させることも可能です。

スイッチャーパネルで、システムコントロールの矢印ボタンを使用して設定ページへ行きます。フィルソースのノブでアートを選択し、LCDの上にあるソフトボタンを使ってフォアグラウンドかバックグラウンドを選択します。フィルソースがプリマルチプライされている場合は、次の設定ページへ進み「プリマルチプライキーオン」ボタンが表示されていることを確認します。有効なボックスの前面にアートが表示されます。使用するアートがプリマルチプライされていない場合は、このマニュアルの「キーイング」のセクションに記述されている通り、クリップ/ゲインコントロールを使用して調整できます。「キーを反転」でキーを反転させることも可能です。

設定のコピー

ボックス1からボックス2へ
設定をコピー

ATEM Software Controlでコピー機能を実行する場合は、「コピー」タブをクリックしてボックスコピー設定を表示させます。現在選択されたボックスの設定を他のあらゆるボックスにすばやく簡単にコピーでき、正確な複製をワンクリックで作成できます。コピーされたボックスはマスターボックスの真後ろに表示されます。また、マスターボックスと同じソースを共有します。ATEM Television Studioで設定を調整している場合、SuperSourceメニューの最後のページへ行き、LCDの下にあるソフトノブを使ってコピー元とコピー先のボックスを選択します。ノブを使って、「全ボックス」にコピーを選択することも可能です。

ATEM Advanced Panelを使用している場合、SuperSourceメニューの最後のページへ行き、LCDの下にあるソフトノブを使ってコピー元とコピー先のボックスを選択します。ノブを使って、「全ボックス」にコピーを選択することも可能です。

SuperSourceをオンエアする

ATEMスイッチャーでは、SuperSourceプロセッサー全体が1つのビデオ入力として表示されます。ATEM Software Controlまたはスイッチャーパネルのプログラムバスで「SuperSource」ボタンを選択するだけで、作成した合成映像を使用できます。

スイッチャー設定の保存と復元

ATEMスイッチャーのセットアップが完了したら、2つの異なるオプションで設定を保存できます。

起動時の状態を保存

すべてのプロダクションで同じ設定を使用する場合、デフォルトの起動時の状態を保存できます。一度保存すると、ATEM Software Controlを起動するたびにすべてのプリセットおよび環境設定がロードされます。これらの設定は、「起動時の状態をクリア」でリセットできます。

設定をXMLとして保存

複数のプロダクションを異なる設定で行っている場合、「別名で保存」機能を使用できます。このパワフルな機能により、決まった設定を使用するライブプロダクションにおいて時間を大幅に節約できます。例えば、保存したカメラ設定、ローワーサード・グラフィック、詳細なキー設定を、ラップトップやUSBドライブから即座に復元できます。

設定を保存する：

1. ATEM Software Controlのメニューバーから、「ファイル」タブの「別名で保存」を選択します。
2. ウィンドウが開くので、ファイル名と保存先フォルダーを指定します。指定したら、「保存」をクリックします。
3. ATEMスイッチャーの各ブロックで使用できるすべての設定のチェックボックスが含まれた保存パネルが開きます。デフォルトでは「すべてを選択」のチェックボックスが有効になっています。「すべてを選択」を有効にして保存すると、ATEM Software Controlは、スイッチャーの設定をすべて保存します。特定の設定のみを保存したい場合は、選択されたチェックボックスを個別に解除してください。また、「すべてを選択」をクリックして、すべての選択を解除することもできます。これで、保存したい設定を選択できます。
4. 「保存」をクリックします。パネルの右下に保存状態が表示され、保存が完了したことが確認できます。

ATEM Software Controlでは、設定はXMLファイルでATEMメディアプールのコンテンツフォルダーとともに保存されます。

設定を保存した後は、「File」の「Save」を選択するか、MacではCommand＋S、WindowsではCtrl＋Sをクリックして、すばやく保存できます。これによって以前に保存した設定が上書きされることはありません。新しいXMLファイルが指定のフォルダーに保存され、時刻と日付が明確に表示されます。つまり、過去の保存内容を必要な際にいつでも復元できます。

ATEM Software Controlで、キー設定、トランジションスタイル、メディアプールコンテンツなど、ライブプロダクション用のスイッチャー設定を保存、復元できます。

スイッチャー設定をラップトップに保存することで、ロケ先でもすべての設定を簡単に使用できます。ラップトップをATEMスイッチャーに接続すると、スイッチャー設定を即座に復元できます。

ライブプロダクション中は非常に慌ただしく、常に瞬時の対応を迫られるため、プロダクションが終わった後、保存したファイルのバックアップを忘れてしまう可能性があります。

保存したい設定がある場合は、それらをコンピューターやUSBなどの外付けドライブに保存します。これにより、保存した設定を持ち運べるだけでなく、コンピューター上に保存した設定を誤って削除してしまった場合にもバックアップが残ります。

設定を復元する：

1. ATEM Software Controlのメニューバーで、「ファイル」タブの「復元」を選択します。
2. ウィンドウが表示されたら開きたいファイルを選択して下さい。保存ファイルを選択し、「復元」をクリックしてください。
3. ウィンドウが表示され、ATEMスイッチャーの各ブロックで保存した設定をチェックボックスで選択できます。「すべてを選択」をオンにして保存した設定をすべて復元するか、または復元したい設定のチェックボックスを選択してください。
4. 「復元」をクリックします。

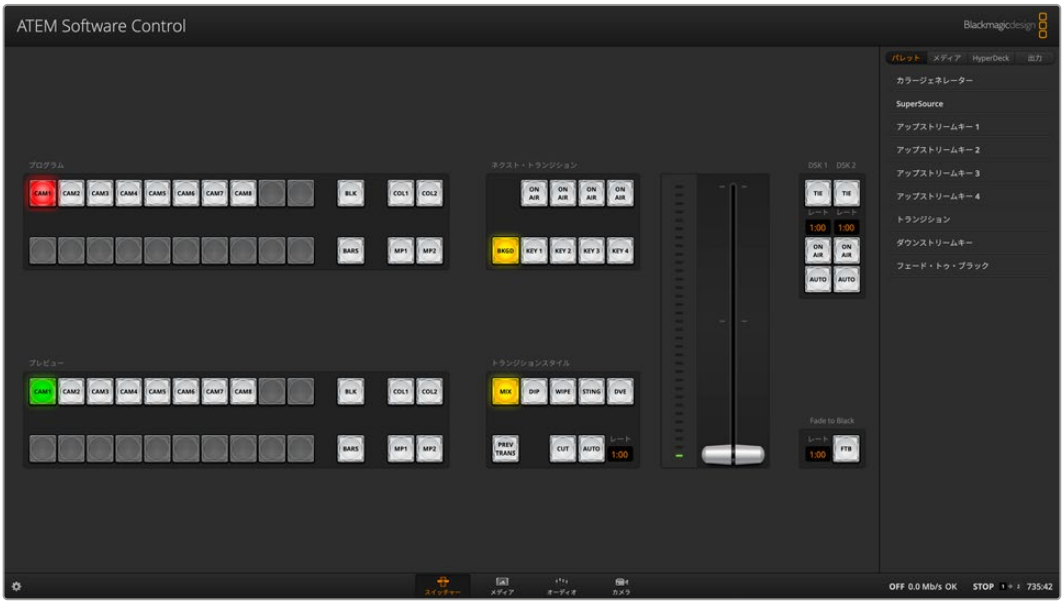
出荷時設定にリセット

ATEMスイッチャーを出荷時設定にリセットするには、ATEM Setupユーティリティを開いて「Factory Reset（出荷時設定にリセット）」をクリックします。出荷時設定にリセットする前に保存したスイッチャー設定は維持されます。

ATEM Software Controlでスイッチング

「スイッチャー」タブはスイッチャーのメインのコントロールインターフェースです。ライブプロダクションの最中は、「スイッチャー」ウィンドウを使用してソースを選択し、オンエアします。

トランジションスタイルの選択、アップストリーム/ダウンストリームキーヤーの管理、フェード・トゥ・ブラックのオン/オフ切り替えが可能です。インターフェースの右側にあるパレットでは、トランジションレートなどトランジション設定の調整、カラージェネレーターの調整、メディアプレーヤーのコントロール、アップ/ダウンストリームキーヤーの調整、フェード・トゥ・ブラックレートなどのコントロールを行います。



マウス/トラックパッドの使用

ATEM Software Controlのボタン、スライダー、フェーダーバーは、コンピューターのマウスで、あるいはラップトップの場合はトラックパッドを使用して操作します。

ボタンを使用するには、マウスを左クリックします。スライダーを操作するには、マウスを左クリックしたままドラッグします。フェーダーバーを操作するには、フェーダーバーのハンドルを左クリックしたままドラッグし、動かしたい方向に操作します。

キーボードのホットキーの使用

いくつかのスイッチャー機能は、ホットキーでコントロールできます。標準のQWERTY配列キーボードで、以下のホットキー機能が使用できます。

ホットキー	機能
<1> ～ <0>	スイッチャー入力1～10のソースをプレビュー。0 = 入力10。
<Shift> <1> ～ <0>	スイッチャー入力11～20のソースをプレビュー。Shift 0 = 入力20。
<Control> <1> ～ <0>	スイッチャー入力1～10のソースをプログラム出力へホットスイッチ。
<Control>を押して放す、 その後 <1> ～ <0>	スイッチャー入力1～10のソースをプログラム出力へホットスイッチ。 ホットスイッチはオンのまま、CUTボタンは赤く光ります。
<Control> <Shift> <1> ～ <0>	スイッチャー入力11～20のソースをプログラム出力へホットスイッチ。
<Control>を押して放す、 その後 <Shift> <1> ～ <0>	スイッチャー入力11～20のソースをプログラム出力へホットスイッチ。 ホットスイッチはオンのまま、CUTボタンは赤く光ります。

<Control>	ホットスイッチがオンになっている場合オフになり、CUTボタンは白く光ります。
<Space>	CUT
<Return> または <Enter>	AUTO

スイッチャーコントロールパネルの使い方の詳細は次セクションに記載されています。

ミックスエフェクト

「スイッチャー」タブのミックスエフェクト・ブロックには、プログラムバスおよびプレビューバスのすべてのソース選択ボタンが含まれています。外部入力や内部ソースを選択して、ネクスト・トランジションのプレビューやオンエアへの切り替え用に使用します。

ATEM Television Studioのミックスエフェクトパネル

プログラムバスのソース選択ボタン

プログラムバスのソース選択ボタンは、バックグラウンドソースをプログラム出力にホットスイッチするのに使用します。現在オンエアされているソースのボタンは赤く光ります。

プレビューバスのソース選択ボタン

プレビューバスのソース選択ボタンは、プレビュー出力にバックグラウンドソースを選択するのに使用します。選択したソースは、次のトランジションの際にプログラムバスへ送信されます。現在選択されているプレビューソースのボタンは緑に光ります。

プログラムバスのソース選択ボタンはプレビューバスと同じです。

入力	入力ボタンはスイッチャーのビデオ入力の番号と一致します。
ブラック	スイッチャーで内部生成する黒ビデオ信号を指します。
SuperSource	SuperSourceを使用すると、モニター上に複数のソースを同時に配置できます。Shift選択でバーを使用できます。
Bars	スイッチャーで内部生成されるカラーバー信号を指します。SuperSourceのShift選択でバーを使用できます。
Col1およびCol2	スイッチャーで内部生成されるカラーマット信号を指します。
メディア1、2	スイッチャーに保存したスチル/クリップを表示する内蔵メディアプレーヤーです。

トランジションコントロールとアップストリームキーヤー

トランジションコントロール

CUT

「CUT」ボタンは、選択したトランジションスタイルを無効にして、プログラム出力からプレビュー出力へ直接トランジションします。

AUTO/レート

「AUTO」ボタンは、選択したトランジションを「レート」ウィンドウに設定されたレートで実行します。各トランジションスタイルのレートは、トランジションパレットで設定します。設定したレートは、対応するトランジションスタイルボタンを選択した際に、トランジションコントロール・ブロックの「レート」ウィンドウに表示されます

トランジションの実行中、「AUTO」ボタンは赤く光り、「レート」ウィンドウはトランジション処理に合わせて、残りのフレーム数を表示します。ATEM Television Studioスイッチャーシリーズのフェーダーバーインジケーターは、トランジションの進行を視覚的にフィードバックします。

フェーダーバー

フェーダーバーは「AUTO」ボタンの代わりに使用して、トランジションをマウスでマニュアルコントロールできます。トランジションの実行中、「AUTO」ボタンは赤く光り、「レート」ウィンドウはトランジション処理に合わせて、残りのフレーム数を表示します。スイッチャーのフェーダーバーインジケーターは、トランジションの進行を視覚的にフィードバックします。

トランジションスタイル

「トランジションスタイル」セクションのボタンで、ミックス、ワイプ、ディップ、DVE、スティンガーの5種類の中からトランジションを選択できます。選択したトランジションのボタンは黄色く光ります。ここで行うボタン選択は、「トランジション」処理パレット内の対応するタブに反映されます。例えば、「トランジション」処理パレットを開いた状態で「ワイプ」ボタンをクリックすると、パレットにワイプタブが自動的に表示され、トランジションの長さやパターンなどを調整できます。

アーム

「ARM」ボタンは、トランジションの後に、プレビューバスで選択した接続済みのHyperDeckからの自動再生を有効にします。これは自動再生機能と似ており、トランジションを開始するために「CUT」または「AUTO」ボタンを押すと、プレビューバスで選択したHyperDeckが再生を開始します。アーム機能を使用するには、Shift選択し、「STING」ボタンの代わりに表示される「ARM」ボタンをクリックします。ボタンを一回押すと、選択したHyperDeckの入力が次のトランジション時にのみ自動再生されます。アームを継続的に有効な状態にするには、キーボードのSHIFTキーを押しながら「ARM」ボタンを二度押しします。

アームが有効になっていると、設定メニューのHyperDeckタブで設定されたプリロールは無効になります。

PREV TRANS

プレビュートランジションモードをオンにします。このモードでは、フェーダーバーを使ってプレビュー出力画面で、ミックス、ディップ、ワイプ、DVEトランジションを確認できます。「PREV TRANS」ボタンを選択すると、プレビュー出力がプログラム出力と同じになるので、選択したトランジションをフェーダーバーで実行して確認できます。この機能は、オンエアでのエラーを避けるために非常に役立ちます。

ネクスト・トランジション

ネクスト・トランジションは、BKGD、KEY 1、KEY 2、KEY 3、KEY 4ボタンで、オンエア/オフエアするエレメントを選択できる機能です。使用できるキーヤーの数は、スイッチャーモデルにより異なります。バックグラウンド・トランジションの実行中、すべてのキーを共にフェード・オン、フェードオフするように設定したり、あるいは、キーだけを独立してトランジションするよう設定すると、バックグラウンド・トランジションをキーのフェード・オン/オフに使用できます。

ネクスト・トランジションのエレメントを選択する際、プレビュー出力を確認してください。この出力では、トランジションが完了した後のプログラム出力の状態を正確に確認できます。BKGDボタンだけを選択している場合、プログラムバスで現在選択されているソースからプレビューバスで選択されている次のソースへのトランジションはキーヤーなしで実行されます。キーヤーだけトランジションするように選択して、現在のバックグラウンドはトランジションさせずにそのまま残すこともできます。

ON AIR

「ON AIR」インジケーターボタンは、どのキーが現在オンエアされているかを表示します。また、キーを即座にカットしてオンエア、オフエアする際にも使用できます。

ダウンストリームキーヤー

TIE

「TIE」ボタンは、プレビュー出力で、ネクスト・トランジションとダウンストリームキーヤー（DSK）をオンにし、DSKをバックグラウンドトランジションコントロールに連結（tie）するので、DSKは、ネクスト・トランジションとともにオンエアされます。

DSKは、トランジションコントロール・ブロックにある「RATE」ウィンドウに設定されたレートでトランジションを実行します。DSKが連結されていても、クリーンフィード1に送信される信号は影響を受けません。

ON AIR

「ON AIR」ボタンは、DSKのオンエア/オフエアの切り替えに使用します。同ボタンはDSKの現在の状態を表示し、オンエア中に点灯します。オンエア中に点灯します。

AUTO

「AUTO」ボタンは、DSKのオンエア/オフエアを「DSK RATE」ウィンドウで指定されたレートでミックスします。この機能は、トランジションコントロール・ブロックにあるメインのAUTOのレートと似ていますが、特定のダウンストリームキーヤーでの使用に制限されています。プロダクション中に、メインプログラムのトランジションを妨げることなく、「ライブ」「リプレイ」などのウォーターマークやロゴをフェードアップ/ダウンするのに使用できます。

ダウンストリームキーヤーと
フェード・トゥ・ブラック

フェード・トゥ・ブラック (FTB)

「FTB」ボタンは、Fade To Blackの「Rate」ウィンドウに設定されたレートで、プログラムビデオ出力すべてを黒画面へとフェードします。プログラム出力がブラックにフェードすると、もう一度ボタンを押すまで、FTBボタンは赤く光り続けます。もう1度ボタンを押すと、同じレートで黒画面からフェードアップします。レートウィンドウで新しいレートを設定することもできます。フェード・トゥ・ブラック機能は、プロダクションの開始時や終了時、あるいはCMに入る際などによく使用されます。出力上のすべてのレイヤーが同時にフェードアウトされます。フェード・トゥ・ブラックはプレビューできません。また、マスターオーディオ出力フェーダーのAFVボタンを使用して、フェード・トゥ・ブラックと同時にオーディオもフェードするようオーディオミキサーを設定することもできます。

処理パレット

ATEM Software Controlパネルには、パレット、メディアプレーヤー、出力を管理するタブがあります。パレットではスイッチャーの処理の順序を確認できます。処理パレットは展開/最小化の操作が可能で、任意のメニューだけを開くことができます。+/–ボタンでパレットをスクロールアップ/ダウンさせて、必要なパレットを選択します。

パレットタブ

「パレット」タブには以下のコントロールがあります。

カラージェネレーター 1と2

ATEMスイッチャーは2つのカラーマット・ジェネレーターを搭載しています。これらは、カラージェネレーターパレットからカラーピッカーで設定したり、あるいは色相、サチュレーション、輝度レベルを調整することで設定できます。

SuperSource

ATEM Television Studioスイッチャーシリーズには、モニター上に複数のソースを同時に配置できる、SuperSourceという機能が搭載されています。詳細は、このマニュアルの「SuperSource」セクションを参照してください。

アップストリームキー

4系統のアップストリームキーヤーが搭載されており、「アップストリームキー」パレットでコンフィギュレーションできます。キーヤーごとに独自のパレットがあり、ルマキー、クロマキー、パターンキー、DVEを設定できます。

パレットを選択すると、キーヤーの設定に使用できるパラメーターが表示されます。アップストリームキーヤーに関する詳細は同マニュアルに後述されています。

トランジション

トランジションパレットでは、各トランジションスタイルのパラメーターを設定できます。例えば、ディップトランジションでは、パレットのドロップダウンメニューでディップソースを選択でき、ワイプトランジションでは、使用可能なワイプパターンがパレットに表示されます。トランジションには様々なバリエーションがありますが、多くのトランジションは、トランジションパレットの設定や機能を組み合わせることで作成できます。

メモ ここで注意すべき点は、同パレットでできることは、選択したトランジションの設定変更のみであることです。実際にトランジションを実行するためには、ソフトウェアまたはハードウェアスイッチャーのトランジションコントロールセクションで、実行したいトランジションをボタンで選択する必要があります。操作性を向上させるために、トランジションの設定にはソフトウェアパネルのパレットを使用し、実際のスイッチングにはハードウェアパネルを使用することも可能です。ソフトウェアパネルおよびハードウェアパネルは互いの設定を反映し、連動して動作するため、あらゆる組み合わせで使用できます。

ダウンストリームキー

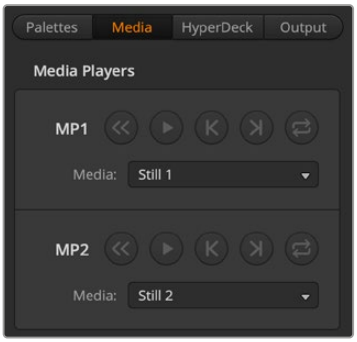
ダウンストリームキーヤーは、ダウンストリームキーパレットで設定できます。同パレットには、フィル＆キー信号を選択するドロップダウンボックス、クリップおよびゲインバリューを設定するスライダー、プリマルチプライ、マスク設定があります。ATEM Television Studioスイッチャーシリーズは2つのダウンストリームキーヤーに対応しています。

フェード・トゥ・ブラック

「フェード・トゥ・ブラック」パレットでは、フェード・トゥ・ブラック・トランジションのレートを設定できます。また、「Audio Follow Video」チェックボックスは、オーディオミキサーのマスターフェーダーAFVボタンのショートカットとして使用できます。この機能を選択すると、フェード・トゥ・ブラックと同時にオーディオもフェードできます。

メディアタブ

「メディア」タブには、ATEMスイッチャーのメディアプレーヤーおよび接続されているHyperDeck用のコントロールがあります。



メディアプレーヤー

ATEMスイッチャーはメディアプレーヤーを搭載しており、スイッチャー内部のメディアプールメモリーに保存されたクリップやスチルを再生できます。メディアプレーヤーで再生するスチルやクリップをドロップダウンリストから選択します。クリップを選択すると、トランスポートコントロールでクリップの再生、一時停止、ループが実行できるようになります。また、クリップの1フレーム戻し/送りも可能です。ATEM Television Studio スイッチャーシリーズは、2つのメディアプレーヤーを搭載しています。

HyperDeckタブ

HyperDeckタブでは、最大10台のHyperDeckをコントロールできます。

HyperDeck

HyperDeckディスクレコーダーを最大10台接続して、ATEM Software Controlの「HyperDeck」パレットでコントロールできます。表示するHyperDeckの数を変更するには、歯車アイコンをクリックして、リストから数値を選択します。詳細は、このマニュアルの「HyperDeckコントロール」セクションを参照してください。

出力タブ

出力タブを使って、ライブ配信設定や収録設定を設定できます。出力タブは、タイムコードやカウンター設定の他、スチルのキャプチャーにも使用できます。

ライブ配信

この出力オプションは非常に重要です。ここで、配信プラットフォームの詳細を入力して、ライブ配信のセットアップを行います。すべての設定を入力したら、「ON AIR」ボタンを押すだけで放送を開始できます。「オフ」をクリックすると放送を停止できます。

ライブ配信ステータスに、大きな赤文字の「ON AIR」とタイムコードジェネレーターが表示され、オンエア中であることが明確に示されます。タイムコードジェネレーターは、タイムコードジェネレーターオプションで設定できます。

配信サービス	「配信サービス：」メニューをクリックして、放送に使用する配信プラットフォームを選択します。Facebook Live、YouTube Live、Twitchなどのオプションがあります。
サーバー	設定ウィンドウをクリックして、最寄りのサーバーをメニューから選択します。
キー	配信プラットフォームから配信用に割り当てられたストリームキーを入力。ストリームキーの取得に関しては、「ネットワークに接続」セクションの「ストリームキーの取得」を参照してください。
パスフレーズ	SRT配信プロトコルの配信サービスを使用している場合、配信プラットフォームのアカウントから割り当てられたパスフレーズを入力します。
解像度	ATEM Television Studio 4K8が2160pに設定されている場合、解像度オプションを使用すれば、ライブ配信をHDにダウンコンバートしたり、スイッチャーのフォーマットのまま維持できます。

品質	配信および収録の品質を選択。 この設定には、以下のオプションが含まれます： • HyperDeck High 45 to 70 Mb/s • HyperDeck Medium 25 to 45 Mb/s • HyperDeck Low 12 to 20 Mb/s • Streaming High 6 to 9 Mb/s • Streaming Medium 4.5 to 7 Mb/s • Streaming Low 3 to 4.5 Mb/s 品質設定に関する詳細は、このセクションに後述されています。

ストリームキーの取得など、イーサネット経由でライブ配信を直接セットアップする際の、これらのオプションの使い方に関しては、このマニュアルに後述される「配信」を参照してください。

これらの設定は非常にシンプルで、配信サービスとその他のオプションを選択するだけです。しかし、知識の豊富なユーザーは、追加設定のXMLファイルも利用できます。これにより、他の配信サービスを追加して、配信メニューを低レベル設定でカスタマイズすることも可能です。XMLファイルを使った保存と復元に関する詳細は、「スイッチャー設定の変更」および「スイッチャー設定の保存と復元」セクションを参照してください。

配信およびHyperDeck品質の設定

品質設定に使用されるデータレートは、スイッチャーで設定されているビデオフォーマットによって変わります。例えば、「Streaming High」の品質を選択し、ATEM Mini Proが1080p24に設定されている場合は、6 Mb/sのデータレートが使用されます。

「HyperDeck High」で使用されるデータレートは45〜70Mb/s、「HyperDeck Medium」は25 - 45Mb/s、「HyperDeck Low」は12 - 20Mb/sです。配信データレートは、インターネットでデータを送信できるように、低くなっています。「Streaming High」は6 - 9Mb/s、「Streaming Medium」は4.5 - 7Mb/s、「Streaming Low」は3 - 4.5Mb/sです。

各設定で、2つの数値がデータレートとして記載されていますが、低い方の数値は、低いフレームレート（24p、25p、30p）に使用され、高い方の数値は、高フレームレート（50p、60p）に使用されます。配信品質のデフォルト設定は、「Streaming High」の6〜9Mb/sです。この設定は、非常に高品質のチャンネル配信が可能で、収録も高品質です。

配信を行わない場合は、HyperDeck品質設定から1つを選択します。これらの設定は、HyperDeck Studio Miniの設定と同じ品質で、放送品質の収録が必要な場合に適したデータレートです。HyperDeck Studio Miniの最新のソフトウェアでは、低品質の配信データレートでの再生も可能です。

Record

If you are recording your stream, this palette is where you can control your disks and start and stop recording. You can also set a file name and trigger record in all connected Blackmagic cameras. For information on formatting media for recording, refer to the ‘storage media’ section.

ファイル名	収録前に、ファイル名ウィンドウに入力してファイル名を設定。ウィンドウの外側をクリックして確定します。収録を停止・再開するたびに、ファイル名にバージョン番号が1ずつ増加して割り当てられます。
ドライブ	スイッチャーに接続されたフォーマット済みのドライブが、収録ウィンドウのリストに表示されます。メニューで選択して、ドライブを割り当てられます。ドライブウィンドウには、ディスク容量と収録可能時間が表示されます。 収録は、空きスペースが多いディスクから常に開始され、次に空きスペースが多いディスクへと順に切り替わります。「切り替え」ボタンを押すと、収録するドライブをマニュアルで切り替えることも可能です。この機能は、現在のディスクの残りが5分に満たず、放送中の任意の時点で次のディスクに切り替えたい場合などに役立ちます。
切り替え	「切り替え」ボタンをクリックすると、現在収録中のドライブから、空き容量が最大の次のドライブに変更します。

作業のこつ ATEM Television Studioコントロールパネルの「SWITCH」ボタンを押してもドライブを変更できます。

停止ボタン	「停止」ボタンをクリックすると収録を停止できます。
収録ボタン	「収録」ボタンをクリックすると収録を開始できます。
ステータスを表示	収録オプションで「ステータスを表示」のチェックボックスをクリックすると有効/無効になります。ATEM Software Controlのユーザーインターフェースの右下にステータスが表示され、収録ステータスを表示します。収録中に収録インジケーターは赤く光り、現在のドライブと収録可能時間を表示します。
全カメラを収録	この機能は、収録ボタンを押すと接続したすべてのBlackmagicカメラで収録を実行するよう設定します。後から編集で使用するために、各カメラをISO収録したい場合に役立つ機能です。Blackmagic RAWを使って収録するように自動的に設定されます。品質は、最後にカメラで設定された品質設定になります。

Blackmagic Cloudへの同期

Blackmagic Cloudは、チームとして共同作業ができるコラボレーション・プラットフォームで、DaVinci Resolveプロジェクトを世界中で共有できます。

ATEMスイッチャーでBlackmagic Cloudにサインインすると、収録またはISOプロジェクトと、外付けディスクまたはフラッシュドライブからのクリップを、DaVinci Resolve Cloudプロジェクトに直接アップロードするよう選択できます。あるいは、Resolve Cloudプロジェクトに同期することなく、個人のBlackmagic Cloudストレージに配信の収録を直接アップロードすることも可能です。

Blackmagic Cloudへのログイン

ATEMスイッチャーでBlackmagic Cloudにログインする前に、ネットワークケーブルを、イーサネットポートからインターネットルーターまたはネットワークスイッチに接続して、スイッチャーをインターネットに接続する必要があります。

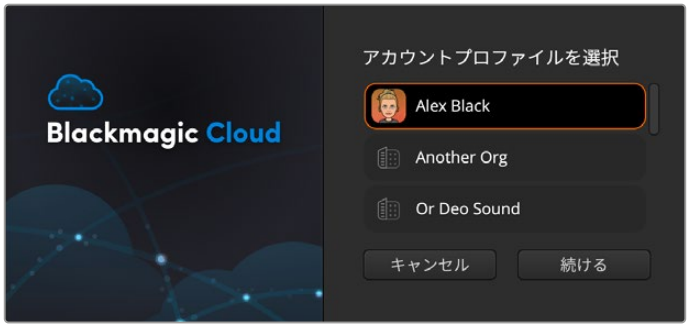
ATEM Television StudioでBlackmagic Cloudアカウントにログインする：

1 「出力」タブをクリックして、「収録」メニューを選択します。

2 「Blackmagic Cloudへの同期」ボックスにチェックを入れ、「ログイン」ボタンをクリックすると、Blackmagic Cloudのログインウィンドウが開きます。

3 Eメールおよびパスワードのフィールドに認証情報を入力し、「ログイン」をクリックします。あるいは、右上にある「ウェブからログイン」のオプションをクリックして、ウェブブラウザからログインします。

4 ウィンドウが表示され、個人のBlackmagic Cloudプロフィールを使用するか、組織のプロフィールを使用するか選択できるようになります。使用したいプロフィールを選択して、「続ける」をクリックします。



Blackmagic Cloudにログインできたら、プロジェクトメニューで、メディアを同期したいプロジェクトを選択します。メニューには、既存のBlackmagic DaVinci Resolve Cloudプロジェクトが表示されます。

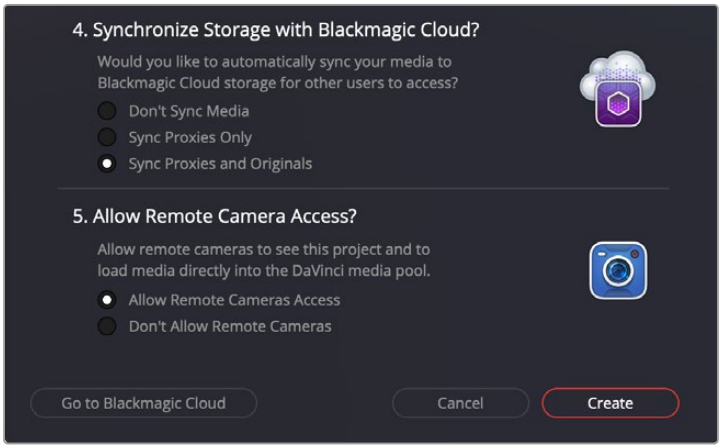
プロジェクトがメニューに表示されない場合、または新規プロジェクトを作成したい場合は、設定を調整するか、DaVinci Resolveで新しいDaVinci Resolve Cloud Projectを作成する必要があります。

DaVinci Resolveでアクセスを許可

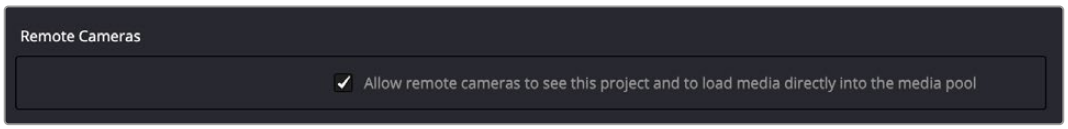
DaVinci Resolveの設定でリモートカメラのアクセスを許可すると、ATEMスイッチャーから新規および既存のBlackmagic Cloudプロジェクトの両方にアップロードできます。プロジェクトでリモートアクセスを有効にすると、「収録」タブのプロジェクトメニューに表示されます。

新規プロジェクトへのアクセスを許可する：

1. DaVinci Resolveを起動します。プロジェクトマネージャーウィンドウで、「クラウド」タブを選択し、Blackmagic Cloudのログイン詳細を入力します。
2. プロジェクトライブラリのリストからBlackmagic Cloudプロジェクトライブラリを選択し、「新規プロジェクト」をクリックします。
3. 新規プロジェクトのウィンドウで、プロジェクトの詳細を入力します。「プロキシとオリジナルを同期」と「リモートカメラのアクセスを許可」を有効にします。



既存のDaVinci Resolve Cloudプロジェクトにクリップをアップロードしたい場合、プロジェクト設定を開いて「Blackmagic Cloud」を選択します。「リモートカメラからこのプロジェクトを見つけてメディアをメディアプールに直接ロードできるようにします。」という項目を有効にします。



スイッチャーをインターネットに接続し、Blackmagic Cloudアカウントにログインすると、ATEMスイッチャーの収録タブにBlackmagic Cloudプロジェクトが表示されます。

DaVinci Resolve Cloudプロジェクトについての詳細は、DaVinci Resolveユーザーマニュアルを参照してください。以下からダウンロード可能です。https://www.blackmagicdesign.com/jp/support/family/davinci-resolve-and-fusion

スチルをキャプチャー

映像からスチルイメージをキャプチャーするには、「スチルをキャプチャー」ボタンを押します。これはスチルストアのように機能し、キャプチャーしたファイルをメディアプールに追加します。これで、スチルを瞬時にメディアプレーヤーにロードして、放送に使用できます。メディアプールをコンピューターに保存することも可能です。

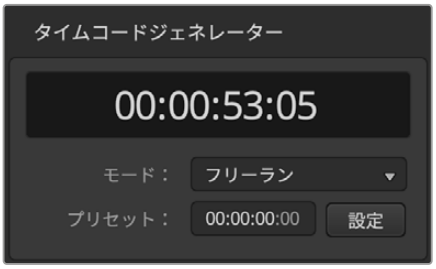
メディアプールを保存する：

1. スクリーン上部のメニューバーで、「ファイル/別名で保存」をクリックします。
2. 保存先を選択します。
3. 「Save」をクリックします。

これでメディアプールがコンピューターに保存されました。キャプチャーしたスチルにアクセスして、グラフィックソフトウェアで使用できます。

タイムコードジェネレーター

タイムコードジェネレーターは、ATEM Software Controlを起動した瞬間から、時刻タイムコードのカウントを開始します。しかし、カウンターをゼロにリセットしたり、新しいタイムコードの数値をマニュアルで入力して、そこから開始することも可能です。



タイムコードジェネレーターは、時刻タイムコード、あるいはマニュアルでプリセットを設定できるフリーラン・タイムコードを選択できます。

プリセットのタイムコード値をマニュアルで設定する：

1. 「モード」のメニューをクリックして「フリーラン」を選択します。
2. 小さい方のタイムコードカウンターに、タイムコード値を入力します。入力すると、新しい値が緑で表示されます。
3. 「設定」をクリックすると、変更が確定し、タイムコードが設定されます。

時刻

ATEM Television Studioスイッチャーシリーズは、コンピューターに接続されている場合、コンピューターと時刻タイムコードを同期します。ユニットには時計が内蔵されており、およそ6日間継続して稼働します。そのため、スイッチャーとコンピューターの接続を外しても時刻タイムコードはバッテリーがなくなるまで継続します。USB経由でコンピューターに接続していると、バッテリーは充電されます。

カウンター

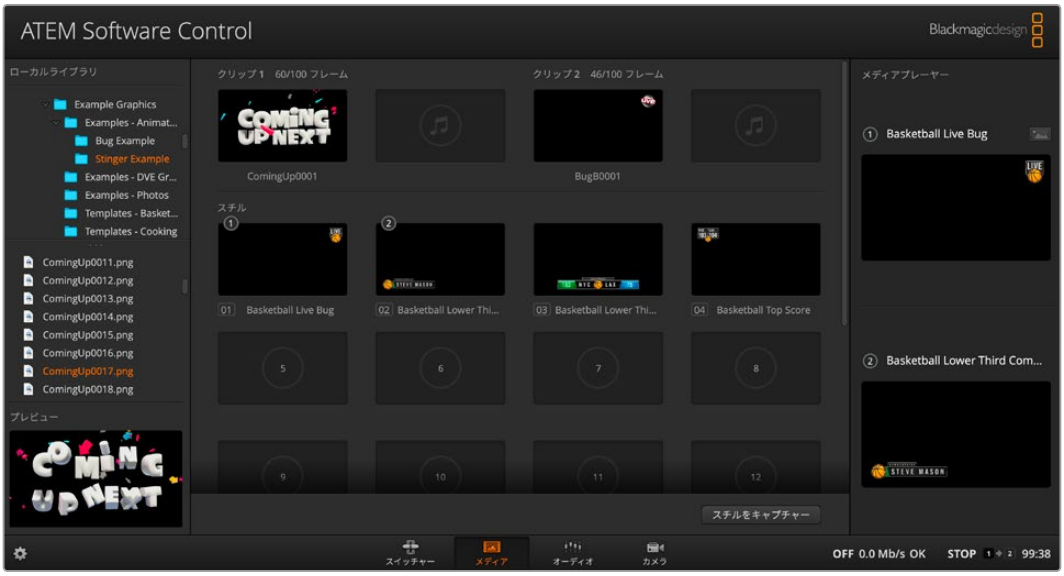
ATEM Television Studio HD8にはカウンターオプションがあるので、出力1にタイマーをオーバーレイできます。講義に制限時間がある場合、プレゼンター用のモニターにカウントダウンを表示したり、制限時間がなくてもカウントアップを表示して講義の長さを確認したりするのに便利です。

カウンターを設定する：

1. カウントダウンまたはカウントアップを選択します。
2. カウントダウンのタイムリミットを設定するには、「開始:」に時間を入力します。
3. オーバーレイのカウンターの位置、サイズ、不透明度を設定します。
4. 設定が完了したら、カウンターを開始できます。上部のツールバーの出力メニューへ行き、出力1で「カウンターオーバーレイ」が選択されていることを確認します。

ATEMメディアプール

スイッチャービューの下部のツールバーでメディアアイコンを押すと、メディアウィンドウが開きます。ATEMスイッチャーのメディアウィンドウでは、スチルなどのグラフィックやビデオクリップをスイッチャーに追加して、スイッチャーのメディアプレーヤーに割り当てられます。スイッチャーウィンドウは大きく2つのエリアがあります。左側のブラウズウィンドウと、右側のメディアプールおよびメディアプレーヤーウィンドウです。



パネルの下部にあるメディアタブをクリックしてメディアプールを開きます

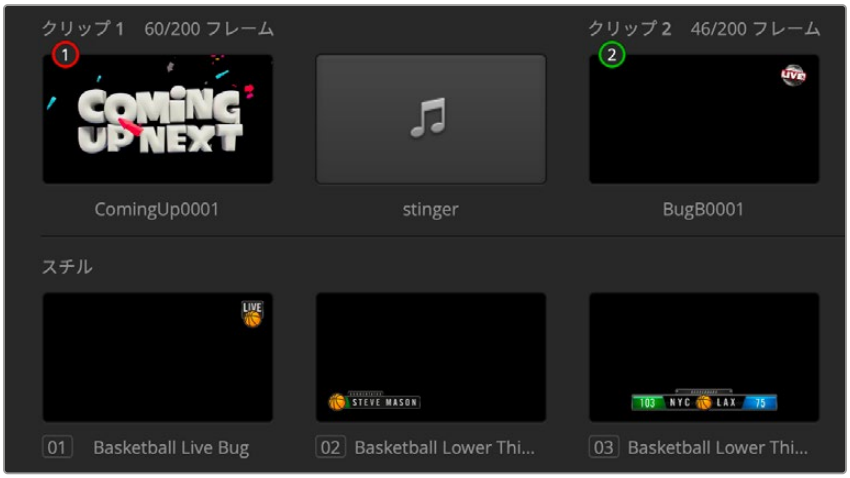
ブラウズウィンドウ

ブラウズウィンドウは簡易化されたファイルブラウザで、コンピューターのイメージファイル検索をナビゲートします。コンピューターに接続されたすべてのドライブが表示され、そこからフォルダーを選択できます。各フォルダーの隣の矢印をクリックすると、サブフォルダーを表示できます。左下のプレビューウィンドウには、選択したファイルが表示されます。ATEMメディアプールは、PNG、TGA、BMP、GIF、JPEG、TIFFのスチルイメージフォーマットをサポートしています。オーディオファイルはWAV、MP3、AIFFです。これらのファイルは、メディアプールに追加できます。

メディアプールウィンドウ

ファイルをメディアプールにロードすると、スチル/クリップスロットにサムネイルイメージが表示されます。クリップスロットにはロードしたシーケンスの真ん中のフレームが表示されます。クリップスロットの上部にはロードしたクリップのフレーム数、さらに選択したビデオフォーマットでロードできる最大フレーム数が表示されます。スチルにはスロット番号がマークされるので、スチルイメージを割り当てる際に識別できます。また、ロードした各スチル/クリップのファイル名がスロットの下に表示されるので、ロードしたスチル/クリップを簡単に把握できます。ロードしたクリップおよびスチルの名前と番号のリストは、スイッチャータブのメディアプレーヤーパレット、ATEMハードウェアパネルのメディアプレーヤービュー、Photoshopプラグインに表示されます。スイッチャーのフロントパネルでは、スロットが空でない限り、スチル名のみが表示されます。

サムネイルの左上に番号が表示されるので、スロットがどのメディアプレーヤーに割り当てられているかは明確です。メディアプレーヤースロットがプログラム出力に切り替わると、番号の丸枠が赤くなり、該当のスロットがオンエア中であることを示します。スロットがプレビュー出力になっている場合は緑になります。



ファイルのブラウズとロード

スチルをブラウズウィンドウからドラッグしてメディアプールの空のスロットにドロップするだけで、簡単にスチルをロードできます。モーションクリップをロードするには、スチルイメージのシーケンスをロードする必要があります。シーケンスがフォルダー内にある場合は、ブラウザウィンドウからフォルダーをクリック&ドラッグし、2つのクリップスロットのどちらかの上でリリースします。シーケンスが専用のフォルダー内に入っていない場合は、まずシーケンスの最初のファイルをクリックしてスクロールダウンし、「Shift」キーを押しながら最後のファイルをクリックします。これでファイルシーケンスがハイライトされ、メディアプールの2つのスロットにドラッグできるようになります。クリップと一緒にオーディオファイルをロードできます。例えば、スティンガートランジションの再生時に、ブラウザからオーディオファイルをドラッグして、クリップスロットの隣にあるオーディオスロットにドロップします。オーディオスロットにはオーディオアイコンが表示されるので区別できます。

スチル、クリップ、オーディオをスロットにドロップする際、プログレスインジケーターがロード状況を表示します。イメージは1つずつ順にロードされるので、1つのイメージをロードしている最中でも、複数のファイルをメディアプールへドラッグできます。既にコンテンツがロードされているウィンドウに別のクリップやスチルをドロップした場合、既存のコンテンツは置き換えられます。

メディアプレーヤーの割り当ては、「メディアプレーヤー」タブで、「メディア」リストからクリップ/スチルを選択することで変更できます。各メディアプレーヤーで「メディア」リストの矢印をクリックし、メディアプールスロットのリストから選択します。

メディアの割り当ては、システムコントロールのメディアプレーヤーメニューから変更できます。あるいはPhotoshopのATEMスイッチャーのメディアプールオプション経由で書き出す際に変更することもできます。Photoshopエクスポートプラグインの使用に関する詳細は、このマニュアルに後述されている「ATEMでAdobe Photoshopを使用」セクションを参照してください。

スチルをキャプチャー

映像からスチルを保存するには、「スチルをキャプチャー」ボタンを押します。

メディアプールの右下にある「スチルをキャプチャー」ボタンを使って、映像からスチルをキャプチャーすることもできます。ボタンをクリックすると、メディアプールの次の空きスロットにスチルが追加されます。

オーディオミキサーの使用

「オーディオ」タブでは、SDI、アナログオーディオ、MADIオーディオ経由でATEMスイッチャーに接続されたオーディオソースや、内蔵メディアプレーヤーのオーディオをミックスできます。

スイッチャーのプログラム出力用のマスターオーディオ出力に加え、各カメラ入力、メディアプレーヤー、MADIおよび外部オーディオソースのラベルがオーディオミキサー上部に表示されます。

各オーディオソースの下には、オーディオレベルメーター、最大オーディオレベルを設定するフェーダー、各チャンネルの左右オーディオのバランスを設定するノブがあります。オーディオミキサーの右側にあるマスターフェーダーには、独立したオーディオレベルメーターが付いており、SDIプログラム出力のオーディオレベルのゲイン設定に使用できます。モニターフェーダーとボタンはマスターフェーダーの下に表示されます。これらを使用して、オーディオレベルの個別の設定や、オーディオ出力でのソロモニタリングが可能です。

各オーディオレベルメーターの下にあるボタンで、オーディオを常にミキシングに使える状態にしておくか、ソースがオンエアされている時だけ使える状態にしておくかを選択できます。ソロボタン（ヘッドフォンアイコン）は、該当のオーディオソースをソロオーディオモニタリングに設定できます。

オーディオレベルミキサーは、オンエア中またはAFVが選択されたオーディオソースのタリーライト、オーディオレベル、オーディオバランス、使用するオーディオを選択するボタンを表示します。

タリー

オンエアされているビデオのエンベデッドオーディオのチャンネルは、ソフトウェアパネル上で、タリーライトが赤く光ります。外部オーディオはデフォルトで常時出力（オンエア）されるので、EXTタリーライトは通常赤く光っています。このページのイメージでは、Cam 4およびCam 7がONに設定されているので、赤く光っています。AFVが選択され、そのチャンネルのカメラがオフエアになると、タリーライトは薄暗い黄色になります。これは、マスターフェーダーAFVボタンが選択された際のマスターフェーダーのタリーライトでも同様です。フェード・トゥ・ブラックが有効になると、マスターフェーダーのタリーライトが赤く点滅します。

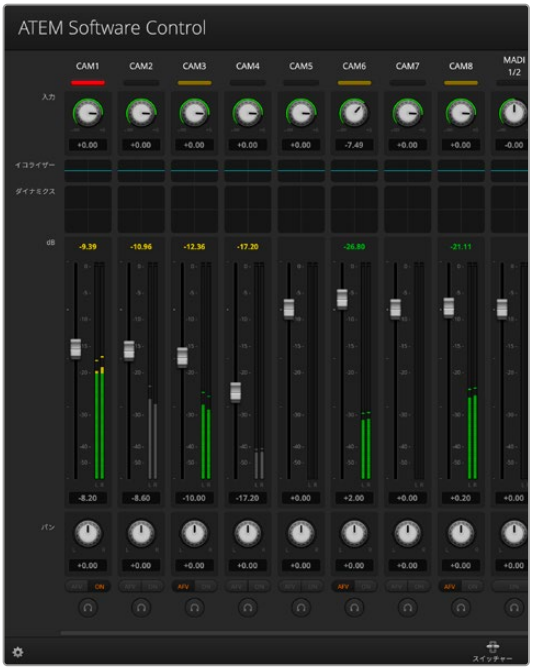
オーディオレベル

カメラやオーディオソースのオーディオレベルのゲインを設定するには、オーディオレベルフェーダーをドラッグします。各オーディオレベルメーターの下のオレンジの数値は、フェーダーで設定した最大オーディオレベルを示します。

オーディオメーター上部の数値は、各オーディオソースのピーク時のオーディオレベルを示します。緑で表示される場合はオーディオレベルが低〜中レベルになっています。オーディオメーターが赤くなり、上部の赤字の数値が変化しない場合、オーディオレベルを下げるとオーディオの歪みを防げます。オーディオレベルを調整した後、赤字の数値をクリックして表示をリセットします。新しい数値を計測して、しばらくの間、音声レベルにあわせて数値が変化することを確認してください。急激に数値が上昇して赤文字になった場合は、オーディオレベルをさらに下げるなどの対処をする必要があります。

オーディオバランス

オーディオミキサーは、各オーディオソースからのステレオオーディオをサポートしています。カメラやその他のオーディオソースで、左右のオーディオチャンネルのバランスを変更したい場合、ノブを使用して必要に合わせたバランスポイントに調整します。



Cam 1のオーディオメーターは、グレーになっています。これは、「ON」または「AFV」のチェックボックスが有効になっていないため、オーディオが使用されないことを示しています。Cam 2はAFVが選択されていますが、タリーライトが薄暗い黄色になっていることで分かるように、現在オンエアされていないためオーディオも使用されていません。Cam 4およびCam 7は、ダイレクトミックスが「ON」になっているので、他のカメラがオンエアされていたとしてもCam 4、Cam 7のミックスオーディオは常に使用されており、タリーライトが光っています。Cam 3、Cam 5、Cam 6、Cam 8は、カメラにオーディオが存在しないことを示しています。

オーディオソース選択

各オーディオレベルメーターの下には「ON」および「AFV」のボタンがあり、スイッチャーのプログラム出力に送信するオーディオソースを選択できます。

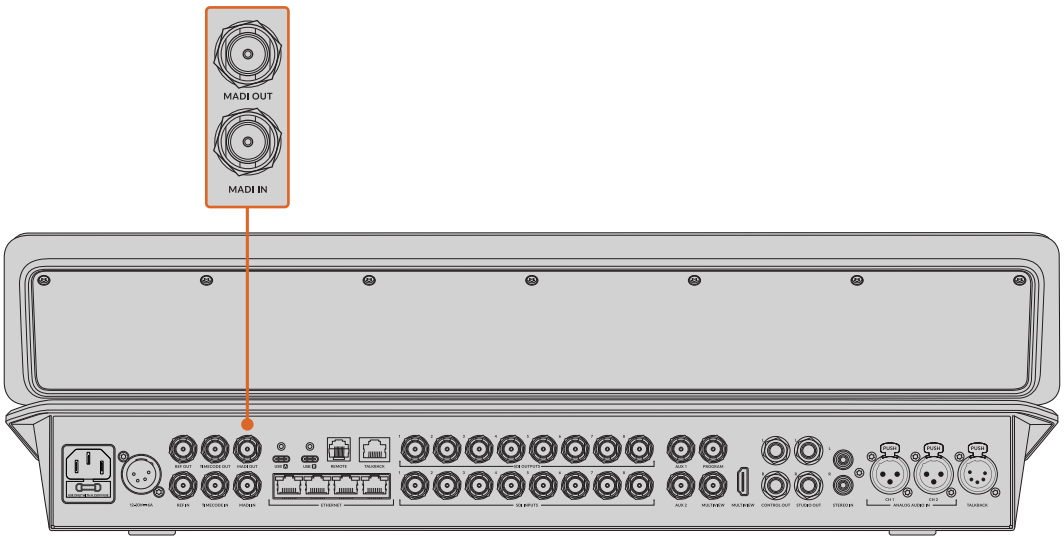
ON	ダイレクトミックスで「ON」を選択すると、関連のビデオソースがオンエアされていなくても、そのオーディオ入力が常にプログラム出力にミックスされます。この場合、オーディオがオンエアされているので、タリーランプは赤く光ります。このオプションを選択すると、自動的にAFVは無効になります。
AFV	AFV（Audio Follow Video）を選択すると、ビデオ入力をクロスポイントにて切り替えた際にオーディオがクロスフェードします。ビデオ入力がオンエアされている場合にのみオーディオがプログラム出力へ送信され、上部のタリーライトが赤く光ります。オフエア中、タリーライトは薄暗い黄色で点灯します。このオプションを選択すると、ダイレクトミックスのON設定は自動的に無効になります。

マスターオーディオレベル出力

オーディオミキサーの右側にあるマスターフェーダーには、独立したオーディオレベルメーターが付いており、SDIプログラム出力のオーディオレベルのゲイン設定に使用できます。マスターオーディオ出力フェーダーのAFVボタンを選択すると、AFVフェード・トゥ・ブラック機能が有効になります。これにより、FTBボタンをクリックしてマスターオーディオをフェードできます。

MADIの使用

ATEMスイッチャーは、MADI（マルチチャンネル・オーディオ・デジタル・インターフェース）プロトコルのデジタルオーディオをサポートしています。MADIはプロ向けのオーディオメーカーや放送局、ハイエンドのレコーディングスタジオなどで幅広い支持を得ています。これらのMADIポートは堅牢なBNCコネクターで、100メートルまでの75Ωの同軸ケーブルでオーディオデータを送信します。



MADIオーディオ用のBNCコネクター、アナログオーディオ入出力用の1/4インチTRSコネクターを搭載。

MADI入力

MADIチャンネル1-32は、デジタルオーディオを24ビット深度、サンプルレート48kHzで受信します。これらのオーディオは、オーディオミキサーの追加の16ステレオチャンネルに接続され、ビデオ入力オーディオのミキシングチャンネルと同じEQおよびダイナミクスを使ってプログラム出力にミキシングできます。16のステレオチャンネルを追加で使用できることで、非常に複雑なオーディオミキシングをすべてATEMスイッチャー内で実行できます。

MADI出力 1

MADI出力1は以下のソースを送信：

チャンネル1-16	SDI入力1-8のチャンネル1、2
チャンネル17/18	メディアプレーヤー1 オーディオ
チャンネル19/20	メディアプレーヤー2 オーディオ
チャンネル20/21	外部マイク
チャンネル22/23	外部XLR
チャンネル23/24	外部RCA
チャンネル25/26	プログラムミックス
チャンネル27/28	モニターミックス
チャンネル29/30	Auxミックス1
チャンネル31/32	Auxミックス2
チャンネル33-48	SDI入力1-8のチャンネル3、4
チャンネル49-64	未使用

ヘッドフォンの設定

ヘッドフォン設定は、ヘッドフォンのオーディオミックスを調整します。リアパネルの5ピンXLRコネクターでヘッドセットを接続して、カメラマンと通信できます。ヘッドセットはトークバックに使用できるだけでなく、ヘッドセットマイクを吹き替えに使用したり、ヘッドフォンをプログラムオーディオのモニタリングに使用することもできます。

ヘッドフォン設定では、各モニタリング出力レベルのミキシングが可能です。例えば、プログラムオーディオに対して、トークバックオーディオのレベルを上げ下げしたい場合などです。

マスター

マスターレベル・スライダーを調整して、ヘッドセットのプログラムオーディオレベルを設定できます。プログラムオーディオが必要ない場合はスライダーを左端へ動かします。

トークバック

トークバックレベル・スライダーは、通信しているカメラマンのオーディオレベルを設定できます。マスタースライダーとトークバックスライダーを設定することで、ヘッドセットのトークバックとプログラムオーディオのバランスを調整できます。

サイドトーン

サイドトーンレベル・スライダーは、ヘッドセットのマイクからの声をモニター出力にミックスします。これは、ノイズキャンセリング機能のついたヘッドセットを使用している場合、便利な機能です。

高度なFairlightコントロール

ATEM Television Studioスイッチャーシリーズは、高度なFairlightオーディオコントロールを搭載しており、各入力およびマスター出力のサウンドの品質を向上、洗練させることができます。これには、入力レベルコントロール、6バンドのパラメトリックEQ、パワフルなダイナミクス設定が含まれます。このセクションでは、異なるFairlightオーディオコントロールを使用して、ライブプロダクションのオーディオミックスを調整、最適化する方法を紹介します。

入力レベル

一般的に、オーディオミックスの最初のステップは、すべての入力をノーマライズする作業です。つまり、各入力の入力レベルノブを調整して、クリッピングさせずに最大限まで上げて、レベルを最適化します。

このコントロールは、タリーライトの下の各トラックの上にあります。ノブをクリックして、左に回すとレベルが下がり、右に回すと上がります。入力コントロールを設定すると、すべての入力を信号の強度を同じレベルまで上げることができ、クリッピングしない最大限のレベルにできます。その後、より高度な変更や微調整を加えます。

すべての入力レベルをノーマライズしたら、6バンド・パラメトリックイコライザーとダイナミクスコントロールを使って、各オーディオ入力で品質の最適化と調整を開始できます。

6バンド・パラメトリックイコライザー

各入力およびマスター出力には、6バンドのパラメトリックイコライザーが付いており、特定の周波数をコントロールできます。マイク入力の低周波ハム音/ノイズを削減したり、音の軽いトラックの低周波数を増幅したり、最終ミックスで区別しやすいように各入力を特徴付けることが可能です。多くのクリエイティブなオプションを使用できます。

任意の入力、またはマスター出力でパラメトリックイコライザーを開くには、対応するイコライザーインジケーターをクリックします。

任意の入力のイコライザーインジケーターをクリックして6バンド・パラメトリックイコライザーを開きます。

ウィンドウ上部にある、1〜6のインジケーターの付いたグラフがまず目に入るでしょう。1〜6の番号が振られたインジケーターは、バンド1〜6に対応する調整可能なハンドルです。

6バンド・パラメトリックイコライザーの各バンドには、それぞれ設定用のセクションがあります。これらの設定は、コントロールするバンドや使用するフィルターのタイプにより異なります。

各オーディオ入力は、6バンド・パラメトリックイコライザーを搭載。

設定を変更したい場合は、まずそのバンドを有効にする必要があります。バンドのラベルをクリックして有効にします。有効になっていると、ボタンのラベルが青く光ります。これで該当のバンドの設定を変更できます。あるいは、ハンドルをクリック&ドラッグすれば、すばやく調整できます。

作業のこつ バンドフィルターに関する詳細はこのセクションで後述されています。

ハンドル

各バンドのハンドルは、グラフ上のラインカーブに配置されています。各ハンドルをクリック&ドラッグすれば、そのバンドで調整したい周波数や、設定したいゲインを選択できます。マウスでハンドルを動かすと、周波数とゲイン設定の両方が同時に変更されるので、周波数全域で各バンドをすばやく調整できます。

メモ ハンドルを使用して変更する場合、該当のバンドが有効になっていることを確認してください。調整したいバンドをクリックして有効にします。有効になったバンドのラベルは青く光ります。

ハンドルを左右にドラッグすると、バンド設定内の周波数およびデシベルが変わります。これは、低/中低/中高/高（L/ML/MH/H）の周波数レンジのプリセットボタンでも同様です。

周波数ノブ

各バンドの周波数ノブを使って、調整する特定の周波数を設定することもできます。

レンジプリセット

各バンドの周波数レンジは、レンジプリセットボタンで設定できます。例えば、低（L）は30〜395Hzの周波数レンジをカバーします。

レンジプリセットで周波数レンジを設定する例として、各バンドフィルターのリストからノッチフィルターを選択し、各レンジプリセットをクリックします。フィルターエフェクトが、選択したレンジプリセットに応じたグラフカーブ上の位置に移動することが確認できます。この方法で、フィルターをかけたい特定の周波数レンジをすばやく設定できます。

以下の表は、各レンジプリセット設定の周波数レンジです。

レンジプリセット	周波数レンジ
低（L）	30 Hz〜395 Hz
中低（ML）	100 Hz〜1.48 kHz
中高（MH）	450 Hz〜7.91 kHz
高（H）	1.4 kHz〜21.7 kHz

ゲインノブ

ゲインノブをクリック＆左右にドラッグして、選択した周波数のボリュームを調整できます。

Qファクター

Qファクターコントロールは、バンド2、3、4、5にベルフィルターが適用されている時に使用でき、フィルターが影響を及ぼす周波数レンジを設定します。例えば、最小の設定にするとフィルターは幅広い周辺周波数に影響を及ぼし、最大の設定にすると影響が狭い範囲に制限されます。これは、周辺周波数内に、これから行う変更に含めたい/除外したい音質がある場合、非常に重要です。

Qファクターを調整する際は、ラインカーブ上のエフェクトの形が、幅広く丸みを帯びたカーブから、先の尖ったシャープなカーブに変わることを確認してください。これは、ターゲットとなる周波数の周囲の周波数レンジが受ける影響を視覚的に示します。

作業のこつ イコライザーウィンドウの一番上にあるバイパスボタンをクリックすると、変更したオーディオとオリジナルのオーディオを比較できます。バイパスボタンはイコライザーをオン/オフします。

バンドフィルター

バンドフィルターは、次の6つのタイプから選択できます：ベル、ハイシェルフ、ローシェルフ、ノッチ、ハイパス、ローパス。これらのフィルターを適用すると、特定の周波数レンジ内の特定のゾーンをコントロールできます。例えば、ローシェルフフィルターはグラフの周波数の低域のボリュームレベルを調整し、ハイシェルフフィルターは周波数の高域をコントロールします。

バンド3にローシェルフフィルターを適用し、ゲイン設定を変更します。グラフ上の周波数の低域に変更が偏っていることが分かります。

各フィルタータイプの概要は以下の通りです。

ベル

ベルフィルターは、特定の周波数の周辺周波数レンジの調整に使用します。

ハイシェルフ

ハイシェルフフィルターは、グラフ上の周波数の高域のボリュームレベルを調整します。

ローシェルフ

ローシェルフフィルターは、グラフ上の周波数の低域のボリュームレベルを調整します。

ノッチ

ノッチフィルターは、特定の周波数を除去/カットします。

ハイパス

ハイパスフィルターは、超低域の周波数をスムーズに除去します。高域の周波数には影響が及びません。

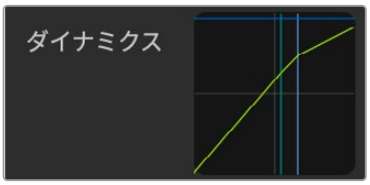
ローパス

ローパスフィルターは、超高域の周波数をスムーズに除去します。低域の周波数には影響が及びません。

作業のこつ それぞれのバンドを調整した際、各バンドのフィルターがグラフカーブ上で重複することは珍しくありません。例えば、バンド4にローシェルフフィルター、バンド5にノッチフィルターを適用して、同じ範囲で周波数を低減できます。

ダイナミクスコントロール

6バンド・パラメトリックイコライザーに加え、ダイナミクスコントロールを使用して入力およびマスター出力のオーディオを改良/微調整することもできます。イコライザーが信号内の周波数をコントロールするのに対し、ダイナミクスコントロールは様々なレベルを設定できます。信号内のレベル調整は、弱/強レベル間のダイナミックレンジの拡張、信号内の弱い/強い部分を選択するための入力ゲーティングを含めた調整が可能です。あるいは、コンプレッサー、リミッターを使用することで、オーディオを全体的に持ち上げたり、クリッピングを発生させずに強めることもできます。



ダイナミクスコントロールは、各入力およびマスター出力で、対応するダイナミクスインジケーターをクリックすると開きます。

イコライザーコントロールと組み合わせた場合、これらの機能は非常にパワフルです。オーディオを正確に調整したり、特徴づけることで、マスター出力のサウンドを最適化できます。

このセクションでは、エクスパンダー、ゲート、コンプレッサー、リミッターコントロールについて説明します。

一般的なダイナミクス設定

エクスパンダー/ゲート、コンプレッサー、リミッターには、オーディオを調整するための共通の設定があります。例えば、エフェクトが効き始めるレベルや、エフェクトの継続時間および強さなどです。調整できる設定は、使用するダイナミクスコントロールによって異なります。

しきい値	エフェクトが効き始めるサウンドレベルを設定します。例えば、コンプレッサーのしきい値を-20dBに設定した場合、信号が-20dBを超えるとコンプレッサーが適用されます。エクスパンダーを-40dBに設定した場合、信号レベルが-40dBを下回るとエクスパンダーが適用されます。
レンジ	エフェクトの影響を受けるデシベルの範囲を設定します。
レシオ	エフェクトの最大値を設定します。
アタック	エフェクトが効き始める際の滑らかさを設定します。例えば、アタックタイムを長くすると、急激に変化するのではなくエフェクトが滑らかに適用されます。多くの短音のバリエーションなどを含む複雑なサウンドでは、アタックタイムが長いとアーチファクトの原因となるため、アタックタイムを短くした方が良いでしょう。
ホールド	ダイナミクス機能の継続時間を設定します。
リリース	アタックタイムと似ています。エフェクトが終了する際の滑らかさを設定します。例えば、信号レベルがしきい値を超える/下回る際に、エフェクトを徐々に終了させるか、急激に終了させるかを設定できます。

エクスパンダー/ゲート

最初のダイナミクスパラメーター・セットは、エクスパンダー/ゲートを切り替えます。

エクスパンダーは、信号の弱い部分をさらに弱めることで、強い部分に対するボリュームの差を強調します。エクスパンダーは、トラックの弱い部分と強い部分の差を強調するため、あるいは信号のダイナミックレンジを上げてノイズを低減するために使用します。

ゲートはエクスパンダーを増強した機能です。レベルを弱めたり、信号内で特定のレベルに満たない部分を無音にすることで、音の弱い部分のノイズを低減/除去します。例えば15〜20dBだと、ボーカルトラックのサウンドを自然に残したまま、息継ぎの音を低減できます。

ゲートは非常に効果的ですが、とてもパワフルな機能なので慎重に使用してください。ゲートのしきい値の設定が高すぎると、音節の始まりや単語の最後が消えたり、聞き取れなくなるなど、アーチファクトの原因となります。その場合、しきい値を少しずつ下げるか、アタックタイム/リリースタイムを短くすることで補正できます。

コンプレッサー

コンプレッサーは、オーディオ信号のピークを低減し、信号のダイナミックレンジを狭めることで、クリッピングを生じさせずに全体のレベルをブーストします。信号の強いエレメントによって弱めのサウンドが聞こえにくくならないようにしたい場合や、信号のオーディオレベルを均一にしたい場合に便利です。

作業のこつ 先にEQコントロールを設定して、その後コンプレッサーを適用すると良いでしょう。

メイクアップ

メイクアップ設定は、圧縮設定と併用して信号全体を調整します。コンプレッサーでオーディオの強い部分が低減されている場合、メイクアップコントロールを使うと、クリッピングを生じさせずに全体のレベルをブーストできます。

リミッター

リミッターは、信号のピークが設定した最大レベルを超えないようにします。リミッターは、ハードクリッピング防止に役立ちます。例えば、リミッターを-8dBに設定すると、入力信号はそのレベルを超えることはありません。アタック、ホールド、リリースを設定することで、リミッターが信号に及ぼす効果を調整できます。

ダイナミクスコントロールの特徴

コントロール	最低値	デフォルト	最高値
エクスパンダー/ゲート			
エクスパンダーコントロール*			
しきい値	-50dB	-45dB**	0dB
レンジ	0dB	18dB	60dB
レシオ	1.0:1	1.1:1	10:1
アタック	0.5ms	1.4ms	30ms
ホールド	0.0ms	0.0ms	4s
リリース	50ms	93ms	4s
ゲートコントロール*			
しきい値	-50dB	-45dB**	0dB
レンジ	0dB	18dB	60dB
アタック	0.5ms	1.4ms	30ms
ホールド	0.0ms	0.0ms	4s
リリース	50ms	93ms	4s
コンプレッサー			
コンプレッサーコントロール			
しきい値	-50dB	-35dB	0dB
レシオ	1.0:1	2.0:1	10:1
アタック	0.7ms	1.4ms	30ms
ホールド	0.0ms	0.0ms	4s
リリース	50ms	93ms	4s
リミッター			
リミッターコントロール			
しきい値	-50dB	-12dB	0dB
アタック	0.7ms	0.7ms	30ms
ホールド	0.0ms	0.0ms	4s
リリース	50ms	93ms	4s

* マスター・ダイナミクスのエクスパンダー/ゲートコントロールはマスターダイナミクスでは使用されません。

** マスター・ダイナミクスのエクスパンダー/ゲートしきい値のデフォルトは-35dB。
マイクダイナミクスおよびXLRダイナミクスエクパンダー/ゲートしきい値のデフォルトは-45dB。

カメラコントロールの使用

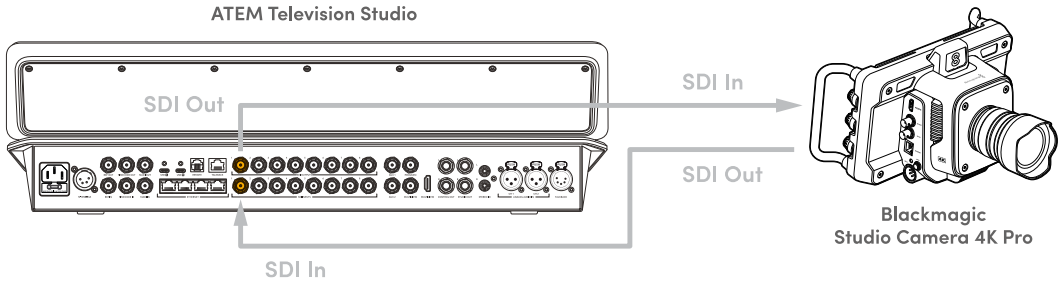
ATEM Software Controlの「カメラ」ボタンを押すと、カメラコントロール機能が開きます。この機能を使って、Blackmagic Studio Camera 6K Pro、URSA Broadcast G2などのBlackmagicカメラをATEMスイッチャーからコントロールできます。互換性のあるレンズを使用している場合は、アイリス、ゲイン、フォーカス、ディテール、ズームコントロールなどのBlackmagicカメラ設定を簡単に調整できます。さらにカメラバランスの調整や、内蔵のDaVinci Resolveプライマリーカラーコレクターを使用したユニークなルックの作成も可能です。

ATEMのカメラコントロール機能は、ATEMスイッチャーからのSDI出力（ダウンコンバートされている出力以外）を介して、カメラコントロール・パケットを送信することで機能します。つまり、スイッチャーのSDI出力をカメラのSDIリターン入力に繋ぐと、カメラはSDIリンクでコントロールパケットを検出し、カメラ自体の機能をコントロールできます。

ATEMカメラコントロール

カメラを接続する：

1. BlackmagicカメラのSDI出力を、ATEMスイッチャーのSDI入力に接続します。
2. ATEMスイッチャーのSDI出力（マルチビュー出力以外）を、カメラのプログラムSDI入力に接続します。カメラコントロール信号は、マルチビュー出力からは送信できません。
3. カメラの設定では、カメラID番号がスイッチャー入力に一致するよう設定してください。例えば、ATEMスイッチャーの「入力1」にStudio Camera 1が接続されている場合は、カメラ設定のカメラ番号を「1」に設定する必要があります。これにより、タリー信号が正しいカメラに送信されます。



カメラコントロールパネル

ATEM Software Controlを起動して、ソフトウェアウィンドウ底部の「カメラ」ボタンをクリックします。ラベル付きのBlackmagicカメラコントローラー列が表示され、各カメラのイメージを調整/微調整するツールを使用できます。これらのコントローラーの使い方は簡単です。マウスを使ってボタンをクリックしたり、クリック&ドラッグすることで調整できます。

カメラコントロールの選択

カメラコントロールページの上部にあるボタン列で、コントロールしたいカメラ番号を選択します。ウィンドウサイズに入りきらない数のカメラを使用している場合、あるいはカラーコレクターウィンドウを開いている場合は、これらのボタンを使ってコントロールしたいカメラを選択します。カメラコントロールのモニタリング用に出力を使用している場合は、これらのボタンを押して、コントロールするカメラを変更すると、該当のカメラのビデオ出力がスイッチャーで設定した出力に送信されます。

チャンネルステータス

チャンネルステータスは、各カメラコントローラーの上部にあり、カメララベル、オンエア・インジケーター、ロックボタンを表示します。ロックボタンを押すと、該当のカメラのすべてのコントロール機能がロックされます。該当のカメラがオンエアされている場合、チャンネルステータスは赤くなり「On Air」と表示されます。

カメラ設定

マスターホイールの左下にあるカメラ設定ボタンでは、Blackmagic Studio Camera、URSA Mini、URSA Broadcastのカラーバー設定をオンにでき、各カメラの映像信号のディテール設定も調整できます。

各カメラコントロールにチャンネルの状況が表示されるので、オンエア中のカメラが確認できます。カラーホイールを使用して、各YRGBチャンネルのリフト、ガンマ、ゲイン設定を調整します。

カラーバーの表示/非表示

Blackmagicカメラに搭載されているカラーバー設定は、「カラーバーを表示」または「カラーバーを隠す」を選択してオン/オフを切り替えられます。この機能は、ライブプロダクションのセットアップ中に各カメラを視覚的に識別するのに非常に便利です。カラーバーはオーディオトーンにも対応しているので、各カメラのオーディオレベルを簡単に確認/設定できます。

ディテール

この設定を使用して、イメージのシャープニングをカメラからライブで実行できます。次のいずれかを選択して、シャープニングのレベルを上下します：ディテール オフ、デフォルト ディテール（低ディテール）、中間ディテール、高ディテール

カラーホイール

カラーホイールはDaVinci Resolveカラーコレクターのパワフルな機能で、各YRGBチャンネルのリフト、ガンマ、ゲイン設定のカラー調整に使用します。カラーホイールの上部にある3つの選択ボタンを押すと、調整する設定を選択できます。

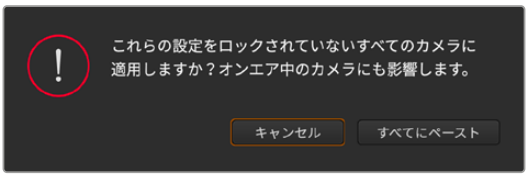
マスターホイール

カラーホイールの下にあるマスターホイールを使用すると、すべてのYRGBチャンネルのコントラストを一度に調整できます。あるいは、各リフト、ガンマ、ゲイン設定で輝度のみの調整も可能です。

リセットボタン

各カメラコントローラーの右下にあるリセットボタンを使えば、リセット、コピー、あるいはペーストしたいカラーコレクション設定を簡単に選択できます。各カラーホイールにも、それぞれ独自のリセットボタンが付いています。ボタンを押すと、設定がデフォルトに戻るか、設定をコピー/ペーストできます。ロックされているコントローラーは、ペースト機能による影響を受けません。

カラーコレクターパネルの右下にあるマスターリセットボタンは、リフト/ガンマ/ゲインのカラーホイール、そしてコントラスト、彩度、色相、輝度ミックス設定をリセットします。カラーコレクション設定は各カメラコントローラーに個別にペーストできますが、すべてのカメラに同時にペーストして統一されたルックを得ることも可能です。アイリス、フォーカス、調整幅、ペデスタルの設定は、ペースト機能による影響を受けません。「すべてにペースト」を適用する際は、操作を確認する注意メッセージが表示されます。この確認表示は、現在オンエア中でロックされていないカメラに、誤って新しい設定をペーストしてしまうのを避けるのが目的です。



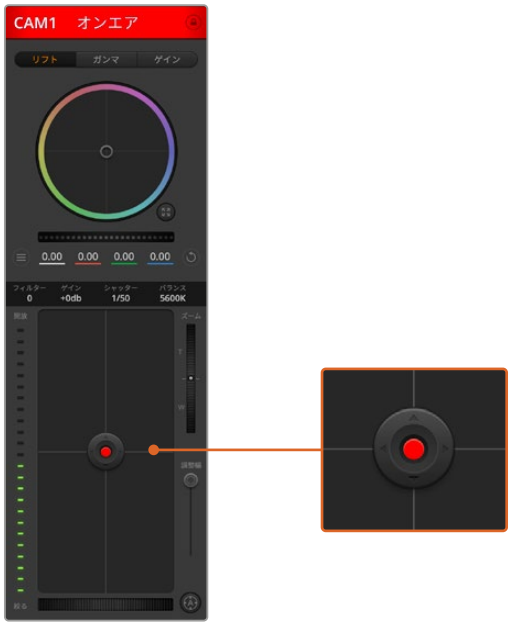
「すべてにペースト」を適用する際は、操作を確認する注意メッセージが表示されます。この確認表示は、現在オンエア中でロックされていないカメラに、誤って新しい設定をペーストしてしまうのを避けるのが目的です。

アイリス/ペデスタルレベル・コントロール

アイリス/ペデスタルレベル・コントロールは、各カメラコントローラーの十字線上にあります。該当のカメラがオンエアされている場合、このコントロールは赤く光ります。

アイリスを開く/閉じるには、コントロールを上下に動かします。SHIFTキーを押しながら操作するとアイリスのみを調整できます。

ペデスタルレベルを下げる/上げるには、コントロールを左右に動かします。Macでは「command」キー、Windowsでは「CONTROL」キーを押しながら操作すると、ペデスタルレベルのみを調整できます。



該当のカメラがオンエアされている場合、アイリス/ペデスタルレベル・コントロールは赤く光ります。

ズームコントロール

電動ズーム機能に対応した互換性のあるレンズを使用している場合は、ズームコントロールを使用してレンズをズームイン/アウトできます。コントローラーは、レンズのズームロッカーと同様に機能します。一方は望遠、もう一方はワイドアングルです。調整幅スライダーの上部にあるズームコントロールをクリックすると、上へドラッグしてズームイン、下へドラッグしてズームアウトできます。

調整幅設定

アイリス/ペデスタルレベル・コントロールの右側にある調整幅設定は、アイリスの幅を制限するために使用します。この機能は、露出過多の映像のオンエア防止に役立ちます。

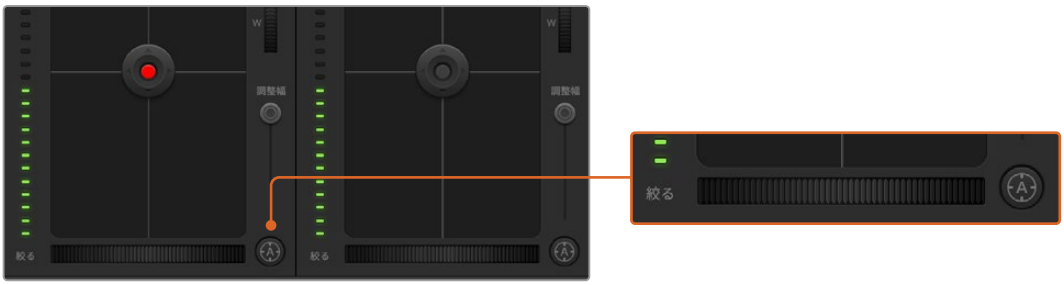
調整幅のしきい値を設定するには、まずアイリスコントロールを使用してアイリスを完全に開きます。次に調整幅設定を上下に動かして適正露出を設定します。調整幅のしきい値を設定したことで、アイリスを調整する際に適正露出を越えることを防止できます。

アイリスインジケーター

アイリス/ペデスタルレベル・コントロールの左側にあるアイリス・インジケーターは、レンズアパーチャーの開閉状態を視覚的に、簡単に確認できます。アイリス・インジケーターは、調整幅設定の影響を受けます。

オートフォーカスボタン

オートフォーカスボタンは、各カメラコントローラーの右下にあります。電動フォーカス調整に対応しているアクティブ方式のレンズでは、このボタンを押すと自動的にフォーカスを合わせられます。ほとんどのレンズは電動フォーカスに対応していますが、マニュアルまたはオートフォーカスモードに設定できるレンズもあります。使用するレンズがオートフォーカスモードになっていることを確認してください。レンズのフォーカスリングをスライドさせて設定できる場合もあります。



オートフォーカスボタンを押すか、マニュアルフォーカス調整を左右にドラッグして
互換性のあるレンズのフォーカスを合わせます。

マニュアルフォーカス調整

カメラのフォーカスをマニュアルで調整したい場合、各カメラコントローラー底部のフォーカス調整を使用できます。ホイールコントロールを左右にドラッグすればマニュアルでフォーカスを調整できます。カメラからのビデオフィードで、イメージがシャープに見えるか確認できます。

カメラゲイン

カメラゲイン設定を使うと、該当のカメラで追加のゲインをオンにできます。この機能は、低照明条件での撮影で、イメージが露出アンダーにならないようにカメラのフロントエンドに追加ゲインが必要な場合に、非常に重要です。dBゲイン設定の左右の矢印ボタンをクリックするとゲインを調整できます。

日暮れ時に野外撮影しており光が弱い場合や、イメージの明るさを強調したい場合など、必要に応じてゲインをオンにできます。ゲインを上げるとイメージのノイズが増えることに注意してください。

シャッタースピード・コントロール

シャッタースピード・コントロールは、カラーホイールとアイリス/ペデスタルレベル・コントロールの間にあります。　マウスカーソルをシャッタースピード・インジケーターの上に置いて、左右の矢印をクリックすると、シャッタースピードを調整できます。

フリッカーが発生した場合、シャッタースピードを下げるとフリッカーを回避できます。シャッタースピードを下げると、イメージセンサーの露出時間が長くなるので、カメラゲインを上げずにイメージを明る

くできます。シャッタースピードを上げるとモーションブラーが少なくなるので、最小限のモーションブラーでシャープかつクリーンなアクションショットを撮りたい場合に最適です。

ホワイトバランス

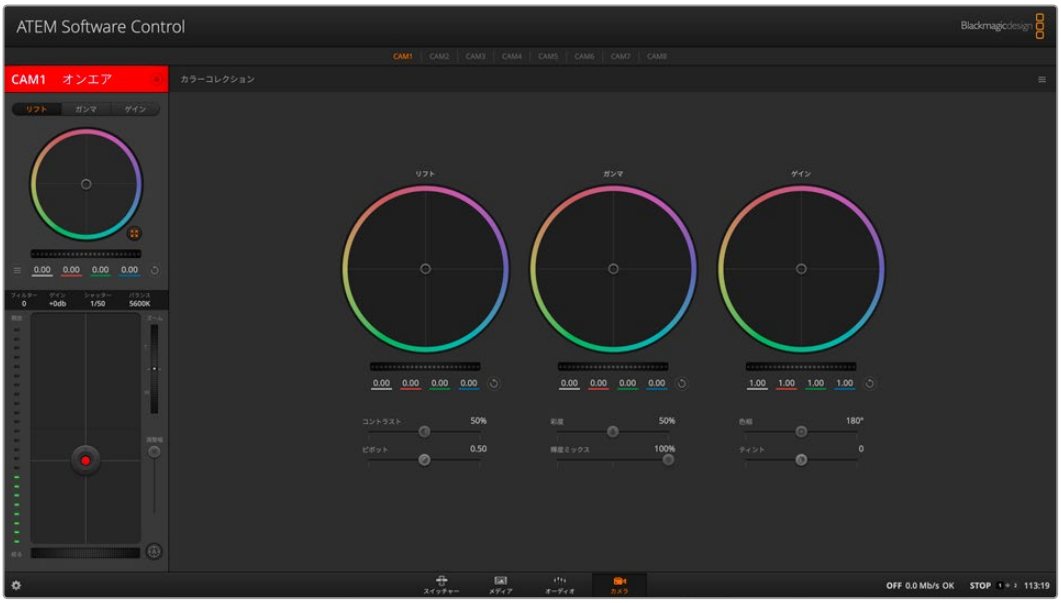
ホワイトバランス設定は、シャッタースピード・コントロールの隣にあります。色温度インジケーターの両側にある左右の矢印をクリックして調整できます。光源の種類によって、暖色や寒色など異なる色を発します。これらはホワイトバランスを調整して補正できます。この補正によって、映像内のホワイトを適切なホワイトに維持できます。

マウスカーソルをフィルター、ゲイン、シャッタースピード、ホワイトバランスのインジケーターに重ねて矢印を表示。クリックして各設定を調整。

DaVinci Resolveプライマリーカラーコレクター

カラーコレクションの経験があるユーザーは、カメラコントロールのインターフェースをスイッチャースタイルのCCUインターフェースから、ポストプロダクションで使用するカラーグレーディングシステムのプライマリーカラーコレクター・ユーザーインターフェースに変更することもできます。

Blackmagicカメラは、DaVinci Resolveのプライマリーカラーコレクターを内蔵しています。Blackmagicカメラでのグレーディングは DaVinci Resolveと全く同じなので、ライブプロダクションでもDaVinci Resolveの経験を活かしたクリエイティブなカラーグレーディングが可能です。カラーコレクターパネルはすべてのカメラコントローラーから拡張でき、追加設定と完全なプライマリーカラーコレクター・インターフェースで、より多彩なカラーコレクション・コントロールが可能になります。



DaVinci Resolveプライマリーカラーコレクターボタンを押すと、カラーコレクションウィンドウおよび設定が拡張。

カラーホイール、そして彩度などの設定を調整でき、シャドウ、ミッドトーン、ハイライトの設定を同時に確認できます。必要に応じて、ウィンドウ上部のカメラ選択コントロールでカメラを切り替えます。

カラーコレクションパネルのリフト/ガンマ/ゲイン・カラーホイール。

カラーホイール

カラーリング内でクリック&ドラッグ
カラーバランス・インジケーター自体をドラッグする必要はありません。カラーバランス・インジケーターを動かすと、下にあるRGBパラメーターに、各チャンネルの変更が反映されます。

カラーリング内でシフトクリック&ドラッグ
カラーバランス・インジケーターを、カーソルの絶対位置にジャンプするので、すばやく大幅な調整が可能です。

カラーリング内でダブルクリック
マスターホイール調整をリセットせずに、カラー調整をリセットします。

カラーリング右上のリセットコントロールをクリック
カラーバランスコントロールとマスターホイールを両方リセットします。

マスターホイール

カラーホイールの下にあるマスターホイールで、各YRGBチャンネルのリフト、ガンマ、ゲインコントロールを調整できます。

左にドラッグすると、選択したイメージのパラメーターが暗くなり、右にドラッグするとパラメーターが明るくなります。調整を行うと、下のYRGBパラメーターに変更が反映されます。Yのみ調整する場合は、ALTまたはCommandキーを押しながら左右にドラッグします。カラーコレクターはYRGB処理を採用しているので、創造力を発揮して、Yチャンネルのみを調整することでユニークなエフェクトを作成できます。Yチャンネル調整は、輝度ミックス設定が右側に設定されている時に最も効果的にYRGB処理を実行できます。通常のRGB処理の場合は左側です。通常、DaVinci Resolveのカラリストは、YRGBカラーコレクターを使用しますが、これは全体のゲインに影響を与えずに、より多彩なカラーバランス・コントロールが可能で、希望通りのルックを短時間で得られるためです。

コントラスト設定

コントラスト設定は、画像の最も暗い部分と最も明るい場部分の差をコントロールできます。リフトとゲインのマスターホイールをそれぞれ逆方向に調整するのと同様の効果が得られます。デフォルト設定は50%になっています。

ピボット設定

コントラスト設定を調整した後、ピボット値を変更すると、コントラストのミッドポイントを調整できます。ピボットコントロールは、輝度スケールのどちらかのサイドを優先させることでコントラストバランスを確立します。コントロールを上げると、イメージの全体的な明るさと鮮明さが増しますが、反対にシャドウが減少します。

彩度設定

彩度設定は、画像の色量を調整します。デフォルト設定は50%になっています。

輝度ミックス設定

Blackmagicカメラに内蔵されたカラーコレクターは、DaVinci Resolveのプライマリーカラーコレクターに基づいています。DaVinci Resolveは1980年代初頭よりカラーコレクターを設計しており、多くのハリウッド映画がDaVinci Resolveを使用してカラーグレーディングされています。

つまり、Blackmagicカメラに内蔵されたカラーコレクターには、ユニークかつクリエイティブなパワフルな機能が搭載されています。YRGB処理はこれらの機能のうちの1つです。

カラーグレーディングの際、RGBまたはYRGB処理を選択できます。ハイエンドのカラリストたちはYRGB処理を好みますが、これは色をより正確にコントロールでき、各チャンネルをはっきりと区別して調整し、より多くのクリエイティブなオプションを使用できるためです。

輝度ミックス・コントロールが右に設定されていると、YRGBカラーコレクターの100%の出力を得られます。輝度ミックス・コントロールが左に設定されていると、RGBカラーコレクターの100%の出力を得られます。輝度ミックスを左/右の間に設定すると、RGBおよびYRGBコレクターを組み合わせた出力を得られます。

どちらの設定を使用するかは、ユーザー次第です。カラーコレクションは純粋にクリエイティブな作業であり、正解や間違いはありません。ユーザーが気に入った設定がベストな選択です。

色相設定

色相設定は、カラーホイールの周囲のすべての色相を回転できます。デフォルト設定の180°では、オリジナルの色相配置が表示されます。この数値を上下に調整すると、カラーホイールに表示される色相配置に沿って、すべての色相が前後に回転します。

ティント設定

ティント設定は、イメージにグリーンまたはマゼンタを加えて、カラーバランスを調整します。これは、蛍光灯やナトリウム灯などの人工照明を使用した撮影で役立ちます。

スライダーを左右にドラッグして、コントラスト、彩度、輝度ミックス設定を調整。

設定の同期

ATEMとBlackmagicカメラを接続すると、カメラコントロール信号がATEMスイッチャーからカメラへと送信されます。誤ってカメラで設定を調整した場合、カメラコントロールは同期を保持できるよう自動的にその設定をリセットします。

ATEMスイッチャーの操作

内部ビデオソース

SDI入力に加えて、ATEMスイッチャーは8つの内部ソースを有しており、これらのソースをプロダクションに使用できます。内部ソースの名前は、ATEM Software Controlでは長いラベルと短いラベルの両方で表示されます。ATEMスイッチャーでは、長いラベルが使用されます。これらのラベルは内部ソースの内容を示しているので、簡単に把握できます。

ブラック

スイッチャーで内部生成した黒画面をソースとして使用できます。黒画面はプロダクションでブラック・マットとして使用します。

カラーバー

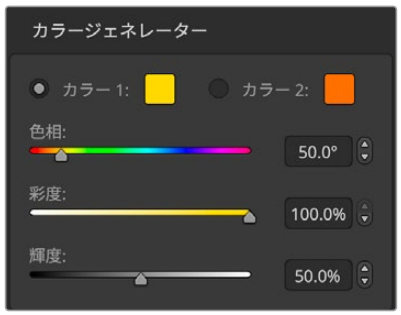
スイッチャーで内部生成したカラーバーをソースとして使用できます。カラーバーは、スイッチャーから出力する信号の検証に役立ちます。また、ベクトルスコープモニターでクロマキーを設定する際にも非常に便利です。

カラージェネレーター

ATEMスイッチャーはカスタマイズ可能な2つのカラーソースを有しており、あらゆるカラーマットを作成してプロダクションで使用できます。カラーソースはワイプトランジションのカラーボーダーや、ディップトランジションのディップ・スルー・カラー（ホワイトなど）として使用できます。

ソフトウェアコントロールパネルでカラーソースを調整するには、カラージェネレーターパレットへ行き、「color chip」をクリックします。カラーピッカーが表示されるので、カラーを選択します。ATEMスイッチャーでは、システムコントロールでカラーを選択し、色相、彩度、輝度を調整します。

最もディープなカラーは、輝度50%に設定されています。



ATEMスイッチャーはカスタマイズ可能な2つのカラーソースを有しており、あらゆるカラーマットを作成してプロダクションで使用できます。

メディアプレーヤー

それぞれのソースには、フィルおよびキー（カット）出力があります。メディアプレーヤーのフィルソースはメディアプレーヤー1、2、と呼ばれ、メディアプレーヤーのキーソースはメディアプレーヤー1キー、メディアプレーヤー2キーなどと呼ばれます。

メディアプレーヤーソースを使い、メディアプールからスチルやクリップを再生します。フィルソースは選択したクリップ/スチルのカラーチャンネルを表示し、キーソースは選択したクリップ/スチルの黒白アルファチャンネルを表示します。メディアプレーヤーはプロダクションの多くの場面で使用できます。

ATEM Television Studioのメディアプレーヤーをコントロール：

1. システムコントロールのメニューボタンで「MEDIA PLAYERS」を選択し、メディアプレーヤーメニューへ進みます。
2. LCD上部のソフトボタンで、操作したいメディアプレーヤーを選択します。
3. コントロールノブを使って、使用したいクリップ/スチルをメディアプールから選択します。
4. モーションクリップを選択した場合、右矢印ボタンを押します。再生/停止、ループ、1フレーム戻し、フレームコントロールで、クリップをコントロールできるようになります。

ATEM Software Controlでメディアプレーヤーを操作：

1. 「スイッチャー」ウィンドウでメディアプレーヤーパレットを選択します。
2. メディアドロップダウンリストで、メディアプールからクリップ/スチルを選択します。
3. モーションクリップを選択すると、頭出し、1フレーム戻し、再生/停止、1フレーム送り、ループのトランスポートコントロールでクリップをコントロールできるようになります。クリップをループさせたい時はループボタンを選択して再生を押します。停止ボタンを押すまでメディアプレーヤーはループを続けます。

ATEM Software Controlで、ロードした
クリップを表示する2つのメディアプレーヤー

トランジションタイプ

放送用スイッチャーの主要な機能の1つは、1つのビデオソースから別のビデオソースへのトランジションです。トランジションのエフェクトやスタイルを組み合わせることで、創造のオプションが無限に広がり、プロダクションの価値が高まります。

ATEMスイッチャーハードウェアまたはATEM Advanced Panelを使ってトランジションを実行できます。このセクションでは、ATEMスイッチャーで使用できる様々なトランジションを紹介します。

カットトランジション

カットは、スイッチャーで実行できる最も基本的なトランジションです。カットトランジションでは、プログラム出力は、1つのソースから別のソースへ瞬時に切り替わります。

カットトランジションのプログラム出力

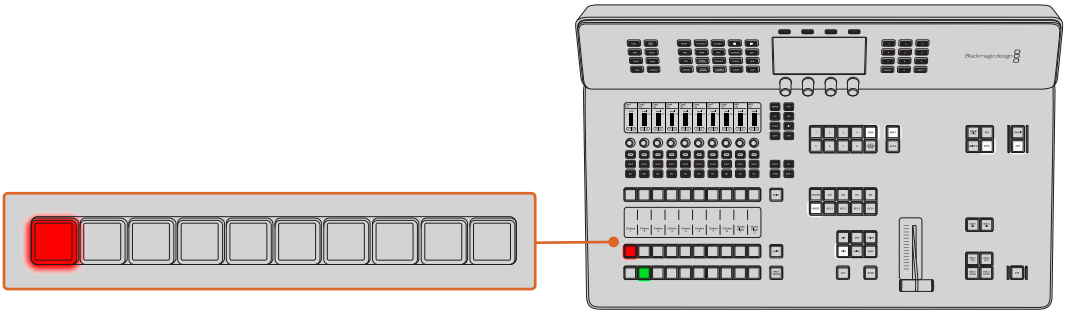
カットトランジションは、プログラムバスから直接実行できます。あるいは、トランジションコントロール・ブロックの「CUT」ボタンでも実行できます。

プログラムバス

プログラムバスからカットトランジションを実行する場合、バックグラウンドのみが切り替わります。アップストリームキーヤーおよびダウンストリームキーヤーは現在の状態のまま残ります。

ATEM Television Studioのプログラムバスからカットトランジションを実行：

プログラムバスで、プログラム出力に使用したいビデオソースを選択します。プログラム出力は瞬時に新しいソースに切り替わります。



プログラム列でソースボタンを押すと、プログラムバスからカットトランジションできます。

ソフトウェアコントロールパネルのプログラムバスでカットトランジションを実行：

次にプログラム出力に使用したいビデオソースをプログラムバスで選択します。プログラム出力は瞬時に新しいソースに切り替わります。

ソフトウェアコントロールパネルでキーボードを使用してカットトランジションを実行：

1. キャプスロック（caps lock）キーをオンにするか、SHIFTキーを押したままにします。
2. プログラム出力に使用したいビデオソースに対応する番号のキーを押します。プログラム出力は瞬時に新しいソースに切り替わります。

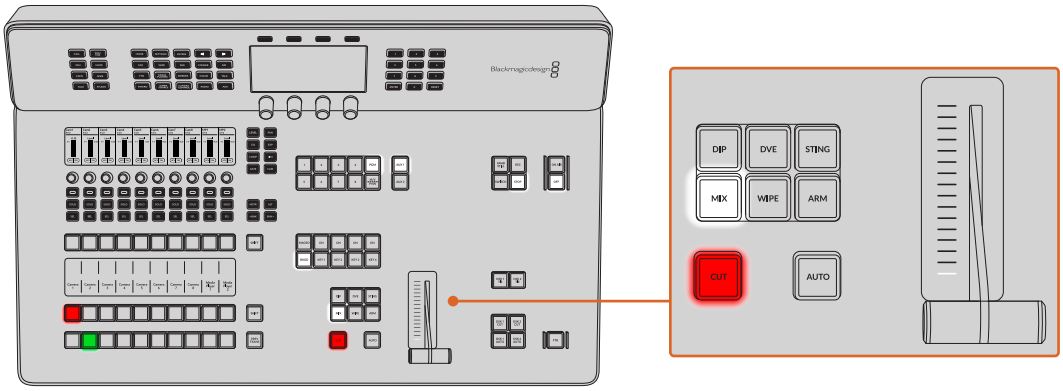
CUTボタン

「CUT」ボタンでカットトランジションを実行する場合、ネクスト・トランジションで選択されているアップストリームキーヤーおよび、トランジションコントロールに連結されているダウンストリームキーヤーの状況も変化します。例えば、トランジションコントロールに連結されているダウンストリームキーは、トランジション前にオフエアの場合はオンエアになり、トランジション前にオンエアの場合はオフエアになります。ネクスト・トランジションで選択されているアップストリームキーも同様です。

ATEM Television StudioのCUTボタンでカットトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。プログラム出力はまだ変更されずそのままの状態です。
2. トランジションコントロール・ブロックで「CUT」ボタンを押します。プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

トランジションコントロール・ブロックを使用すると、プログラム出力に送信する前に、カメラのフォーカスなどといったビデオの詳細をプレビュー出力で確認できるので、トランジションを実行する際は、トランジションコントロール・ブロックを使用することを推奨します。



ソフトウェアコントロールパネルのCUTボタンでカットトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。プログラム出力はまだ変更されずそのままの状態です。
2. トランジションコントロール・ブロックで「CUT」ボタンを押します。プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

トランジションスタイルのセクションにある「CUT」トランジションボタン

ソフトウェアコントロールパネルでキーボードを使用してカットトランジションを実行：

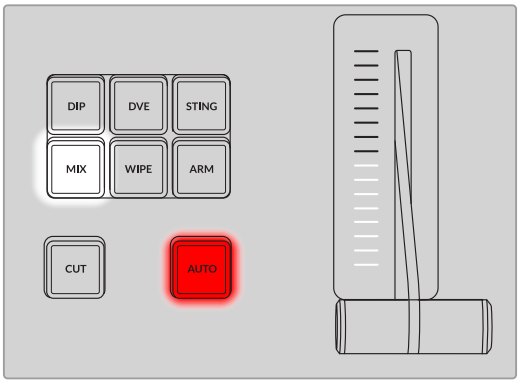
1. キャプスロック（caps lock）キーがオフになっていることを確認します。
2. プログラム出力に使用したいビデオソースに対応する番号のキーを押します。プレビューでソースが選択され、プログラム出力はそのままの状態です。
3. スペースキーを押します。プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

オートトランジション

オートトランジションは、プログラムソースとプレビューソース間で、事前に設定したレートで自動的にトランジションを実行できます。ネクスト・トランジションで選択されているアップストリームキーヤーおよび、トランジションコントロールに連結されているダウンストリームキーヤーの状態も変化します。オートトランジションは、トランジションコントロール・ブロックの「AUTO」ボタンを使用して実行できます。ミックス、ディップ、ワイプ、DVE、スティンガートランジションをオートトランジションとして実行できます。

ATEM Television Studioでオートトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. トランジションコントロール・ブロックで、トランジションタイプボタンを使用してトランジションのタイプを選択します。
3. システムコントロールで、トランジションレートを設定し、必要に応じてその他のパラメーターを調整します。
4. トランジションコントロール・ブロックの「AUTO」ボタンを押し、トランジションを開始します。



ディップ、ミックス、ワイプなどのトランジションタイプには独立した選択ボタンがあります。

トランジションの実行中、プログラムバスおよびプレビューバスの赤/緑のボタンは両方赤くなり、トランジションが実行中であることを示します。フェーダーバーのインジケーターは、トランジションの進行を表示し、RATEウィンドウは残りのフレーム数を表示します。

トランジションが完了すると、プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

各トランジションタイプは、独自のトランジションレートを設定できるので、トランジションタイプを選択して「AUTO」ボタンを押すだけで、すばやくトランジションを実行できます。前回使用したトランジションレートは、変更しない限りそのまま保存されます。

プロダクションスイッチャーでは、様々なタイプのトランジションを使って1つの画面から別の画面へと切り替えられます。一般的には、単純なカットトランジションでバックグラウンドソースを切り替えます。ミックス、ディップ、ワイプ、DVEトランジションは、1つのソースを徐々に消して（フェーズ・アウト）、別のソースを徐々に表示（フェーズ・イン）することで、2つのバックグラウンドソースを切り替えます。スティンガーおよびグラフィックワイプは、特殊なタイプのトランジションで、後のセクションに詳細が記載されています。ミックス、ディップ、ワイプ、DVEトランジションは、トランジションコントロール・ブロックからオートトランジションおよびマニュアルトランジションで実行できます。

トランジションスタイルのセクションにある「AUTO」トランジションボタン

ソフトウェアコントロールパネルでオートトランジションを実行：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 トランジションコントロール・ブロックで、トランジションスタイルのボタンを使用してトランジションのタイプを選択します。

3 トランジションパレットに行き、トランジションコントロール・ブロックで選択したトランジションと同じトランジションタイプの設定タブを選択します。

4 トランジションレートを設定し、必要に応じてその他のパラメーターを調整します。

5 トランジションコントロール・ブロックの「AUTO」ボタンを押し、トランジションを開始します。

6 トランジションの実行中、プログラムバスおよびプレビューバスの赤/緑のボタンは両方赤くなり、トランジションが実行中であることを示します。ソフトウェアパネル上のフェーダーバーは、トランジション処理に合わせて自動的に動き、「レート」ウィンドウは残りのフレーム数を表示します。

7 トランジションが完了すると、プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

ソフトウェアコントロールパネルでキーボードを使用してオートトランジションを実行：

1 キャプスロック（caps lock）キーがオフになっていることを確認します。

2 プログラム出力に使用したいビデオソースに対応する番号のキーを押します。プレビューでソースが選択され、プログラム出力はそのままの状態です。

3 トランジションコントロール・ブロックで、トランジションスタイルのボタンを使用してトランジションのタイプを選択します。

4 トランジションパレットに行き、トランジションコントロール・ブロックで選択したトランジションと同じトランジションタイプの設定タブを選択します。

5 トランジションレートを設定し、必要に応じてその他のパラメーターを調整します。

6 リターンキーまたはエンターキーを押し、トランジションを開始します。

トランジションの実行中、プログラムバスおよびプレビューバスの赤/緑のボタンは両方赤くなり、トランジションが実行中であることを示します。ソフトウェアパネル上のフェーダーバーは、トランジション処理に合わせて自動的に動き、「レート」ウィンドウは残りのフレーム数を表示します。

トランジションが完了すると、プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

ミックストランジション

ミックストランジションは、1つのソースから別のソースへの段階的なトランジションです。エフェクトの実行中に、2つのソースを効果的にオーバーラップさせ、2つのソース間で徐々に切り替えます。トランジションの長さや、オーバーラップ時間の長さは、ミックスレートを変更することで調整できます。

ミックストランジションのプログラム出力

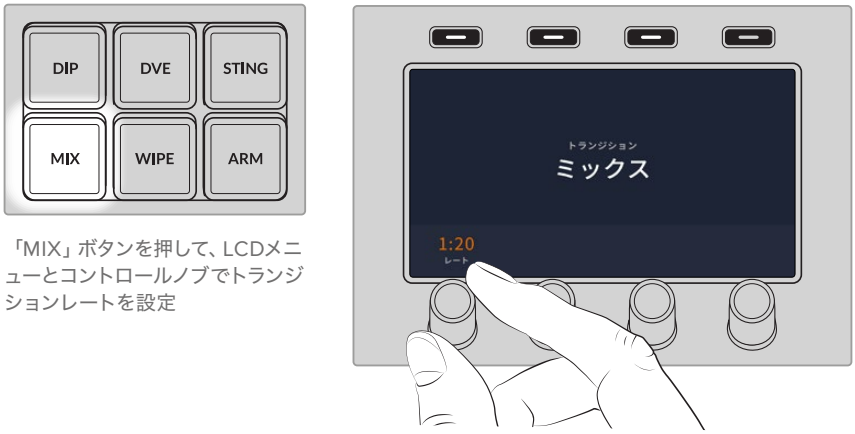
ATEM Television Studio HD8でミックストランジションを実行：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 「DIP/MIX」または「MIX」ボタンを押してミックストランジションを選択します。システムコントロールは自動的にトランジションメニューを表示します。

3 LCDパネルで、ソフトコントロールノブを使ってミックスレートを設定します。スイッチャーのトランジションコントロール・ブロックのレートウィンドウが動的にアップデートされます。テンキーパッドを使ってレートを入力することもできます。

4 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。



「MIX」ボタンを押して、LCDメニューとコントロールノブでトランジションレートを設定

ミックストランジションのレート設定

ソフトウェアコントロールパネルでミックストランジションを実行　：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 トランジションコントロール・ブロックで、ミックストランジションを選択します。

3 トランジションパレットを開き、トランジションタイプのバーから「ミックス」を選択します。

4 レートウィンドウに数値を入力してミックスレートを設定します。トランジションコントロール・ブロックのレートウィンドウがアップデートされます。

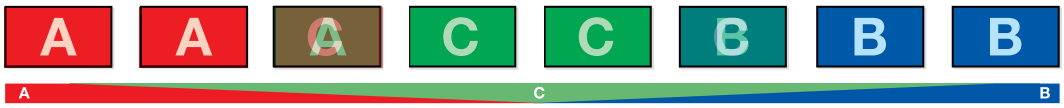
5 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

ミックストランジション・パラメーター

レート	ミックストランジションレートを<秒：フレーム>で表示。

ディップトランジション

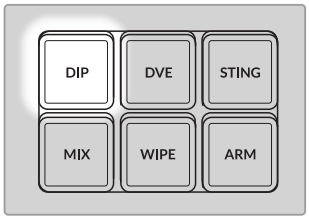
ディップトランジションは、1つのソースから別のソースへの段階的なトランジションという意味ではミックストランジションと似ていますが、ディップトランジションは、ディップソースと呼ばれる3つ目のソースを介して切り替わります。例えば、白い光やスポンサーのロゴを一時的に挿入するトランジションなどです。ディップトランジションの長さやディップソースはカスタマイズ可能です。



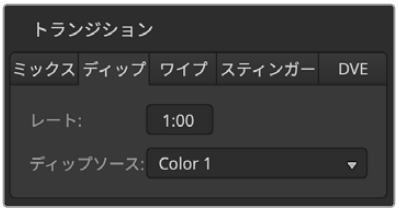
ディップトランジションのプログラム出力

ATEM Television Studioでディップトランジションを実行：

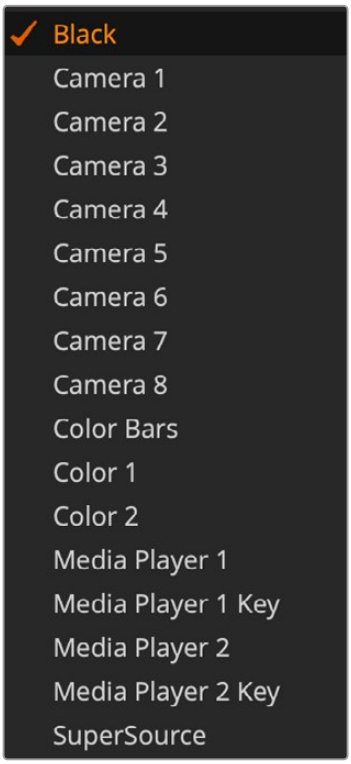
1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. 「DIP」ボタンを押してディップトランジションを選択します。LCDメニューにトランジション設定が自動的に表示されます。
3. LCDの下のソフトコントロールノブを使ってディップレートを設定します。テンキーパッドを使ってレートを入力することもできます。
4. 対応するコントロールノブを使ってディップソースを選択します。選択バスでディップソースを選択することもできます。
5. トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。



トランジションコントロール・ブロックの「DIP」ボタンを押し、LCDメニューとコントロールノブでディップソースおよびトランジションレートを設定



ディップトランジション設定



ディップソース・メニュー

ソフトウェアコントロールパネルでディップトランジションを実行：

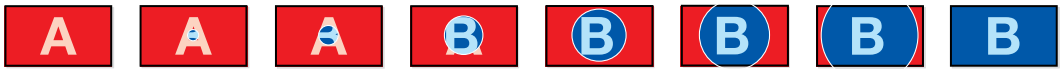
1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. トランジションコントロール・ブロックで、ディップトランジションを選択します。
3. トランジションパレットを開き、トランジションタイプのバーから「ディップ」を選択します。
4. レートウィンドウに数値を入力してディップレートを設定します。トランジションコントロール・ブロックのレートウィンドウがアップデートされます。
5. ディップソースを選択します。
6. トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

ディップトランジション・パラメーター

レート	ディップトランジションレートを<秒：フレーム>で表示
ディップソース	ディップソースは、スイッチャーのビデオ信号をディップトランジションの仲介映像として使用します。通常、カラージェネレーターやメディアプレーヤーを使用します。

ワイプトランジション

ワイプトランジションは、特定のシェイプを形成するパターンを使ってソースを置き換えることにより、1つのソースから別のソースへトランジションします。例えば、円形やひし形が徐々に大きくなるなど、様々なパターンがあります。



ワイプトランジションのプログラム出力

ATEM Television Studioでワイプトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. 「WIPE」ボタンを押してワイプトランジションを選択します。LCDメニューにトランジション設定が自動的に表示されます。
3. システムコントロールのノブで、ワイプパターンとレートを選択します。ワイプの方向もボタンで選択できます。
4. LCDボタンの左にある矢印ボタンで、位置、シンメトリー、ボーダーソースなどのワイプ特性の設定へ進めます。

5 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

ワイプトランジション設定

ソフトウェアコントロールパネルでワイプトランジションを実行：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 トランジションコントロール・ブロックで、ワイプトランジションを選択します。

3 トランジションパレットを開き、トランジションタイプのバーから「ワイプ」を選択します。

4 ワイプパレットの設定で、ワイプトランジションをカスタマイズします。

5 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

ワイプトランジション・パラメーター

レート	ワイプトランジションの長さを秒数とフレーム数で表示します。
シンメトリー	パターンのアスペクトレシオをコントロールする際に使用します。 例えば、シンメトリー・パラメーターを調整することで円形を楕円形にできます。ATEMスイッチャーでは、シンメトリーは、コントロールノブを使って調整できます。
位置	ワイプパターンの位置設定が必要な場合、スイッチャーのコントロールノブ、あるいはソフトウェアコントロールパネルのトランジションパレットにある「位置 X」および「位置 Y」ボックスを使って各パターンの中心を移動できます。
逆方向	円形、ひし形、四角形などのパターンは、反転に設定されていれば、スクリーンの端から中心に向けてトランジションします。選択されているとテキストがオレンジに点灯します。
フリップフロップ	フリップモードがオンの場合、トランジションを実行するたびに、標準と反転を繰り返します。選択されているとテキストがオレンジに点灯します。
ボーダーソフトネス	ソフトネス・パラメーターは、ワイプパターンのエッジをシャープ/ぼかし調整できます。
ボーダー	ボーダーの幅を調整します。
ボーダーフィルソース	ワイプトランジションのボーダーソースは、スイッチャーのあらゆるソースを使用できます。例えば、メディアプレーヤーをソースとする幅広のボーダーを使ってスポンサーやブランドを紹介できます。

スティンガートランジション

スティンガートランジションはメディアプレーヤーのクリップを使用してトランジションを実行します。通常、グラフィックアニメーションのクリップが使用され、バックグラウンドにキーイングされます。フルスクリーンでクリップが再生される場合、アニメーションの下で、バックグラウンドがカットまたはミックストランジションされます。例えば、このタイプのトランジションは、スポーツ中継などのリプレイ画面の切り替えによく見られます。スティンガートランジションは、トランジション・ブロックに内蔵された専用のキーヤーを使用するので、すべてのアップストリームキーヤーおよびダウンストリームキーヤーは、出力合成用に使用できます。スティンガートランジションは以下の手順で実行します。

スティンガートランジションを実行

ATEM Television Studioでスティンガートランジションを実行：

1. トランジションコントロール・ブロックで、「STING」トランジションボタンを押します。
2. LCDメニューで「ソース」のソフトコントロールノブを回して、使用するメディアプレーヤーを選択します。矢印ボタンを使用して追加設定を表示し、必要に応じてプリロール、トリガー、ミックス、継続時間を調整します。
3. これでスティンガートランジションを適切なメディアプレーヤーで使用するよう設定できたので、LCDの隣にあるシステムコントロールの「MEDIA PLAYER」ボタンを押してメディアプレーヤーを確定します。
4. メディアプレーヤーのメニューでは、「メディア」ソフトコントロールノブを使って、使用したいスチル/クリップをメディアプールから選択します。必要に応じて、対応する「フレーム」ソフトコントロールノブを使い、クリップを開始するフレームを設定します。
5. トランジションコントロール・ブロックから、オートトランジションでトランジションを実行します。

スティンガートランジション設定

ソフトウェアコントロールパネルでスティンガートランジションを実行：

1. トランジションコントロール・ブロックでSTNGトランジションスタイルボタンを選択します。
2. ソースメニューでトランジションのメディアプレーヤーを選択します。使用したいクリップがメディアプレーヤーソースにあることを確認します。
3. 必要に応じて、クリップの長さ、トリガーポイント、ミックスレート、プリロールのパラメーターを調整します。
4. トランジションコントロール・ブロックから、オートトランジションでトランジションを実行します。

   スティンガートランジションでは、フェーダーバーを使用したマニュアルトランジションは実行できません。

スティンガートランジションのパラメーター

ソース	アニメーション・トランジション用のクリップを再生するメディアプレーヤーです。
クリップの長さ	クリップの長さは、アニメーションの長さを表します。通常はアニメーションの長さと一致します。クリップの最後をトリミングすることもできます。
トリガーポイント	トリガーポイントは、スイッチャーがアニメーション映像の下で、バックグラウンドのミックストランジションを開始する時点です。通常、アニメーションがフルスクリーンになった時点でトランジションを開始します。
ミックスレート	ミックスレートは、アニメーションの下で実行されるプレビューからプログラムへのミックストランジションの長さを設定します。ミックスの代わりにカットトランジションを使用する場合、レートを1フレームに設定します。
プリロール	プリロールは、クリップの始まりをトリミングするためのトリムインです。 プリロールの時間は最長で3:00秒です。
プリマルチプライキー	メディアプレーヤーのクリップのキー信号をプリマルチプライキーとして認識します。
クリップ	クリップレベルを調整して、メディアプレーヤーで再生するクリップにキーホールを抜く際のしきい値を設定します。クリップレベルを下げると、バックグラウンドがより多く表示されます。バックグラウンドビデオが完全に黒くなっている場合、クリップレベルが下がり過ぎています。
ゲイン	ゲインを調整して映像がオン/オフになる値を修正し、メディアプレーヤーで再生するクリップのキーのエッジを滑らかにします。エッジを希望通りのソフトネスにしてもバックグラウンドの輝度（明るさ）が影響を受けないよう、ゲイン値を調整してください。
キーを反転	キーを反転します。

トリガー、ミックス、継続時間は、互いに依存しています。例えば、トリガー＋ミックスレートは、クリップの長さより長くすることはできません。また、レートウィンドウに表示されるタイム表示は、クリップの長さ+プリロールであることに留意してください。

DVEトランジション

ATEMスイッチャーは、DVEトランジション用のパワフルなデジタルビデオ・エフェクト・プロセッサーを搭載しています。DVEトランジションは、映像を様々な方法で置き換えることにより、1つのソースから別のソースへトランジションします。例えば、現在の画面をスクリーンの端へスクイーズさせて、その下から新しいソースを表示させるなどです。

ATEM Television StudioでDVEトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. 「DVE」トランジションボタンを押してDVEトランジションを選択します。LCDメニューにDVE設定が表示されます。

> **メモ** アップストリームキーヤーでDVEが既に使用されている場合、キーがオフエアになり、ネクスト・トランジションで選択されていない状態になるまで、DVEトランジションは選択できません。詳細はこのセクションで後述される「DVEリソースの共有」を参照してください。

3. DVE LCDメニューで、ソフトコントロールノブやボタンを使ってDVEのパラメーターを設定します。例えば、DVEのパターン、動き、方向の選択や、DVEトランジションレートの設定ができます。LCDの横の左右矢印ボタンを使用して、追加設定にナビゲートします。

4 「AUTO」ボタンまたはフェーダーバーを使って、オートまたはマニュアルでトランジションを実行します。

DVEトランジション設定

ソフトウェアコントロールパネルでDVEトランジションを実行：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 トランジションコントロール・ブロックで、DVEトランジションを選択します。

3 トランジションパレットを開き、トランジションタイプのバーから「DVE」を選択します。

アップストリームキーヤーでDVEが使用されている場合、キーがオフエアになり、ネクスト・トランジションで選択されていない状態になるまで、DVEトランジションスタイルボタンは選択できません。詳細は「DVEリソースの共有」セクションを参照してください。

DVEパレットの設定を使用して、DVEトランジションをカスタマイズします。

4 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

DVEトランジション・パラメーター

パターン	DVEパターンをプッシュまたはスクイーズから選択します。
ムーブメント	パターントランジションの方向を設定します。
DVEレート	DVEトランジションの長さを秒数とフレーム数で表示します。ATEM Television Studioスイッチャーシリーズで DVEレートのノブを回すとDVEトランジションレートを調整できます。新しく設定したレートは、トランジションコントロール・ブロックの「レート」ウィンドウにすぐに表示されます。
方向	標準に設定すると、DVEをプログラムチャンネルで実行し、プレビューチャンネルにトランジションします。
逆方向	反転に設定すると、DVEエフェクトはプレビューチャンネルで実行されます。反転では、プレビュービデオからプログラム出力にDVEエフェクトでトランジションします。
フリップフロップ	フリップフロップモードをオンにすると、トランジションを実行するたびに標準と反転が切り替わります。

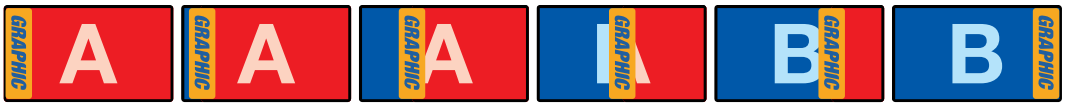
DVEキーパラメーター

キーを有効化	DVEキーをオン/オフします。ボタンが光っている場合、DVEキーがオンになっています。
プリマルチプライキー	プリマルチプライキーにDVEキーを選択します。
クリップ	クリップレベルを調整して、キーホールを抜く際のしきい値を設定します。クリップレベルを下げると、バックグラウンドがより多く表示されます。バックグラウンドビデオが完全に黒くなっている場合、クリップレベルが下がり過ぎています。
ゲイン	ゲインを調整してオン/オフの角度を電子的に修正し、キーのエッジを滑らかにします。エッジを希望通りのソフトネスにしてもバックグラウンドの輝度（明るさ）が影響を受けないよう、ゲイン値を調整してください。
キーを反転	「プリマルチプライキー」が選択されていない時、キー信号を反転します。

DVEリソースの共有

ATEMは、複数のDVEチャンネルに対応しており、DVEトランジションあるいはアップストリームキーヤーに使用できます。DVEトランジションを選択する際、システム内でDVEが他の用途に使用されているとDVEトランジションは選択できず、スイッチャーではDVEボタンが無効になります。DVEトランジションを実行するには、現在使用されているDVEをトランジションで使用できる状態にしなければなりません。プログラムおよびプレビュー出力のアップストリームキーにDVEが使用されていないことを確認します。また、フライキーをオンにしないでください。DVEをアップストリームキーヤーから外すには、キータイプをDVE以外に変更するか、フライキーをオフにします。これでDVEトランジションにDVEを使用できるようになります。

グラフィックトランジションは、DVEを使ったポピュラーなトランジションです。バックグラウンドのトランジションの上で、グラフィックがスクリーン上を動きます。例えば、グラフィックワイプは、グラフィックが水平に動き、ワイプボーダーを置き換えます。グラフィックミックスでは、ミックストランジションの上でグラフィックがスピンします。グラフィックトランジションはテレビ局のロゴをワイプしたり、フットボールを回転させて新しいバックグラウンドに切り替えたりするのに最適です。グラフィックトランジションは、トランジション・ブロックに内蔵された専用のキーヤーを使用するので、すべてのアップストリームキーヤーおよびダウンストリームキーヤーは、出力合成用に使用できます。グラフィックトランジションは以下の手順で実行します。



グラフィックワイプトランジションのプログラム出力の一例

グラフィックトランジションを実行

ATEM Television Studioでグラフィックトランジションを実行：

1 トランジションコントロール・ブロックで、DVEトランジションボタンを押します。LCDにDVE設定メニューが表示されます。

アップストリームキーヤーでDVEが既に使用されている場合、キーがオフエアになり、ネクスト・トランジションで選択されていない状態になるまで、DVEトランジションは選択できません。詳細はこのセクションで後述される「DVEリソースの共有」を参照してください。

2 LCDメニューで「エフェクト」ソフトボタンを押して、エフェクト設定を開きます。

デフォルトでは、ワイプ方向は左から右です。「逆方向」を選択すればワイプ方向を変更できます。また、「フリップフロップ」をオンにすると、トランジションを実行するたびに同じ方向に動くのではなく、デフォルト方向と逆方向が交互に切り替わります。

3 システムコントロールボタンの右矢印を押すとキー設定を調整できます。キーを有効にしてフィル＆キーソースを選択します。クリップ/ゲイン設定など、キーを調整する必要がある場合は、システムコントロールボタンの右矢印を押すとキーパラメーターにアクセスできます。

作業のこつ グラフィックトランジションでは、概してソースはメディアプレーヤーにロードされたグラフィックです。デフォルトでは、フィルソースにメディアプレーヤーを選択すると、キーソースは自動的にメディアプレーヤー・キーチャンネルを選択し、プリマルチプライキーは「オン」に設定します。つまり、スイッチャーは、アルファチャンネルにエンベッドされたキーマットを含むグラフィックを自動的に選択します。別のメディアプレーヤーのメディアファイルや、異なる入力ソースを使用したい場合、プリマルチプライキーを無効にし、キーソースを変更できます。

4 AUTOボタンでオートトランジション、またはフェーダーバーでマニュアルトランジションを実行します。

ソフトウェアコントロールパネルでグラフィックトランジションを実行：

1 トランジションコントロール・ブロックで、DVEトランジションを選択します。

アップストリームキーヤーでDVEが使用されている場合、キーがオフエアになり、ネクスト・トランジションで選択されていない状態になるまで、DVEトランジションスタイルボタンは選択できません。詳細は次の「DVEリソースの共有」セクションを参照してください。

2 トランジションパレットを開き、トランジションタイプのバーから「DVE」を選択します。矢印ボタンを使用して、異なるDVEタイプを選択します。

3 エフェクトオプションからグラフィックワイプトランジションを選択

4 ドロップダウンリストから、使用するグラフィックのフィルソースとキーソースを選択します。

5 必要に応じて、キーパラメーターを調整します。

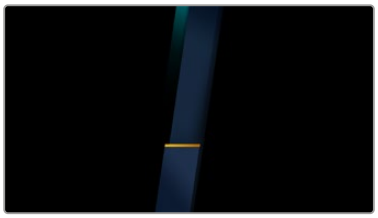
6 トランジションコントロール・ブロックから、オートトランジション、もしくはマニュアルトランジションでトランジションを実行します。

グラフィックワイプ・パラメーター

レート	トランジションの長さを秒数とフレーム数で表示します。レートノブでレートを調整したり、あるいはテンキーパッドとEnterボタンを使ってレートを入力することもできます。
標準	標準は、グラフィックを左から右へ移動します。スイッチャーのシステムコントロールでは、標準設定の際は「逆方向」設定が白で表示されます。
逆方向	反転で方向を変更すると、グラフィックが右から左に移動します。ATEMスイッチャーでは、逆方向が有効の際はオレンジで表示されます。
フリップフロップ	フリップフロップモードをオンにすると、トランジションを実行するたびに標準と反転が切り替わります。ネクスト・トランジションの方向は、「標準」または「反転」のライトで確認できます。
フィルソース	フィル信号は、トランジションの上を移動するグラフィックです。
キーソース	キーソースは、除去するグラフィックの領域を定義し、ワイプの上にフィル信号を正確に重ねるためのグレースケールのイメージです。

グラフィックワイプ・イメージ

グラフィックワイプでは、横方向に移動するボーダーとして使用するための静止グラフィックが必要になります。このグラフィックは、縦方向のバナーのようなグラフィックで、画面幅の16%以内の大きさでなければなりません。



グラフィックワイプのスクリーン幅要件

2160p	ATEM Television Studio 4K8で2160pを扱っている場合、グラフィックの幅は230ピクセル以下にしてください。
1080i	スイッチャーで1080iを扱っている場合、グラフィックの幅は116ピクセル以下にしてください。
720p	スイッチャーで720pを扱っている場合、グラフィック幅は320ピクセル以下にしてください。

マニュアルトランジション

マニュアルトランジションは、トランジションコントロール・ブロックのフェーダーバーを使って、プログラム/プレビュー間をマニュアルでトランジションします。ミックス、ディップ、ワイプ、DVEトランジションは、マニュアルトランジションが可能です。

ソフトウェアコントロールパネルまたはATEM Television Studioでマニュアルトランジションを実行：

1. プレビューバスで、プログラム出力に使用したいビデオソースを選択します。
2. トランジションコントロール・ブロックで、トランジションタイプボタンを使用してトランジションのタイプを選択します。
3. フェーダーバーを一方からもう一方へ手動で動かすことでトランジションを実行します。次にフェーダーバーを動かすと、新しいトランジションが始まります。

4 トランジションの実行中、プログラムバスおよびプレビューバスの赤/緑のボタンは両方赤くなり、トランジションが実行中であることを示します。スイッチャーは、フェーダーバーのインジケーターがトランジションの位置および進行状況を表示します。ソフトウェアコントロールパネルでは、ソフトウェア上のフェーダーバーがトランジションの位置および進行状況を表示します。

5 トランジションが完了すると、プログラムバスとプレビューバスで選択されているソースが切り替わり、プレビューバスで選択されていたソースがプログラム出力となります。

プレビュートランジション

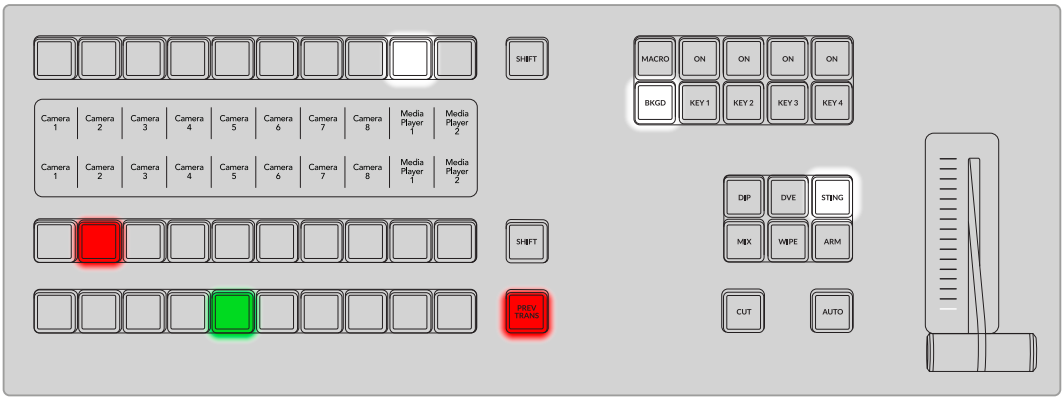
ATEMスイッチャーは、プレビュー出力でトランジションをプレビュー/調整できるパワフルな機能を搭載しています。プレビュートランジション・モードを使い、実際にオンエアする前に、トランジションを確認できます。

ソフトウェアコントロールパネルまたはATEM Television Studioでトランジションをプレビュー：

1 プレビューバスで、プログラム出力に使用したいビデオソースを選択します。

2 トランジションコントロール・ブロックで、トランジションタイプボタンを使用してトランジションのタイプを選択します。

3 「PREV TRANS」ボタンを押すとスイッチャーがプレビュートランジション・モードになります。「PREV TRANS」ボタンは赤く光り、プレビュー出力にプログラム出力と同じ映像が表示されます。



4 フェーダーバーをマニュアルで端から端へと移動させ、プレビュー出力でトランジションをプレビューします。プログラム出力はまだ変更されずそのままの状態です。

5 「PREV TRANS」ボタンを押してプレビュートランジション・モードをオフにします。

ATEMスイッチャーのキーイング

キーヤーは、異なるソースの視覚的要素を同一のビデオイメージ上に配置できるパワフルなプロダクション・ツールです。

キーヤーでは、マルチレイヤーの映像やグラフィックがバックグラウンドに重ねて表示されます。バックグラウンドに重ねて表示するレイヤーを調整して部分的に透明にすることで、バックグラウンドが見えるようになります。この処理をキーイングといいます。各スイッチャーに搭載された種類の異なる様々なキーヤーで、様々なテクニックを用いてレイヤーの部分的な透明度を調整できます。

以下のセクションでは、アップストリームとダウンストリームの両方で使用できるルマキーおよびリニアキーについて説明します。また、アップストリームキーヤーだけで使用できるクロマ、パターン、DVEキーについても説明します。

キーイングとは

ひとつのキーに対し、フィル信号およびキー信号（カット信号）の、計2つのビデオソースが必要です。フィル信号には、バックグラウンドに重ねて表示する映像が含まれています。キー信号は、フィル信号の透明にする部分を選択するために使用されます。フィル/キー信号はあらゆるスイッチャーの外部入力または内部ソースから選択でき、静止画・動画の両方をフィルソースまたはキーソースとして使用できます。

ATEM Software Controlパネルでは、フィル/キー信号はアップストリーム/ダウンストリームキーパレットのドロップダウンリストから選択できます。ATEMスイッチャーでは、フィル/キー信号は選択バスを使用して選択します。

ATEMスイッチャーには、アップストリームキーヤー/ダウンストリームキーヤーという2種類のキーヤーがあります。エフェクトキーヤーとも呼ばれる4つのアップストリームキーヤーは、スイッチャーのM/Eブロックにあります。各アップストリームキーヤーは、ルマ、リニア、プリマルチプライ、クロマ、パターン、DVEなどのキーに設定できます。2つのダウンストリームキーヤーは、ダウンストリームキーヤー専用ブロックにあります。各ダウンストリームキーヤーは、ルマまたはリニアキーに設定できます。

ルマキー

「セルフキー」とも呼ばれるルマキーでは、バックグラウンドに重ねて表示するビデオイメージを含むビデオソースを1つ使用します。ビデオ信号のルミナンスで定義されるすべてのブラック部分が透明になり、下にあるバックグラウンドが見えます。切り取る部分の決定には1つのイメージしか使用されないため、ルマキーはフィルおよびキーに同一の信号を使用します。下のイメージは、バックグラウンド、ルマキー信号、それらを結合した結果のイメージ画像です。

ルマキーを使用したバックグラウンドとフィル/キーの結合

バックグラウンド

カメラソースなどのフルスクリーンイメージ。

フィル

フィル - バックグラウンド映像の上に重ねて表示するグラフィック。ブラック部分はすべてイメージから切り取られるため、最終的な合成映像にグラフィックのブラック部分は一切含まれません。

リニアキー

リニアキーは、フィル信号およびキー信号（カット信号）の2つのビデオソースを使用します。フィル信号には、バックグラウンドに重ねて表示する映像が含まれています。キー信号は、フィル信号の透明にする部分を特定するために使用されます。フィル信号とキー信号はともにビデオ入力であるため、画面上で動く場合があります。下の画像は、バックグラウンドとフィル/キー信号、それらを結合した結果のイメージ画像です。

リニアキーを使用したバックグラウンドとフィル/キーの結合

バックグラウンド

カメラソースなどのフルスクリーンイメージ。

フィル

フィル - バックグラウンド映像の上に重ねて表示するグラフィック。キー信号はフィル信号の透明部分の特定に使用されるため、グラフィックのブラック部分はそのまま残ります。フィル信号はグラフィックシステムなどから供給できます。

キー

フィル信号がバックグラウンド上に正しく表示されるよう、イメージから除去する部分を決定するグレースケールマスク。キー信号はグラフィックシステムなどから供給できます。

プリマルチプライキー

フィル/キー出力を搭載する近年のグラフィックシステムやキャラクタージェネレーターの多くには、プリマルチプライキー（シェイプキー）として知られる機能があります。プリマルチプライキーは、ブラックのバックグラウンド上でフィル信号とキー信号をプリマルチプライした、フィル/キー信号の特別な組み合わせです。Photoshopで作成されたアルファチャンネルを含むイメージはプリマルチプライされています。

ATEMスイッチャーにはプリマルチプライされたキー用に自動キー調整機能が付いているため、マルチプライキー設定を有効にすると、システムによりクリップおよびゲインパラメーターが自動で設定されます。

Photoshopで作成したイメージを使用する場合は、ブラックのバックグラウンドレイヤー上でグラフィックを生成し、すべてのコンテンツを上のレイヤーに配置してください。また、ATEMでグラフィックとライブ映像をブレンドする際に使用できる、アルファチャンネルをPhotoshopファイル内に追加します。Targaイメージファイルとして保存した場合、またはメディアプールに直接ダウンロードした場合は、キーヤーでプリマルチプライを選択できるため、優れたキーを得られます。

Photoshopファイルはすでにプリマルチプライされているため、これらのファイルをキーイングする際は常にATEMスイッチャーのプリマルチプライ設定を使用します。

アップストリームルマ/リニアキーを実行

ルマ/リニアキーのパラメーターは同一であるため、ソフトウェアコントロールパネルおよびATEMスイッチャーの共通メニューであるルマキーメニューを使用して設定を行います。キーがルマであるかリニアであるかは、フィルおよびキーソースの選択により決定されます。ルマキーでは、フィルソースとキーソースは同一です。リニアキーでは、フィルソースとキーソースは異なります。

アップストリームキー・パレットの各タブの上部には、パラメーターをリセットできるメニューがあります。リセットしたいセクションをメニューから選択します。

ATEM Television Studioのアップストリームキーヤー1でルマ/リニアキーを設定：

1 「KEY 1」ボタンを押して、プレビュー出力のキーヤーを有効にします。これにより、システムコントロールのLCDにキーヤーメニューが自動的に表示されます。「KEYS」ボタンを押して直接メニューへ行くこともできます。

2 「キーの種類」インジケーターの下にあるコントロールノブを使って、「ルマ」キーを選択します。

3 「フィルソース」および「キーソース」コントロールノブを回して、フィル/キーソースを指定します。

作業のこつ ソース選択バスで対応するボタンを押してフィル＆キーソースを選択することもできます。

4 キーの種類、フィル/キーソースを選択したら、右矢印ボタンで次のメニューアイテムへスクロールします。コントロールノブを使って、マスク、ゲイン、クリップなどのキーパラメーターの調整、プリマルチプライキーのオン/オフが可能です。

ソフトウェアコントロールパネルのアップストリームキーヤー1でルマ/リニアキーを設定：

1 アップストリームキー 1パレットを拡張して「ルマ」タブを選択します。

2 フィルソースとキーソースを選択します。

ルマキーを実行する場合は、フィルとキーに同一のソースを選択します。

キーパラメーターを使用してキーを調節します。ルマキーパラメーターについての説明は、以下の表に記載されています。

アップストリーム・ルマ/リニア・キーパラメーター：

マスク	長方形のマスクを有効にします。マスクは上/下/左/右パラメーターを使用して調整できます。
プリマルチプライキー	キー信号をプリマルチプライされたキーとして認識します。
クリップ	クリップレベルを調整して、キーホールを抜く際のしきい値を設定します。クリップレベルを下げると、バックグラウンドがより多く表示されます。バックグラウンドビデオが完全に黒くなっている場合、クリップレベルが下がり過ぎています。

ゲイン	ゲインを調整してオン/オフの角度を電子的に修正し、キーのエッジを滑らかにします。エッジを希望通りのソフトネスにしてもバックグラウンドの輝度（ルミナンス）が影響を受けないよう、ゲイン値を調整してください。
キーを反転	キー信号を反転します。
フライキー	DVEエフェクトを有効/無効にします。

ダウンストリーム・ルマ/リニア・キーを実行する

ATEM Television Studioのダウンストリームキーヤー1でルマ/リニアキーを設定：

1. 「DSK 1 TIE」ボタンを押して、プレビュー出力のダウンストリームキーヤーを有効にします。これにより、システムコントロールのLCDにダウンストリームキーメニューが自動的に表示されます。「KEYS」ボタンと右矢印ボタンで直接メニューへ行くこともできます。
2. 「DSK 1」または「DSK 2」ソフトボタンで使用するダウンストリームキーヤーを選択します。

作業のこつ ダウンストリームキーヤーは常にルマキーを使用するので、キーの種類を選択する必要はありません。

3. LCDメニューの下にあるコントロールノブを使ってフィル/キーソースを選択します。対応するソース選択ボタンでフィル/キーソースを選択することもできます。
4. フィル/キーソースを選択したら、左右の矢印ボタンを使って、マスク、ゲイン、クリップ、プリマルチプライキー設定など、追加のメニューをスクロールします。

ソフトウェアコントロールパネルのダウンストリームキーヤー1でルマ/リニアキーを設定：

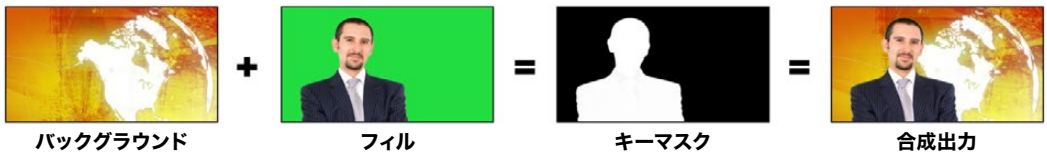
1. ダウンストリームキーヤー 1パレットを選択します。
2. フィルソース/キーソースのドロップダウンコントロールを使用して、フィル/キーソースを指定します。ルマキーを実行する場合は、フィルとキーに同一のソースを選択します。
3. キーパラメーターを使用してキーを調節します。

ダウンストリームキーヤー設定

クロマキー

クロマキーは気象情報番組などで広く使われており、気象学者が大きな地図の前に立っているように見える技術です。しかし実際は、気象学者はスタジオ内のブルー/グリーンバックの前に立っています。クロマキーでは、2つの映像を特殊な技術で合成します。片方の画像から特定の色を切り抜くことで、後ろにあるもう1つの画像が見えるようになります。この技術はカラーキーイング、カラーセパレーションオーバーレイ、ブルー/グリーンバックなどとも呼ばれています。

クロマキーは、背景にコンピューターグラフィックを用いる際に最も多く使われます。コンピューターのHDMI出力またはBlackmagic DesignのDeckLinkやIntensityなどのビデオカードを使用して外部コンピューターをATEMスイッチャーに接続し、ビデオクリップをATEMスイッチャーで簡単に再生できます。グリーンバックをアニメーションにレンダリングする場合、このグリーンバックをキーイングして、あらゆる長さの美しいアニメーションをすばやく作成できます。このグリーンバックはコンピューターで生成された非常にフラットな色であるため、キーイングが簡単です。



バックグラウンドとフィルおよびクロマキー/カットの結合

バックグラウンド

フルスクリーンイメージ。クロマキーの場合、天気図に使用されることが多い。

フィル

バックグラウンド映像の上に重ねて表示するイメージ。クロマキーの場合、グリーンバックの前にいる気象予報士の映像です。

キー/カット

クロマキーの場合、キー/カット信号はフィル信号から生成されます。

Advanced Chroma Keyを実行する

ATEMスイッチャーは、より精密なクロマサンプリングと調整オプションに対応したAdvanced Chroma Keyをサポートしています。これらのコントロールにより、フォアグラウンドとバックグラウンドの合成が向上するので、よりリアルなキーイングを実現できます。

ATEM Television Studioのアップストリームキーヤー1でクロマキーを設定：

1. 「KEY 1」ボタンを押して、プレビュー出力のキーヤー1を有効にします。これにより、システムコントロールのLCDにキーヤーメニューが自動的に表示されます。「KEYS」ボタンを押して直接メニューへ行くこともできます。
2. 対応する「キーの種類」コントロールノブを使い、「クロマ」を選択します。
3. 対応するLCDコントロールノブを回してフィルソースを選択します。通常、フィルソースはグリーンバックを背景とした出演者の映像か、メディアプレーヤーにロードしたグラフィックを使用します。ソース選択バスで対応するボタンを押してフィルソースを選択することもできます。
4. 右矢印ボタンでクロマの調整スクリーンへ進みます。
5. 「クロマをサンプリング」ボタンをクリックします。

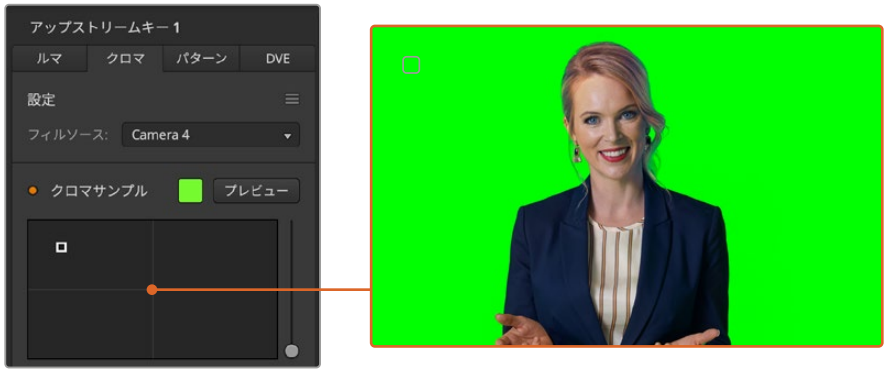
ソフトウェアコントロールパネルのアップストリームキーヤー1でクロマキーを設定：

1 「アップストリームキー1」パレットを開き、キーの種類のバーから「クロマ」を選択します。

2 「フィルソース」を選択します。通常、フィルソースはグリーンバックを背景とした出演者の映像か、メディアプレーヤーにロードしたグラフィックを使用します。

3 「クロマサンプル」ボタンをクリックします。

クロマサンプルが選択されると、ボックス型のカーソルが付いた新しいパネルが表示されます。このカーソルは、プレビュー出力でも表示されます。



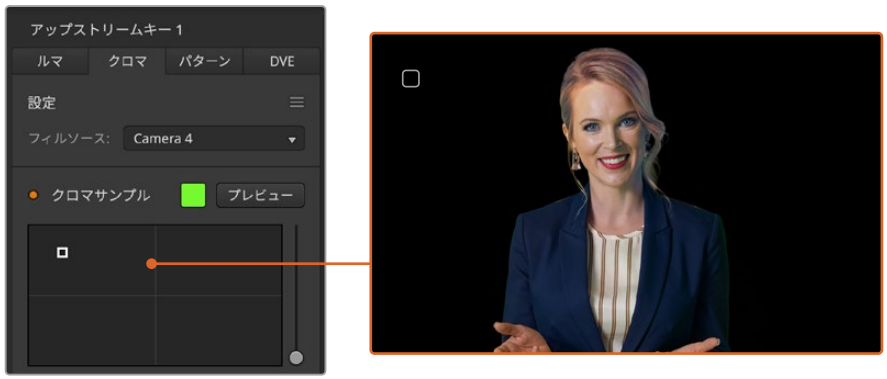
クロマサンプル設定では、スクリーン上のサンプリングしたい部分にカーソルを移動できます。

4 ボックス型カーソルをクリック&ドラッグして、サンプリングしたい位置に持って行きます。

グリーンバック内で、可能な限り輝度レンジをカバーする範囲を選択します。ボックス型カーソルのデフォルトサイズは、比較的均一に照明が当たっているグリーンバックに適しています。しかし、グリーンバック内で色に大きな差異がある場合は、サンプルウィンドウの右側にあるスライダーをクリックし、上下にドラッグすることでサイズを変更できます。スイッチャーでは、対応するノブを使ってボックスの位置を動かしたり、Z軸でサイズを変更できます。

作業のこつ 色が均一でないグリーンバックをサンプリングする際は、最初に暗い部分をサンプリングしてから、サンプルボックスのサイズを大きくすることを推奨します。この方法で、より正確なキーを抜くことができます。

クロマサンプルパネルの上部にある「プレビュー」ボタンをクリックするか、システムコントロールのLCDスクリーン上部の「クロマをプレビュー」ボタンを押せば、いつでもキーを確認できます。



プレビューボタンを使うと、プレビュー出力でキーがどのように見えるか確認できます。

キーの微調整

グリーンバックの大部分を切り抜き、フォアグラウンドのエレメントを残した高品質のクロマサンプルができたら「キー調整」コントロールを使い、キーを微調整します。ATEM Television Studioスイッチャーシリーズでは、右矢印ボタンを押して「クロマ調整」メニューへ進みます。

フォアグラウンド

「フォアグラウンド」スライダーまたはコントロールノブを使って、フォアグラウンドマスクの不透明度を調整します。これにより、バックグラウンドに対するフォアグラウンドの強さが決まります。スライダーを上げると、フォアグラウンドイメージの細かい透明なエリアを埋めることができます。このスライダーを動かして、フォアグラウンドがしっかりと見えるようになったらすぐに止めるという方法を推奨します。

バックグラウンド

「バックグラウンド」スライダーおよびコントロールノブは、キーを抜いたエリアの不透明度を調整します。このスライダーを使用して、イメージ内の取り除きたいエリアに残ってしまったフォアグラウンドの細かいアーチファクトを埋めることができます。キーを抜いたエリアが一貫して不透明になるまでこのスライダーを動かすという方法を推奨します。

キーエッジ

「キーエッジ」スライダーおよびコントロールノブは、キーを抜いたエリアのエッジを内側/外側に動かします。フォアグラウンドの隅に残ったバックグラウンドのエレメントを取り除いたり、キーの境界がはっきりしすぎている場合にフォアグラウンドをわずかに外に広げたりできます。髪の毛などのディテールの調整に特に役立ちます。バックグラウンドのアーチファクトが見えなくなり、クリーンなキーエッジが得られるまでこのスライダーを動かすという方法を推奨します。

キーまたはクロマ調整コントロールを使用すると、フォアグラウンドのエレメントをバックグラウンドからクリーンに分離できます。

カラースピル/フレア抑制を使用したクロマ修正

フォアグラウンドのエレメントにグリーンバックの色が反射したり、フォアグラウンド（フィルイメージ）の色により問題が生じることがあります。これはカラースピルやフレアと呼ばれます。「クロマ修正」設定では、カラースピルやフレアにより影響を受けたフォアグラウンドのエリアを修正できます。キーのこのような領域は「クロマ修正」設定で修正できます。

スピル

「スピル」スライダーを調整し、フォアグラウンドのエレメントのエッジから色かぶりを取り除きます。例えば、グリーンバックの色が反射したエリアなどです。

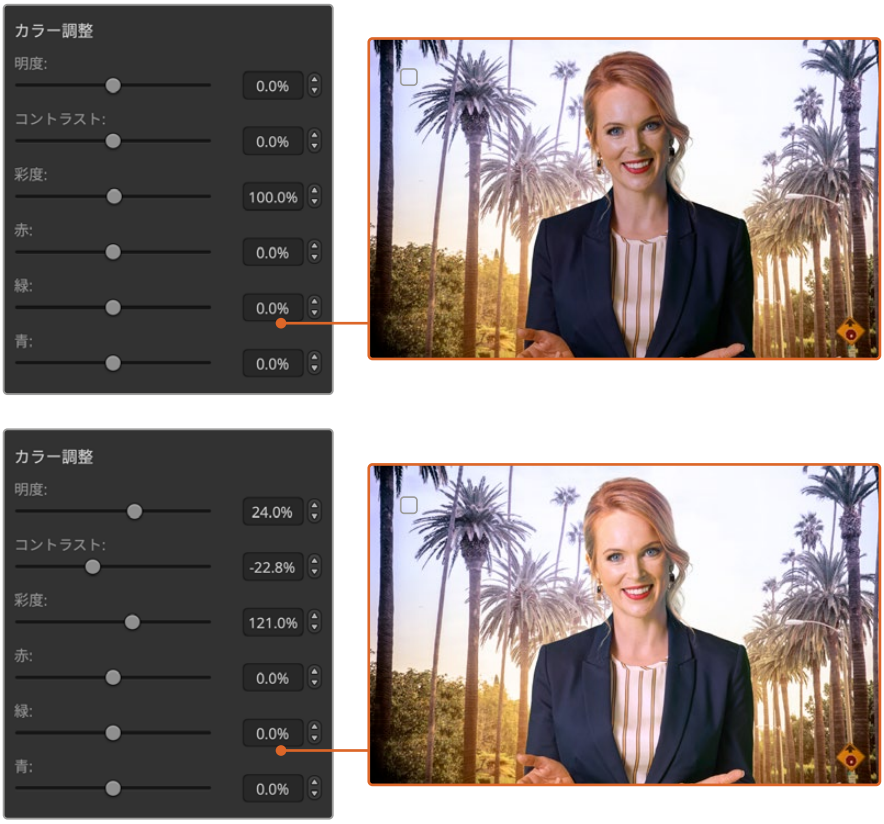
フレア抑制

フレア抑制は、フォアグラウンドのすべてのエレメントから緑の色かぶりを均一に取り除きます。

フォアグラウンドとバックグラウンドのマッチング

グリーンバックからフォアグラウンドを適切に切り抜き、スピルおよびフレア抑制を調整したら、「カラー調整」コントロールでフォアグラウンドとバックグラウンドをマッチさせます。

フォアグラウンドイメージの明るさ、コントラスト、彩度、カラーバランスを調整してバックグラウンドとなじませることで、エフェクトの仕上がりが自然になります。



カラー調整コントロールを使用して、フォアグラウンドとバックグラウンドを調和

パターンキー

パターンキーは、1つのイメージから幾何学的なカットを切り抜き、他のイメージの上に重ねて表示する際に使用します。パターンキーを使用する際、キー/カット信号はスイッチャー内蔵のパターンジェネレーターによって生成されます。内蔵パターンジェネレーターで生成できるシェイプは18種類あり、サイズ・位置を調節して望ましいキー信号を作成できます。

バックグラウンドとフィル/パターンキーの結合

バックグラウンド

フルスクリーンイメージ

フィル

バックグラウンドに重ねて表示する、もう1つのフルスクリーンイメージ

キー/カット

パターンキーを使用する際、キー/カット信号はスイッチャー内蔵のパターンジェネレーターによって生成されます。

アップストリームパターンキーを実行する

ATEM Television Studioのアップストリームキーヤー1でパターンキーを設定：

1. ネクスト・トランジションの「KEY 1」ボタンを押して、プレビュー出力のキーを有効にします。これにより、システムコントロールのLCDでキーヤーメニューが自動的に選択されます。「KEY 1」ネクスト・トランジションボタンを押すと、キーがネクスト・トランジションと連結され、ネクスト・トランジションを実行した時にキーもオンエアされます。
2. キーヤーのLCDメニューで、対応する「キーの種類」コントロールノブを使い、「パターン」キーを選択します。
3. 対応するソフトコントロールノブを使用するか、ソース選択バスでソースボタンを押してフィルソースを選択します。
4. 対応するソフトコントロールノブを回して、パターンキーに使用したい「パターン」を選択し、パターンの「サイズ」を設定します。
5. システムコントロールにある左右の矢印ボタンを押してパターンキーパラメーターへ行き、コントロールノブで設定を調整します。プレビュー出力でキーを確認できます。

作業のこつ パターンによっては、中心位置を再設定できます。対応するコントロールノブを使用して、パターンの位置を変えられます。位置をリセットしたい場合は、パターンの種類の設定へ行き、別のパターンを選択してから再度元のパターンを選択すると、デフォルトの位置にリセットされます。

パターンキー設定

ソフトウェアコントロールパネルのアップストリームキーヤー1でパターンキーを設定：

1. 「アップストリームキー1」パレットを開き、キーの種類のバーから「パターン」を選択します。
2. 「フィルソース」を選択します。
3. キーのパターンを選択します。
4. キーパラメーターを使用してキーを調節します。パターンキーパラメーターについての説明は、下の表に記載されています。

サイズ	選択したパターンのサイズを縮小・拡大します。
シンメトリー	パターンによっては、シンメトリーまたはアスペクトレシオを調節できます。円形のパターンは、形を調節して縦長/横長の楕円にできます。
ソフトネス	キー信号のエッジのソフトネスを変更します。
パターンを反転	フィルソースが表示される領域を反転します。例えば、円形のワイプを希望の位置に配置して、「パターンを反転」を選択することで、円の外側の部分にフィルソースを表示します。
フライキー	DVEエフェクトを有効/無効にします。

パターンのX/Y位置を調節する

パターンによっては、中心位置を再設定できます。パターンを配置するには、設定するキーヤーのパターン選択ページに行きます。コントロールノブを使用して、パターンを縦方向および横方向に動かします。パターンの中心位置を再設定するには、メニュー内で現在使っているパターンのパターン選択ボタンを押します。パターンの位置およびシンメトリーがリセットされます。

DVEキー

DVE（デジタルビデオエフェクト）を使用して、ボーダー付きのピクチャー・イン・ピクチャーを作成します。ほぼすべてのモデルに、スケーリング、ボーダー、ドロップシャドウに対応する2D DVEが1チャンネル搭載されています。

バックグラウンド、DVEフィル、DVEキー/カットの結合

バックグラウンド

フルスクリーンイメージ

フィル

スケーリングされた、またはボーダーが付けられた、もう1つのフルスクリーンイメージ。バックグラウンドの上に重ねて表示されます。

キー/カット

DVEキーを使用する際、キー/カット信号はスイッチャー内蔵のDVEプロセッサーによって生成されます。

アップストリームDVEキーを実行

ATEM Television Studioのアップストリームキーヤー1でDVEキーを設定：

1. 「KEY 1」ネクスト・トランジションボタンを押して、プレビュー出力のキーヤーを有効にします。
2. キーヤーのLCDメニューで、対応するソフトコントロールノブを使い、「DVE」キーを選択します。
3. 対応するコントロールノブを使用するか、ソース選択バスでソースボタンを押してフィルソースを選択します。
4. システムコントロールにある左右の矢印ボタンを押してDVEパラメーターへ行き、ソフトコントロールノブで、位置、サイズ、マスク設定、光源、ボーダー、ムーブメントのキーフレームなどの設定を調整します。

作業のこつ 設定時にテンキーパッドで数値を入力する場合、「RESET」ボタンを数秒間長押しすると負の数値を入力できます。もう一度押すと、通常の値に戻ります。

ソフトウェアコントロールパネルのアップストリームキーヤー1でDVEキーを設定：

1 「アップストリームキー1」パレットを開き、キーの種類のバーから「DVE」を選択します。

2 「フィルソース」を選択します。

3 キーパラメーターを使用してキーを調節します。DVEキーパラメーターについての説明は、以下の表に記載されています。

DVEキー設定

DVEパラメーター

フィルソース	DVEのソースを調整します。
サイズ	XおよびYの値で、DVEの横および縦のサイズを調整します。
マスク	長方形のマスクを有効にします。マスクは上/下/左/右パラメーターを使用して調整できます。
シャドウ	DVEまたはピクチャー・イン・ピクチャー上の光の方向を調節します。この設定を変更すると、ボーダーとドロップシャドウの両方に効果が適用されます。

DVEボーダーの追加

DVEボーダーパラメーター

システムコントロールのノブおよびソフトボタンを使用して、ボーダーパラメーターを調節できます。パラメーターは複数あり、それぞれ調節が必要であるため、ソフト/カラーボタンおよび「SHIFT」ボタンを使用して、各ノブで調節するパラメーターを切り替えます。

ボーダー	ボーダーを有効/無効にします。
カラー	ボーダーの色を調整します。
色相	ボーダーの色を変更します。色相の値は、カラーホイール上での位置です。
彩度	ボーダーの色の彩度を変更します。
ルマ	ボーダーの色の明るさを変更します。
外幅	ボーダーの外側の幅を調節します。
内幅	ボーダーの内側の幅を調節します。
外ソフトネス	ボーダーの外側のエッジを調節します。外側のエッジとは、バックグラウンド映像と相接する部分です。
内ソフトネス	内側のソフトネスを調節します。ソフトネスパラメーターで、ボーダーの内側のエッジを調節します。内側のエッジとは、映像と相接する部分です。
ボーダーの透明性	ボーダーの透明度を調節します。この機能を利用して、色付きガラスのような魅力的なボーダーを作成できます。

キーマスク

アップストリームおよびダウンストリームキーヤーには調整可能な長方形マスクがあり、ビデオ信号内の荒いエッジやノイズなどの除去に使用できます。マスクには、左/右/上/下のクロップコントロールがあります。マスク機能は、スクリーン上に長方形の切り抜きを作り出すクリエイティブなツールとしても使用できます。

ハードウェアパネルでは、各アップ/ダウンストリームキーのマスク設定は「EFFECTS KEYS」または「DSK KEYS」メニューのシステムコントロール・マスクメニューで行います。

ATEM Software Controlパネルでは、各アップ/ダウンストリームキーの設定は設定タブのパレットで行います。

フライキー

ルマ/クロマ/パターンアップストリームキーにはフライキー設定機能があります。DVEチャンネルが使用できる場合、フライキー設定でDVEエフェクトをキーに適用できます。

アップストリームキーヤー・トランジションを実行する

アップストリームキーヤーには、トランジションコントロールブロックまたはシステムコントロールからアクセスできます。アップストリームキーヤーのプログラム出力へのオン/オフには、ネクスト・トランジションボタンまたはONボタンを使用します。

ONボタン

ONボタンを使用してアップストリームキーヤーのプログラム出力へのオン/オフを切り替える場合は、以下の手順で行います。

1. 対応するネクストトランジション・キーボタンの上にあるONボタンを押して、アップストリームキーのプログラム出力へのオン/オフを即座に切り替えます。
2. ONボタンでは、現在プログラム出力でアップストリームキーヤーがオン/オフであるかも確認できます。

ネクスト・トランジションボタン

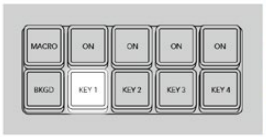
ネクスト・トランジションボタンを使用してアップストリームキーヤーのプログラム出力へのオン/オフを切り替える場合は、以下の手順で行います。

1. ネクスト・トランジションボタンの「BKGD」、「KEY 1」、「KEY 2」、「KEY 3」、「KEY 4」を使用して、トランジションしたいエレメントを選択します。
2. プレビュー出力では、トランジションを行った後のプログラム出力のルックが正確に確認できます。
3. 「CUT」または「AUTO」を押すか、フェーダーバーを使用してトランジションを実行します。

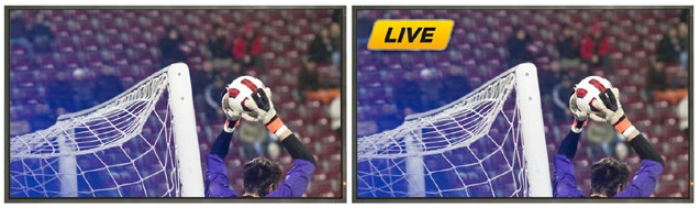
プログラム出力上の複数のキーをオン/オフにする様々な方法を分かりやすく説明するため、ここではいくつかの例を記載しています。下の例では、KEY 1では「LIVE」のウォーターマークがスクリーンの上部左側にあるのに対し、KEY 2ではスクリーンの下部右側に表示されています。

例1：

この例では、どのアップストリームキーヤーも現在オンエアされていません。ネクスト・トランジションでKEY 1が選択されているため、ネクスト・トランジションの KEY 1がオンになり、KEY 1がプログラム出力上で見える状態になります。



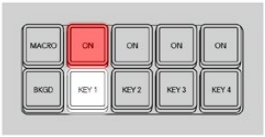
コントロールパネルのネクスト・トランジションボタン。トランジション前。



トランジション前のプログラム出力　　トランジション後のプログラム出力

例2：

この例では、現在KEY 1がオンエアされています。ONボタンが点灯していることで確認できます。ネクスト・トランジションでKEY 1が選択されているため、ネクスト・トランジションによって KEY 1がオフになり、プログラム出力上で見えない状態になります。

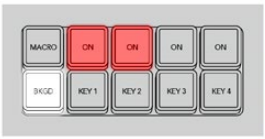


コントロールパネルのネクスト・トランジションボタン。トランジション前。

トランジション前のプログラム出力　　トランジション後のプログラム出力

例3：

この例では、現在KEY 1とKey 2がオンエアされています。ONボタンが点灯していることで確認できます。ネクスト・トランジションでバックグラウンドが選択されているため、BKGDボタンが点灯しています。従ってネクスト・トランジションによってバックグラウンドのみがトランジションされ、オンエアされているKEY 1およびKEY 2は影響を受けません。

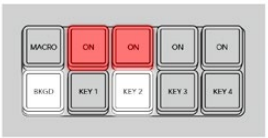


コントロールパネルのネクスト・トランジションボタン。トランジション前。

トランジション前のプログラム出力　　トランジション後のプログラム出力

例4：

この例では、KEI 1とKEY 2がオンエアされています。ネクスト・トランジションでバックグラウンドとKEY 2が選択されているため、ネクスト・トランジションによってバックグラウンドがトランジションされ、KEY 2がオフになりプログラム出力上で見えない状態になります。



コントロールパネルのネクスト・トランジションボタン。トランジション前。

トランジション前のプログラム出力　　トランジション後のプログラム出力

キーは様々な方法でプログラム出力にトランジションできます。キーはカットによるオン/オフ、ミックスによるオン/オフ、またはバックグラウンドのトランジションと同時のミックスなどが可能です。アップストリームキーは、ネクスト・トランジション・ブロックを使用してプログラム出力へトランジションします。ダウンストリームキーは、専用のトランジションボタンを使用してトランジションしたり、「DSK TIE」ボタンを使ってトランジションをメインのトランジションコントロール・ブロックとリンクできます。

ダウンストリームキーヤー・トランジションを実行する

ダウンストリームキーヤーには、それぞれ専用のトランジションボタンとトランジションレート・ウィンドウがあります。ダウンストリームキーヤーの設定が済んでいれば、以下のいずれかの方法でキーのプログラム出力へのオン/オフを簡単に切り替えることができます。

1. 「DSK CUT」ボタンを押すと、プログラム出力上のダウンストリームキーのオン/オフが即座に切り替わります。
2. 「DSK AUTO」ボタンを使用すると、プログラム出力上のダウンストリームキーのオン/オフが、レートウィンドウに表示されるレートで徐々に切り替わります。
3. 「DSK TIE」ボタンを使用すると、ダウンストリームキーがメインのトランジションコントロール・ブロックとリンクします。リンクされた状態では、ダウンストリームキーのオン/オフは、メインのトランジションコントロール・ブロックで選択されているあらゆる種類のトランジションとともに、トランジションコントロール・ブロックで指定されているレートで切り替わります。

   「DSK TIE」ボタンを押すと、ダウンストリームキーがプレビュー出力で見える状態になります。

   メインのトランジションブロックとリンクされている状態で、ダウンストリームキーのトランジションをプレビューすることはできません。「DSK TIE」ボタンがオンの状態でプレビュートランジションモードに切り替えた場合、連結（Tie）機能はプレビュートランジションモードがオフになるまで無効となります。

DSKパラメーター

クリップ	クリップレベルを調整して、キーホールを抜く際のしきい値を設定します。クリップレベルを下げると、バックグラウンドがより多く表示されます。バックグラウンド映像が完全に黒くなっている場合、クリップのしきい値が高すぎます。
ゲイン	ゲインを調整してオン/オフの角度を電子的に修正し、キーのエッジを滑らかにします。エッジを希望通りのソフトネスにしてもバックグラウンドの輝度（明るさ）が影響を受けないよう、ゲイン値を調整してください。
レート	ダウンストリームキー・トランジションのオン/オフが切り替わるミックスレート。
キーを反転	キー信号を反転します。
プリマルチプライキー	キー信号をプリマルチプライされたキーとして認識します。

配信

ATEMスイッチャーは、コントロールパネルの専用ボタンを使用して、YouTubeやTwitchなどのプラットフォームに直接配信できます。配信を開始するには、まずATEM Software Controlでストリームキーを設定する必要があります。

ストリームキーの取得

使用したいプラットフォームをATEM Software Controlで選択し、配信関連のすべての設定を行います。定期的に使用するチャンネルでの配信を設定する場合、それらの設定をスイッチャーに保存できます。このため、いつでもあらゆるインターネット接続に繋いで、ATEMスイッチャーから直接配信できます。

このセクションでは、YouTube StudioおよびTwitchの設定方法を説明します。

作業のこつ 配信の設定を行う際、使用するグラフィックをATEM Software Controlのメディアプレーヤーにロードしてプログラム出力に切り替えれば、実際にライブ配信を行う前に、すばやくテストできます。

Blackmagic Cloudのコンフィギュレーション

Blackmagic Cloud Stream Routerはバーチャルのビデオルーターであり、SRTおよびRTMPを使用して、ライブビデオのストリームをBlackmagic Cloud経由で接続およびルーティングできます。

配信を開始する前に、Stream RouterのソースがBlackmagic Cloudであなたのプロフィールに割り当てられている必要があります。これには、自分のBlackmagic Cloudアカウントの個人または組織のプロフィールを自分自身でソースに割り当てるか、別のBlackmagic Cloudのユーザーがあなたのプロフィールをソースに割り当てるかの2つの方法があります。

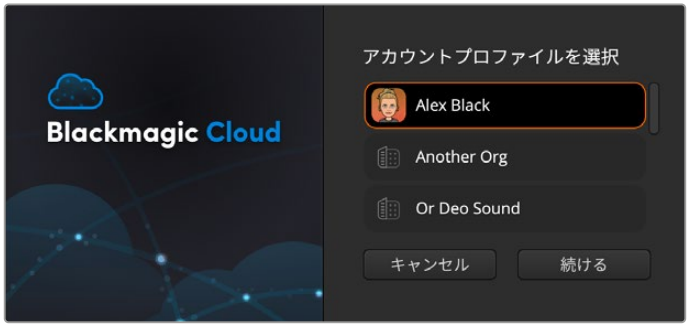
ソース入力のコンフィギュレーションが終わったら、配信を開始できます。

Blackmagic Cloudへ配信する：

1. ライブ配信パレットを開き、プラットフォームメニューをクリックします。
2. リストから「Blackmagic Cloud」を開きます。Blackmagic Cloudにログインしていない場合、「ログイン」ボタンをクリックします。

3 ログインウィンドウで、eメールおよびパスワードのフィールドに認証情報を入力し、「ログイン」をクリックします。あるいは、右上にある「ウェブからログイン」のオプションをクリックして、ウェブブラウザからログインします。

4 送信先として使用するBlackmagicアカウントの個人または組織プロフィールを選択します。



5 「完了」をクリックして設定ウィンドウを閉じ、ライブ配信パレットに戻ります。

ログインすると、使用可能なStream Routerの送信先がリストに表示されます。

6 メニューから、ルーターと配信を行う送信先を選択します。割り当てているStream Routerの送信先が1つだけの場合、メニューはその送信先をデフォルトで使用します。

配信を始めるには、「オンエア」をクリックするか、スイッチャーの「ON AIR」ボタンを押します。放送が終了したら、「オフ」をクリックするか、スイッチャーで「OFF」ボタンを押すと配信を停止できます。Stream Routerの入力を選択すると、ライブ配信がオフに設定されていても、接続は継続します。放送終了後にStream Routerの入力を空けたい場合、ルーターまたは送信先のリストから「なし」を選択します。

作業のこつ 配信の設定を行う際、使用するグラフィックをATEM Software Controlのメディアプレーヤーにロードしてプログラム出力に切り替えれば、実際にライブ配信を行う前に、すばやくテストできます。

YouTube Studioの設定をコンフィギュレーションする

1 YouTubeのアカウントにログインします。「Create」メニューで「Go Live」をクリックします。

2 指示に従って、「Right now」で配信を開始するか、あるいは「Later date」を選択して、オプションから「Streaming software」を選択します。

3 配信のタイトルの横にある「Edit」をクリックして、名前や説明文、オーディエンスの設定などを編集します。

4 オーディエンス設定を放送の内容に合ったものに設定して「Save」を押します。

5 プレビューウィンドウの右上にストリームキーが自動生成されるので、アイコンをクリックして、ストリームキーをコピーします。

コピーした配信用のストリームキーを、ATEM Software Controlの配信の「キー：」にペーストします。

1 ATEM Software Controlの処理パレットで「出力」タブをクリックします。「ライブ配信」パレットを開きます。

2 メニューをクリックし、メニューリストからYouTubeを選択して、プラットフォームをYouTubeに設定します。サーバーを「Primary」に設定します。

3 YouTubeでコピーしたストリームキーを「キー：」設定にペーストします。

4 配信の品質をLow（低）、Medium（中）、High（高）から選択します。これにより、USB-C経由の収録用出力の品質も設定されます。

5 これで、配信に関するすべての詳細を設定できました。テストを行なって、すべてが適切に機能しているか確認します。スイッチャーで「ON AIR」ボタンを押すか、ライブ配信パレットで「ON AIR」ボタンをクリックします。

これで、YouTube Studioで配信する準備が整いました。メモリーバッファが開始されるまでに数秒かかる場合があります。バッファリングが完了したら、YouTube Studioマネージャーに「Go Live」ボタンが表示されます。必要な作業は、このボタンをクリックするだけです。

配信が始まりました！

すべてが適切に機能しているか確認するには、「Share」アイコンをクリックしてリンクをコピーし、インターネットブラウザの新しいウィンドウまたはタブにペーストします。これで、視聴者が見ているライブ配信の映像をモニタリングできます。

放送が終了したら、スイッチャーで「OFF」の配信ボタンを押すだけで配信を停止できます。

Twitchの設定をコンフィギュレーションする

1 Twitchのアカウントにログインします。右上にあるアカウントのアバターをクリックします。

2 「Creator dashboard」をクリックします。

3 設定オプションで、「Stream」を選択します。

4 プライマリー・ストリームキーが自動的に生成されます。「Copy」をクリックします。

コピーした配信用のストリームキーを、ATEM Software Controlの配信の「キー：」にペーストします。

1 ATEM Software Controlの処理パレットで「出力」タブをクリックします。「ライブ配信」パレットを開きます。

2 メニューをクリックし、メニューリストからTwitchを選択して、プラットフォームをTwitchに設定します。

3 「サーバー：」設定のメニューリストをクリックして、最寄りのサーバーを選択します。

4 Twitchでコピーしたストリームキーを「キー：」設定にペーストします。

5 配信の品質をLow（低）、Medium（中）、High（高）から選択します。これにより、USB-C経由の収録用出力の品質も設定されます。

6 これで、配信に関するすべての詳細を設定できました。テストを行なって、すべてが適切に機能しているか確認します。ATEMスイッチャーで「ON AIR」ボタンを押すか、ライブ配信パレットで「ON AIR」ボタンをクリックします。

配信が始まりました！配信を確認するには、アカウントのアバターをクリックして「Back to Twitch」を選択します。Twitchのメインウィンドウに戻ったら、アバターアイコンを再度クリックして「Channel」を選択します。これで、自分のチャンネルの放送を確認できます。ライブのインジケーターがウィンドウの上部に表示されます。

コンピューターのインターネット共有による直接配信

スイッチャーにATEM Software Controlが接続されていれば、コンピューターのインターネット接続を介した直接配信を設定できます。有線接続が使用できない場合でも、コンピューターのワイヤレスインターネット接続を使用できます。

ATEMスイッチャーをソフトウェアコントロールおよび直接配信用にセットアップする：

1 ATEMをコンピューターのイーサネットポートに接続します。DHCPがユニットを検出してIPアドレスを割り当てるのに少し時間がかかる場合があります。

2 ATEM Software Controlを起動します。

3 ネットワークに接続されているATEMスイッチャーのリストに、ATEM Television Studioが表示されるので、使用するスイッチャーを選択します。

4 「接続」をクリックします。

5 イーサネットポートを通じてインターネット接続を共有できるようにコンピューターを設定します。

Macコンピューターでインターネット共有をコンフィギュレーションする：システム環境設定で「Sharing」をクリックし、「Service」リストから「Internet Sharing」を選択します。使用しているMacがWifiでインターネットに接続されている場合、「Share your connection from」メニューで「Wifi」を選択します。「To computers using」リストで「Ethernet」を選択します。「Service」リストで「Internet Sharing」のチェックボックスをチェックします。インターネットの共有をオンにしたいか確認されるので、「Start」をクリックします。

Windowsコンピューターでインターネット共有をコンフィギュレーションする：Windowsの検索ボックスに「View network connections」と入力してEnterキーを押します。イーサネット接続を右クリックし、「Properties」を選択します。「Sharing」タブで「Allow other network users to connect through this computer's internet connection」にチェックを入れます。メニューでネットワーク接続を選択し、「OK」をクリックします。

ATEM Software Controlのボタンとインジケーターが光って表示されます。これで、USB-C経由の場合と同様にスイッチャーを操作できます。コンピューター経由で直接配信できるよう、ATEMスイッチャーがセットアップされました。

スマートフォンのテザリング

ATEMスイッチャーを、YouTube、Twitch、あるいはその他のプラットフォームで配信するようにセットアップしたら、スマートフォンを使用して直接配信できます。つまり、スマートフォンが4G/5Gのセルラー接続に対応している場合や、WiFi接続のリバーステザリングが可能な場合は、すばやくセットアップして、あらゆる場所から世界中に配信できます。

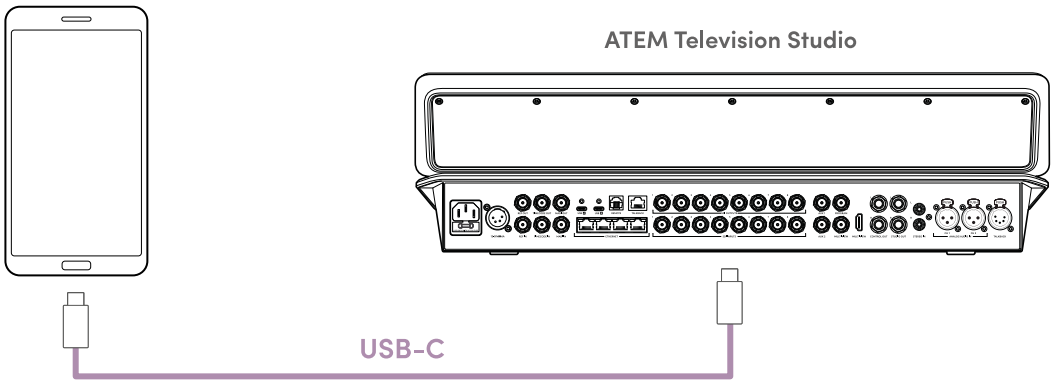
1 スマートフォンとスイッチャーのUSB-Cポートのひとつをケーブルで接続します。

2 接続できたら、スマートフォンでホットスポットが有効になっていることを確認します。

iOSデバイスでは、「Settings」>「Personal Hotspot」を開き、「Allow others to join」オプションがオンになっていることを確認します。

Androidデバイスでは、スクリーンをスワイプしてクイックメニューを表示します。ホットスポットアイコンを長押しして、USBテザリングをオンにします。

これで、ATEMスイッチャーで「ON AIR」ボタンを押すと、ライブ配信を開始できます。



イーサネットおよび携帯電話の両方がATEMスイッチャーに接続されている場合、ATEM Setupの優先接続を使用して、配信に使用する接続を選択できます。

ISOシリーズの追加機能

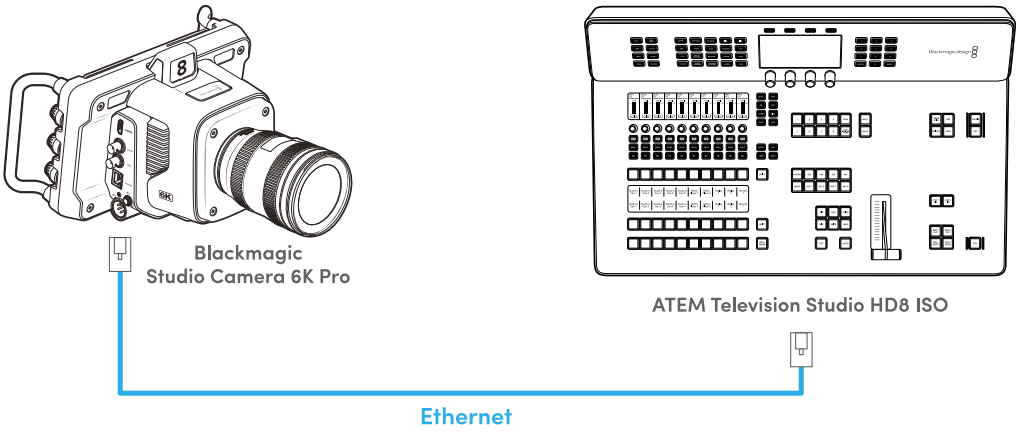
ATEM Television Studio HD8 ISOスイッチャーは、各入力のISO収録、イーサネット経由での配信時にリモートソースを接続する機能など、放送の選択肢を広げる追加機能を搭載しています。つまり、ローカルネットワークだけでなく、世界中からカメラを追加できます。

Blackmagic Studio Camera 6K ProおよびURSA Broadcast G2など、一部のBlackmagic Designカメラは配信エンジンを内蔵しており、ATEM Television Studio HD8 ISOに直接配信できます。

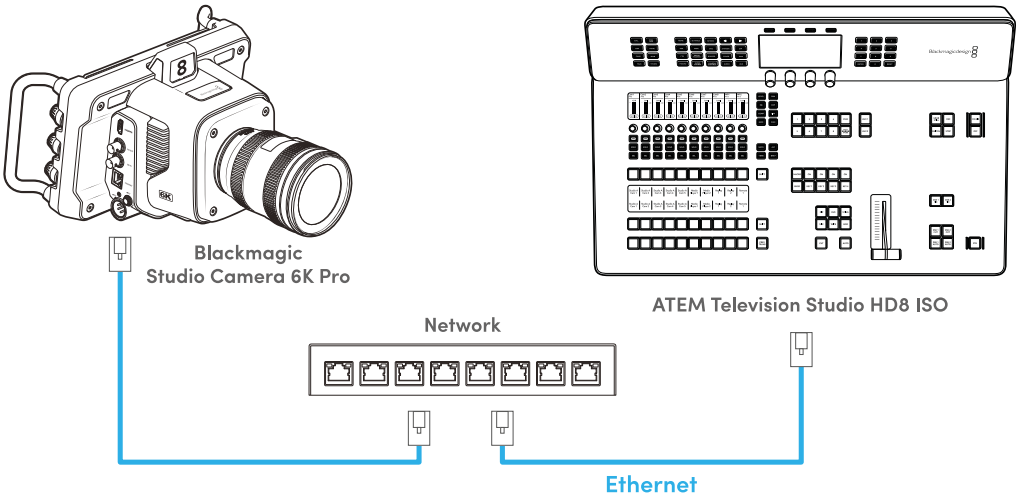
ローカルネットワークでリモートソースを接続

ATEM Television Studio HD8 ISOおよびBlackmagic Studio Camera 6K Proは、どちらもデフォルトでDHCPに設定されているので、イーサネット経由で接続するとわずかな手順で配信を開始できます。

直接接続



ネットワークスイッチ経由で接続



最初に、ATEM Software Controlの一般設定をチェックして、スイッチャーがネットワーク上にあることを確認します。

1 ATEM Software Controlを起動します。

2 左下にあるギアのアイコンをクリックして、設定メニューを開きます。

3 「一般設定」タブの最後の設定で、「ネットワーク上でスイッチャーを検出できるようにする」のオプションにチェックを入れます。

スイッチャーがネットワーク上にあることを確認したら、カメラをセットアップします。ローカルネットワークを使用している場合、各カメラはデジタルスレート上のカメラ名でスイッチャーに認識されます。つまり、複数のソースを接続している場合は、各カメラに、A、B、C、あるいはCam1、Cam2など、個別の名前を付けるとスイッチャー側でカメラを特定しやすくなります。カメラ名の設定に関する詳細は、カメラマニュアルの「メタデータ入力」セクションを参照してください。

カメラからの配信を開始する：

1 カメラの「MENU」ボタンを押して、「セットアップ」タブに行きます。

2 「セットアップ」タブでライブ配信設定へ行き、プラットフォーム設定からATEM Television Studio HD8 ISOスイッチャーを選択します。

3 「配信」ボタンを押して配信を開始します。設定画面で「LIVE」が青く点灯し、配信中であることを示します。カメラで配信情報を有効にしている場合、ヘッドアップディスプレイにデータレート情報が表示されます。

入力の選択

カメラからの配信を始めたら、ATEM Software Controlのソースタブを使用して入力を選択できます。

リモートソースを入力として選択する：

1 ATEM Software Controlの設定メニューで「ソース」タブを選択します。

2 入力1の横にあるメニューをクリックします。デジタルスレートに、該当のカメラのカメラIDがリスト表示されます。

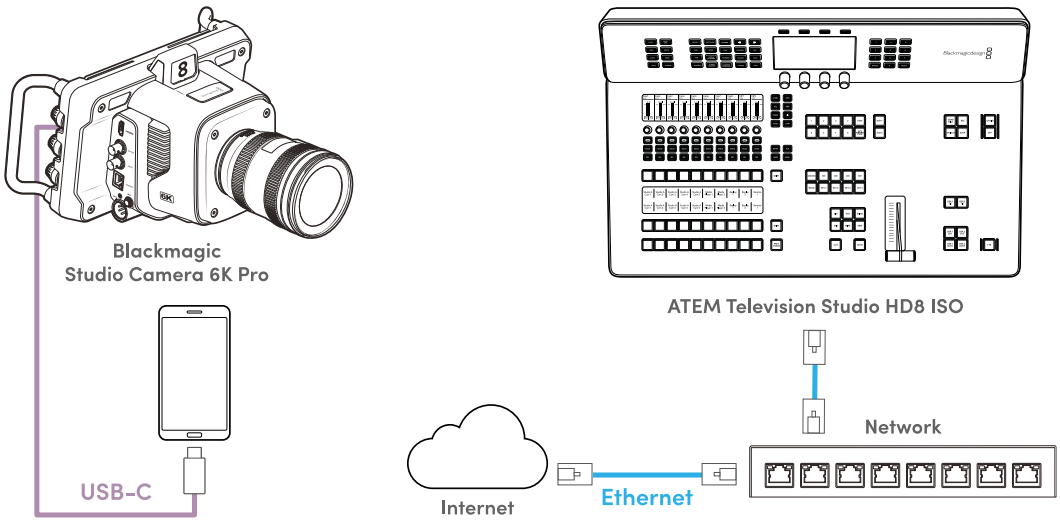
3 ソースを選択します。入力を選択すると、選択したカメラ信号がマルチビューに表示されます。これで、該当の入力を他のSDI入力と同様に扱えます。

タリーおよびカメラコントロールを有効にしたい場合は、カメラのATEMカメラIDを、スイッチャーで割り当てた入力番号と同じ番号に設定する必要があります。これで、カメラが該当の入力のタリーを検出できるようになり、スイッチャーやATEM Software Controlのカメラコントロール設定を使用して調整が可能になります。Blackmagic Studio Cameraは、配信を開始して入力が割り当てられると、該当の入力にマッチするカメラIDを設定します。他のカメラの場合、ATEMカメラIDは、配信を行っていない時にしか変更できません。IDを設定した後、電源を切って再起動する必要がある場合があります。ATEMカメラIDの設定に関する詳細は、Blackmagic Designカメラマニュアルを参照してください。

ATEMカメラIDの設定に関する詳細は、Blackmagic Designカメラマニュアルを参照してください。

インターネット経由でリモートソースを接続

ATEM Television Studio HD8 ISOスイッチャーでは、リモートソースを世界中どこからでも追加できます。つまり、リモートユーザーは、固定のイーサネット接続を使用して、またはスマートフォン接続をテザリングして、インターネット経由でカメラ信号を配信可能です。ATEM Software Controlを使用してキーを生成することで、必要なすべての接続情報を含むXMLファイルを書き出すことができます。このXMLファイルをカメラマンにeメールします。ファイルをカメラに読み込むと直ぐに配信を開始できます。



ストリームキーを生成する最初のステップは、外部ネットワークでスイッチャーが検出できるようになっているか確認することです。

1 ATEM Software Controlを起動して、左下の歯車アイコンから「設定」を開きます。

2 「一般設定」タブを選択し、ネットワーク検出設定の「インターネット設定」をクリックします。

3 「自動検出」をクリックします。ATEM Television Studio HD8 ISOがインターネット接続を分析し、スイッチャーのパブリックIPアドレス、選択したポート、インターネットステータスを表示します。「世界中から検出可能」と表示されたら、処理の準備は完了です。インターネットステータス・インジケーターに「ポート転送エラー」と表示されたら、ネットワークまたはインターネットサービスプロバイダーでさらに設定が必要な場合があります。つまり、インターネットプロバイダーあるいはネットワーク管理者に連絡して、インターネット接続のポートフォワーディングを「TCP port 1935」に設定してもらう必要があります。

4 ステータスに「世界中から検出可能」と表示されたら、「完了」をクリックします。これで、設定ウィンドウのソースタブでストリームキーを生成できるようになりました。

5 左側の「ソース」を選択し、ウィンドウ底部の「リモートソース設定」をクリックします。

6 ウィンドウ底部にある「ソースをマニュアルで追加」をクリックします。セットアップウィンドウにキーが表示されます。テキストフィールドをクリックするとソース名を変更できます。デフォルトから名前を変更することで、ソースタブからリモートソースを選択する際に、入力を特定しやすくなります。キーアイコンを押すと新しいパスワードが生成されます。

7 共有ボタンをクリックし、指示に従って設定をXMLファイルに保存します。XMLファイルを保存したら、ファイルをeメールでカメラマンに送信します。カメラマンは受け取ったファイルをUSBメディアあるいはSDカードにコピーして、カメラに読み込みます。

8 ストリームキーが生成されたら、入力メニューからソースを選択できます。つまり、リモートカメラが配信を開始する前に入力を割り当てられます。カメラが配信を始めると、マルチビューに入力が表示されます。ソースウィンドウの入力タブで入力を選択し、メニューから、先ほど読み込んだストリーミングキーに対応するソース名をクリックします。

9 ストリームキーをeメールで送る際に、担当のカメラに割り当てられた入力番号をカメラマンに伝えて、ATEMカメラIDを同じ番号に設定してもらいます。ATEMカメラIDがスイッチャーの入力番号に一致していると、カメラが該当の入力のタリーデータを検出するので、カメラでタリーライトが正常に機能します。また、スイッチャーやATEM Software Controlのカメラコントロール設定を使用して調整が可能になります。Blackmagic Studio CameraのATEMカメラIDは、カメラが入力に割り当てられて配信を開始すると、自動的にアップデートされます。

ATEMカメラIDの設定およびXMLの読み込みに関する詳細は、使用しているモデルのBlackmagicカメラマニュアルを参照してください。

Stream Routerからソースを接続

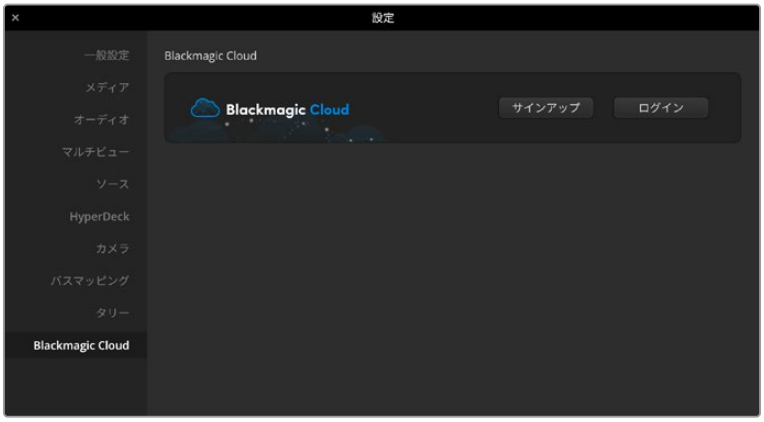
Blackmagic Cloud Stream Routerはバーチャルのビデオルーターであり、SRTおよびRTMPを使用して、ライブビデオのストリームをBlackmagic Cloud経由で接続およびルーティングできます。Stream Routerはカメラコントロールとタリーに対応しています。

ソースを接続する前に、Stream Routerの出力がBlackmagic Cloudであなたのプロフィールに割り当てられている必要があります。これには、自分のBlackmagic Cloudアカウントの個人または組織のプロフィールを自分自身でソースに割り当てるか、別のBlackmagic Cloudのユーザーがあなたのプロフィールをソースに割り当てるかの2つの方法があります。

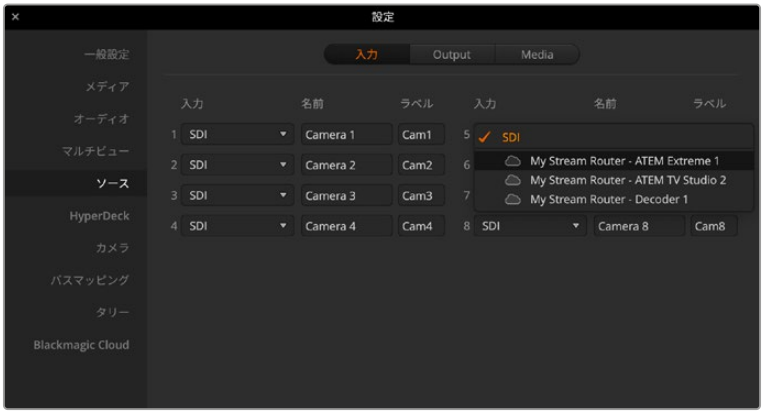
Stream Routerの出力のコンフィギュレーションが完了したら、ソースタブから追加できます。

Stream Routerからソースを追加する：

1 Stream Routerのソースを追加する最初のステップは、Blackmagic Cloudにログインしているか確認することです。



2 ログインしたら、「ソース」タブを選択します。接続したい入力の横にあるメニューをクリックします。この例では、入力5です。割り当てられているStream Routerの出力がリストに表示され、名前の左にクラウドのアイコンが表示されます。その横に、Stream Routerの名前と出力名が表示されます。



3 マルチビューに配信が表示されます。何も表示されない場合は、Blackmagic CloudでStream Routerがソースを正しくルーティングしているか確認する必要があります。接続された入力が出力名の上に表示されます。

このステップを繰り返すと、最大8つの配信ソースをATEM Television Studio HD8 ISOに追加できます。

作業のこつ Stream Routerから選択したソースの接続は、ログアウトした後も維持されます。そのため、同じスイッチャーで次回Blackmagic Cloudにログインすると、Stream Routerの入力はすでに設定されている状態になっています。

Blackmagic Streaming DecoderやATEM Mini Extreme ISO G2スイッチャーなどの他のBlackmagic機器で使用するためにStream Routerの出力を空けたい場合は、入力を他のHDMIソースに切り替えるだけで、出力を空けられます。

ログアウト前に入力を変更するのを忘れた場合、ウェブブラウザでBlackmagic Cloudにログインし、Stream Routerの割り当てを一旦「Unassigned（未割り当て）」に切り替え、その後「Myself（自分）」に戻します。

誰かがあなたに割り当てを行った場合、Blackmagic Cloudの管理者または設定権限を持つユーザーに連絡して、再割り当てを依頼する必要があります。

ISOファイルの収録

ATEM Television Studio HD8 ISOは、各ビデオ入力からビデオファイルを収録できます。これらのファイルは個別入力ファイル（ISOファイル）と呼ばれます。

デフォルトでは、ATEM ISOシリーズは、プログラム出力のビデオファイルを収録します。ISOファイルを収録することを選択した場合、入力ビデオファイル、オーディオファイル、DaVinci Resolveプロジェクトファイルを含むフォルダーが収録されます。

ISOファイルの収録

ISOファイルおよびその他のアイテムを含むフォルダーを収録するには、ATEM Software Controlの収録パレットに行き、「全入力を個別収録」を選択します。これにより、収録パレットまたはフロントパネルで収録ボタンを押した際に、スイッチャーは、コンテンツを含むフォルダーを収録します。

ISO（個別）収録を有効にするには、「収録」パレットで「全入力を個別収録」にチェックを入れます。

十分な速度に対応しているディスクを使用することは非常に重要です。高性能フラッシュディスクの使用を推奨します。機械式のディスクは、多くの場合、9ストリームのH.264のHDビデオを収録するのに十分な速度がありません。最新の推奨USB-Cフラッシュディスクのリストはサポートページでご確認ください。www.blackmagicdesign.com/jp/support

メモ スイッチャーのビデオフォーマットが、1080i60などのインターレースに設定されている場合、ISO収録は無効になります。

ISOフォルダーに含まれるコンテンツ

収録フォルダーは、収録パレットに従って名前がつけられます。このフォルダーには複数のISOファイルと共に、メインのプログラムも収録されます。ISO収録を実行中は、このフォルダー内に他のアイテムと共に保存されます。

ISOビデオファイルは各入力から収録され、「Video ISO Files」という名前のサブフォルダーに保存されます。各入力から収録される各ビデオファイルは、該当のSDI入力に接続されている映像を収録したものです。ISOファイルには同期タイムコードとカメラ番号メタデータが含まれるため、編集ソフトウェアのマルチカム機能を使用できます。編集作業をよりシンプルにするために、全ISOファイルはマスタービデオファイルと同じプログラムオーディオを含みます。

ISOファイルには同期タイムコードとカメラ番号メタデータが含まれるため、DaVinci Resolveの同期ビンを使用でき、ショットをすばやく選択して編集をスピーディに作成できます。

メディアプールのグラフィックを使用する場合、これらは「Media Files」という名前のサブフォルダーに自動的に保存されます。このサブフォルダーは「Video ISO Files」フォルダー内にあります。これにより、ライブプログラムで実際に使用されたタイトルを使って、編集を作成できます。

各入力からのオーディオ入力ファイルとマイク入力も収録されます。これらは、「Audio Source Files」サブフォルダーに保存されます。これらのファイルはBroadcast Wave Formatで、プロ仕様のステレオオーディオファイルです。内蔵オーディオミキサーの機能を使用して適用した処理やEQは除去されます。

つまり、クリーンなファイルが得られるため、プロ仕様のオーディオソフトウェアを使用して、完全に新しいオーディオミックスを作成できます。オーディオファイルもタイムコードを含むため、ビデオファイルと同期しています。

また、プロジェクトフォルダーにはDaVinci Resolveプロジェクトファイルも保存されます。このファイルは、収録を開始した時点からのスイッチャーのアクションに基づき作成されます。現在、数種類のスイッチャー機能を収録でき、このファイルをダブルクリックすると、DaVinci Resolveが起動し、これら全ての編集を適用した完全なタイムラインとして開きます。

現在サポートされているATEMスイッチャーの機能は、全入力とメディアプレーヤー間のカットおよびミックス編集、ダウンストリームタイトル、フェード・トゥ・ブラックです。これらは、最も頻繁に使用される機能であり、DaVinci Resolveでビデオ編集として復元されます。今後、さらに機能が追加される予定です。

アペンド収録

収録の際にプロジェクト名を変更しない場合、以前にディスクに収録したDaVinci Resolveプロジェクトファイルに付け足す形で収録されます。これは、ミスが生じたり、休憩を取る際に収録を一旦止めて、その後再開する場合に便利な機能です。両方の収録は同じタイムラインで開けるため、これらの収録をつなぎ合わせて、ビューアでシームレスに表示されます。アペンド収録を行いたくない場合は、プロジェクト名を変更するか、新しい空のUSBディスクを使用してください。

ライブプロジェクトを編集する利点

ライブイベントを編集する利点は多数あります。実行する必要がある編集の一部を極めて迅速に完了させることができ、アップロードする前に新しいマスターファイルをレンダリングできます。つまり、ライブ配信中に行った編集をそのまま使用する必要はなく、アップロード前に変更を適用することが可能です。

また、ISO収録機能と編集により、プログラムを迅速に作成できます。これは、ATEM Television Studio HD8 ISOを複数トラックのレコーダーとして使用して、複数のカメラビューを含む編集をコンピューターにフィード可能だからこそ実行できることです。

DaVinci Resolveプロジェクトを読み込むと、ライブプロダクションがすぐに編集としてタイムラインに構成されます。これを使用することで、ビデオをアップロードする前に、イベントをクリエイティブに編集する作業が迅速に実行できます。

レイヤーについて

スイッチャー内での処理は、通常、スイッチャーの入力があるコントロールパネルの左側から、出力機能がある右側に移行していきます。この理由は、ビデオ入力からのライブ処理パイプラインは、スイッチャーの全機能を介して、ビデオ出力として出力されるからです。

これは、編集作業と全く異なります。編集ソフトウェアは、積み重なったレイヤーとして処理します。一番下のレイヤーは、その上すべてのレイヤーにカバーされます。つまり、レイヤー2にあるクリップは、レイヤー1をカバーします。通常、カットや編集にはレイヤー1が使用されることが多く、その他のアイテムがその上にレイヤーとして重ねられます。レイヤー3のクリップは、レイヤー1と2のクリップをカバーします。複雑な編集には、数十ものレイヤーを使用することがあります。

DaVinci Resolveでは、プロジェクトファイルを読み込むと、多数の編集レイヤーとして様々な処理が適用されます。

レイヤー1	レイヤー1は、ソース間の主な編集をすべて含みます。このレイヤーでは、クリップを端から端まで見ることができます。編集ポイントとして表示されているものは、カットの場合もあればディゾルブの場合もあります。このレイヤーは、メインの入力のスイッチングに基づき作成されます。ビデオ入力を使用した編集とスチルフレームのソースはすべて、レイヤー1として配置されます。
レイヤー2	レイヤー2は、ダウンストリームキーヤーです。ATEMスイッチャーには、トランジションブロックの後にダウンストリームキーヤーがあります。編集において、これはレイヤー2になり、レイヤー1に配置されたメインスイッチングをオーバーライドします。ダウンストリームキーヤーでアルファチャンネル付きのグラフィックをオンエアした場合、ビデオ出力にこのタイトルが追加されます。これはレイヤー2となり、レイヤー1のアルファチャンネル付きの同じグラフィックの上に重ねられます。
レイヤー3	レイヤー3は、フェード・トゥ・ブラックです。フェード・トゥ・ブラックはスイッチャーで最後に処理され、スイッチャー内の全レイヤーを徐々にブラックにします。これは、多くの場合、プログラムの最後やCMに入る前に使用されます。フェード・トゥ・ブラックがレイヤー3である理由は、スイッチャー内での処理同様、その下にあるレイヤーすべてをオーバーライドするからです。フェード・トゥ・ブラックは、ディゾルブを含むブラックビデオのジェネレーターであり、プログラムの開始時と終了時に使用できます。

編集点を移動する

編集を行う利点は、編集点を移動させることができることです。ライブプロダクションでは、動きが非常に速くなり、スイッチングが追いつかないことがあります。複数の出演者が間髪入れずに発言するインタビューでは、ライブスイッチングが会話に追いつかないことがあります。

編集点を移動させることで、発言者が話し始める前に編集点を動かすことが可能です。ライブスイッチングでは、出演者が話し始める前に切り替えるのは難しいことがあります。しかし、編集点を動かすことで、発話者が話し始める前に映像を切り替えられます。これにより、プログラムの雰囲気を変えることができます。

編集点を前に動かすには、タイムラインで編集点までスクロールして、下のタイムラインで編集点をマウスで動かします。2本線のツールが表示されます。これをクリックして左にドラッグすると、編集点が時間的に前に移動します。これをクリックして右にドラッグすると、編集点が時間的に後ろに移動します。

小さな矢印が付いた2本線をクリックしないように注意してください。これらは、イン点/アウト点のトリムを実行するツールです。編集点の周りでマウスを動かすと、ツールが自動的に変わります。イン点/アウト点のトリム用のツールを使用すると、ビデオ全体の長さが延長または短縮され、グリーンのオーディオトラックとして表示されるオーディオは、同期が解除されます。

ショットの置き換え

同期ビンは、タイムラインの現在の位置に同期しているショットを見つけます。つまり、カットするカメラを間違えた場合に修正したり、時間を掛けてより良いショットを探したりできます。

同期ビンは、カットページの左上で選択できます。選択したら、左上にメディアプールが表示され、ビューアが変わります。メディアプールは、使用できるクリップのタイムラインを表示し、ビューアは手持ちのショットをマルチビューとして複数同時に表示します。これらは、タイムラインの現在の位置に同期しているショットのみです。タイムラインを移動すると、これらのショットも同調して進んでいきます。

同期ビンは、アシスタントエディターのような存在です。必要なショットを見つけ出し、マルチビューに表示するので、それらを使って編集を簡単に実行できます。

ATEM Television Studio HD8 ISOは、接続している入力を認識し、それらの入力を個別のビデオファイルに収録するため、ファイルにはカメラ番号のメタデータが含まれます。つまり、同期ビンのカメラ1は、スイッチャーの入力1に接続されたビデオ入力であり、入力2は、同様にカメラ2となります。

別の編集を選択するには、2つの手順を踏む必要があります。まず、必要なショットを選択し、イン点とアウト点を設定します。次に、そのショットをタイムラインで現在のショットの上に編集します。

置き換えたいショットの開始点までタイムラインをスクロールします。このクリップの上に編集します。ビューアには、置き換えに使用できる他のショットがマルチビューとして表示されます。これらは、ATEM Mini ISOシリーズの入力で収録された、すべての入力ビデオファイルです。

使用したいショットをクリックします。フルスクリーンでショットが表示されます。また、イン点が自動的に設定され、現在のタイムラインの位置に配置されます。また、4秒間の長さでアウト点も設定されます。このままアウト点を使用したい可能性は低いでしょう。アウト点の場所を変更するには、置き換えに使用する新しいショットを終わらせたい場所までタイムラインをスクロールして、「O」キーを押します。アウト点が、その場所まで移動します。

間違えたショットを選択した場合、「esc（エスケープ）」キーを押すとマルチビューに戻り、正しいショットを選び直すことができます。

ショットを選択したので、それをタイムラインに配置します。これを実行するには、「ソース上書き」編集モードを使用します。編集モードはメディアプールの下の中央部分にあります。右端にあるボタンが「ソース上書き」モードです。ボタンの上にマウスを重ねると、編集ラベルの付いたツールチップが表示されるため、編集モードの名前が確認できます。

「ソース上書き」モードはインテリジェントな機能で、選択したクリップに基づき、タイムラインでタイムコードが完全にマッチする場所にクリップを編集します。つまり、「ソース上書き」でタイムラインに編集するショットはすべて、同期が維持されます。さらに、タイムラインでイン点とアウト点を設定する必要はありません。スクロールして、ショットを探し、カットアウェイとしてタイムラインに追加できます。

「ソース上書き」編集モードは、タイムラインの現在のクリップの上のレイヤーにクリップを常に配置します。レイヤーがない場合、レイヤーを追加して配置します。つまり、オリジナルの編集の上にレイヤーとして配置されるため、カットアウェイを簡単に見つけられます。

タイムラインをスクロールし、同期ビンのマルチビューからカットアウェイを選択して、必要に応じて、好きなだけショットを置き換えられます。

ディゾルブの追加

もう一つの優れた編集機能は、タイムラインにディゾルブを追加できることです。低帯域で配信するとディゾルブが荒くなる場合があります。このため、ライブ配信ではディゾルブを使用しないことが多いかもしれません。しかし、プログラムをアップロードする際は、ディゾルブを追加して優しくエレガントな雰囲気を出したいこともあるでしょう。

ディゾルブを追加することで、プログラムの流れをスムーズにできます。DaVinciでは、トランジションパレットから各編集点にトランジションをドラッグできますが、よりすばやくディゾルブを追加する方法があります。カットページのメディアプールの右下に、3つのトランジションボタンがあります。1つのボタンは、あらゆるトランジションを削除して、該当の編集点をカットにしますが、真ん中のボタンはディゾルブを追加します。メディアプールをスクロールして、真ん中のボタンを押すだけで、ディゾルブを追加できます。

タイムラインルーラーに注目すると、小さな三角のマーカーが上下に動いていることが分かります。これは、DaVinciが推測するディゾルブの追加編集点を示しています。つまり、ディゾルブボタンを押すだけで、マークした編集点に追加されるので、タイムラインにイン点を追加する必要もありません。スクロールしてボタンを押すだけで、必要な位置にディゾルブを追加できる非常にスピーディーな方法です。

退屈なシーンや問題のあるシーンを削除

プログラムの中で、退屈に思えるシーンや、何らかの間違いを見つけることがあります。分割ツールを使用すれば、これらのシーンを削除できます。メディアプールの左下に、ハサミのツールアイコンがあります。このツールをクリックすると、タイムラインのすべてのレイヤーを分割できます。カット間の複数のクリップをクリックすると、「Delete」キーを押すだけでそれらのクリップが削除されます。タイムラインのギャップは自動的に閉じます。

このように、ライブイベントを簡単に修正できます。カットページの右上でクイックエクスポートを選択すると、すべての変更が適用された新しいマスターファイルを作成できます。

DaVinci Resolveを使用した編集

DaVinci Resolveの操作を理解する最善の方法は、オンラインのトレーニングビデオを視聴し、無償版をダウンロードして実際に使ってみることでしょう。DaVinci Resolveは非常に洗練されたソフトウェアで、ハリウッドのハイエンドなスタジオで長編映画などに使用されていますが、カットページは大幅に簡略化されており、簡単に操作を学べます。詳細はオンラインでご確認ください。

カメラで収録

ATEM Television Studio HD8 ISOは、スイッチャーの出力から2つ目のSDIケーブルをカメラの入力に接続することで、Blackmagic Studio Camera 4K Pro、URSA Mini Pro、URSA Broadcast G2をSDI経由でコントロールできます。ATEM Television Studio HD8 ISOスイッチャーは、ローカルネットワークのイーサネットあるいはインターネット経由で、リモートカメラをコントロールできます。

つまり、ATEM Software Controlアプリのカメラコントロールパネルから、カラーコレクションや、レンズ設定の調整などを実行できます。それらの手順に関しては、このマニュアルの該当セクションを参照してください。

このコントロールのもうひとつの利点は、「収録」パレットで「全カメラで収録」を選択できることです。USBディスクに収録しながら、カメラでも収録できます。

カメラで収録することの利点は、Blackmagic RAWで収録できることです。Blackmagic RAWはフィルムガンマのファイルなので、高度なカラーコレクションに最適です。さらに優れた点は、カメラのファイルは4Kであるため、ライブプロダクションをUltra HDでマスタリングできることです。これらはHDスイッチャーですが、アップロードおよび放送用に、Ultra HDのマスターを作成できます。

カメラとの接続により、カメラ番号、ファイル名の情報に加え、タイムコードもアップロードされます。つまり、Blackmagic RAWファイルは、スイッチャーのタイムコードと同期するので、扱いが簡単になります。

カメラのBlackmagic RAWファイルを使用するには、「収録」パレットで「全カメラで収録」を選択します。収録が完了したら、カメラのファイルを、スイッチャーのVideo ISOファイルフォルダーに必ずコピーしてください。DaVinci Resolveプロジェクトファイルを最初に開く際は、DaVinci Resolveがこれらのファイルを確認する必要があるため、この作業は重要です。

しかし、スイッチャーの個別収録 (ISO) ファイルと、カメラのBlackmagic RAWファイルを両方使用することの問題点は、それらのファイルのタイムコードとカメラ番号が同一であることです。しかし、DaVinci Resolveは、デフォルトでISOファイルを使用するため、これは問題ではありません。

プロジェクトで、より高解像度のBlackmagic RAWを使用したい場合は、カットページの右上でカメラオリジナルのアイコンを選択します。このカメラ型のアイコンを選択すると、フィルムガンマのBlackmagic RAWファイルが選択され、タイムラインが変更されます。

ルックを向上させるために、これらのファイルにカラーコレクションを施す必要がある場合があります。Blackmagic RAWファイルは、カラーコレクション前はクリーンな状態なので、DaVinci Resolveのパワフルなカラーコレクションツールを使用して、驚異的なマスターを作成できます。

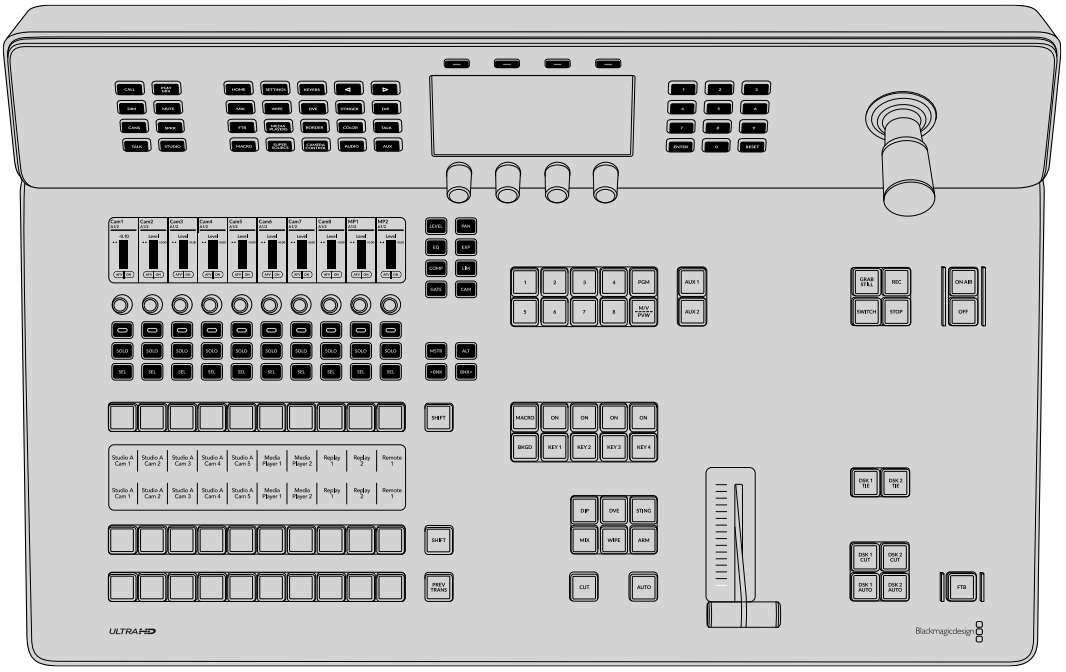
Ultra HDで納品したい場合は、カメラオリジナルアイコンの横で解像度メニューを選択すると、様々な解像度およびアスペクトレシオを選択できます。一番上の設定はUltra HD用です。この解像度を選択すると、プロジェクト全体がUltra HDに変更され、イメージがよりシャープになります。

コンピューターのスライドショーなどのカメラ以外の入力は、自動的にアップスケールされます。メディアプールのHDイメージもまた、自動的にアップスケールされます。これらのメディアフォルダーのイメージは、メディプール内のより高解像度のバージョンに置き換えることもできます。

クイックエクスポートを選択すると、HDスイッチャーからUltra HDマスターを書き出しできます。

ATEM Television Studio 4K8の ジョイスティック

3軸ジョイスティックは、キー、DVE、その他のエレメントのサイズおよび位置の変更に使用します。ジョイスティックは、VISCA PTZリモートカメラのコントロールにも使用できます。



ジョイスティックコントロール

ジョイスティックでカメラをコントロール

スイッチャーと接続している場合は、VISCAプロトコルを使用するリモートカメラヘッドを、ジョイスティックでコントロールできます。

これはPTZコントロールとも呼ばれており、リモートカメラのパン、ティルト、ズームを制御できる極めてパワフルなツールです。カメラコントロールボタンを押して、次に「カメラ」ソフトコントロールノブで各カメラを選択するだけで、複数のカメラを1つずつ簡単にコントロールできます。ジョイスティックを使ってパン/ティルト調整を行います。

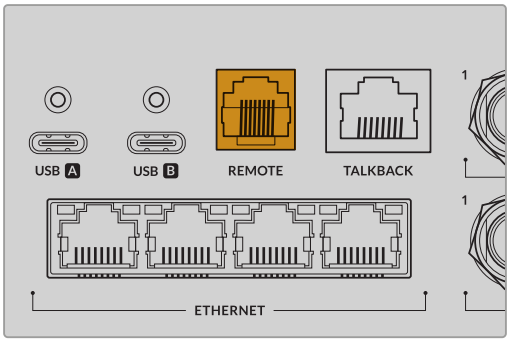
また、パネル設定メニューの「カメラコントロールティルト」ページで「反転」または「標準」を選択することで、ジョイスティックのティルト方向を変更できます。「反転」を選択すると、ジョイスティックのティルト方向が反対になります。

リモートヘッドの接続

ATEM Television Studio 4K8は、「REMOTE」とラベルの付いたRS-422ポート経由でリモートヘッドと通信します。ATEM Television Studio 4K8モデルのRS-422ポートは、標準的な電話線コネクターと似た形状のRJ12です。

スイッチャーのRS-422ポートのリモート動作が、LCDの「シリアルポート」設定メニューで「VISCA」または「GVG」に設定されていることを確認してください。

リモートヘッドを2つ以上接続するには、通常、各ヘッドのRS-422出力と入力をつなぎ、デイジーチェーン方式で接続します。



リモートヘッドのPTZ設定

すべてのPTZ設定オプションは、「設定」LCDメニューで設定します。矢印ボタンまたはキーパッドの「8」を押して「シリアルポート」設定メニューへ行き、「ポートコントロール」を「VISCA」に設定します。PTZカメラで使用するレートと一致するよう、通信速度を設定します。カメラのサポート資料を参照して、適切な通信速度を確認します。

「CAMERA CONTROL」ボタンを押すとカメラ設定が開き、VISCAコントロールを選択して、調整したいカメラを選べます。しかし最初に、接続したカメラが検出されるか確認する必要があります。

接続されたシリアルデバイスを検出する：

1 「SETTINGS」ボタンを押し、矢印ボタンで「シリアルポート」設定に進みます。

2 「検出」ソフトボタンを押します。

スイッチャーに接続した最初のカメラがLCDスクリーンに「カメラ 1」として表示されます。複数のカメラを接続している場合、「カメラ」ソフトコントロールノブを回して選択できます。カメラ番号は、チェーンに接続された1台目のカメラから、最後に接続されたカメラまでの順に基づいています。

LCDメニューに表示されたカメラの数が、実際に接続しているカメラの数と一致しない場合は、すべてのカメラヘッドに電源が入っているかどうか、RS-422ポートが適切に接続されているかどうかを確認してください。すべてのカメラヘッドがATEM Television Studio 4K8スイッチャーで確認できたら、「カメラ」ソフトコントロールノブで各カメラを選択し、ジョイスティックで簡単な調整をして、それらがすべて正しく機能していることを確認してください。

作業のこつ SDIを介した一般的なカメラコントロールのデフォルトはSDIです。VISCAコントロールを使用する場合、VISCAプロトコルのPTZカメラにアクセスするために、VISCAソフトボタンを必ず押してください。

SDI経由のPTZコントロール

SDI経由でPTZカメラヘッドをコントロールすることもできます。例えば、スイッチャーからのプログラムリターンフィードをカメラに接続し、カメラの拡張ケーブルからのSDI出力をPTZヘッドに接続すると、SDI信号経由でヘッドをコントロールできます。

ジョイスティックPTZコントロール

ジョイスティックPTZコントロールは、非常に直感的に使用できます。ジョイスティックノブを時計回りまたは反時計回りに回して、ズームイン/アウトを調整します。また、ジョイスティックノブを上下に動かしてカメラのティルトを、左右に動かしてパンを調整できます。これらのコントロールは、ジョイスティックを動かす度合いを感知するため、カメラムーブメントのイーズイン/イーズアウトが可能です。コントロールの感度は、使用するリモートヘッドによって異なる場合があります。

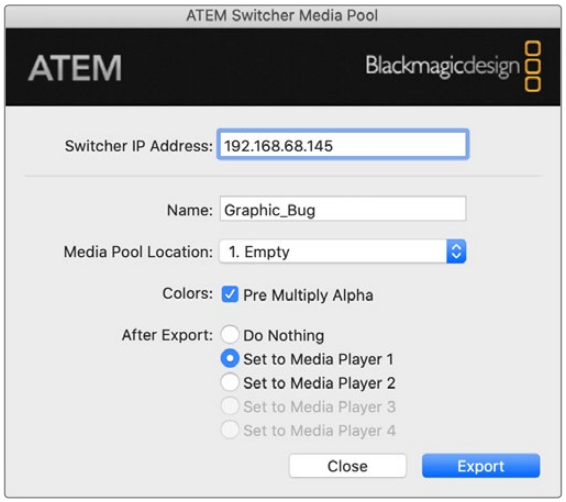
標準RS-422ポートDB-9コネクターを使用して、カスタムビルドのPTZユニットを配線したい場合は、「コントロールケーブルを接続するシリアルポートのピンコネクター」を参照してください。

ATEMでAdobe Photoshopを使用

ATEMソフトウェアをコンピューターにインストールすると、Photoshopプラグインもインストールされ、PhotoshopのグラフィックをATEMメディアプールに直接ダウンロードできます。

つまり、デザイナーからグラフィックを受け取る際、世界のデザイナーの100%が使用するアプリケーション、Adobe Photoshopで受け取ることができます。さらに、Photoshopイメージのレイヤーを利用して、1つのグラフィックの異なるタイトルなど、グラフィックのバリエーションを保存できます。Photoshopの中から好きなレイヤーを選び、ボタンを押すだけでそれらを簡単にダウンロードできます。ダウンロード時、レイヤーはダウンロードされる前に自動かつリアルタイムでフラットになります。この作業はバックグラウンドで行われ、Photoshopのファイルが書き出しによって影響を受けることはありません。

ATEMエクスポートプラグインを使用する場合、Adobe Photoshopが必要です。Photoshopのインストール後にATEMソフトウェアをインストール/再インストールして、ATEMエクスポートプラグインがインストールされているか確認してください。



ATEMエクスポートプラグイン

プラグインのスイッチャーロケーションの設定

初めてPhotoshopエクスポートプラグインを使用する際、スイッチャーロケーションを選択するよう表示が出ます。スイッチャーロケーションとはスイッチャーのIPアドレスのことで、プラグインがスイッチャーを見つけて情報を伝達できるようにするためのものです。デフォルトでは、IPアドレスは192.168.10.240に設定されています。これは、出荷時にスイッチャーにデフォルトで設定されているアドレスです。同一のPhotoshopファイルを複数のバージョンでエクスポートする場合、エクスポートプラグイン・ウィンドウを使用してエクスポートする各ファイルに名前を付けることができ、エクスポート後にそれらのファイルをメディアプレーヤーに設定するかどうかも選択できます。

ダウンロードするグラフィックの準備

最高の品質を得るために、Photoshopファイルの解像度はATEMスイッチャーで使用しているビデオフォーマットと一致するものを使用することをお勧めします。1080 HDフォーマットでは、解像度は1920x1080ピクセルを使用してください。720p HDフォーマットでは、1280x720ピクセルを使用してください。

ATEMでPhotoshopファイルを使用する場合、バックグラウンドレイヤーには一切コンテンツを乗せず、上のレイヤーにすべてのコンテンツを乗せてください。バックグラウンドレイヤーは常にブラックの無地でフルフレームにし、Photoshopのグラフィックのキーイングにはキーヤーのプリマルチプライキー設定を使用します。

作業を開始するにあたって参考になるよう、「Example Graphics」フォルダー内にガイドとグラフィック・テンプレートのファイルが含まれています。このフォルダーは、ATEMスイッチャーのソフトウェアと共にコンピューターにインストールされています。

ATEMメディアプールにグラフィックをダウンロードするには、Photoshopのエクスポートメニューを選択し、さらにATEM Switcher Media Poolを選択してエクスポートしてください。ウィンドウが開くので、メディアプール内のダウンロード先を選択します。リストには、現在メディアプールにロードされているすべてのグラフィックのファイル名が表示されます。希望するダウンロード先を選択して、エクスポートをクリックします。

グラフィックを急いでオンエアしたい場合は、そのグラフィックが書き出し後にいずれかのメディアプレーヤーに自動でコピーされるよう設定してください。これで、イメージを素早くオンエアできます。メディアプレーヤーのグラフィックソースに干渉させたくない場合は、メディアプレーヤーをそのグラフィックにコピーしないよう設定してください。

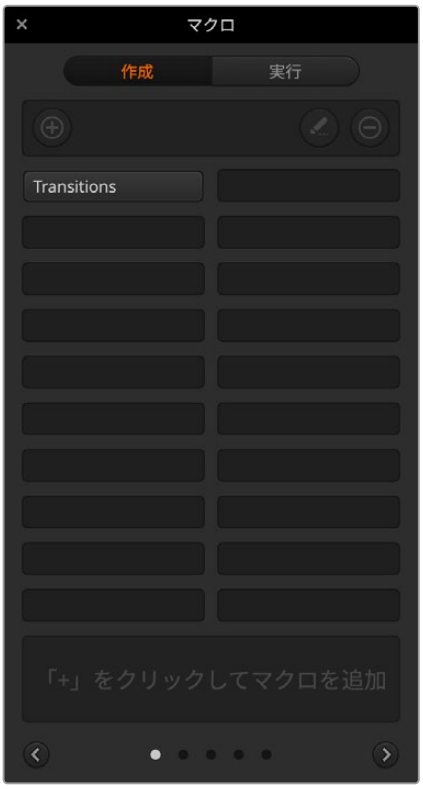
「Pre Multiply Alpha」は、ほぼ常に有効にしておいてください。「Pre Multiply Alpha」を有効にするには、スイッチャーまたはATEM Software Controlのプリマルチプライキー設定もオンにする必要があります。プリマルチプライを行うと、エクスポートの際にグラフィックの色とアルファチャンネルがミックスされ、グラフィックのエッジが滑らかになって映像に自然に溶け込みます。

マクロの使用

マクロとは？

マクロとは、スイッチャーの一連の動作を簡単に自動化できる方法です。ボタンを押すかクリックするだけで、一連の動作を繰り返し実行できます。例えば、キーエフェクト、オーディオミキサー調整、カメラコントロール設定など、複数ビデオソース間での一連のトランジションを記録できます。すべての作業をマクロボタンに記録し、そのボタンを押すだけで、記録したすべてのアクションを瞬時に実行できます。マクロは、ATEM Software Controlのマクロウィンドウ、ATEM Television Studioスイッチャーシリーズのシステムコントロール、またはそれら両方を使用して記録でき、ATEMスイッチャーに保存されます。マクロはすべてのコントロールパネルで共有されるため、あらゆるコントロールパネルから実行できます。

ATEM Software Controlのマクロウィンドウ



ATEM Software Controlでマクロウィンドウを開くには、タイトルバーの「マクロ」をクリックします。または、Macでは「Shift+Command+M」、Windowsでは「Shift+Control+M」で開きます。マクロウィンドウはフローティングウィンドウなので、デスクトップの好きな場所に配置できます。したがって「Switcher」、「Media」、「Audio」、「Camera」ページを移動しながら作業を行っている場合でも、いつでもアクセスできます。マクロを記録する際は、右上の角にある最小化アイコンをクリックしてウィンドウのサイズを小さくすることも可能です。

マクロは、100個あるマクロスロットの好きな場所に記録できます。各ページに表示できるマクロは最大20個です。前後のページに移動するには、ウィンドウの下部両側にある矢印をクリックします。「作成」および「実行」ボタンをクリックすると、作成/実行ページが切り替わります。これらのページを使用して、マクロを記録し、ライブプロダクション中に使用できます。

マクロの記録

マクロは、明確に定義されたシーケンスで、最初から最後までエラーなく、包括的に記録する必要があります。これは、マクロがユーザーの行う設定、ボタンのプッシュ、スイッチャーの操作をすべて記録するためです。マクロを使用すると、そのマクロに記録したすべてのスイッチャー操作が正確に繰り返されます。

マクロは、ユーザーが変更した設定のみを記録するということを覚えておくことが重要です。例えば、3:00秒間のトランジションが必要で、スイッチャーのトランジションレートがすでに3:00秒に設定されている場合、その設定をマクロに記録するには、設定を一度変更し、もう一度3:00秒に設定し直す必要があります。この作業を行わなかった場合、使用したいトランジションレートが記録されず、マクロを使用した際にはスイッチャーが最後に設定されたトランジションレートが使用されます。これが、マクロを正確に設定する必要がある理由です！

マクロの記録中に設定が変更され、それらの設定を特定の状態に戻したい場合は、マクロの最終ステップを記録する際にそれらの設定を元に戻します。マクロを記録して、様々なプロジェクトの設定を復元することも可能です。マクロの使用には多くの選択肢があります。マクロを記録する際は、自分の求めるエフェクトの作成に必要な設定変更をすべて行うことが重要です。

ATEM Software Controlを使用してマクロを記録

以下の例では、カラーバーからカラー1に3秒間でミックストランジションし、2秒間一時停止し、さらに3秒間でブラックにミックストランジションする作業をATEMスイッチャーに実行させるマクロを作成します。このマクロをATEMスイッチャーで作成することで、マクロ作成のステップを理解できます。

1. ATEM Software Controlを起動し、マクロウィンドウを開きます。
2. マクロウィンドウの「作成」ボタンをクリックし、作成ページを選択します。
3. マクロを記録するマクロスロットをクリックします。この例では、マクロスロット1をクリックします。選択したスロットの周りに赤いボーダーが表示されます。
4. マクロ作成ボタン（「+」アイコン）をクリックし、マクロ作成ポップアップメニューを開きます。

   必要に応じて、マクロの名前とメモを入力できます。これらの情報を入力することで、各マクロの内容が簡単に把握できます。マクロをクリックすると、入力した情報がステータスウィンドウに表示されます。

マクロの記録を開始するには、マクロスロットを選択し、マクロ作成ボタンをクリックします。情報を入力し、「記録」をクリックします。

5. 「記録」ボタンを押します。

   ポップアップウィンドウが閉じ、ATEM Software Controlパネルの周りにマクロの記録中であることを意味する赤いボーダーが表示されます。ボーダーの上部に「ポーズを追加（ADD PAUSE）」ボタンが表示されます。

   マクロの記録中です。スイッチャー操作を開始します。

記録中は、マクロ作成ボタンは「記録」ボタンに変わります。すべてのスイッチャー操作を実行したら、「記録」ボタンをクリックして記録を停止します。

6 「スイッチャー」ページのプログラムパネルにあるバーボタンをクリックします。これにより、スイッチャーの出力にバーが設定されます。

7 プレビューパネルで「カラー1（COLOR 1）」を選択します。

8 トランジションパレットを開き、「ミックス」に設定します。

すでに「ミックス」が選択されている場合は、ワイプトランジションなど他のトランジションタイプを選択し、もう一度「ミックス」を選択することで、設定をマクロに確実に記録させます。

9 トランジションレートを3:00に変更します。これにより、ミックストランジションレートが3秒に設定されます。

10 トランジションスタイルパネルで「AUTO」ボタンをクリックします。スイッチャーがカラーバーからカラー1へのミックストランジションを実行します。

11 他のトランジションを実行する前にスイッチャーが2秒間待つよう設定するには、赤いボーダーの上部にある「ポーズを追加」ボタンをクリックします。ウィンドウが開くので、ポーズを5:00に設定し、「ポーズを追加」をクリックして確定します。

2秒間のポーズが必要な場合にポーズを5秒にセットするのはなぜでしょうか？ それは、ミックストランジションは、完了するまでに3秒間要するためです。したがってポーズを追加する際は、トランジションの長さ、さらに次のトランジションが始まる前のポーズの長さを合わせて考慮する必要があります。

この例では、トランジションが完了するまでに3秒、さらに2秒間のポーズに2秒かかるため、ポーズを5秒と入力します。もう一つの方法は、トランジションの長さとポーズを分けて、2つのポーズを別々に追加する方法です。これらの方法はユーザーの好みに応じて使い分けられます。

12 プレビューパネルの「Blk」を選択し、トランジションスタイルパネルの「AUTO」ボタンをクリックします。ATEMスイッチャーがブラックへのミックストランジションを実行します。

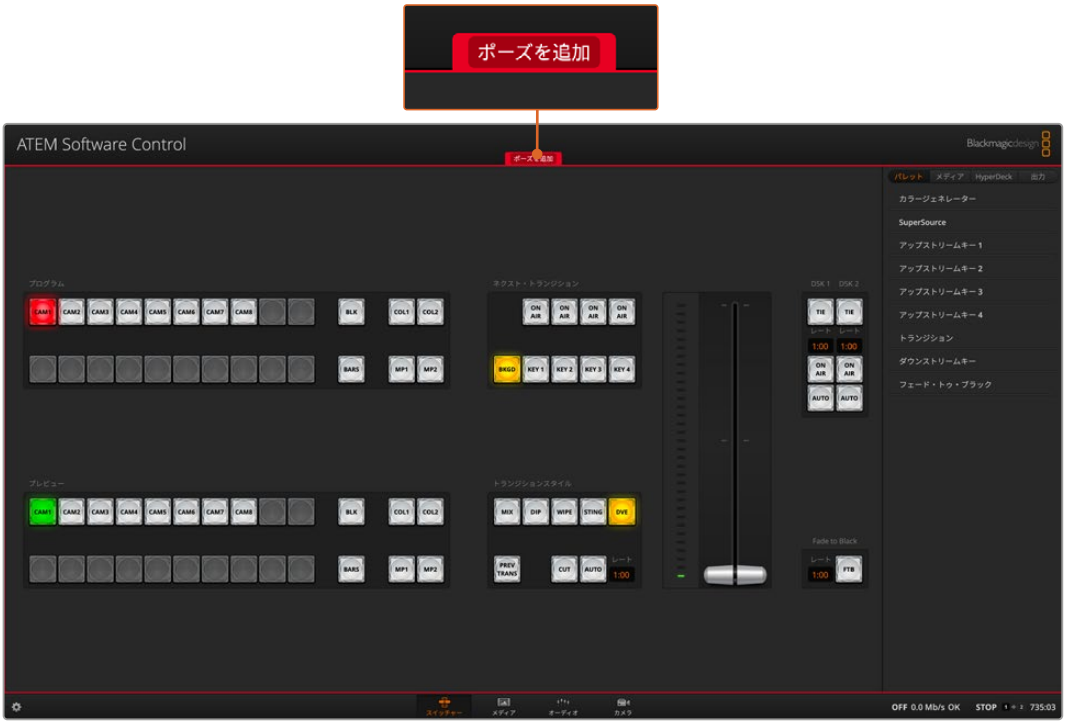
13 マクロウィンドウの記録ボタンをクリックし、マクロの記録を停止します。

記録したマクロが、選択したマクロスロットにボタンとして表示されます。マクロを確認するには、マクロウィンドウの「実行」ボタンをクリックして実行ページに切り替えます。「呼び出して実行」を選択すると、マクロボタンをクリックした際にマクロが実行されるようマクロウィンドウが設定されます。「Transitions」と名前の付いた新しいマクロボタンをクリックします。

14 マクロを選択した際にすぐに実行されるように設定したい場合は、「呼び出して実行」ボタンをクリックします。この機能を有効にすることで、マクロのロードと実行を1クリックで行えます。

マクロが正しく設定されていれば、マクロウィンドウの1つのボタンをクリックするだけで、ATEMスイッチャーは3秒間のミックストランジションでカラーバーからカラー1へと移行し、2秒間ポーズして、さらに3秒間のミックストランジションでブラックへと移行します！マクロの実行中、ATEMスイッチャーはソフトウェアコントロールパネルの外枠にオレンジのボーダーを表示します。

マクロが予定通りの作業を実行しない場合は、作成したマクロを前のステップに従って記録してください。



ATEM Software Controlに赤いボーダーが表示され、マクロの記録中であることが確認できます。赤いボーダーの上部に表示された「ポーズを追加」ボタンで、各スイッチャー操作の間のポーズの長さを入力できます。

マクロ名とメモを入力することで、マクロに記録したスイッチャー操作を把握できます。

大規模なマクロを設定

マクロ内に、別のマクロのトリガーを記録することも可能です。これにより、複数の小規模なマクロを使って、大規模なマクロを簡単に設定できます。例えば、操作の数を限定したマクロを記録して、これらのマクロを大規模なマクロにコンパイルしていきます。これは、単一のシーケンスで大規模なマクロを設定すると、修正がある場合に最初からやり直して記録しなければならないためです。操作数の少ない小規模のマクロの方が、格段に作業が簡単になります。

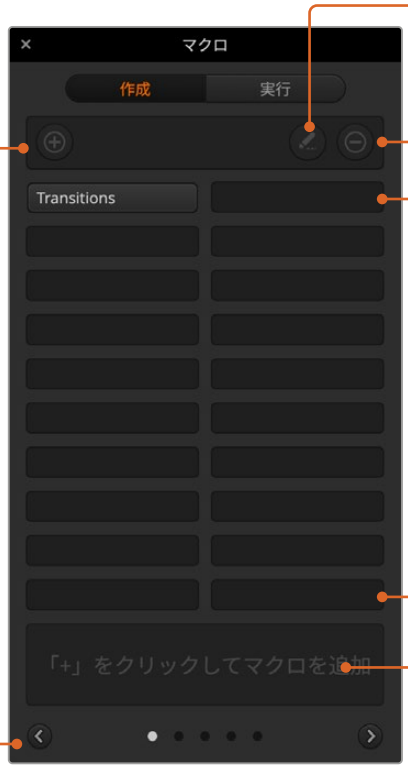
小規模なマクロを使って大規模なマクロを記録する方法では、変更したい小規模なマクロだけを再記録した後、これらの小規模なマクロを再び大規模なマクロにコンパイルすることで、大規模なマクロを編集できます。

小規模なマクロを大規模なマクロにコンパイルする：

1. 新しいマクロの記録を開始し、記録中に「実行」ボタンをクリックして実行ページを開きます。
2. 「呼び出して実行」を選択していると、ボタンをクリックした時点で自動的にマクロが実行されます。同ボタンを選択していないと、マクロはロードされますが、実行はマニュアルで行います。
3. 各小規模なマクロの時間をカバーする時間を空けて、小規模なマクロのシーケンスを実行し、大規模なマクロにコンパイルします。
4. 記録を停止します。これで、小規模なマクロで構成された、複雑かつパワフルな大規模マクロが設定できました。必要に応じて、簡単に変更できます。

実行できる操作の数に制限はありません。複雑なトランジションや、キーヤーを使用したリピート可能なユニークなエフェクトを作成したり、頻繁に使用するBlackmagic Studio Cameraの設定、グラフィックオーバーレイ、DVEを設定しておくことで、新規のプログラムを始める度に再構築する必要はなくなります。マクロ機能は楽しいだけでなく、時間も節約します。

マクロウィンドウの作成ページ



マクロ作成ボタン：
「マクロ作成」ボタンをクリックすると、マクロ作成のポップアップウィンドウが開きます。ここで、新しく記録するマクロに名前を付けたり、メモを入力して、「記録」をクリックすると、マクロの記録が開始されます。

矢印およびページアイコン：
20以上のマクロにアクセス/記録したい場合、マクロウィンドウの下にある右矢印をクリックすると新しいマクロページが開きます。前のマクロページに戻る場合は、左矢印をクリックします。左右の矢印の間にあるページアイコンを見ると、どのマクロページを開いているか確認できます。

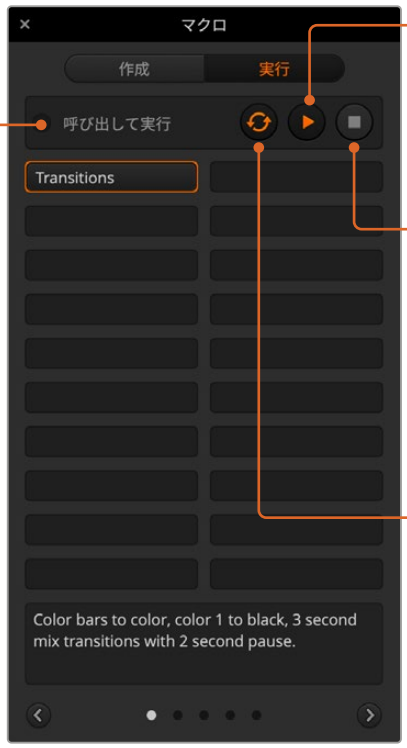
マクロ編集ボタン：
編集したいマクロを選択してマクロ編集ボタンをクリックすると、該当マクロの名前とメモを編集できます。

マクロ削除ボタン：
削除したいマクロを選択して「マクロ削除」ボタンをクリックすると、該当マクロが削除されます。

マクロボタン：
選択したマクロスロットにマクロを記録すると、マクロボタンとして表示されます。1ページにつき20のマクロボタンが表示されます。記録時にマクロに名前をつけなかった場合は、選択したマクロスロットの番号が名前になります。

ステータスウィンドウ：
マクロの記録/実行を開始するためのプロンプトやメッセージが表示されます。マクロが選択されている場合、入力したメモが表示されます。

マクロウィンドウの実行ページ



呼び出して実行：
「呼び出して実行」を選択している場合、マクロボタンをクリックするとマクロが即座に実行されます。「呼び出して実行」を選択していない場合、マクロボタンをクリックするとマクロがロードされるので、再生ボタンをクリックしてマクロを実行します。

再生：
「呼び出して実行」が選択されておらず、マクロボタンをクリックしてマクロをロードした場合は、再生アイコンをクリックすると、マクロが実行されます。

停止：
停止ボタンをクリックすると、マクロの実行が停止しますが、現在実行中の操作は実行されます。例えば、トランジションの最中に停止ボタンを押すと、スイッチャーはトランジションを実行した後で停止します。

ループ：
ループボタンを選択している状態でマクロを実行すると、停止ボタンを押すまで、マクロの実行を継続します。ループボタンを選択していない場合、マクロは継続せずに完了します。

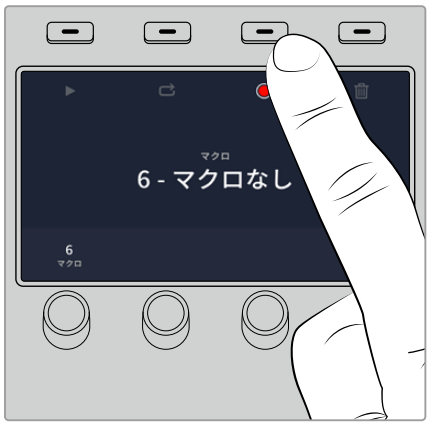
ATEM Television Studioを使用してマクロを記録

ATEM Television Studioスイッチャーシリーズでは、ATEM Software Controlを使用せずにマクロを記録/実行できます。ATEM Software Controlの「スイッチャー」ページで行うすべての操作は、スイッチャーのパネルでも実行できます。メディアプールのグラフィックの管理、カメラ設定の調整などが必要な場合は、ATEM Software Controlを使用してそれらの設定項目にアクセスしてください。

ATEM Television Studioでマクロの記録/実行に使用するボタンは、システムコントロールのボタンに配置されています。マクロボタンの名前はソース名ディスプレイに表示されます。

以下のステップに従い、前述のATEM Software Controlを使用した例と同じ「Transitions」マクロを作成します。今回は、マクロスロット 6にマクロを作成します。

1. 「マクロ」ソフトボタンを押してマクロのLCDメニューを開きます。
2. LCDの下にある「マクロ」ノブを使用して、記録したいマクロスロットを選択します。この例ではスロット「6 - なし」を選択します。
3. LCDの上にある記録アイコンのソフトボタンを押してマクロの記録を開始します。記録アイコンは、赤い丸です。記録時はアイコンが赤い四角形になり、LCDの周囲に赤い枠線が表示されます。



記録アイコンのソフトボタンを押して、マクロの記録を開始します。

マクロの記録中、LCDの周囲に赤いボーダーが表示されます。

4 プログラムバスで「Color Bars」をSHIFT選択します。ボタンが点滅し、シフト選択されたソースであることがわかります。

5 プレビューバスで「Color1」をSHIFT選択します。カラーバー、ブラック、カラージェネレーターなどに、さらに簡単にアクセスしたい場合は、これらのボタンを、プログラム/プレビューバスの10個のメインボタンにマッピングすることもできます。設定方法については、このマニュアルの「ボタンマッピング」セクションを参照してください。

6 トランジションコントロールで「WIPE」ボタンを押して、マクロがワイプトランジションのセクションに記録されるようにします。

7 「ワイプ」のLCDメニューで、レートを2:00秒に設定します。

8 トランジションコントロールの「AUTO」ボタンを押してカラーバーからカラー1へのワイプトランジションを実行します。

9 「MACRO」ボタンを押してマクロスクリーンに戻ります。

10 次のトランジションを適用する前に2秒間待つようマクロを設定するため、LCDメニューの「ポーズを追加」ソフトボタンを押し、「秒」ノブを回して2秒に設定します。「確定」ソフトボタンを押してポーズを記録します。

11 プレビューバスで「Black」をSHIFT選択し、トランジションコントロールの「MIX」ボタンを押し、さらに「AUTO」トランジションボタンを押します。ATEMスイッチャーがブラックへのミックストランジションを実行します。

12 「MACRO」ボタンを押してマクロメニューへ戻り、「停止」ソフトボタンを押して記録を停止します。

ATEM Television Studioを使用したマクロの記録が完了しました。このマクロはマクロスロット 6に配置されているため、「Macro 6」と名前の付いたマクロボタンとして表示されます。ATEM Software Controlの「マクロを編集」ボタンをクリックすれば、マクロの名前や関連するメモを簡単に追加できます。

マクロを実行するには、「MACRO」ボタンを押してパネルのソース選択列をマクロモードに設定します。マクロモードでは「MACRO」ボタンは、青く光ります。「Macro 6」ボタンを押します。マクロの実行中は、マクロボタンが緑に点滅し、LCDメニューの周囲がオレンジになるので簡単に確認できます。

マクロが正しく設定されていれば、ATEMスイッチャーの1つのボタンをクリックするだけで、ATEMスイッチャーが2秒間のミックストランジションでカラーバーからカラー1へ移行し、2秒間ポーズして、さらに2秒間のミックストランジションでブラックへと移行します。マクロをループして実行し続けたい場合は、「ループ」ソフトボタンを押してループを有効にします。もう一度押すと無効になります。

マクロがユーザーの求める特定の機能をすべて実行し、一切の作業をもらさず、不測の動作を起こさないことを確実にするために、作成したマクロは様々なスイッチャー設定を使用してテストすることをお勧めします。

HyperDeckコントロール

HyperDeckコントロールについて

最大10台のHyperDeckディスクレコーダーをスイッチャーに接続し、ATEMスイッチャーのシステムコントロールボタンまたはATEM Software Controlの「HyperDeck」パレットを使用して操作できます。これは非常にパワフルな機能です。スイッチャーに10台のHyperDeckを接続すれば、持ち運び可能なビデオテープシステムのような感覚で使用できます。スイッチャー出力の収録とグラフィック再生に対応し、すでに収録されている部分をボタン一押しでロールするようスイッチャーを設定することも可能です。

トランスポートコントロールは、ATEM Television Studioのシステムコントロールメニューおよび ATEM Software Controlの「HyperDeck」パレットにあり、ビデオの再生、ジョグ＆シャトル、クリップのスキップ、一時停止などに使用できます。また、ビデオの収録も可能です。

この機能をATEMのパワフルなマクロ機能と組み合わせれば、ライブプロダクションの品質を大きく向上させる、クリエイティブな可能性が無限に広がります。

HyperDeck Studio HD Plus

HyperDeckの接続

HyperDeckとスイッチャーの接続は、カメラや他のビデオソースをスイッチャーのSDI入力に接続するのと良く似ています。唯一異なるのは、ATEMスイッチャーとHyperDeckディスクレコーダーの通信用にイーサネットも接続する点です。

1. イーサネットコネクターを使用して、HyperDeckディスクレコーダーをATEMスイッチャーが接続されているネットワークに接続します。
2. HyperDeckのコントロールパネルで「REM」ボタンを押します。「REM」ボタンが光ります。これは、HyperDeckのリモートコントロールが有効になったことを意味しています。HyperDeck Studio HD Miniを使用している場合、LCDメニューの設定タブで「Remote」設定を「On」にします。
3. HyperDeckのSDI出力を、ATEMスイッチャーのSDI入力に接続します。
4. ATEMスイッチャーのプログラム出力をHyperDeckで収録したい場合は、スイッチャーのSDI出力の1つをHyperDeckのSDI入力に接続します。
5. 接続する各HyperDeckで、同じ作業を行います。

HyperDeckをスイッチャーに接続したら、システムコントロールおよびLCDソフトボタンを使い、HyperDeckを設定/コントロールできます。

まず、システムコントロールで「設定」ボタンを押します。

「HyperDeck」の上のLCDソフトボタンを押して「HYPERDECK設定」メニューへ行きます。最初のメニューページでは、「HYPERDECK」インジケーターと入力インジケーターが左下に表示されます。「HYPERDECK」インジケーターの下にあるコントロールノブを回すと使用可能なHyperDeckを確認できます。

使用するHyperDeckを選択したら、次に入力インジケーターの下にあるノブを回して、HyperDeckが接続されているスイッチャー入力を選択します。例えば、HyperDeck 1がスイッチャーのSDI入力4に接続されている場合、入力インジケーターの下にあるノブを「カメラ4」に合わせます。入力ノブを押して選択を確定します。

2ページ目では、自動再生機能のオン/オフを切り替えたり、フレームオフセットの値を設定できます。自動再生機能がオンの場合、プログラム出力に切り替えた際に、HyperDeckディスクレコーダーが自動的にビデオを再生します。例えば、再生を開始したいポイントをHyperDeckで頭出ししておき、ミックスエフェクト列のプログラムボタンを押すと、ソースを再生できます。スチルフレームに合わせたい場合やHyperDeckのビデオ再生を手動で行いたい場合は、「自動再生」機能を無効にしてください。

HyperDeckは再生を開始する前に数フレームをバッファリングする必要があります。このことから、切り替えをクリーンに行うために、実際のカットは事前に設定したフレーム分だけ遅れて実行されます。これは、ビデオテープ機器のプリロール設定に似ています。遅れの長さは「オフセット」ボックスの数値を変更して調整できます。多くの場合、5フレームに設定することでクリーンな切り替えが得られます。

HyperDeckに入力を割り当てたら、IPアドレスを入力する必要があります。これにより、ATEM Television StudioスイッチャーシリーズはイーサネットIP経由でHyperDeckをコントロールできるようになります。

HyperDeckのIPアドレスを入力するには、HyperDeck設定メニューで左右の矢印ボタンを使うかテンキーパッドで3を押して、3ページ目へ行きます。

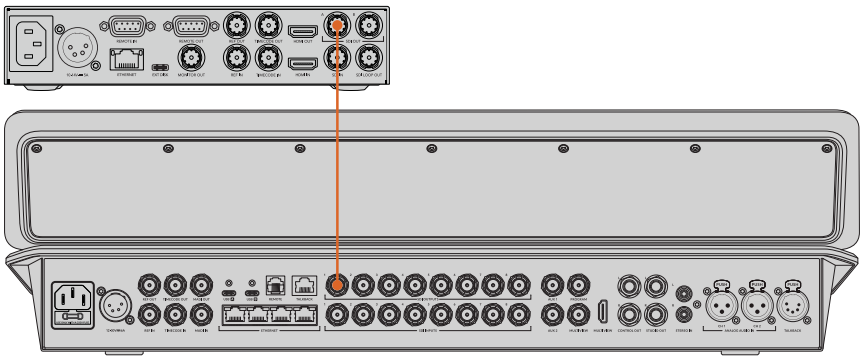
このページでは、現在選択しているHyperDeckのIPアドレスが表示されます。各IPアドレスの数字は下にある回転ノブに対応しています。これらの数字を変更するには、対応するノブを回すか、ノブを1度押してテンキーパッドで数字を入力します。

この作業を繰り返し、IPアドレスのすべての数字を入力します。

HyperDeckのIPアドレスを入力できたら、ソフトボタンを押して変更を保存し、アドレスを確定します。変更をキャンセルする場合は「取り消し」ボタンを押します。

続けて他のHyperDeckのIPアドレスを入力する場合は、HYPERDECK設定メニューの最初のページでHyperDeckを選択します。

「メディアプレーヤー」ソフトボタンを使用して、HyperDeckをスイッチャー経由でコントロールできます。詳細は、このマニュアルの「HyperDeckコントロール」セクションを参照してください。



HyperDeck Studio HD PlusのSDI出力をATEM Television StudioのSDI入力に接続

他に必要な作業は、各HyperDeckに使用する入力とIPアドレスを、ATEMスイッチャーで指定することのみです。この作業は、ATEM Software Controlスイッチャー設定の「HyperDeck」タブか、ATEM Television Studioスイッチャーシリーズのシステムコントロールソフトボタンで実行できます。

HyperDeck設定

HyperDeckの接続設定は、ATEM Software Controlスイッチャー設定の「HyperDeck」タブにあります。ここで、10台までのHyperDeckをセットアップできます。

「IPアドレス」ボックスにHyperDeckのIPアドレスを入力し、接続するソースを「入力」メニューで選択するだけで、必要な情報を簡単に設定できます。「接続」をクリックすると、HyperDeckをコントロールできます。

HyperDeckアイコンの上下に表示されるステータスインジケーターで、接続状況が確認できます。グリーンのチェックは、HyperDeckが接続されており、リモートコントロールが有効であることを意味しています。

HyperDeckが接続されており、認識されているものの、リモートボタンが有効になっていない場合は、リモートが無効である旨のメッセージが表示されます。

HyperDeckが認識されていない場合は「接続に失敗しました。」というメッセージが表示されます。このメッセージが表示されたら、HyperDeckのイーサネットポートがネットワークに接続されており、IPアドレスが正しく入力されているか確認してください。

自動再生

自動再生機能では、プログラム出力に切り替えた際に、HyperDeckディスクレコーダーが自動的にビデオを再生するよう設定できます。例えば、再生を開始したいポイントをHyperDeckで頭出ししておき、ミックスエフェクト列のプログラムボタンを押すと、ソースを再生できます。

HyperDeckは再生を開始する前に数フレームをバッファリングする必要があります。このことから、切り替えをクリーンなものにするために、実際のカットは事前に設定したフレーム分だけ遅れて実行されます。これは、ビデオテープ機器のプリロール設定に似ています。遅れの長さは「オフセット」ボックスの数値を変更して調整できます。多くの場合、5フレームに設定することでクリーンな切り替えが得られます。

スチルフレームに合わせたい場合やHyperDeckのビデオ再生を手動で行いたい場合は、「自動再生」機能を無効にしてください。

ATEM Software ControlでHyperDeckをコントロール

スイッチャーに接続したHyperDeckをコントロールするには、ソフトウェアコントロールパネルで「メディアプレーヤー」タブをクリックし、「HyperDeck」パレットを選択します。

同パレットで、上部のボタンのうち1つを選択することで、システムに接続されているHyperDeckを選択できます。これらのボタンには、ATEM設定で入力したラベルの名前が表示されます。コントロール可能なHyperDeckは白い文字で表示され、現在コントロール中のHyperDeckはオレンジで表示されます。

HyperDeckパレットのボタンを使用して10台までのHyperDeckを選択

テキストの色に加え、各HyperDeckの選択ボタンはタリー表示に対応しています。

緑の外枠	HyperDeckがプレビュー出力にスイッチされています。
赤の外枠	HyperDeckがプログラム出力にスイッチされており、オンエア中です。HyperDeckの選択ボタンの上には、以下のステータスインジケーターのいずれかが表示される場合があります。
準備完了	HyperDeckがリモートに設定されており、ディスクも挿入されています。再生および収録（空きスペースがある場合）が可能です。
収録	HyperDeckが収録中です。
ディスクなし	HyperDeckにディスクが挿入されていません。
ローカル	HyperDeckが「リモート」に設定されておらず、ATEMからは現在コントロールできません。

HyperDeckを選択すると、現在選択されているクリップの名前、長さ、経過時間、収録可能時間が表示されます。これらの情報の下にはコントロールボタンがあります。

	**収録** このボタンをクリックしてHyperDeckへの収録を開始します。収録を停止するには、ボタンをもう一度クリックします。
	**前のクリップ** HyperDeckメディアリストの前のクリップに移動します。
	**再生** 再生ボタンをクリックすると再生が始まり、もう一度クリックすると停止します。HyperDeck設定の「自動再生」が有効になっている場合は、HyperDeckをプログラム出力に切り替えると自動的に再生が開始されます。
	**次のクリップ** HyperDeckメディアリストの次のクリップに移動します。
	**ループ** ループボタンをクリックすると現在選択しているクリップがループされ、もう一度クリックするとHyperDeckメディアリストのすべてのクリップがループされます。

クリップ内の移動には、該当するHyperDeckのコントロールボタンの下にあるシャトル/ジョグスライダーを使用します。選択したクリップ内のすばやい移動（シャトル）や、フレームごとのジョグが実行できます。2つのモードは、シャトル/ジョグスライダーの隣にあるボタンで切り替えられます。

トランスポートスライダーの左にあるボタンで、シャトルまたはジョグを選択。スライダーを左右に調整してクリップを前後に移動できます。

トランスポートコントロールの下には、選択したHyperDeckに含まれる使用可能なクリップが表示されます。このリストは、右の矢印を押して展開/最小化できます。

再生

HyperDeckのメディアは簡単に再生できます。HyperDeckをプレビュー出力に切り替え、表示したいクリップを選択します。トランスポートコントロールを使用して、クリップの再生開始ポイントに合わせます。HyperDeckをプログラム出力に切り替えると、「自動再生」機能で、事前に設定したポイントから自動的に再生が開始されます。

スチルフレームを表示してから再生するなど、再生を手動でトリガーしたい場合は、ATEMソフトウェアの設定メニューで「HyperDeck」タブを選択し、該当するHyperDeckの「自動再生」チェックボックスを無効にします。

収録

HyperDeckに挿入したフォーマット済みのディスクに収録するには、「HyperDeck」パレットの収録ボタンを押します。HyperDeckパレットの「残り時間」インジケーターには、SSDのおおよその収録可能時間が表示されます。

ATEM Television StudioでHyperDeckをコントロール

HyperDeckを「HyperDeckの接続」セクションに記載されている通りにスイッチャーに接続したら、パネル上のシステムコントロールボタンおよびLEDメニューで各HyperDeckを設定/コントロールできます。

ATEM Television StudioでHyperDeckをコントロール

システムコントロールの「メディアプレーヤー」メニューでHyperDeckをコントロールできます。このメニューへ行くには、まず「メディアプレーヤー」ボタンを押し、次に「HYPERDECK」インジケーターの上にあるソフトボタンを押してHyperDeckコントロールにアクセスします。スイッチャーが3つ以上のメディアプレーヤーに対応している場合、次のメニューページへ行き、HyperDeckコントロールにアクセスします。

これで「HYPERDECK」、「クリップ」、「ジョグ」、「シャトル」インジケーターの下にある回転ノブを使用して、HyperDeckやクリップの選択や、クリップのジョグ/シャトルが可能です。

HyperDeckコントロールメニューの中央のテキストは、選択したHyperDeckとクリップを反映して変更します。

LCDメニューの「メディアプレーヤー」の2ページと3ページ目には、再生、停止、ループ再生、次/前クリップの頭出しなど、より多くのHyperDeckコントロールがあります。

作業のこつ すべてのクリップを再生するには、SHIFTボタンを長押ししながら再生アイコンのソフトボタンを押します。

メニューの3ページ目では、収録ボタンを押してスイッチャーのプログラム出力をHyperDeckに収録できます。「ジョグ」と「シャトル」コマンドを使用して、収録したフッテージをスクラブできます。

タリーの使用

GPI and Tally Interfaceを使用してタリー信号を送信する

ATEMスイッチャーからモニターやカメラにタリー信号を送信して、現在どのソースがオンエアされているかなど、プログラム出力に出力されているソースが確認できます。

タリーを使用してカメラやモニターの上に付けられた赤いライトを点灯させ、どのカメラが放送中かを出演者に知らせることができます。また、タリーを使用して、Blackmagic SmartView 4Kなどモニターのボーダーに色をつけることも可能です。境界線に色をつけることで、制作スタッフはどのカメラがオンエア中か確認できます。

Blackmagic DesignのGPI and Tally Interfaceはイーサネットデバイスで、グラウンドとの8系統の接点の開閉を機械式に切り替えることでタリーとして使用できます。タリー信号はATEMスイッチャーのイーサネットポートから送信され、スイッチャーと同じネットワーク上のGPI and Tally Interfaceへと送られます。GPI and Tally Interface裏面の接続ガイドに従い、Blackmagic SmartView DuoやSmartView HDなどコンタクト・クロージャー・タリー信号対応のビデオ機器にブレイクアウトケーブルを接続します。1台のGPI and Tally Interfaceで、最大8台のタリー受信デバイスに対応できます。ATEM Television Studioでは、必要なのは1台のGPI and Tally Interfaceだけです。

GPI and Tally Interface

GPI入力はグラウンドへの接続でトリガーされる、14mA時で最大5Vの光アイソレーターです。

タリー出力はグラウンドとの設定の開閉を機械的に切り替える方式で、1A時で最大30Vです。

ネットワーク/タリーの設定を変更する

ATEM Setupを使用して、GPI and Tally Interfaceのネットワーク設定を行うことで、ATEMスイッチャーと通信可能になります。ATEM Setupを使用して設定を行う際は、GPI and Tally InterfaceをUSBで接続する必要があります。

1. GPI and Tally Interfaceを、ATEMスイッチャーと同一のイーサネットネットワークに接続します。
2. GPI and Tally InterfaceをコンピューターのUSBポートに接続し、さらに同梱の電源を接続します。
3. ATEM Setupを起動します。
4. イーサネットネットワークスイッチを介さず、ATEMスイッチャーをコンピューターに直接接続している場合は、「Configure Address Using Static IP」を選択します。GPI and Tally Interfaceは、出荷時にデフォルトで固定IPアドレス「192.168.10.2」に設定されています。設定を簡単に行うため、この数字をそのまま使用することをお勧めします。

他の静的IPアドレスを使用したい場合は、ネットワーク上の他のデバイスによって使用されていない限り、ATEMスイッチャーと同じ範囲内であらゆる数値に設定できます。アドレスの競合を避けるため、192.168.10.1、192.168.10.2、192.168.10.3、192.168.10.10、192.168.10.50、192.168.10.60、192.168.10.240など、ATEM製品のデフォルトIPアドレスは使用しない方が良いでしょう。

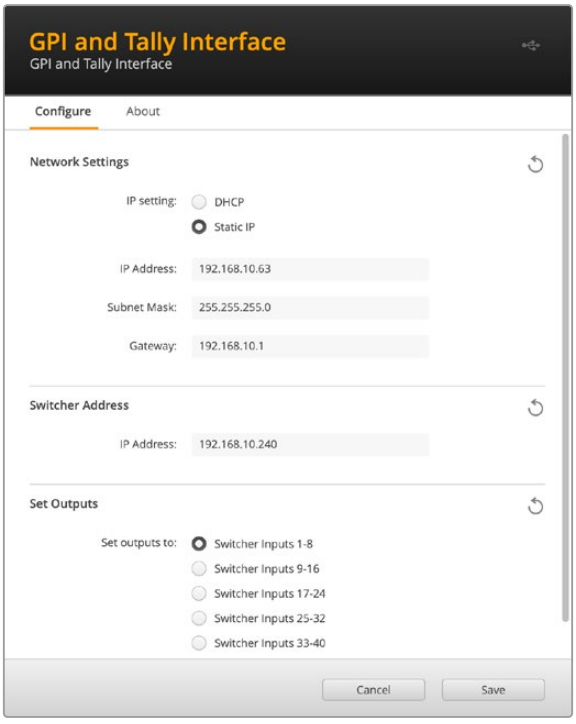
イーサネットネットワークスイッチを介してATEMスイッチャーを接続している場合、「Configure Address Using DHCP」を選択すると、IPアドレス、サブネットマスク、ゲートウェイなどの情報がDHCPサーバーから自動で取得できます。

5 「Switcher Address」の欄に、ご使用のATEMスイッチャーのIPアドレスを入力します。ATEMスイッチャーは、出荷時にデフォルトでDHCPに設定されています。また、静的IPアドレスに設定することも可能です。

6 「Set Outputs」は「Switcher Inputs 1-8」に設定します。

7 「Apply」をクリックします。USBポート右側にある白いLEDライトの点滅が停止し、点灯したままとなります。これは、ATEMスイッチャーを正しく認識できたことを意味します。GPI and Tally Interfaceを使用する準備が整いました。

8 ATEM Setupを閉じて、USBケーブルを外します。



GPI and Tally Interfaceのネットワーク設定と出力設定

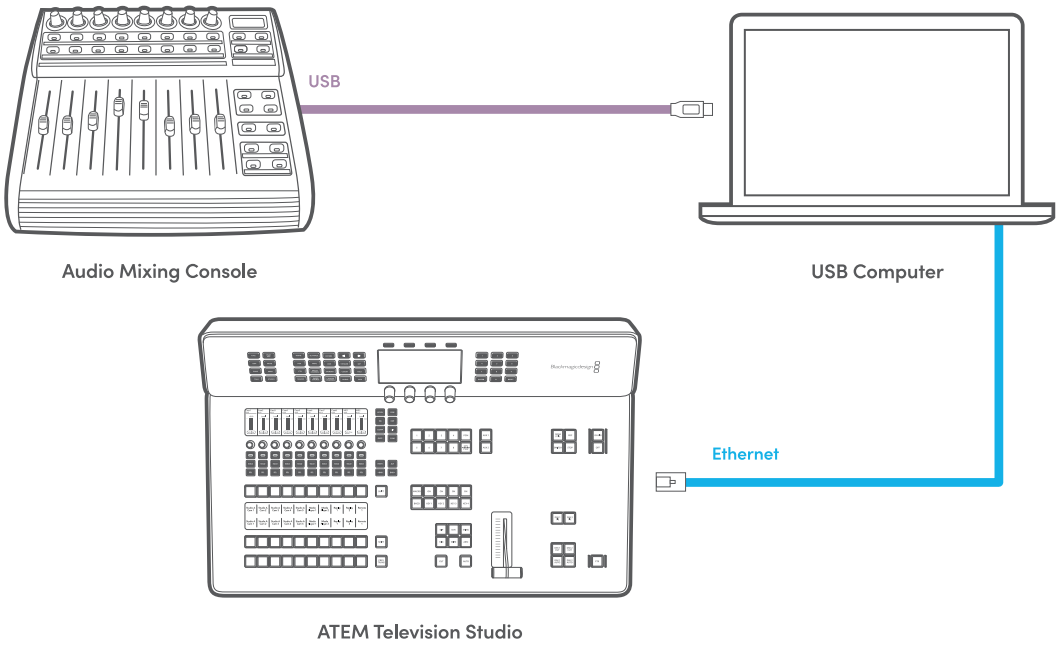
サードパーティ製のオーディオミキサー・コントロールパネルを使用

オーディオミキサー・コントロールパネルを使用

ペースの速いライブTVプロダクションの世界では、マウスを使った調整では遅いと感じることがあるでしょう。ATEMスイッチャーで同時に2つ以上のオーディオソースをミックスする必要がある場合は、次の方法が役に立ちます。ハードウェアのオーディオミキサー・コントロールパネルをATEMスイッチャーに接続すれば、両手を使って複数のオーディオレベルを同時に調節できます。

オーディオミキサー・コントロールパネルをMacやPCにMIDIデバイスとして接続すると、「Mackie Control」コマンドを使用してATEMスイッチャーと通信できます。

サードパーティ製のMIDIコントロールパネルの多くはATEMスイッチャーと互換性がありますが、不明な場合はお使いのコントロールパネルの製造業者に確認してください。



ATEM Software Controlを起動しているコンピューターにハードウェア・オーディオミキサーを接続すれば、複数のオーディオレベルを同時に調整できます。

オーディオミキサー・コントロールパネルの接続

1 互換性のあるMIDIコントロールパネルをMac/PCに接続します。最新型のコントロールパネルの多くはUSBで接続できます。

2 コンピューターがコントロールパネルをMIDIデバイスとして認識することを確認します。

Macコンピューターでは、Applications > Utilities > Audio MIDI Setupの順に進み、アプリケーションを起動します。「Window」メニューに進み、「Show MIDI Window」を選択します。お使いのコントロールパネルがウィンドウ上にMIDIデバイスとして表示されていることを確認します。

Windowsコンピューターでは、Device Manager > Sound, Video and Game Controllersの順に進み、お使いのコントロールパネルがアイコンのリストに表示されていることを確認します。

3 ATEMオーディオミキサーは、「Mackie Control」コマンドを使用してコントロールパネルと通信するよう設計されているため、お使いのコントロールパネルが「Mackie Control」をサポートしている必要があります。また、コントロールパネルが、Mackie ControlまたはMackie Controlエミュレーションを使用するよう設定されていることを確認してください。設定の詳細は、お使いのコントロールパネルのユーザーマニュアルを参照してください。

コントロールパネルによっては数種類のMackie Controlエミュレーションが搭載されているものがあるので、コントロールパネルの最も多くの機能が有効化されるものを選択してください。例えば、Behringer BCF 2000では、「Mackie Control Mapping for Cakewalk Sonar 3 [MCSo]」を選択すると、レベルフェーダー、バンクセレクター、バランスコントロール、AFVおよびON/MUTE機能が有効化されます。また、どのフェーダーがオーディオミックス用に選択されているかを表すLEDスクリーンも有効化されます。LEDスクリーンは、他のMackie Controlエミュレーションを選択した場合は有効化されません。

4 ATEM Software Controlを起動すると、最初に検出されたMIDIデバイスの1番目のポートから、お使いのコントロールパネルが自動で検出されます。ATEM Software Controlの「Audio」タブをクリックすると、ATEMオーディオミキサーが表示されます。ハードウェアコントロールパネルのゲインフェーダーを上下にスライドさせると、コンピューター画面上のソフトウェアでもオーディオミックスフェーダーが同様に上下することを確認してください。これが確認できれば、お使いのコントロールパネルとATEMスイッチャーを使用する設定が整っています。

MUTEボタン

ATEMオーディオミキサー・インターフェースの「ON」ボタンが選択されている時は、そのオーディオは常にオンの状態、つまりミックス上に存在している状態にあります。「ON」ボタンが選択されていない時は、オーディオが存在しないか、またはミュートされています。ハードウェアパネルとATEM Software Controlのインターフェースを一致させるには、オーディオがオンになっている/存在する場合にオーディオミキサー・コントロールパネルの「MUTE」ボタンが光っていることを確認してください。オーディオが存在しない、またはミュートになっている場合は、「MUTE」ボタンは点灯しません。

デシベルスケール

すべてのハードウェアミキサーは設計が異なるため、お使いのコントロールパネルに表示される目盛りがATEMオーディオミキサー・インターフェースの目盛りと一致しない場合があります。正しいデシベルスケールを確認する際は、常にATEMオーディオミキサーのレベルを参照してください。

DaVinci Resolve Micro Panelの使用

各カメラコントローラーのDaVinci Resolveプライマリーカラーコレクターは、DaVinci Resolve Micro Panelを使ってコントロールできます。これにより、ハードウェアコントロールパネルを使って正確なカラー調整をすばやく行えます。

パネルをセットアップする：

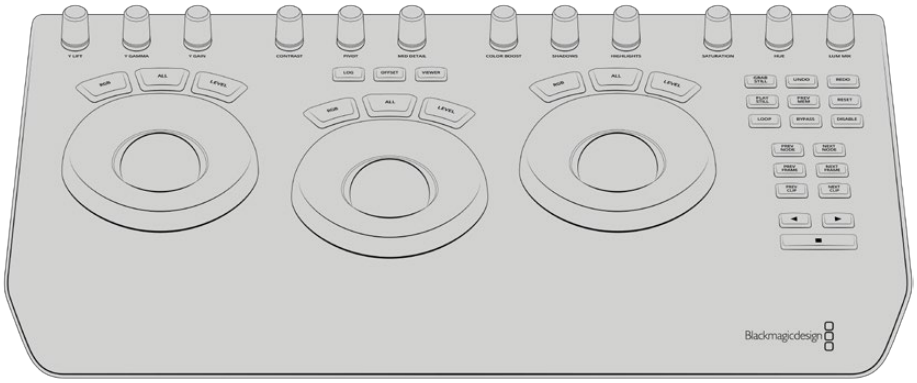
1. DaVinci Resolve Micro PanelをUSB-C経由でコンピューターに接続し、ATEM Software Controlを起動します。
2. 「カメラ」タブへ行き、コントロールしたいカメラのコントローラーをクリックして選択します。
3. DaVinci Resolve Micro Panelでトラックボールやノブを使い、プライマリーカラーコレクターのコントロールを調整します。

カラーコレクション調整

DaVinci Resolve Micro Panelは、本来はDaVinci Resolveソフトウェアと使用するよう設計されています。しかし、以下の方法で、ATEM Software Controlのカラーコレクターで調整が可能です。

トラックボール

3つのトラックボールで、カラーコレクションパネルのリフト/ガンマ/ゲイン・カラーホイールをコントロールします。トラックボール周辺のリングは、カラーホイールの下にある、対応するマスターホイールを調整します。



DaVinci Resolve Micro Panel

コントロールノブ

ハードウェアパネルで設定を変更すると、ソフトウェアでも同じ設定が変更されます。以下のコントロールノブで調整可能です。

Y リフト	黒レベルのYのみを調整してイメージのコントラストを修正。
Y ガンマ	ガンマのYのみを調整してイメージのコントラストを修正。
Y ゲイン	ハイライトのYのみを調整してイメージのコントラストを修正。
コントラスト	時計回り/反時計回りに回してコントラストを上げる/下げる。
ハイライト	選択したカメラのアイリスをコントロール。時計周り/反時計回りに回してアイリスを開く/閉じる。
彩度	時計周り/反時計回りに回して彩度を上げる/下げる。
色相	時計周り/反時計回りに回し、カラーホイールに表示される色相配置に沿って色相を調整。
輝度ミックス	時計周り/反時計回りに回し、RGB/YRGBコレクター間の出力ミックスを設定。

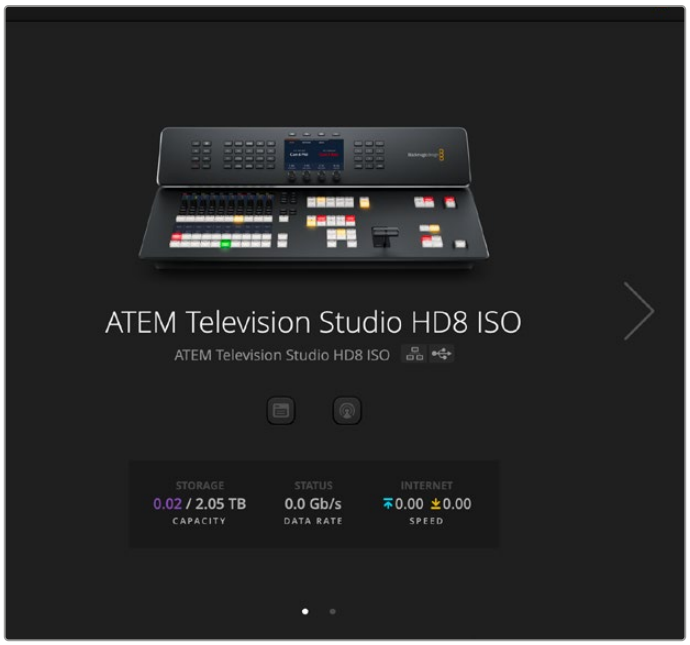
コントロールボタン

左矢印	前のカメラ番号を選択
右矢印	次のカメラ番号を選択

各コントロールがイメージに与える影響の詳細は、このセクションで前述されています。

ATEM Setupの使用

ATEM Software Controlをコンピューターにインストールすると、ATEM Setupという名前のセットアップユーティリティもインストールされます。このセットアップユーティリティでは、ATEM Television Studioのアップデート、ユニットの名前付け、ネットワーク設定の変更を行えます。また、プログラム/プレビューモードおよびカットバスモードや、キーヤー関連のパネル設定を設定できます。



ATEM Setupを立ち上げると、最初に表示される画面はホームスクリーンです。複数のATEMスイッチャーをUSBまたはネットワークで接続している場合、左右の矢印をクリックすると使用したいスイッチャーを選択できます。

内部クラウドストレージをインストールしている場合、ホームスクリーン下部のインジケーターは、ストレージ容量の合計、使用しているスペース、ネットワーク接続の状況、現在の最大データレートを表示します。使用量を示す数字が紫色の場合、ストレージでの読み書きが可能です。数字が青の場合、ストレージへのアクセスが読み取り専用に設定されています。

ストレージインジケーターの上にある左側のアイコンをクリックするとSetupページが開きます。右側のアイコンをクリックすると、ATEM Software Controlが起動します。

Setup（セットアップ）タブ

Name（名前）

スイッチャーの名前を変更したい場合は、新しい名前をボックス内に入力して「Save」をクリックします。

Software（ソフトウェア）

ATEM Television Studioにインストールされている現在のソフトウェアバージョンを表示します。

Date and Time (日付と時刻)

チェックボックスを選択すると、ATEM Television Studioで日付と時刻が自動的に設定されます。

日付と時刻が自動設定されると、ATEMスイッチャーはNTPのフィールドで設定されているネットワークタイムプロトコル・サーバーを使用します。デフォルトのNTPサーバーはtime.cloudflare.comですが、別のNTPサーバーをマニュアルで入力することもできます。入力したら、「Set (設定) 」をクリックします。

日付と時刻を自分で入力する場合、各フィールドに日付、時刻、タイムゾーンを入力します。日時を正確に設定することで、ネットワークと同じ日時の情報が収録ファイルに記録されます。また、これにより一部のネットワークストレージ・システムで生じることのある競合を防ぎます。

Network (ネットワーク)

ネットワークへの接続にDHCPまたは静的IPアドレスのどちらを使用するかなどのオプションを設定できます。ATEMスイッチャーとネットワークの接続に関する詳細は「ネットワークに接続」セクションを参照してください。

Allow utility administration (ユーティリティ管理を可能にする)

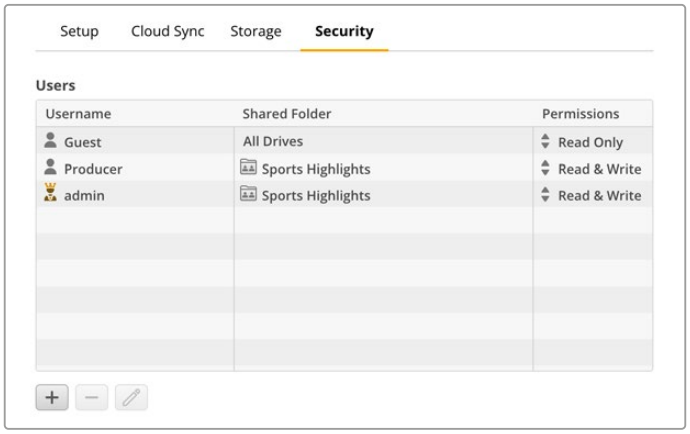
ATEM Setupには、ATEMスイッチャーをUSBまたはネットワークを介して接続するとアクセスできます。ネットワーク経由でのアクセスを無効にするには、「via USB (USBを介して) 」を選択します。

Connection Priority (優先接続)

イーサネットおよび携帯電話の両方がATEM Television Studioに接続されている場合に、配信に使用される接続を選択できます。モバイルテザリングの詳細は「スマートフォンのテザリング」セクションを参照してください。

Security (セキュリティ) タブ

「Security」タブには、ユーザー認証設定に加え、ユーザーの作成、共有フォルダーの割り当て、フォルダー権限の割り当てのオプションがあります。

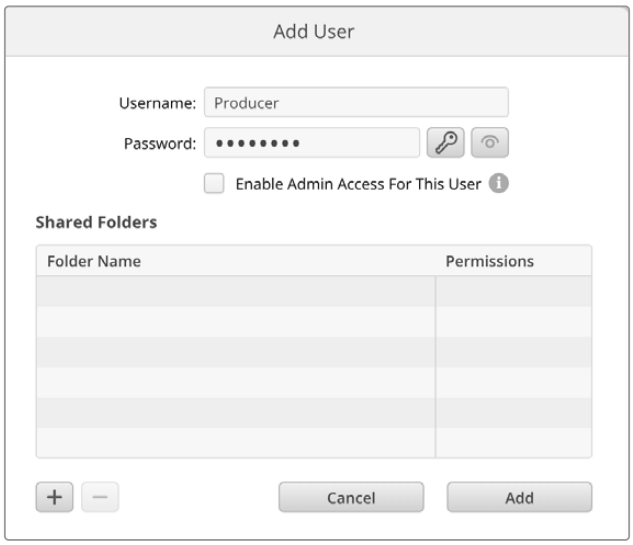


Adding Users（ユーザーを追加）

これらの設定では、ユーザーの作成、共有フォルダーの割り当て、フォルダー権限の設定が実行できます。これは、ローカルで保存したパスワードでユーザーが接続している際に適用されます。例えば、プロジェクトの管理者に、共有フォルダーへの読み取り/書き込みの権限を割り当て、ファイルの閲覧だけが必要なユーザーには読み取りのみの権限を割り当てるなどが可能です。共有フォルダーには、ATEMスイッチャーの外付けUSBストレージ、またはオプションの内部クラウドストレージのあらゆるフォルダーを使用できます。

1 「Security（セキュリティ）」タブの左下にある「+」ボタンをクリックして、「Add User（ユーザーを追加）」ウィンドウを開きます。

2 「Add User（ユーザーを追加）」ウィンドウで新規ユーザーのユーザー名を入力します。ローカルで保存したパスワードを使用してSMB経由で接続するユーザーを作成する場合、「Password」フィールドにパスワードを入力します。鍵のアイコンを押すと、セキュリティパスワードが自動的に生成されます。



新規ユーザーに管理者アクセスを与えたい場合、「Enable Admin Access for this user（該当ユーザーの管理者アクセスを有効）」にチェックを入れます。これにより、該当のユーザーはイーサネット経由でATEM Setupにアクセスして設定を変更できるようになります。

3 「+」ボタンをクリックして、共有フォルダーウィンドウを開きます。

ATEM Television Studioスイッチャーの内部ストレージの最上層にある全フォルダーのリストが表示されます。サブフォルダーを見るにはフォルダーをダブルクリックします。ウィンドウの上部にあるメニューには現在表示されているフォルダー名が表示され、フォルダーの階層を遡ることができます。新規ユーザーにアクセスを許可する共有フォルダーを選択し、「Set」を押します。

4 「Add User（ユーザーを追加）」ウィンドウの「Shared Folders（共有フォルダー）」リストに、該当の共有フォルダーが表示されます。

別のフォルダーを割り当てるには、「+」ボタンをクリックします。共有フォルダーへのアクセスを削除するには「−」ボタンをクリックします。「Add User（ユーザーを追加）」ウィンドウを閉じて「Security」タブに戻るには、「Add（追加）」と「Save（保存）」をクリックします。

これで、新規ユーザーはATEMスイッチャーにログインして、割り当てられた共有フォルダーにアクセスできます。

Macコンピューターで共有フォルダーにアクセスする：

1 Finderを開き、サイドバーの「ネットワーク」をクリックします。

2 リストで、ATEMスイッチャーをクリックします。

3 「Connect as（別名で接続）」をクリックし、ユーザー名とパスワードを入力して「Connect（接続）」をクリックします。

ATEMスイッチャーが場所のサイドバーに表示されるので、該当のスイッチャーをクリックして、共有フォルダーを表示します。

Windowsコンピューターで共有フォルダーにアクセスする：

1 File Explorerのサイドバーにある「ネットワーク」をクリックします。ATEMスイッチャーがリストに表示されます。

2 ご使用のATEMスイッチャーをダブルクリックすると、ネットワーク認証情報を入力するWindowsのセキュリティ・ダイアログボックスが表示されます。

3 ユーザー名とパスワードを入力します。

4 「OK」をクリックします。

これで、File Explorerのウィンドウに ATEMスイッチャーが表示され、他のネットワークドライブと同様にストレージにアクセスできます。

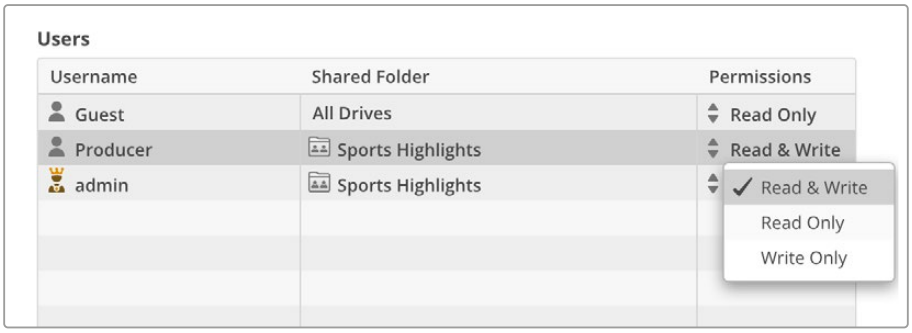
Permissions（権限）

「Permissions」は、共有フォルダー内でのユーザーのアクセスレベルを管理できます。フォルダーを最初にユーザーに割り当てる際、共有フォルダー内のコンテンツを追加、移動、変更、削除できる「読み取り/書き込み」の権限が該当のユーザーに与えられます。この共有フォルダーの権限を「Read Only（読み取り専用）」または「Write Only（書き込み専用）」に変更できます。「Read Only（読み取り専用）」に設定すると、ユーザーはフォルダー内のコンテンツを見ることはできますが、ファイルを追加、削除、変更することはできません。「Write Only（書き込み専用）」に設定すると、ユーザーはファイルをフォルダーにコピーできますが、コンテンツを見ることはできません。

権限を変更する：

1 「Security（セキュリティ）」タブの「Users（ユーザー）」リストからユーザーを選択します。

2 「Permission（権限）」の列でユーザーの現在の権限をクリックし、リストからオプションを選択します。



3 「Save（保存）」をクリックして、選択を確定します。

作業のこつ 「Guest（ゲスト）」ユーザーはデフォルトで作成され、ATEMスイッチャーのストレージにあるすべての共有フォルダーの読み取りと書き込みの権限が自動的に与えられます。ゲストユーザーの権限は、「Security」タブの「Permissions」セクションで、「Read & Write（読み取り/書き込み）」、「Write Only（書き込み専用）」、「Read Only（読み取り専用）」に変更できます。

Manage User（ユーザーの管理）

ユーザーのフォルダーの割り当て、ユーザー名、パスワードを変更したり、管理者アクセスを有効/無効にするには、「Manage User（ユーザーの管理）」オプションを使用します。

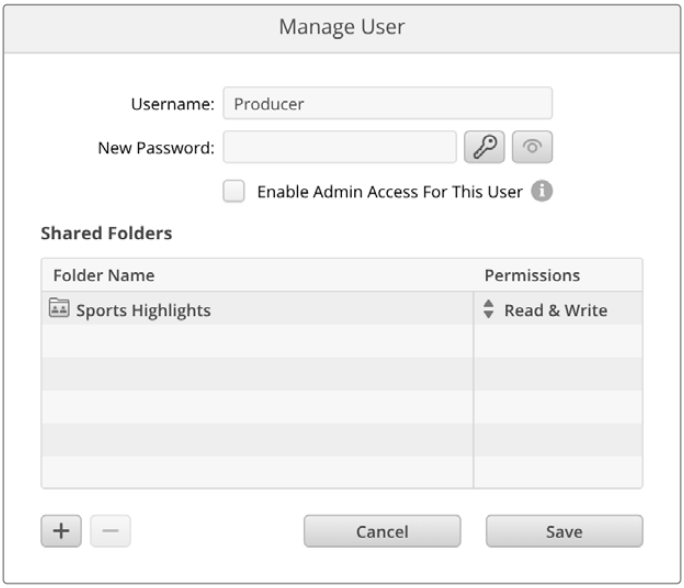
設定

ユーザーを管理する：

1 「Security（セキュリティ）」タブの「Users（ユーザー）」リストから、管理したいユーザーを選択します。

2 鉛筆のアイコンをクリックします。

3 「Manage Users（ユーザーの管理）」ウィンドウで、ユーザーの情報を更新します。



4 「Save」を押して変更を確定します。

ユーザーの削除

ユーザーを削除するには、「Security（セキュリティ）」タブの「Users（ユーザー）」リストから、削除したいユーザーを選択し、「−」ボタンを押します。「Delete（削除）」をクリックして確定します。ユーザーを削除すると、該当ユーザーはあらゆる共有フォルダーにアクセス不可になります。

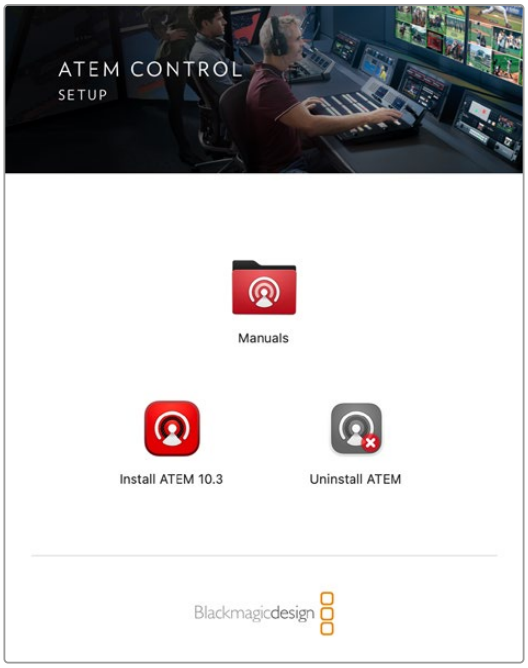
ソフトウェアアップデート

ATEMソフトウェアのアップデート方法

Blackmagic Designは、ATEMスイッチャーおよびハードウェアパネルの新しいソフトウェアを常にリリースしており、新機能の追加、バグ修正、サードパーティ製ソフトウェアおよびビデオデバイスとの互換性を向上させています。

ATEMスイッチャーを新しいソフトウェアにアップデートするには、ATEM Setupを使用してATEMスイッチャーおよびハードウェアパネルに接続します。ATEM Setupはスイッチャーの内部ソフトウェアをチェックし、コンピューターに新しいバージョンがインストールされている場合はアップデートするかをユーザーに確認します。

接続する機器は同じファームウェアバージョンである必要があります。アップデートは常に同じタイミングで行ってください。



ATEM Software Installer

アップデートする場合は、ATEMスイッチャーとコンピューターをUSBで直接接続できます。

スイッチャーとコンピューターをすでにイーサネット接続している場合は、イーサネット接続でのアップデートも可能です。

まずは、同マニュアルのソフトウェア・インストールのセクションを参照して、最新のBlackmagic ATEM Switcherソフトウェアをダウンロードし、MacあるいはPCにインストールします。インストールが完了すると、ATEMスイッチャー用の新しいソフトウェアがATEM Setupユーティリティに追加されます。

スイッチャーソフトウェアのアップデート

1 USBポートを使用してスイッチャーを接続します。

スイッチャーとコンピューターをすでにイーサネット接続している場合は、イーサネット接続でのアップデートも可能です。

ソフトウェアをUSB経由でアップグレードする際は、Setup Utilityソフトウェアを起動しているコンピューターにUSB接続されているATEMデバイスが該当のスイッチャーだけであることを確認して下さい。複数のATEMデバイスが接続されていると、スイッチャーを認識できない場合があります。

2 ATEM Setupを起動します。

3 スイッチャーソフトウェアのアップデートが必要な場合、ウィンドウが表示されソフトウェアをアップデートするかどうか確認されます。「Update」をクリックしてアップデートを開始します。この作業には数分かかる場合があります。ソフトウェアのアップデート中はスイッチャーから電源を抜かないでください。

4 ソフトウェアのアップデートが完了すると、ウィンドウが表示され、スイッチャーを再起動するよう指示がでます。スイッチャーの電源を切り、もう一度電源を入れ直して、ダイアログボックスを閉じます。

イーサネット経由でアップデート

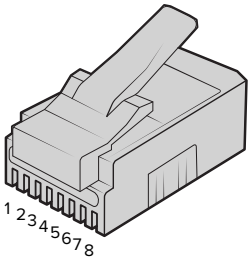
イーサネットを使用したATEMスイッチャーのアップデートは、よりスピーディで簡単です。しかし以下の状況では、イーサネット経由でのアップデートが実行できず、USBを使用しなければならない場合があります：

- 内部ソフトウェアを初めてアップデートする場合。
- ATEMネットワーク設定のコンフィギュレーションが完了しており、すぐに使用できる場合でも、他のビデオ機器を含むネットワークに接続している場合は、IPアドレスの重複が生じる場合があり、コンピューターとスイッチャーの間で通信ができない恐れがあります。ネットワーク設定は、USB経由でしか調整できません。

トークバックおよびカメラコントロール用のアダプターケーブル

トークバックのピン接続

ATEM Television Studioスイッチャーシリーズのバックパネルのトークバックコネクターは、エンジニア/プロダクショントークバックのルーティング用です。以下のピン配列ダイアグラムを使用して、RJ45コネクターのアダプターケーブルを作成できます。



Eng TX+	Eng TX-	Prod TX+	Prod RX+	Prod RX-	Prod TX-	Eng RX+	Eng RX-
1	2	3	4	5	6	7	8

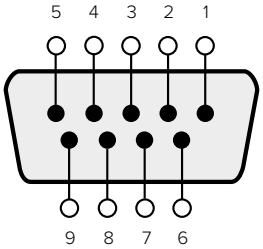
ATEM Television Studioのバックパネルにあるトークバックコネクター用RJ45ピン配列

コントロールケーブルを接続するシリアルポートのピンコネクター

コントロールケーブルを接続するRS-422ピンコネクター

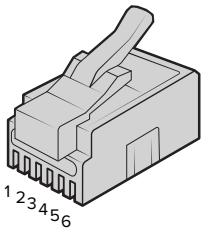
RS-422は通信規格のひとつで、一般的なDE-9あるいはRJ12コネクターを使用します。これらのタイプのコネクターは簡単に再配線できるため、PTZコントロールをカスタマイズして独自のコントロールをデザインできます。

RS-422 DE 9およびRJ12コネクターのピン配列ダイアグラムは、以下の通りです。



受信 (–)	受信 (+)	送信(–)	送信(+)	グランドピン
8	3	2	7	1, 4, 6, 9

RS-422 PTZピン接続



TX+	TX-	GND	GND	RX-	RX+
1	2	3	4	5	6

ATEM Television StudioのPTZリモート用RJ12ピン配列

5ピンXLRトークバックヘッドセットコネクターピン配列図

外観	ピン	信号	入力/出力	概要
 5ピンXLR"トークバック"ヘッドセットコネクター	1	インターコムマイク (Y)	In -	インターコムマイク入力は、ダイナミックマイク (バランス/アンバランス) をサポートしています。ピン1はマイク信号 (コモン) 、ピン2は両タイプのマイク信号入力です。エレクトレットマイクでは、航空用ヘッドセットを使用可能にする外部DCバイアス供給アダプターが必要です。
	2	インターコムマイク (X)	In +	
	3	GND	GND	GND
	4	左インターコム	出力	
	5	右インターコム	出力	

デベロッパーの皆様へ

Blackmagic SDI Camera Control Protocol

Version 1.3

If you are a software developer you can use the SDI Camera Control Protocol to construct devices that integrate with our products. Here at Blackmagic Design our approach is to open up our protocols and we eagerly look forward to seeing what you come up with!

Overview

The Blackmagic SDI Camera Control Protocol is used by ATEM switchers, Blackmagic 3G-SDI Shield for Arduino and the Blackmagic Camera Control app to provide Camera Control functionality with supported Blackmagic Design cameras. Please refer to the 'Understanding Studio Camera Control' chapter section of this manual, or the ATEM Switchers Manual and SDK manual for more information. These can be downloaded at www.blackmagicdesign.com/support.

This document describes an extensible protocol for sending a uni directional stream of small control messages embedded in the non-active picture region of a digital video stream. The video stream containing the protocol stream may be broadcast to a number of devices. Device addressing is used to allow the sender to specify which device each message is directed to.

Assumptions

Alignment and padding constraints are explicitly described in the protocol document. Bit fields are packed from LSB first. Message groups, individual messages and command headers are defined as, and can be assumed to be, 32 bit aligned.

Blanking Encoding

A message group is encoded into a SMPTE 291M packet with DID/SDID x51/x53 in the active region of VANC line 16.

Message Grouping

Up to 32 messages may be concatenated and transmitted in one blanking packet up to a maximum of 255 bytes payload. Under most circumstances, this should allow all messages to be sent with a maximum of one frame latency.

If the transmitting device queues more bytes of message packets than can be sent in a single frame, it should use heuristics to determine which packets to prioritize and send immediately. Lower priority messages can be delayed to later frames, or dropped entirely as appropriate.

Abstract Message Packet Format

Every message packet consists of a three byte header followed by an optional variable length data block. The maximum packet size is 64 bytes.

Destination device (uint8)	Device addresses are represented as an 8 bit unsigned integer. Individual devices are numbered 0 through 254 with the value 255 reserved to indicate a broadcast message to all devices.
Command length (uint8)	The command length is an 8 bit unsigned integer which specifies the length of the included command data. The length does NOT include the length of the header or any trailing padding bytes.

Command id (uint8)	The command id is an 8 bit unsigned integer which indicates the message type being sent. Receiving devices should ignore any commands that they do not understand. Commands 0 through 127 are reserved for commands that apply to multiple types of devices. Commands 128 through 255 are device specific.
Reserved (uint8)	This byte is reserved for alignment and expansion purposes. It should be set to zero.
Command data (uint8[])	The command data may contain between 0 and 60 bytes of data. The format of the data section is defined by the command itself.
Padding (uint8[])	Messages must be padded up to a 32 bit boundary with 0x0 bytes. Any padding bytes are NOT included in the command length.

Receiving devices should use the destination device address and or the command identifier to determine which messages to process. The receiver should use the command length to skip irrelevant or unknown commands and should be careful to skip the implicit padding as well.

Defined Commands

Command 0 : change configuration

Category (uint8)	The category number specifies one of up to 256 configuration categories available on the device.
Parameter (uint8)	The parameter number specifies one of 256 potential configuration parameters available on the device. Parameters 0 through 127 are device specific parameters. Parameters 128 though 255 are reserved for parameters that apply to multiple types of devices.
Data type (uint8)	The data type specifies the type of the remaining data. The packet length is used to determine the number of elements in the message. Each message must contain an integral number of data elements.

Currently defined values are:

0: void / boolean	A void value is represented as a boolean array of length zero. The data field is a 8 bit value with 0 meaning false and all other values meaning true.
1: signed byte	Data elements are signed bytes
2: signed 16 bit integer	Data elements are signed 16 bit values
3: signed 32 bit integer	Data elements are signed 32 bit values
4: signed 64 bit integer	Data elements are signed 64 bit values
5: UTF-8 string	Data elements represent a UTF-8 string with no terminating character.

Data types 6 through 127 are reserved.

128: signed 5.11 fixed point	Data elements are signed 16 bit integers representing a real number with 5 bits for the integer component and 11 bits for the fractional component. The fixed point representation is equal to the real value multiplied by 2^11. The representable range is from -16.0 to 15.9995 (15 + 2047/2048).

Data types 129 through 255 are available for device specific purposes.	
Operation type (uint8)	The operation type specifies what action to perform on the specified parameter. Currently defined values are:
0: assign value	The supplied values are assigned to the specified parameter. Each element will be clamped according to its valid range. A void parameter may only be 'assigned' an empty list of boolean type. This operation will trigger the action associated with that parameter. A boolean value may be assigned the value zero for false, and any other value for true.
1: offset / toggle value	Each value specifies signed offsets of the same type to be added to the current parameter values. The resulting parameter value will be clamped according to their valid range. It is not valid to apply an offset to a void value. Applying any offset other than zero to a boolean value will invert that value.
Operation types 2 through 127 are reserved.	
Operation types 128 through 255 are available for device specific purposes.	
Data (void)	The data field is 0 or more bytes as determined by the data type and number of elements.

The category, parameter, data type and operation type partition a 24 bit operation space.

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Lens	0.0	Focus	fixed16	–	0	1	0.0 = near, 1.0 = far
	0.1	Instantaneous autofocus	void	–	–	–	trigger instantaneous autofocus
	0.2	Aperture (f-stop)	fixed16	–	-1	16	Aperture Value (where fnumber = sqrt(2^AV))
	0.3	Aperture (normalised)	fixed16	–	0	1	0.0 = smallest, 1.0 = largest
	0.4	Aperture (ordinal)	int16	–	0	n	Steps through available aperture values from minimum (0) to maximum (n)
	0.5	Instantaneous auto aperture	void	–	–	–	trigger instantaneous auto aperture
	0.6	Optical image stabilisation	boolean	–	–	–	true = enabled, false = disabled
	0.7	Set absolute zoom (mm)	int16	–	0	max	Move to specified focal length in mm, from minimum (0) to maximum (max)
	0.8	Set absolute zoom (normalised)	fixed16	–	0	1	Move to specified focal length: 0.0 = wide, 1.0 = tele
	0.9	Set continuous zoom (speed)	fixed16	–	-1	+1.0	Start/stop zooming at specified rate: -1.0 = zoom wider fast, 0.0 = stop, +1 = zoom tele fast

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Video	1.0	Video mode	int8	[0] = frame rate	–	–	24, 25, 30, 50, 60
				[1] = M-rate	–	–	0 = regular, 1 = M-rate
				[2] = dimensions	–	–	0 = NTSC, 1 = PAL, 2 = 720, 3 = 1080, 4 = 2k, 5 = 2k DCI, 6 = UHD
				[3] = interlaced	–	–	0 = progressive, 1 = interlaced
				[4] = Color space	–	–	0 = YUV
	1.1	Gain	int8		1	16	1 = 100 ISO, 2 = 200 ISO, 4 = 400 ISO, 8 = 800 ISO, 16 = 1600 ISO
	1.2	Manual White Balance	int16	[0] = color temp	2500	10000	Color temperature in K
			int16	[1] = tint	-50	50	tint
	1.3	Set auto WB	void	–	–	–	Calculate and set auto white balance
	1.4	Restore auto WB	void	–	–	–	Use latest auto white balance setting
	1.5	Exposure (us)	int32		1	42000	time in us
	1.6	Exposure (ordinal)	int16	–	0	n	Steps through available exposure values from minimum (0) to maximum (n)
	1.7	Dynamic Range Mode	int8 enum	–	0	1	0 = film, 1 = video,
	1.8	Video sharpening level	int8 enum	–	0	3	0 = off, 1 = low, 2 = medium, 3 = high
	1.9	Recording format	int16	[0] = file frame rate	–	–	fps as integer (eg 24, 25, 30, 50, 60, 120)
				[1] = sensor frame rate	–	–	fps as integer, valid when sensor-off-speed set (eg 24, 25, 30, 33, 48, 50, 60, 120), no change will be performed if this value is set to 0
				[2] = frame width	–	–	in pixels
				[3] = frame height	–	–	in pixels
				[4] = flags	–	–	[0] = file-M-rate
					–	–	[1] = sensor-M-rate, valid when sensor-off-speed-set
					–	–	[2] = sensor-off-speed
					–	–	[3] = interlaced
					–	–	[4] = windowed mode
	1.10	Set auto exposure mode	int8	–	0	4	0 = Manual Trigger, 1 = Iris, 2 = Shutter, 3 = Iris + Shutter, 4 = Shutter + Iris
	1.11	Shutter angle	int32	–	100	36000	Shutter angle in degrees, multiplied by 100
	1.12	Shutter speed	int32	–	24	2000	Shutter speed value as a fraction of 1, so 50 for 1/50th of a second
	1.13	Gain	int8	–	-128	127	Gain in decibel (dB)
	1.14	ISO	int32	–	0	2147483647	ISO value

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Audio	2.0	Mic level	fixed16	–	0	1	0.0 = minimum, 1.0 = maximum
	2.1	Headphone level	fixed16	–	0	1	0.0 = minimum, 1.0 = maximum
	2.2	Headphone program mix	fixed16	–	0	1	0.0 = minimum, 1.0 = maximum
	2.3	Speaker level	fixed16	–	0	1	0.0 = minimum, 1.0 = maximum

Blackmagic Embedded Tally Control Protocol

Version 1.0 (30/04/14)

This section is for third party developers or users who may wish to add support for the Blackmagic Embedded Tally Control Protocol to their products or system. It describes the protocol for sending tally information embedded in the non-active picture region of a digital video stream.

Data Flow

A master device such as a broadcast switcher embeds tally information into its program feed which is broadcast to a number of slave devices such as cameras or camera controllers. The output from the slave devices is typically fed back to the master device, but may also be sent to a video monitor.

The primary flow of tally information is from the master device to the slaves. Each slave device may use its device id to extract and display the relevant tally information.

Slave devices pass through the tally packet on their output and update the monitor tally status, so that monitor devices connected to that individual output may display tally status without knowledge of the device id they are monitoring.

Assumptions

Any data alignment / padding is explicit in the protocol. Bit fields are packed from LSB first.

Blanking Encoding

One tally control packet may be sent per video frame. Packets are encoded as a SMPTE 291M packet with DID/SDID x51/x52 in the active region of VANC line 15. A tally control packet may contain up to 256 bytes of tally information.

Packet Format

Each tally status consists of 4 bits of information:

uint4

bit 0: program tally status (0=off, 1=on)

bit 1: preview tally status (0=off, 1=on)

bit 2-3: reserved (0x0)

The first byte of the tally packet contains the monitor device tally status and a version number.

Subsequent bytes of the tally packet contain tally status for pairs of slave devices. The master device sends tally status for the number of devices configured/supported, up to a maximum of 510.

struct tally

uint8

bit 0: monitor device program tally status (0=off, 1=on)

bit 1: monitor device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4-7: protocol version (0b0000)

uint8[0]

bit 0: slave device 1 program tally status (0=off, 1=on)

bit 1: slave device 1 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 2 program tally status (0=off, 1=on)

bit 5: slave device 2 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

uint8[1]

bit 0: slave device 3 program tally status (0=off, 1=on)

bit 1: slave device 3 device preview tally status (0=off, 1=on)

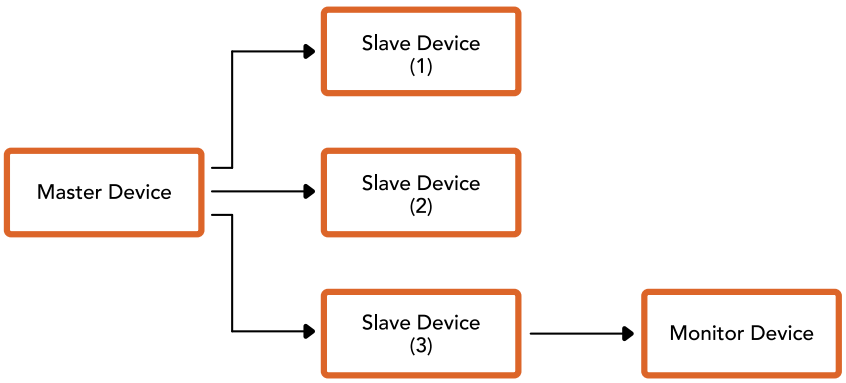
bit 2-3: reserved (0b00)

bit 4: slave device 4 program tally status (0=off, 1=on)

bit 5: slave device 4 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

. . .



Byte	7 MSB	6	5	4	3	2	1	0 LSB

ヘルプライン

すぐに情報が必要な方は、Blackmagic Designオンラインサポートページで、ATEMスイッチャーの最新サポート情報を確認できます。

Blackmagic Designオンラインサポートページ

最新のマニュアル、ソフトウェア、サポートノートは、www.blackmagicdesign.com/jp/supportのBlackmagicサポートセンターで確認できます。

Blackmagic Designサポートに連絡する

サポートページで必要な情報を得られなかった場合は、サポートページの「メールを送信」ボタンを使用して、サポートのリクエストをメール送信してください。あるいは、サポートページの「お住まいの地域のサポートオフィス」をクリックして、お住まいの地域のBlackmagic Designサポートオフィスに電話でお問い合わせください。

現在インストールされているバージョンを確認する

コンピューターにインストールされているATEMソフトウェアのバージョンを確認するには、「About ATEM Software Control」ウィンドウを開きます。

- Macでは、「Applications」フォルダーから「ATEM Software Control」を開きます。アプリケーションメニューから「About ATEM Software Control」を選択すると、バージョン番号が表示されます。
- Windowsでは、「Start」メニューから「ATEM Software Control」を開きます。メニューバーで「Help」をクリックして「About」を選択すると、バージョン番号が表示されます。

最新のソフトウェアを入手する

コンピューターにインストールされているATEMソフトウェアのバージョンを確認したら、Blackmagic Designサポートセンター（www.blackmagicdesign.com/jp/support）で最新のアップデートをチェックしてください。常に最新のソフトウェアを使用することを推奨しますが、重要なプロジェクトの実行中は、ソフトウェアのアップデートは行わない方がよいでしょう。

規制に関する警告

欧州連合内での電気機器および電子機器の廃棄処分

製品に記載されている記号は、当該の機器を他の廃棄物と共に処分してはならないことを示しています。機器を廃棄するには、必ずリサイクルのために指定の回収場所に引き渡してください。機器の廃棄において個別回収とリサイクルが行われることで、天然資源の保護につながり、健康と環境を守る方法でリサイクルが確実に行われるようになります。廃棄する機器のリサイクルのための回収場所に関しては、お住まいの地方自治体のリサイクル部門、または製品を購入した販売業者にご連絡ください。

この機器は、FCC規定の第15部に準拠し、クラスAデジタル機器の制限に適合していることが確認されています。これらの制限は、商用環境で機器を使用している場合に有害な干渉に対する妥当な保護を提供するためのものです。この機器は無線周波エネルギーを生成、使用、放出する可能性があります。また、指示に従ってインストールおよび使用しない場合、無線通信に有害な干渉を引き起こす恐れがあります。住宅地域で当製品を使用すると有害な干渉を引き起こす可能性があり、その場合はユーザーが自己責任で干渉に対処する必要があります。

動作は次の2つを条件とします：

1. 本機は、有害な干渉を起こさない。
2. 本機は希望しない動作を発生しかねない干渉を含む、いかなる受信干渉も受け入れる必要がある。

R-R-BMD-20220729001
R-R-BMD-20220729002
R-R-BMD-20230316001
R-REM-BMD-201805002

ISED Canadaステートメント

本機は、カナダのクラスAデジタル機器の規格に準拠しています。

本機のいかなる改造、あるいは目的の用途以外での使用は、これらの規格への順守を無効にすることがあります。

HDMIインターフェースへの接続は、必ず高品質のシールドHDMIケーブルを使用する必要があります。

本機は、商用環境で目的の用途に順守した使用においてテストを行なっています。非商用環境で使用された場合、無線妨害を引き起こす可能性があります。

安全情報

感電を避けるため、当製品は必ずアース端子付きコンセントに接続してください。不確かな場合は、資格を持つ電気技師に連絡してください。

感電のリスクを減らすため、水が跳ねたり、滴るような場所には置かないでください。

ユニットに接続するDC電源が、DC INコネクターに表示された入力電圧および定格電流に適合していることを確認してください。

この製品は、周囲温度が最高40度までの熱帯地区での使用に対応しています。

通気が妨げられないように、この製品の周囲は通気に十分なスペースを開けるようにしてください。

この製品の内部には、ユーザーが保守できる部品はありません。サービスに関しては、お近くのBlackmagic Designのサービスセンターにお問い合わせください。

海抜2000m以上では使用しないでください。

カリフォルニア州ステートメント
この製品のユーザーは、プラスチック部品内の微量の多臭素化ビフェニルなどの化学物質にさらされる可能性があります。カリフォルニア州は、多臭素化ビフェニルは発がん性があり、先天異常や生殖機能へ危害を及ぼす物質であると認識しています。

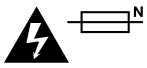
正規サービススタッフへの注意

メンテナンス前に、電源を電源インレットから外してください。



警告 – 二極/中性ヒューズ
この機器の電源供給には、電圧線と中性線の両方にヒューズが使われており、ノルウェーのIT電力分配システムへの接続にも適しています。

保証

12ヶ月限定保証

Blackmagic Designは、 お買い上げの日から12ヶ月間、 本製品の部品および仕上がりについて瑕疵がないことを保証します。この保証期間内に製品に瑕疵が見つかった場合、Blackmagic Designは弊社の裁量において部品代および人件費無料で該当製品の修理、あるいは製品の交換のいずれかで対応いたします。

この保証に基づいたサービスを受ける際、お客様は必ず保証期限終了前にBlackmagic Designに瑕疵を通知し、保証サービスの手続きを行ってください。お客様の責任において不良品を梱包し、 Blackmagic Designが指定するサポートセンターへ配送料前払で送付いただきますようお願い致します。理由の如何を問わず、 Blackmagic Designへの製品返送のための配送料、 保険、 関税、 税金、 その他すべての費用はお客様の自己負担となります。

不適切な使用、または不十分なメンテナンスや取扱いによる不具合、故障、損傷に対しては、この保証は適用されません。Blackmagic Designはこの保証で、以下に関してサービス提供義務を負わないものとします。a) 製品のインストールや修理、サービスを行うBlackmagic Design販売代理人以外の者によって生じた損傷の修理、b) 不適切な使用や互換性のない機器への接続によって生じた損傷の修理、c) Blackmagic Designの部品や供給品ではない物を使用して生じたすべての損傷や故障の修理、d) 改造や他製品との統合により時間増加や製品の機能低下が生じた場合のサービス。この保証はBlackmagic Designが保証するもので、明示または黙示を問わず他の保証すべてに代わるものです。Blackmagic Designとその販売社は、商品性と特定目的に対する適合性のあらゆる黙示保証を拒否します。Blackmagic Designの不良品の修理あるいは交換の責任が、特別に、間接的、偶発的、または結果的に生じる損害に対して、Blackmagic Designあるいは販売社がそのような損害の可能性についての事前通知を得ているか否かに関わらず、お客様に提供される完全唯一の救済手段となります。Blackmagic Designはお客様による機器のあらゆる不法使用に対して責任を負いません。Blackmagic Designは本製品の使用により生じるあらゆる損害に対して責任を負いません。使用者は自己の責任において本製品を使用するものとします。

Mélangeurs ATEM Television Studio

ATEM Television Studio HD8
ATEM Television Studio HD8 ISO
ATEM Television Studio 4K8

Chère cliente, cher client,

Nous vous remercions d’avoir fait l’acquisition d’un mélangeur ATEM Television Studio pour vos travaux de production en direct !

Si les mélangeurs de production en direct sont nouveaux pour vous, vous êtes sur le point de découvrir le secteur le plus passionnant de l'industrie de la télévision : la production en direct ! Il n'y a rien de tel que la production en direct. Il est tellement facile de devenir accro à la poussée d’adrénaline provoquée par le montage en temps réel, alors que l’événement en direct se déroule sous vos yeux. Vous voilà plongé dans de la vraie production télévisée.

Dans le passé, la production en direct de qualité broadcast était une solution trop onéreuse pour la plupart des gens. De plus, les mélangeurs bon marché étaient de piètre qualité et leurs fonctionnalités étaient limitées. Les mélangeurs ATEM Television Studio vous font entrer dans une nouvelle ère et vous permettront d’obtenir des résultats professionnels. Nous espérons que vous vous servirez de votre mélangeur pendant des années et que vous prendrez beaucoup de plaisir à faire de la production en direct.

Ce manuel d’instruction contient toutes les informations dont vous aurez besoin pour installer et utiliser votre mélangeur ATEM Television Studio.

Veuillez consulter la page d’assistance sur notre site Internet www.blackmagicdesign.com/fr pour obtenir la dernière version du logiciel ATEM. Connectez simplement votre ordinateur au mélangeur ATEM et au panneau de contrôle matériel ATEM via USB pour mettre à jour votre logiciel. Vous obtiendrez ainsi les dernières fonctions disponibles ! Enfin, veuillez enregistrer votre équipement lors du téléchargement du logiciel afin que nous puissions vous tenir informés des mises à jour. Nous souhaitons continuellement améliorer nos produits, n'hésitez donc pas à nous faire part de vos commentaires !

Grant Petty
PDG de Blackmagic Design

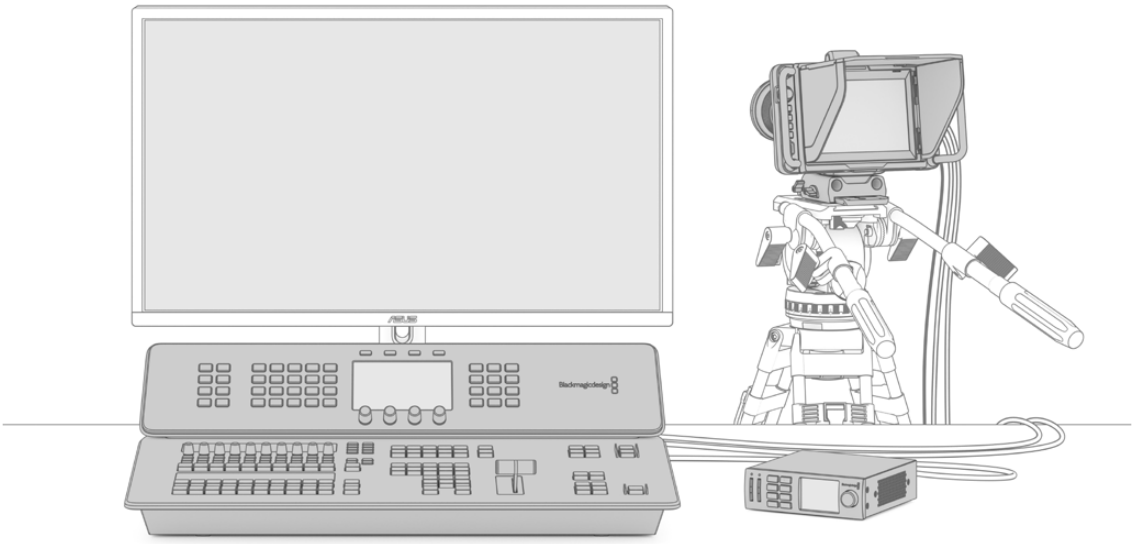
Découvrez l’ATEM Television Studio

Les mélangeurs ATEM Television Studio sont des mélangeurs de production numériques de qualité broadcast pour professionnels, capables de basculer et de traiter une variété de sources vidéo dans des environnements de production vidéo et de diffusion en direct. Le mélangeur est pourvu d’un design standard de type M/E (Mix Effects) avec des options de contrôle logicielles et matérielles. Il fournit un workflow rapide en basculant entre les fonctions programme/prévisualisation. Si vous avez l’habitude des anciens modèles de mélangeurs de type A/B, les mélangeurs ATEM prennent également en charge la commutation directe A/B, ce qui facilite la mise en route.

Vous n’avez besoin que de votre mélangeur ATEM pour commencer, car il intègre un panneau de contrôle qui vous permettra de commuter les sources de votre production en direct. Toutefois, pour plus de polyvalence, vous pouvez également utiliser le logiciel ATEM Software Control et, pour une solution plus avancée, ajouter un ou plusieurs panneaux de contrôle matériels.



Pour installer votre mélangeur ATEM Television Studio, il suffit de brancher la sortie multi view à un moniteur, de connecter une caméra et de relier la sortie programme à un enregistreur.

Qu'est-ce qu'un mélangeur M/E ?

Si vous avez utilisé des mélangeurs peu onéreux dans le passé, ils ne fonctionnaient sans doute pas selon le mode Mix Effects communément abrégé par M/E. En revanche, si vous avez déjà utilisé un mélangeur de type M/E, vous pouvez si vous le souhaitez, passer cette étape et vous mettre au travail avec votre nouveau mélangeur ATEM.

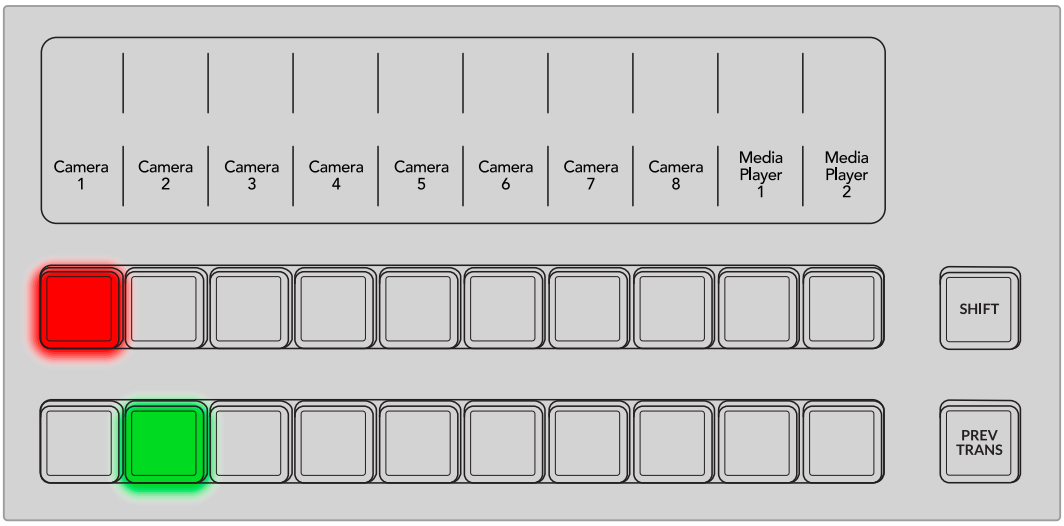
Si c’est la première fois que vous utilisez un mélangeur, l'ATEM peut paraître quelque peu intimidant avec tous ses boutons et ses molettes. Rassurez-vous : il est très logiquement structuré et très simple à utiliser.

L'ATEM est un véritable mélangeur de diffusion haut de gamme qui fonctionne à l'aide des standards de workflow M/E utilisés dans l’industrie de la diffusion. Ainsi, lorsque vous vous serez familiarisé avec son fonctionnement, vous serez à l'aise avec la plupart des mélangeurs utilisés actuellement dans le domaine de la diffusion.

Le mode de fonctionnement M/E a été développé sur plusieurs décennies pour permettre d’éliminer les erreurs de commutation durant les événements en direct et répond aux standards de la diffusion. En effet, il permet de savoir ce qui se passe en permanence, ce qui évite toute confusion et toute création d'erreurs. Le mode de fonctionnement M/E permet de vérifier les sources et les effets avant leur passage à l'antenne. Vous avez devant vous les boutons représentant toutes les incrustations et les transitions, vous savez donc instantanément ce qui est en train de se passer et ce qui va arriver juste après.

La meilleure façon d'en apprendre davantage sur le fonctionnement de votre ATEM est de prendre votre mélangeur et de tester ses fonctionnalités tout en consultant ce manuel. Vous allez peut-être même être tenté de sauter le pas et d'installer votre mélangeur avant même d'avoir terminé la lecture de ce paragraphe.

Pour commencer, la partie la plus visible du panneau de contrôle M/E est le levier de transition, qui est une barre en forme de T, ainsi que les bus Programme et Prévisualisation qui contiennent les boutons source.



Les boutons des rangées Programme et Prévisualisation vous permettent de prévisualiser une source, puis de la commuter à l'antenne

Plusieurs types de transitions sont disponibles et sélectionnables à l'aide des boutons du contrôle système à gauche de l'écran LCD, ou en appuyant sur le bouton représentant la transition souhaitée sur le panneau de contrôle. Vous pouvez choisir entre de nombreux motifs wipe ou effets DVE, puis utiliser le menu à l'écran pour ajuster la durée de la transition et d'autres paramètres relatifs à la transition.

Lorsque vous utilisez des mélangeurs de style M/E, y compris les modèles ATEM, la vidéo se trouvant sur les rangées Programme et Prévisualisation se nomme vidéo d'arrière-plan. Elle est appelée ainsi car les incrustateurs en amont (effets) et les incrustateurs en aval se superposent à cette source. Vous pouvez donc télécharger des graphiques sur les incrustateurs et les visualiser sur la vidéo de prévisualisation. Une fois les incrustations activées, ils viendront se superposer à la vidéo programme. C'est une fonction très efficace qui permet de construire plusieurs couches.

Un autre avantage du mode de fonctionnement M/E est que vous pouvez lier des incrustateurs à la transition. Ainsi, lorsque vous réalisez une transition mix, vous pouvez effectuer simultanément des fondus d'incrustations en entrée et en sortie. Cela vous permet de créer une composition, et de faire passer le tout à l'antenne en même temps. C'est le rôle des boutons Next Transition/Transition suivante. Vous pouvez sélectionner des arrière-plans pour les transitions normales ou sélectionner une ou plusieurs incrustations et les faire passer à l'antenne.

Vous pouvez également appuyer sur plusieurs boutons du panneau de contrôle de l'ATEM Television Studio pour lier l'arrière-plan et plusieurs incrustations en même temps. Vous trouverez également des boutons spécialement conçus pour lier les incrustations en aval à la transition. Les incrustations en aval sont très polyvalentes et disposent également de boutons cut et mix. Les incrustateurs en aval sont toujours superposés à toutes les autres couches, y compris celle de la transition. Ils sont donc très utiles pour les incrustations de graphiques et de logos.

Enfin, lorsque vous finalisez vos travaux de production en direct, la commande Fade to Black (FTB) s'avère très utile pour réaliser un fondu au noir. La commande Fade to Black se trouve en bas à droite sur le mélangeur. Elle vous permet d'effectuer un fondu au noir et, par la même occasion, de vérifier que vous n'avez pas oublié de couche. Le fondu au noir est la dernière étape du processus, vous obtenez donc un fondu de toutes vos sources.

La dernière section d'un mélangeur de type M/E est le bus de sélection. Il est situé au-dessus de la rangée programme, et permet de sélectionner les sources, notamment pour créer des effets.

Le libellé figurant au-dessus indique les sources que vous êtes en train de commuter. Le bus de sélection permet de sélectionner les entrées des incrustations et peut également être utilisé pour exécuter des macros directement à partir du panneau de contrôle.

Comme ce bref aperçu vous le démontre, le mode de fonctionnement M/E permet une production en direct efficace. Il vous donne un feedback précis de ce qui se passe, des paramètres de votre mélangeur et du programme à n'importe quel moment de votre production. Une fois que vous vous serez familiarisé avec le mode de fonctionnement M/E, vous pourrez jongler entre différents modèles de mélangeurs de production, car ils fonctionnent tous de la même manière.

Qu'est-ce qu'un mélangeur de type A/B ?

Si vous utilisez des mélangeurs vidéo depuis longtemps, les modèles plus anciens de mélangeurs de type A/B n'ont certainement aucun secret pour vous.

Les mélangeurs de type A/B sont équipés d'un bus A et d'un bus B. Le premier est le bus Programme qui indique la sortie programme actuelle au moyen d'un bouton rouge. Le deuxième est le bus Prévisualisation qui indique la prévisualisation de la vidéo au moyen d'un bouton vert. Lorsque vous déplacez le levier de transition vers le haut ou vers le bas, les bus s'intervertissent afin que le bouton de programme rouge suive le levier. Le mode de commutation directe A/B est très facile à utiliser car les boutons restent allumés au même endroit et c'est uniquement les couleurs rouge et verte qui s'intervertissent.

La commutation directe de type A/B peut paraître un peu plus complexe lorsque la commutation n'est pas effectuée au moyen du levier de transition. Si vous utilisez un bouton de transition Cut ou Auto pour faire passer votre source de prévisualisation à l'antenne, ou si vous utilisez plus d'un panneau de contrôle sur votre mélangeur, le levier de transition n'aura pas changé de place sur le panneau de contrôle que vous utilisez. La sortie programme rouge suit toujours le levier de transition. Et comme vous ne l'avez pas déplacé, le voyant rouge du programme doit se déplacer sur un autre bouton situé sur la même rangée et le voyant de prévisualisation vert doit se déplacer sur un autre bouton dans sa rangée.

Vous pouvez facilement vous embrouiller lorsque vous n'utilisez pas le levier de transition pour toutes les commutations, car les rangées contenant vos boutons de prévisualisation et de programme vont parfois basculer et parfois rester au même endroit, ce qui peut entraîner des erreurs.

C'est la raison pour laquelle un modèle plus moderne de style M/E est préférable, car le bouton de prévisualisation vert se situe toujours dans la rangée intitulée Preview, et le bouton de programme rouge dans la rangée intitulée Program. La commutation de style M/E offre un résultat consistant et vous permet d'éviter les mauvaises surprises.

Comprendre les mélangeurs ATEM

Les mélangeurs ATEM Television Studio couvrent tout le traitement vidéo et vous fournissent tous les connecteurs d'entrée et de sortie vidéo.

Le mélangeur intègre un panneau de contrôle doté de boutons et de molettes pour une commuation directe à partir du mélangeur. Toutefois, vous pouvez également le connecter à un ordinateur via Ethernet et utiliser le logiciel ATEM Software Control qui offre les mêmes commandes. Plusieurs opérateurs peuvent commuter votre production en utilisant le panneau logiciel et le panneau de contrôle intégré au mélangeur. Vous pouvez par exemple commuter les caméras à l’aide du panneau intégré alors que les autres opérateurs contrôlent la caméra et les niveaux audio à l’aide du panneau logiciel. Les options sont infinies.

Les mélangeurs ATEM Television Studio supportent la vidéo HD jusqu’à 1080p60 via 3G-SDI. Les mélangeurs ATEM Television Studio 4K8 supportent la vidéo 4K jusqu’à 2160p60. Comme toutes les entrées de votre mélangeur intègrent un synchronisateur et un convertisseur de normes, vous pouvez connecter différents formats qui seront automatiquement convertis vers le format de sortie réglé sur le mélangeur.

Chaque mélangeur comprend des incrustateurs chroma avancés, un mixeur audio Fairlight, des commandes pour le contrôle caméra, la possibilité de charger des images dans la bibliothèque de médias et bien plus. Lorsqu’il est connecté à un réseau, vous pouvez sélectionner les entrées de streaming ou enregistrer directement sur un stockage en réseau.

Les ATEM Television Studio comprennent des sorties auxiliaires compatibles avec toutes les sources vidéo internes et externes. Par exemple, des flux de programme, si vous avez besoin de plus de signaux de sortie du programme, ou des clean feeds sans incrustations en aval, et même des entrées vidéo spécifiques. Les ATEM Television Studio HD8 disposent de 2 sorties auxiliaires, alors que les ATEM Television Studio 4K8 en ont 10. Les sorties auxiliaires supplémentaires des ATEM Television Studio 4K8 peuvent être connectées à des enregistreurs à disque HyperDeck externes, et vous pouvez enregistrer toutes les entrées vidéo pour un montage ultérieur. L'enregistrement des entrées vidéo est appelé enregistrement ISO, car vous enregistrez les entrées isolées.

ATEM Television Studio HD8 ISO

ATEM Television Studio HD8

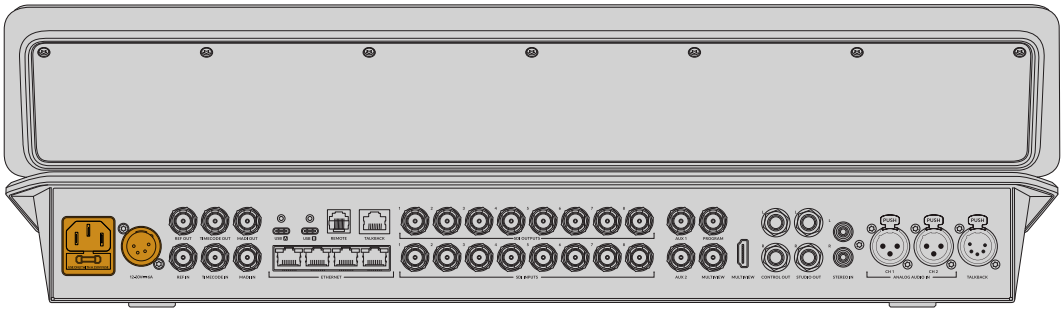
ATEM Television Studio 4K8

Mise en route

Pour démarrer avec votre ATEM Television Studio, il suffit de brancher l'alimentation, d'ajouter vos sources vidéo SDI, de connecter le multi view et d'utiliser le panneau de contrôle intégré pour vérifier vos entrées.

Brancher l'alimentation

Pour allumer votre ATEM Television Studio, branchez un câble CEI standard à l'entrée d'alimentation du panneau arrière. Les modèles de mélangeurs ATEM Television Studio comprennent également une entrée DC qui vous permet d'alimenter l'appareil depuis une batterie 12V externe. Une fois le mélangeur alimenté, les écrans LCD du panneau de contrôle et les boutons des caméras s'allumeront.



Connectez l'alimentation via les entrées CEI ou DC de l'ATEM Television Studio.

Connecter le multi view

Pour vérifier les entrées, connectez un écran à la sortie multi view à l'aide des connexions multi view SDI ou HDMI.

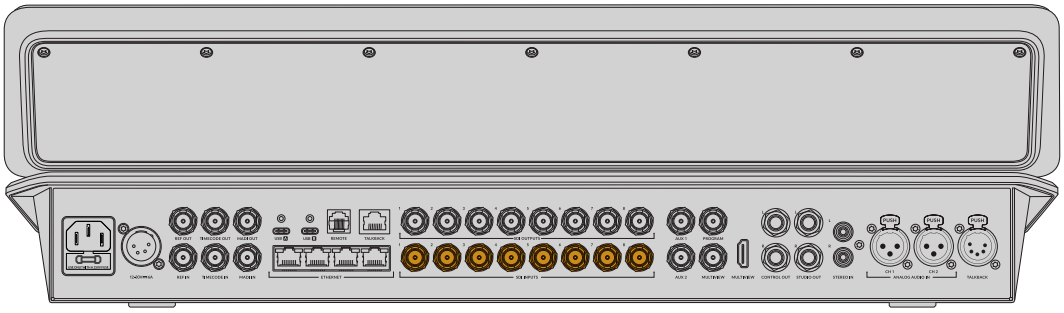
Une fois connecté, 8 petites et 2 grandes fenêtres devraient s'afficher à l'écran. Chaque fenêtre représente une vue et dès que vous connectez des sources supplémentaires, elles apparaîtront dans leur fenêtre respective. Vous pouvez personnaliser l'apparence du multi view pour afficher jusqu'à 16 vues via l'ATEM Software Control. Pour plus d'informations, consultez la section « Utiliser le multi view » de ce manuel.

Si vous pouvez visualiser le multi view, alors votre ATEM est alimenté et fonctionne correctement. Vous pouvez donc commencer à brancher les sources.

Connectez votre ATEM Television Studio à un moniteur pour visualiser la sortie multi view

Connecter des sources

Branchez vos caméras SDI et autres sources aux entrées SDI de l'ATEM Television Studio SDI. Ces connexions SDI sont dotées de convertisseurs de format et de synchroniseurs d'image. Ainsi, toutes les sources seront conformes au format de la vidéo réglée sur votre mélangeur.

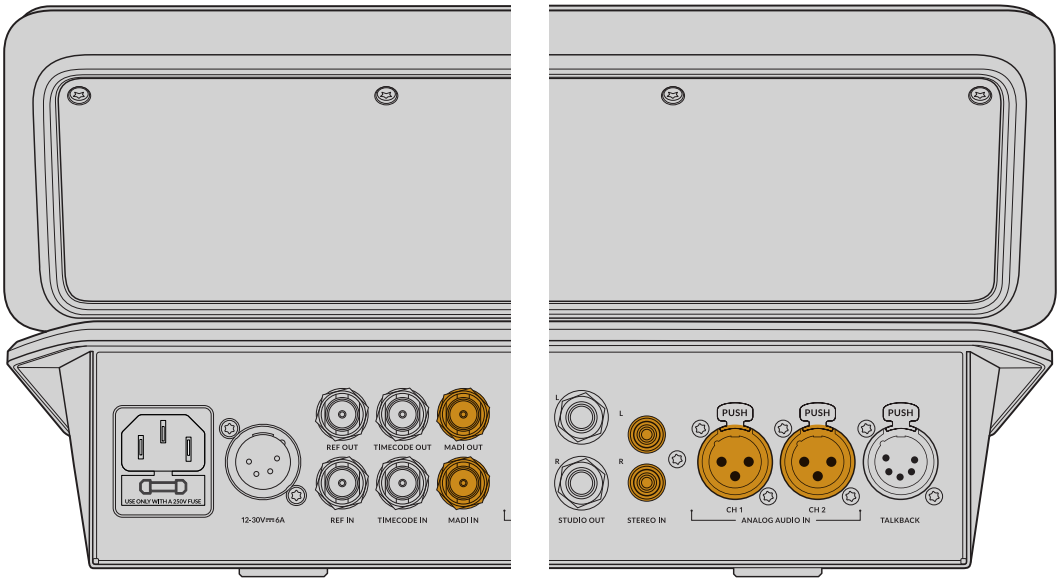


Entrées SDI de l'ATEM Television Studio

Sur les mélangeurs ATEM Television Studio HD8 ISO, vous pouvez aussi connecter des sources de streaming via les ports Ethernet, comme la Blackmagic Studio Camera 6K Pro. Pour plus d'informations sur la sélection des sources via Ethernet, consultez la section « Fonctionnalités supplémentaires des modèles ISO » de ce manuel.

Brancher l'audio

Les mélangeurs ATEM Television Studio incluent un mixeur audio qui permet d'utiliser l'audio SDI intégré à vos caméras, ainsi que l'audio externe des entrées XLR et RCA, et celui des entrées BNC MADI. Ces entrées audio supplémentaires peuvent être utilisées pour d'autres sources audio telles que des microphones de caméra et de l'audio préenregistré.



Entrées audio sur l'ATEM Television Studio

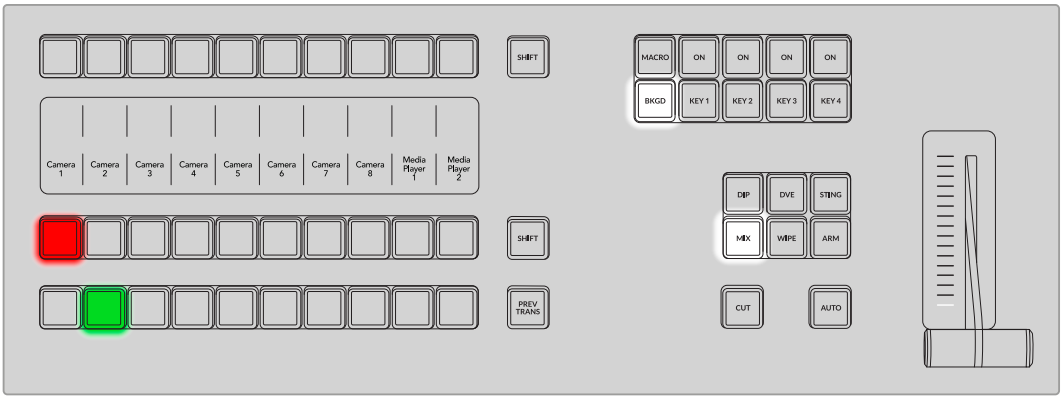
Une fois l'audio connecté, vous pouvez confirmer le signal de chaque canal en regardant les niveaux du mixeur audio du panneau de contrôle.

Vérifiez les niveaux audio via les indicateurs audio du mixeur audio Fairlight

Pour plus d'informations, consultez la section « Mixeur audio » de ce manuel.

Effectuer une transition

Pour commencer, la partie la plus visible du panneau de contrôle M/E est le levier de transition, qui est une barre en forme de T, ainsi que les bus Programme et Prévisualisation qui contiennent les boutons source.

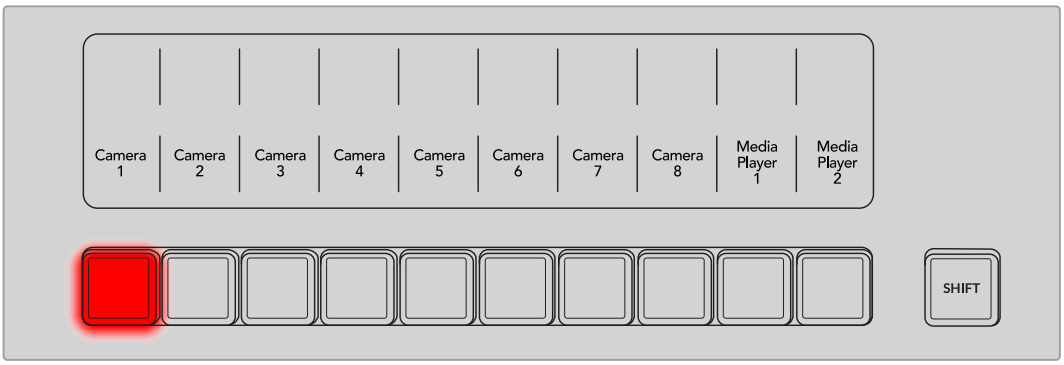


Lorsque vous vérifiez votre configuration, vous pourriez vouloir effectuer une transition.

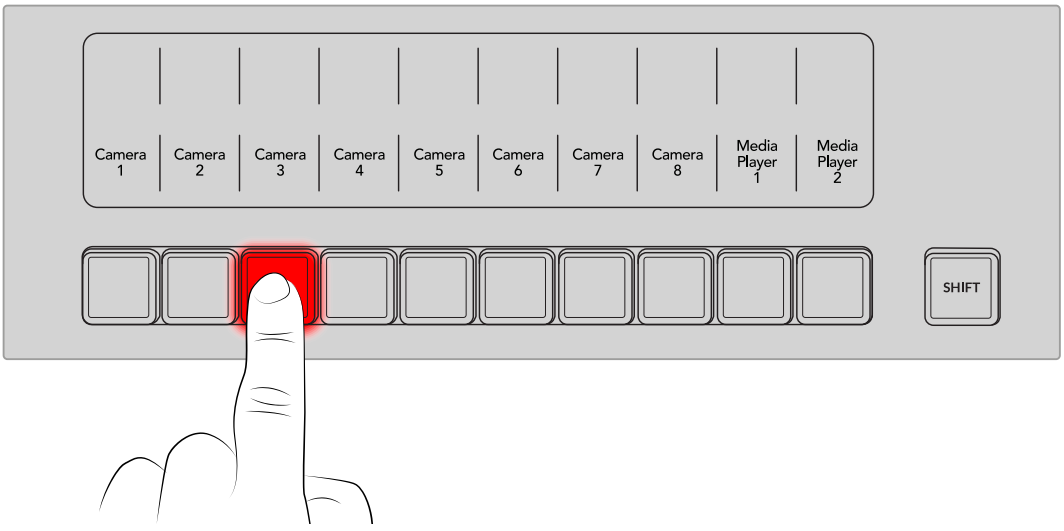
Votre mélangeur ATEM Television Studio offre deux modes de commutation. Le mode **Programme/Prévisualisation** réglé par défaut permet de prévisualiser la source avant de la commuter à l'antenne. Toutefois, les boutons de sélection des sources du bus programme dans la rangée supérieure peuvent être utilisés pour une commutation rapide et directe des sources sur le signal de sortie programme. Soyez vigilants lorsque vous sélectionnez vos sources sur ce bus, car elles passeront instantanément à l'antenne.

Effectuer un Cut de l'entrée 1 à l'entrée 3 avec la rangée Programme :

1 L'entrée 1 est allumée en rouge pour indiquer qu'elle est en direct à l'antenne.



2 Dans la rangée Programme, appuyez sur l'entrée 3.



L’entrée 1 commute immédiatement sur l’entrée 3. Le bouton de l’entrée 3 s’allume en rouge, ce qui signifie que l’entrée 3 est à présent à l’antenne. Cette opération est appelée Cut, car c’est une coupe franche d’une source à l’autre.

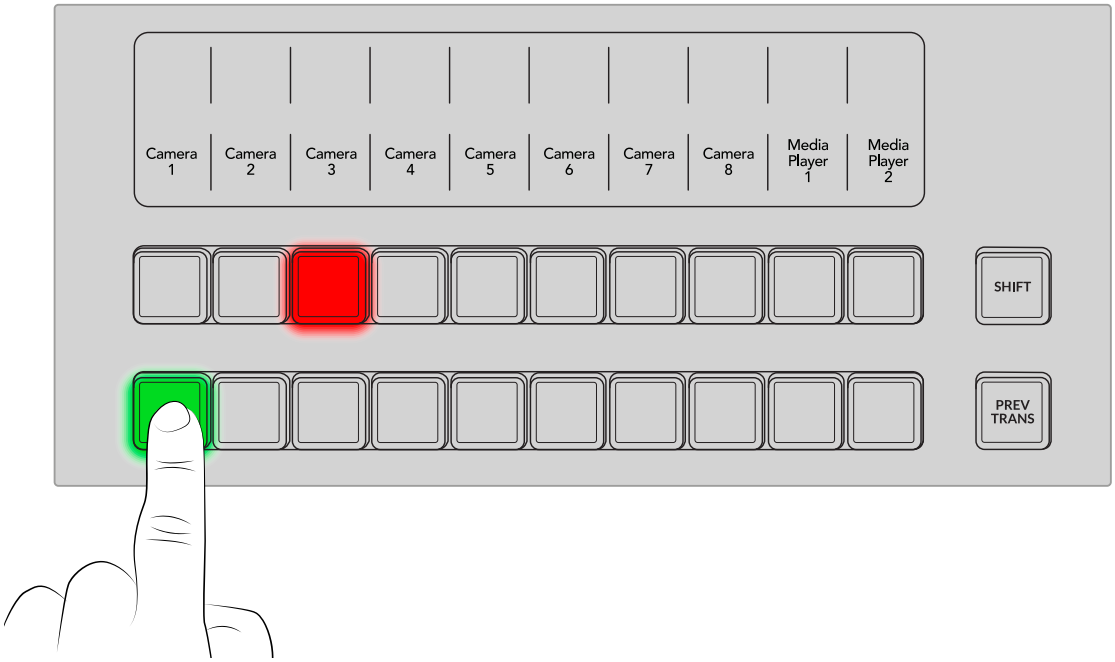
La meilleure façon d'effectuer des transitions est de les sélectionner sur le bus Prévisualisation, puis d'utiliser une transition pour les faire passer à l'antenne.

C'est une manière très efficace d'utiliser un mélangeur. En effet, en sélectionnant votre source sur la rangée prévisualisation, vous pouvez la visualiser sur la sortie prévisualisation afin de confirmer que vous avez la bonne source avant de sélectionner la transition souhaitée. Vous pouvez voir ce qui se passe à toutes les étapes du processus : il est de ce fait difficile de faire des erreurs. Seul le mode de fonctionnement M/E vous permet de savoir exactement ce qui se passe.

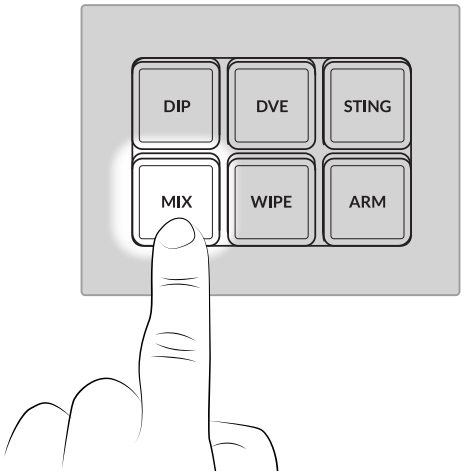
La rangée de boutons du bas permet de sélectionner les sources du bus prévisualisation. C'est à cet endroit que vous passerez une grande partie de votre temps à sélectionner les sources qui vont passer à l'antenne. La source sélectionnée est envoyée au signal de sortie programme lors de la transition suivante. Cette dernière peut être activée en appuyant sur le bouton cut, le bouton auto, ou en déplaçant le levier de transition vers le bas ou vers le haut. Vous pouvez choisir entre une transition mix, dip, wipe, DVE ou autres en fonction de ce que vous avez sélectionné dans la section de contrôle des transitions.

Dans l’exemple suivant, un mix est utilisé pour passer de la source 3 à la source 1.

1 Sélectionnez la source suivante en appuyant sur le bouton 1 dans la rangée prévisualisation. Ce bouton s'allume en vert pour indiquer qu'il est sélectionné sur le bus prévisualisation.

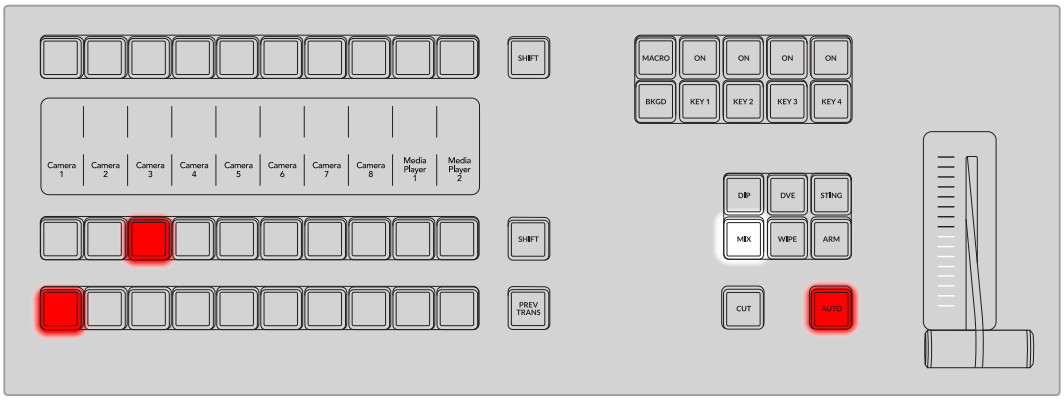


2 Appuyez sur le bouton de transition **Mix**.

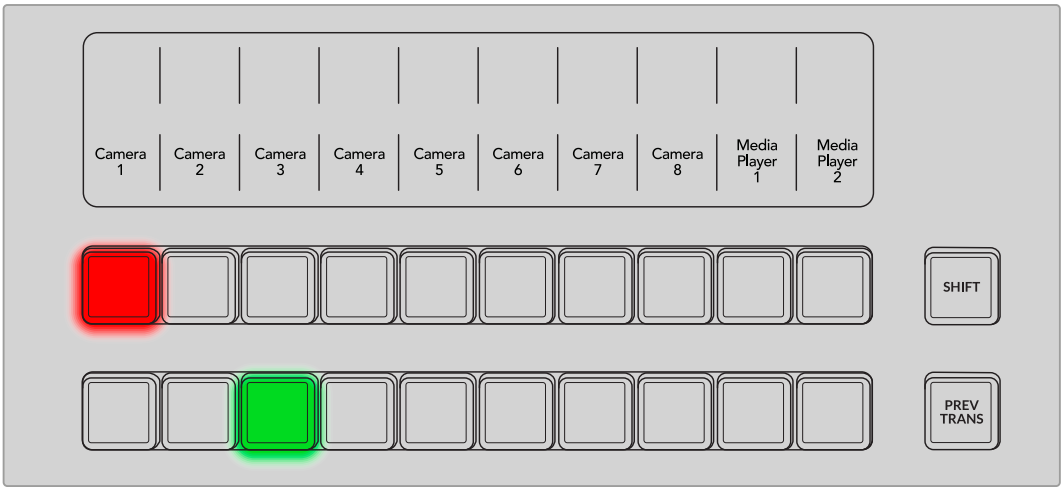


3 Appuyez sur le bouton **Auto** pour effectuer la transition.

Durant la transition, les boutons d'entrée des rangées programme et prévisualisation s'allument en rouge pour indiquer qu'ils sont à l'antenne. L'indicateur du levier de transition s'allumera également.



Vous constaterez qu'une fois votre transition terminée, les sources sélectionnées sur les bus programme et prévisualisation s'intervertissent. C'est parce que la source que vous avez sélectionnée sur le bus prévisualisation est maintenant à l'antenne. Une fois la transition terminée, la source passe sur le bus programme. Gardez à l'esprit que ce bus affiche toujours ce qui passe à l'antenne.



Configurer votre réseau

Votre mélangeur ATEM vous est livré avec des paramètres qui permettent à vos panneaux de contrôle matériels d'être directement connectés via un câble Ethernet. Toutefois, l'ATEM prend en charge les protocoles Ethernet IP pour que vous puissiez placer votre ATEM Television Studio et le panneau matériel ATEM externe sur votre réseau ou partout dans le monde grâce à Internet. Lorsque vous vous connectez à un réseau, le contrôle de votre mélangeur est beaucoup plus polyvalent. Par exemple, vous pouvez connecter un ATEM Camera Control Panel sur le même réseau que votre mélangeur afin qu'un opérateur puisse commuter le contenu pendant qu'un autre ajuste les caméras. Vu que le panneau de contrôle logiciel sera également installé sur votre ordinateur, un troisième opérateur pourra contrôler l'audio ou gérer les médias.

Comme les mélangeurs ATEM Television Studio sont réglés par défaut sur DHCP, ils obtiennent automatiquement les informations réseau. Toutefois, vous pouvez régler une adresse IP fixe manuellement.

1. Si vous n'êtes pas dans le menu d'accueil, appuyez sur le bouton **Home** pour y retourner.
2. Appuyez sur le bouton multifonction **Réseau** situé au-dessus de l'écran LCD et utilisez la flèche droite pour aller jusqu'à **Adresse IP**. Si votre mélangeur peut détecter le réseau, l'adresse IP attribuée apparaîtra au bas de l'écran.
3. Pour régler une adresse IP manuelle, appuyez sur le bouton multifonction DHCP au-dessus de l'écran LCD pour désactiver le DHCP. Réglez votre adresse IP manuelle à l'aide des molettes correspondantes au-dessous de l'écran LCD. Lorsque vous utilisez une adresse IP statique, le mélangeur doit avoir le même sous-réseau que les appareils auxquels vous souhaitez vous connecter, par exemple un HyperDeck. Cela signifie que les trois premiers champs de l'adresse IP doivent être identiques.

4. Une fois l'adresse IP saisie, appuyez sur le bouton **Sauvegarder**.

Maintenant que le mélangeur est sur votre réseau, vous pouvez sélectionner votre plateforme de streaming via l'ATEM Software Control et utiliser les boutons **On Air** pour démarrer votre stream.

Pour plus d'informations sur la sélection de votre plateforme de streaming, consultez la section « Onglet Sortie » de ce manuel.

C'est tout ce qu'il vous faut savoir pour vous lancer ! Continuez à lire ce manuel pour obtenir des informations sur la façon d'utiliser toutes les fonctionnalités et les commandes de votre mélangeur ATEM Television Studio.

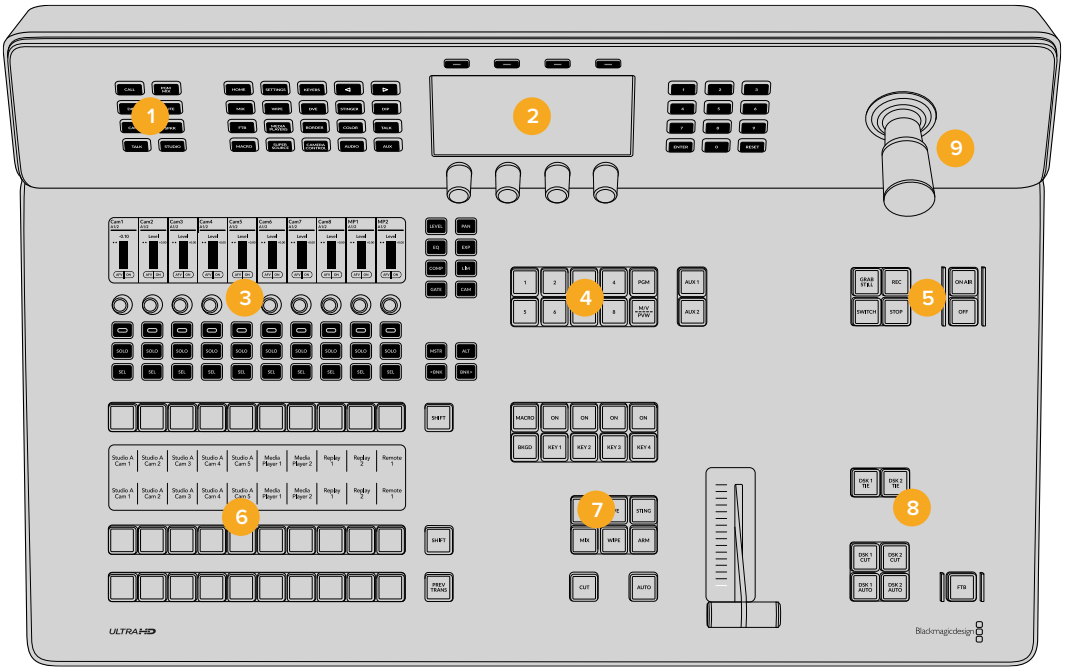
Utiliser l'ATEM Television Studio

Le panneau de contrôle avancé de votre mélangeur ATEM Television Studio comprend les rangées programme et prévisualisation, un panneau M/E, des commandes pour le réseau d'ordres, un mixeur audio Fairlight dédié, des boutons pour le contrôle caméra, un menu à l'écran et un levier pour un contrôle précis des transitions.

Comme le panneau de contrôle intégré et le panneau logiciel fourni ATEM Software Control fonctionnent ensemble, tous les changements apportés à un panneau se reportent à l'autre. Vous pouvez également utiliser les deux panneaux en même temps. Vous pouvez aussi brancher des panneaux de contrôle supplémentaires, comme l'ATEM Camera Control Panel, lorsqu'un autre opérateur s'occupe du contrôle caméra.

Aperçu du panneau de contrôle

Cette section présente les fonctionnalités primaires du panneau de contrôle, par exemple le Contrôle système principal, le menu à l'écran, les boutons programme et prévisualisation, les boutons de transition, les boutons d'incrustation et les commandes audio Fairlight.



ATEM Television Studio 4K8

1 Boutons de réseau d'ordres et d'appel

2 Contrôle système

3 Mixeur audio

4 Boutons de sélection des sorties auxiliaires

5 Boutons de streaming et d'enregistrement

6 Programme, Prévisualisation et sélection des sources

7 DVE et transitions

8 Incrustation en aval et bouton FTB

9 Joystick sur les ATEM Television Studio 4K8

Contrôle système

La partie supérieure du panneau de contrôle, qui comprend l'écran LCD et les boutons tout autour, s'appelle le Contrôle système. C'est le centre de contrôle du mélangeur. Ce dernier offre un menu centralisé qui permet de modifier les paramètres importants et de configurer votre mélangeur.

Contrôle système

Naviguer dans le menu à l'écran

Lorsque vous appuyez sur un bouton du Contrôle système, comme le bouton **Home** par exemple, l'écran LCD affichera les réglages et paramètres correspondants. Utilisez les boutons multifonctions et les molettes, situés respectivement au-dessus et au-dessous de l'écran LCD, pour effectuer les modifications.

Chaque menu possède une ou plusieurs pages de paramètres, qui sont indiquées par des points situés sous le nom du menu. Vous pouvez naviguer entre ces pages de paramètres à l'aide des flèches gauche et droite ou du pavé numérique situé à droite de l'écran LCD.

Par exemple, pour sélectionner le mode de commutation entre **Programme/Prévisualisation** et **A/B direct** :

1 Appuyez sur le bouton **Settings**. Une fois sélectionné, les boutons flèche et les boutons numérotés s'allumeront.

Les boutons numérotés situés à droite de l'écran LCD s'allumeront pour vous offrir un accès rapide à chaque page du menu

2 Appuyez plusieurs fois sur le bouton flèche droite jusqu'à ce que le mode de commutation apparaisse ou appuyez sur le bouton numéro 6 pour aller immédiatement sur le menu du mode de commutation.

Utilisez le pavé numérique pour naviguer dans les menus

3 Dans les options situées sur le haut de l'écran, sélectionnez programme/prévisualisation ou A/B direct.

Utilisez les touches de sélection multifonctions situées au-dessus de l'écran LCD pour choisir votre mode de commutation

4 Appuyez sur le bouton **Home** pour quitter le menu de configuration.

Le pavé numérique peut également être utilisé pour saisir directement des valeurs. Par exemple, pour modifier la durée des transitions auto sur la page d'accueil, appuyez sur la molette **Durée auto** et le pavé numérique s'allumera.

Saisissez la nouvelle durée et appuyez sur **Enter**.

Appuyez sur Enter pour confirmer les changements

Modifier les paramètres

L'écran d'accueil est le premier menu qui s'affichera à l'écran. Ce dernier comprend les paramètres réseau et les profils utilisateur. Lorsque vous souhaitez retourner sur l'écran d'accueil, il vous suffira d'appuyer sur le bouton **Home**.

Appuyez sur le bouton multifonction **Mappage des boutons** pour accéder au menu **Mappage des boutons**

Menu d'accueil

Le menu d'accueil affiche les entrées en cours, les durées de transition, les sous-menus des paramètres réseau, les informations sur la version logicielle et la sauvegarde des profils.

Accueil	L'écran LCD principal.
Réseau	Réglez votre mélangeur sur DHCP ou utilisez une adresse manuelle.
À propos	Affiche la version du logiciel.
Profils	Sauvegardez vos paramètres préférés et les macros pour les charger lorsque vous réutilisez le panneau. C'est la solution idéale lorsque plusieurs utilisateurs se servent du même mélangeur.

Réglages

Appuyer sur le bouton **Settings** affichera les menus **Réglages**, **HyperDecks** et **Mappage des boutons**, qui peuvent être sélectionnés à l'aide des boutons multifonctions situés au-dessus de l'écran.

Modifier les paramètres

Utilisez les molettes, les boutons multifonctions et le pavé numérique pour ajuster les options du menu Réglages.

Configurer la norme vidéo du mélangeur	Le paramètre vidéo est utilisé pour sélectionner la norme vidéo du mélangeur ATEM. À chaque changement de norme vidéo, toutes les images téléchargées dans la bibliothèque de médias sont effacées.
Configurer la norme vidéo du multi view	Si votre norme vidéo de production est réglée sur 1080p25 ou plus, vous pouvez ajuster la sortie du multi view sur une fréquence d'images plus basse. Ainsi, pour une meilleure compatibilité avec les moniteurs, vous pouvez régler les sorties du multi view afin qu'elles soient down-converties.
Régler la luminosité	Personnalisez la luminosité des boutons, des libellés et des écrans avec les paramètres de luminosité et les molettes. Cela peut être utile lorsque vous travaillez dans des environnements plus sombres.

Timecode du mélangeur	Le générateur de timecode génère automatiquement le timecode de l'heure de la journée à partir du moment où vous allumez le mélangeur. Cependant, vous pouvez réinitialiser le compteur sur zéro, ou entrer manuellement un nouveau timecode de départ.
Mode de commutation	Par défaut, votre mélangeur est configuré sur une commutation Programme/Prévisualisation, ce qui est la configuration standard des mélangeurs M/E. Vous pouvez changer cette préférence sur A/B Direct si vous désirez une commutation de type A/B.
Fondu au noir (FTB)	Le bouton FTB sur l'ATEM Television Studio 4K8 peut être activé ou désactivé à l'aide des boutons multifonctions de l'écran LCD du Contrôle système.
Paramètres du port série	Les mélangeurs ATEM Television Studio intègrent un port RJ12 à l'arrière de l'appareil pour le contrôle RS-422. Vous pouvez choisir la façon de l'utiliser à l'aide du menu Port série.
Paramètres du contrôle caméra	Avec les ATEM Television Studio 4K8, vous pouvez choisir la direction du tilt de votre joystick en sélectionnant **Inversé** ou **Normal**. Utilisez la molette pour sélectionner la sortie SDI pour le monitoring des caméras.
Sélection de la langue	Les mélangeurs ATEM Television Studio peuvent être affichés en anglais, allemand, espagnol, français, italien, japonais, coréen, polonais, portugais, russe, turc, ukrainien et chinois simplifié.
Formater les supports	La dernière page du menu de configuration vous permet de formater le stockage interne. Ce paramètre sera désactivé pour les mélangeurs sans stockage optionnel. Pour plus d'informations, consultez la section « Support de stockage » de ce manuel.
Paramètres de démarrage	Si votre ATEM Television Studio utilise les mêmes paramètres pour toutes vos productions, vous pouvez les sauvegarder en tant que paramètres de démarrage par défaut. Une fois sauvegardés, vos préréglages et vos préférences se chargeront chaque fois que vous allumerez votre mélangeur. Vous pouvez effacer ces paramètres en sélectionnant **Effacer les paramètres de démarrage**.

Paramètres de l'HyperDeck

Vous pouvez connecter jusqu'à 10 enregistreurs à disque HyperDeck et les contrôler à l'aide du Contrôle système. Lorsque vous reliez des HyperDecks, utilisez ces paramètres pour régler les entrées, activer la lecture automatique et le décalage de l'image, et configurer l'adresse IP. Pour plus d'informations sur la configuration des HyperDecks, consultez la section « Contrôle de l'HyperDeck » de ce manuel.

Mapper des boutons

Pour accéder aux réglages du mappage des boutons, appuyez sur le bouton **Settings** pour afficher les paramètres généraux du mélangeur sur l'écran LCD. Ensuite, appuyez sur le bouton multifonction **Mappage des boutons**.

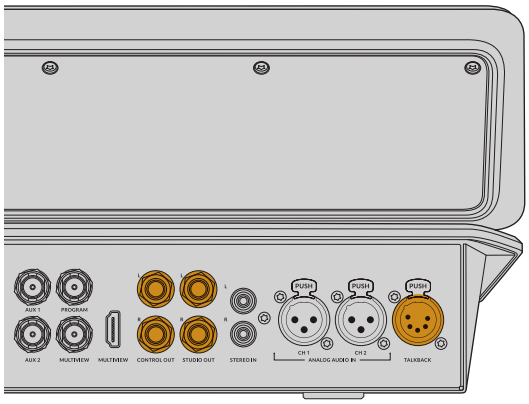
Utilisez les molettes situées sous chaque paramètre pour sélectionner le bouton que vous souhaitez mapper et l'entrée sur laquelle vous voulez appliquer les réglages. Si vous souhaitez mettre certaines sources en évidence, vous pouvez également changer la couleur des boutons et des libellés qui s'afficheront sur le panneau. Par exemple, vous pouvez régler vos sources de lecture sur une couleur spécifique, ce qui vous permettra de les repérer du premier coup d'œil. Le bouton s'allumera sur les rangées Prévisualisation et Programme jusqu'à ce que vous commutiez la source vers la sortie de prévisualisation ou de programme. À ce moment-là, il s'allumera respectivement de couleur verte ou rouge.

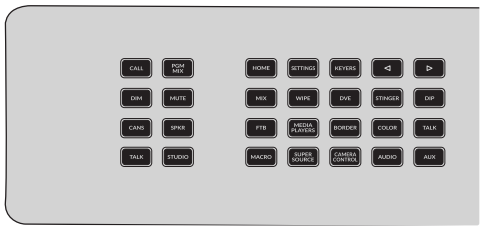
Les changements que vous avez configurés s'appliquent instantanément. Vous n'avez pas besoin de sauvegarder. Appuyez sur le bouton **Home** pour revenir au menu de la page d'accueil.

Si vous souhaitez modifier la luminosité des boutons, appuyez sur le boutons **Settings** pour ouvrir le menu des paramètres généraux du mélangeur, puis utilisez les flèches pour naviguer jusqu'à la 4e page du menu, ou appuyez sur le numéro 4 du pavé numérique. Tournez la molette correspondante pour ajuster la luminosité des libellés et des boutons jusqu'au niveau désiré. Une fois que vous avez effectué toutes vos modifications, appuyez sur le bouton **Home** pour retourner au menu d'accueil. Pour plus d'informations, consultez la section « Paramètres de luminosité » de ce manuel.

Boutons de réseau d'ordres et d'appel

Les boutons de réseau d'ordres (Talk) et d'appel (Call) situés sur le panneau offrent un accès direct aux fonctions du réseau d'ordres sans matériel supplémentaire. Branchez un casque intercom équipé d'un micro dans la prise XLR à 5 broches pour réseau d'ordres à l'arrière du mélangeur.





Bouton Call

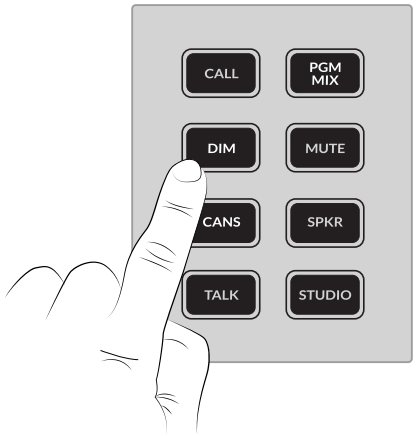
Lorsque vous maintenez le bouton **Call** enfoncé, le voyant tally de toutes les caméras connectées clignotera. C'est un moyen très pratique pour attirer l'attention des cadreurs, ou pour les informer que vous êtes prêt à passer à l'antenne.

Bouton PGM MIX

Appuyez sur PGM MIX pour entendre le mix du programme. Lorsque le bouton Cans ou Spkr est sélectionné, le mix du programme peut être entendu via la connexion XLR du réseau d'ordres et les haut-parleurs reliés à la sortie Control Out.

Bouton DIM

Pour réduire temporairement le niveau du mix du programme sans ajuster le fader, appuyez sur DIM. Pour revenir au niveau d'origine, appuyez à nouveau sur DIM.



Bouton MUTE

Sélectionnez MUTE pour couper temporairement le son de la sortie du programme sans ajuster le fader.

Bouton CANS

Lorsque vous utilisez un casque connecté à la connexion XLR à 5 broches pour réseau d'ordres située à l'arrière du mélangeur, appuyez sur le bouton CANS pour activer l'audio via cette connexion. Lorsqu'il est sélectionné, appuyez sur PGM MIX pour entendre le mix du programme.

Bouton SPKR

Sélectionner le bouton SPKR activera l'audio via la connexion Control Out située à l'arrière du mélangeur.

Bouton TALK

Lorsque vous utilisez un casque intercom, vous pouvez activer la sortie micro en appuyant sur TALK. Cela fonctionne uniquement sur la sortie Studio lorsque le bouton STUDIO est maintenu enfoncé, ou en appuyant deux fois sur celui-ci pour qu'il reste activé.

Si vous appuyez deux fois sur le bouton TALK, le micro restera actif et le bouton restera allumé jusqu'à ce que vous appuyiez à nouveau deux fois dessus. Lorsque les boutons STUDIO et SPKR sont sélectionnés, le micro restera actif sur tous les canaux de réseau d'ordres.

Bouton STUDIO

Le bouton STUDIO active la sortie **Studio Out** située à l'arrière de l'appareil. Cette dernière peut être connectée à un haut-parleur dans le studio afin que le sujet filmé puisse entendre. Lorsque le bouton TALK est sélectionné, maintenez le bouton STUDIO temporairement enfoncé ou appuyez deux fois et parlez.

Les niveaux du casque ainsi que des sorties Control et Studio peuvent être ajustés à l'aide des boutons AUDIO et TALK du Contrôle système.

1. Appuyez sur le bouton **TALK**. Les paramètres du casque sont utilisés pour ajuster le mix audio pour la connexion casque XLR à 5 broches située sur la face arrière. Ces derniers continuent sur la 2e page.
2. Tournez la molette correspondante pour ajuster les niveaux.

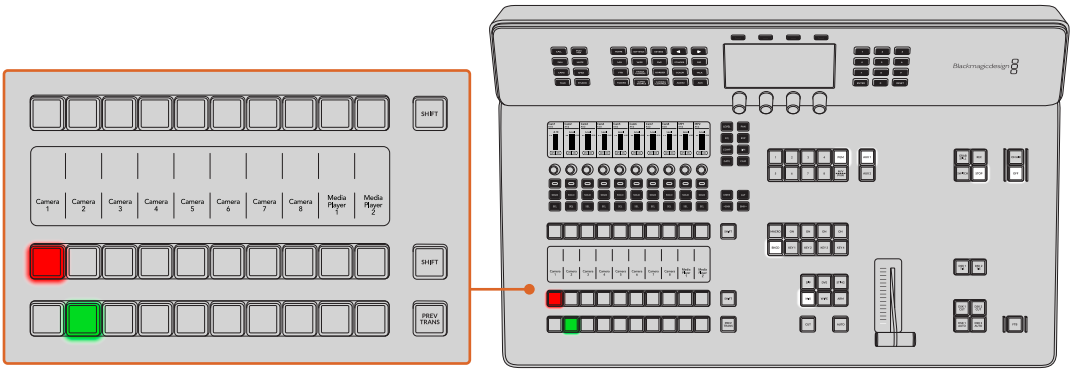
3 Ajustez les niveaux des sorties **Control Out** et **Studio Out** à l'aide des pages 3 et 4.

Paramètres

Niveau	Ajuste le niveau de sortie général du casque ou des sorties Studio Out ou Control Out.
Mix du programme	Régle le niveau audio du programme.
Production	Augmente ou réduit le niveau du réseau d'ordres de la production pour chaque sortie.
Ingénieurs	Augmente ou réduit le niveau du réseau d'ordres des ingénieurs pour chaque sortie.
Effet local Casque uniquement	Disponible uniquement pour le casque, le niveau de l'effet local permet de mélanger la voix provenant du micro du casque avec la sortie de monitoring. C'est très utile lorsque vous utilisez un casque qui prend en charge la réduction de bruit.
Gain micro Casque uniquement	Le niveau du micro de certains casques pour réseau d'ordres est parfois difficile à entendre. Ajustez le paramètre Gain micro pour augmenter ou réduire le volume du micro.

Mix Effects

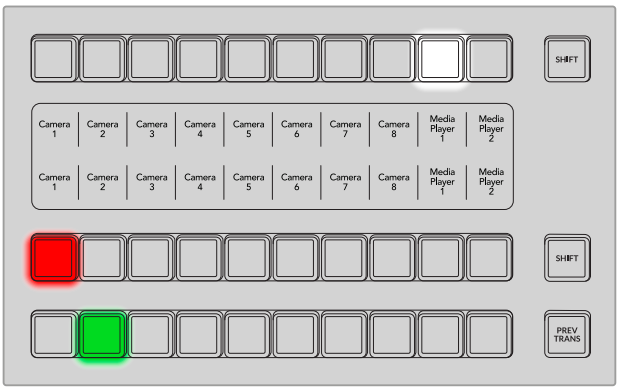
Le bus Programme, le bus Prévisualisation et la zone d'affichage des noms de sources sont utilisés ensemble pour commuter les sources sur les signaux de sortie programme et prévisualisation.



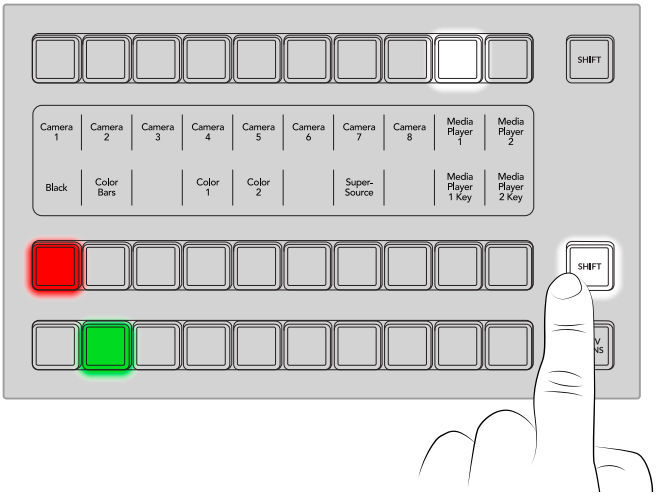
Zone d'affichage des noms de sources

La zone d'affichage des noms de sources utilise des libellés qui représentent les entrées externes et les sources internes du mélangeur. Les libellés des entrées externes peuvent être modifiés dans l'onglet Paramètres du panneau de contrôle logiciel. Les libellés représentant les sources internes sont fixes et ne peuvent pas être modifiés.

Vous pouvez voir les libellés de chaque bouton des rangées de la sélection des sources, du programme et de la prévisualisation.



En appuyant sur le bouton SHIFT, vous pouvez modifier la zone d'affichage des noms de sources et dévoiler des sources supplémentaires, permettant ainsi la sélection de 20 sources différentes.



En appuyant simultanément sur le bouton SHIFT situé dans la rangée de la sélection des sources et sur le bouton SHIFT de la rangée Programme, l'affichage des noms de sources change et vous dévoile les sources protégées, qui seront disponibles dans la rangée de sélection des sources pour les incrustateurs et les sorties auxiliaires. Les sources protégées sont : programme, prévisualisation, clean feed 1 et clean feed 2.

Bus programme

Le bus programme permet de commuter directement les sources d'arrière-plan au signal de sortie programme. La source à l'antenne est indiquée par un voyant rouge. Un voyant rouge clignotant indique que la source dévoilée à l'aide du bouton SHIFT est à l'antenne. Pour afficher cette source, il suffit d'appuyer sur le bouton SHIFT.

Bus prévisualisation

Le bus prévisualisation permet de sélectionner une source sur le signal de sortie prévisualisation. Cette source est envoyée au programme lors de la transition suivante. La source sélectionnée est indiquée par un voyant vert. Un voyant vert clignotant indique qu'une source dévoilée à l'aide du bouton SHIFT est en cours de prévisualisation. Pour afficher cette source, il suffit d'appuyer sur le bouton SHIFT.

Bouton SHIFT

Le bouton SHIFT permet de modifier la disposition des sources ainsi que leur libellé sur les bus Programme, Prévisualisation et de sélection. Il permet également d'activer des types de transition et d'autres fonctions du menu.

Une double pression sur les boutons des bus Prévisualisation et de sélection des sources, ainsi que sur les boutons représentant les types de transition revient au même que de les sélectionner à l'aide du bouton SHIFT, et peut s'avérer plus rapide. Il n'est pas possible d'appuyer deux fois sur les boutons du bus Programme afin d'éviter qu'une fausse source apparaisse momentanément sur le signal de sortie programme.

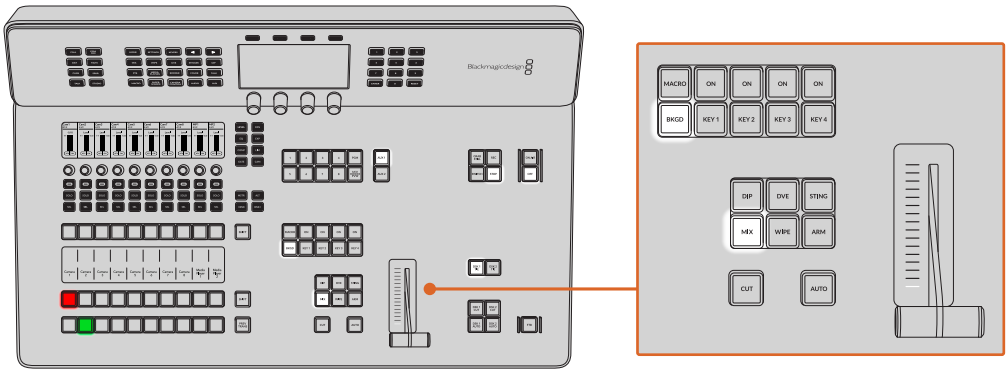
Bus de sélection des sources

Le bus de sélection des sources fonctionne conjointement avec la zone d'affichage des noms de sources. Il permet d'attribuer des sources aux sorties auxiliaires et aux incrustateurs. Lorsque le bouton macro est activé, cette rangée de boutons est également utilisée pour charger et exécuter les macros enregistrées sur les emplacements correspondants. Les boutons s'allument en bleu lorsque le bouton macro est activé.

La zone d'affichage de la destination et le bus de sélection indiquent l'attribution des sources aux incrustations et aux sorties auxiliaires. La source sélectionnée est indiquée par un bouton lumineux. Un voyant clignotant indique une source dévoilée à l'aide du bouton SHIFT. Un voyant vert identifie une source protégée.

Les sources protégées sont : programme, prévisualisation, clean feed 1 et clean feed 2.

Contrôle des transitions et incrustateurs en amont



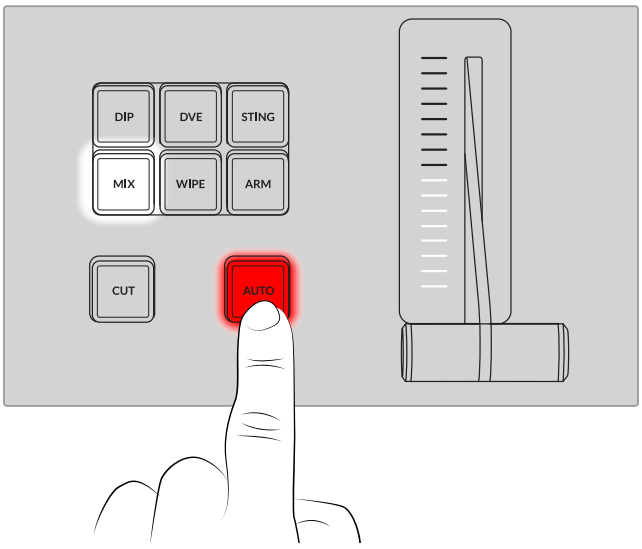
Cut

Le bouton CUT effectue une transition immédiate des signaux de sortie programme et prévisualisation, indépendamment du style de transition sélectionné.

Auto

Le bouton AUTO effectuera la transition sélectionnée pour la durée que vous avez spécifiée dans le paramètre Durée auto du menu d'accueil. Vous pouvez régler la durée de transition de chaque type de transition à partir de l'écran LCD. La durée s'appliquera lorsque le bouton du style de transition correspondant est sélectionné.

Le bouton AUTO s'allume en rouge pendant la durée de la transition et les voyants LED du levier de transition s'allument successivement pour indiquer la progression de la transition. Si le panneau de contrôle logiciel est actif, le levier de transition virtuel se met à jour afin de fournir un feedback visuel de la progression de la transition.



Levier de transition et indicateur du levier de transition

Le levier de transition est une alternative au bouton AUTO qui permet à l'opérateur de contrôler la transition manuellement. Les voyants LED du levier de transition situés à côté de ce dernier fournissent un feedback visuel de la progression de la transition.

Le bouton AUTO s'allume en rouge pendant la durée de la transition et les voyants LED du levier de transition indiquent la progression de la transition. Si le panneau de contrôle logiciel est actif, le levier de transition virtuel se met à jour simultanément.

Boutons des types de transition

Les boutons des types de transition permettent à l'opérateur de sélectionner un des cinq types de transitions: Mix, Wipe, Dip, DVE et Stinger, nommée Sting sur le panneau. Vous pouvez sélectionner un type de transition en appuyant sur le bouton de transition correspondant. Ce bouton s'allume lorsqu'il est sélectionné.

Lorsqu'un type de transition est sélectionné, le menu LCD affiche la durée de transition et vous donne accès à tous les réglages correspondants à ce type de transition. Utilisez les boutons multifonctions et les molettes pour naviguer dans les réglages et effectuer des modifications.

Le bouton ARM n'est pas actif pour le moment, mais il sera disponible dans une prochaine mise à jour.

Arm

Le bouton ARM active la lecture automatique depuis un HyperDeck connecté et sélectionné dans le bus de prévisualisation suivant une transition. Comme avec la fonctionnalité Auto roll, l'HyperDeck sélectionné dans le bus de prévisualisation commencera la lecture lorsque vous appuierez sur le bouton CUT ou AUTO pour lancer la transition. Pour utiliser la fonctionnalité ARM, appuyez sur le bouton ARM dédié et la lecture se lancera automatiquement pour l'entrée de l'HyperDeck sélectionné, sur la prochaine transition uniquement. Pour garder la fonctionnalité ARM activée, double-cliquez sur le bouton ARM. Il s'allumera en vert pour confirmer son activation.

Veuillez noter que n'importe quel Pre roll réglé via l'HyperDeck sera ignoré lorsque la fonction ARM est activée.

Prévisualisation des transitions

Le bouton PREV TRANS active le mode prévisualisation de transition, qui permet à l'opérateur de vérifier une transition Mix, Dip, Wipe ou DVE en l'exécutant sur la sortie prévisualisation à l'aide du levier de transition. Lorsque vous appuyez sur ce bouton, la fonctionnalité de prévisualisation de la transition est activée, et vous pouvez ainsi prévisualiser votre transition autant de fois que vous le souhaitez. Cela vous permet de tester la transition et d'effectuer d'éventuels changements avant de la diffuser à l'antenne. Vous pouvez également prévisualiser les transitions Stinger. Une fois les modifications apportées, appuyez de nouveau sur le bouton pour désactiver le mode prévisualisation de transition. Vous êtes maintenant prêt à envoyer votre transition à l'antenne.

Section Transition suivante

Les boutons BKGD, KEY 1, KEY 2, KEY 3 et KEY 4 permettent de sélectionner les éléments qui vont transitionner à l'antenne ou hors antenne avec la transition suivante. Vous pouvez sélectionner n'importe quelle combinaison d'arrière-plan et d'incrustations en appuyant simultanément sur plusieurs boutons. Pour sélectionner toutes les incrustations en amont de la transition suivante actuellement à l'antenne et les copier sur les boutons de la section Transition suivante, il suffit d'appuyer deux fois sur le bouton BKGD.

En appuyant sur n'importe quel bouton de la section Transition suivante, vous désactiverez tous les autres. Lors de la sélection des éléments de la transition suivante, il est recommandé que l'opérateur du mélangeur observe attentivement le signal de sortie prévisualisation car il fournit une représentation exacte du signal de sortie programme après la transition. Lorsque vous sélectionnez uniquement le bouton BKGD, une transition de la source en cours du bus programme à la source sélectionnée sur le bus prévisualisation a lieu.

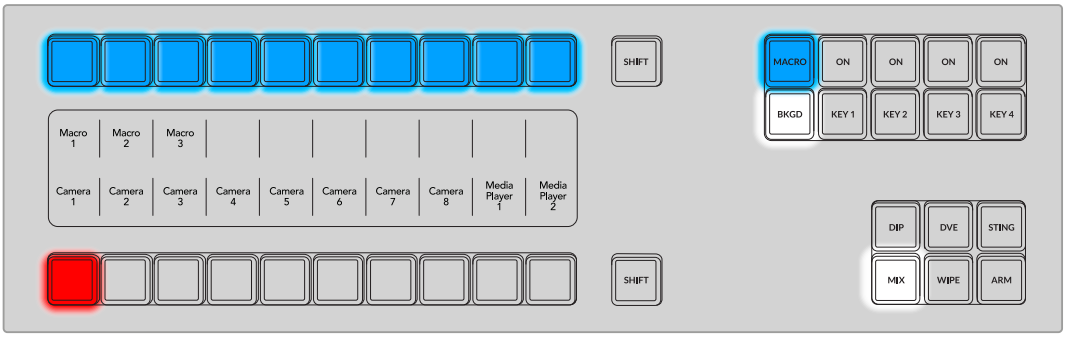
On Air

Les boutons de la section ON AIR sont situés au-dessus de chaque incrustateur et sont nommés ON. Ils indiquent quelles incrustations sont à l'antenne et permettent également de faire passer une incrustation à l'antenne ou hors antenne.

Macro

Le bouton MACRO permet d'activer les fonctionnalités macro. Lorsqu'elles sont activées, les boutons de la rangée de sélection des sources deviennent des boutons macro correspondants aux emplacements des macros.

Il existe dix boutons macro dans la rangée de sélection des sources. Si vous avez plus de 10 macros enregistrées, vous pouvez accéder à la totalité de vos macros en affichant les réglages des macros sur l'écran LCD et en modifiant le groupe de macros à l'aide de la molette.

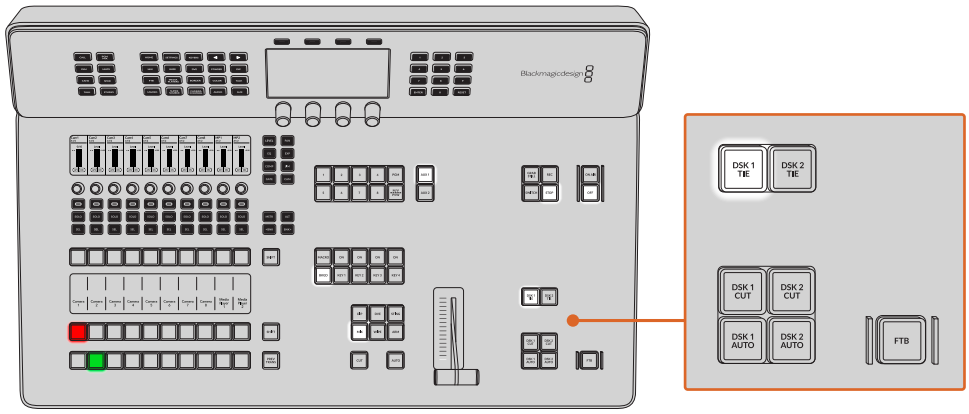


Pour plus d'informations sur la façon d'enregistrer et d'exécuter des macros avec l'ATEM Television Studio, consultez la section « Utiliser des macros » de ce manuel.

Incrustateurs en aval

Bouton DSK TIE

Le bouton DSK TIE active le DSK ainsi que les effets de la transition suivante sur le signal de sortie prévisualisation et le lie à la commande de transition principale afin que le DSK passe à l'antenne avec la transition suivante.



Comme l'incrustateur en aval est à présent lié à la transition principale, la transition se déroulera sur la durée spécifiée dans les réglages **Durée auto** du menu d'accueil de l'écran LCD. Lorsque le DSK est lié, le signal routé au clean feed 1 n'est pas affecté.

Bouton DSK CUT

Le bouton DSK CUT permet de mettre le DSK à l'antenne ou hors antenne et indique si le DSK est actuellement à l'antenne ou pas. Le bouton est allumé lorsque le DSK est à l'antenne.

Bouton DSK AUTO

Le bouton DSK AUTO mixe le DSK à l'antenne ou hors antenne pour la durée spécifiée dans les paramètres du menu Durée DSK de l'écran LCD.

Bouton FTB

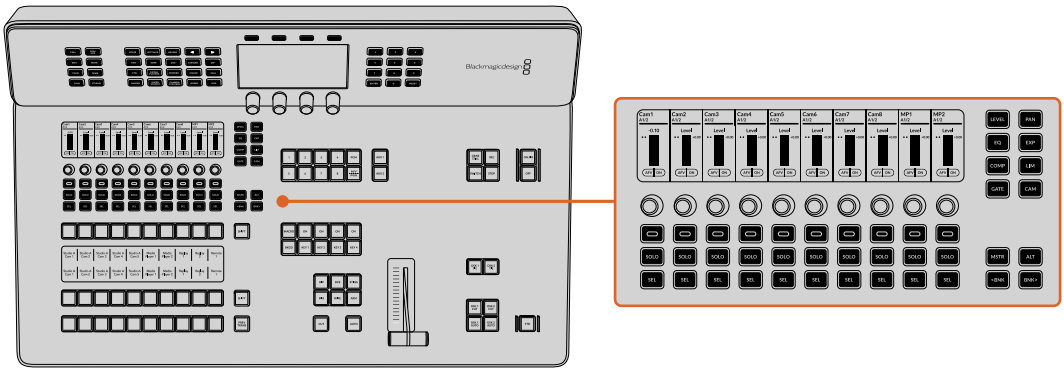
Le bouton FTB va créer un fondu au noir du signal de sortie programme pour la durée spécifiée dans les paramètres du menu **Durée du fondu au noir**. Une fois le fondu du signal de sortie programme terminé, le voyant rouge du bouton FTB va clignoter jusqu'à ce que vous appuyiez dessus à nouveau, ce qui créera un fondu au noir en entrée pour la même durée. Les fondus au noir ne peuvent pas être prévisualisés.

Vous pouvez également régler votre mélangeur afin qu'il effectue un fondu de l'audio en même temps que le fondu au noir. Pour ce faire, naviguez dans le menu du fondu au noir et réglez le paramètre AFV sur **On**. Le fondu de l'audio passe ainsi au silence en se calant sur la durée définie pour le fondu au noir. Si vous souhaitez garder l'audio pendant et après le fondu au noir, réglez le paramètre AFV sur **Off**.

Mixeur audio

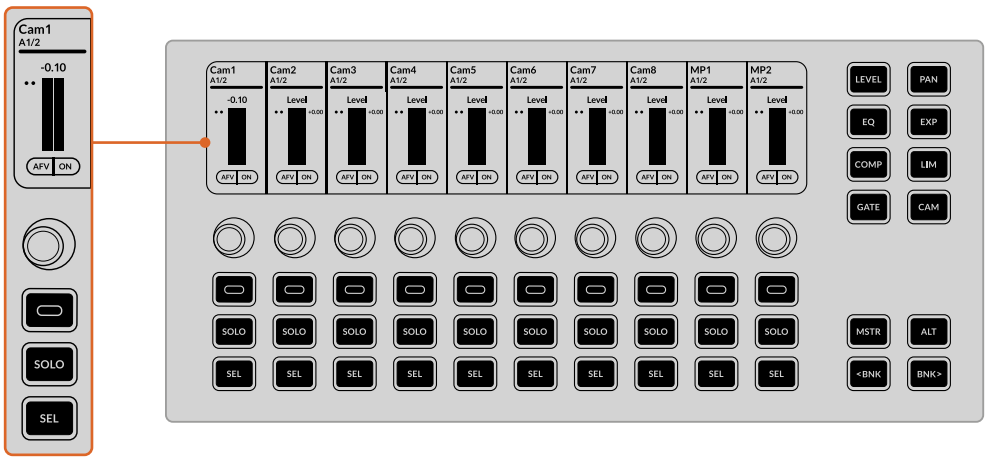
Les mélangeurs ATEM Television Studio intègrent des commandes audio avancées qui permettent d'améliorer la qualité du son de chaque entrée et de la sortie principale. Ces commandes comprennent notamment le contrôle du niveau des entrées, un égaliseur paramétrique à six bandes et des paramètres de dynamique puissants. Cette section du manuel présente les différentes commandes audio que vous pouvez utiliser pour optimiser le mixage audio de votre production en direct. En plus d'ajuster l'audio, vous pouvez utiliser les mêmes molettes et boutons pour contrôler les caméras et ajuster les sorties audio du mélangeur.

Le mixeur audio comprend de nombreuses commandes que vous pouvez utiliser pour le monitoring et le mixage de votre production en direct. Certains boutons n'ont qu'une seule fonction, alors que d'autres en remplissent plusieurs. Il est donc judicieux de comprendre les différents types de commandes avant d'expliquer les boutons et les molettes en détail.



Tranches de console

La plus grande partie du mixeur audio est dédiée aux tranches de console. Le mode d'opération par défaut du mixeur offre 10 tranches de console, chacune comprenant un bouton ON, SOLO et SEL, ainsi qu'une molette pour les ajustements et un écran LCD qui affiche les informations du canal. Tous les changements appliqués aux commandes de la tranche de console sont reflétés sur la page Audio de l'ATEM Software Control.



Écran LCD

Lors du premier démarrage de votre mélangeur ATEM Television Studio, l'écran LCD en haut de chaque tranche de console affiche le nom de l'entrée et un indicateur de niveau. Les écrans LCD affichent différentes informations selon le mode sélectionné à l'aide des boutons à droite de la tranche. Par exemple, lorsque PAN est sélectionné, les indicateurs audio de 10 entrées sont affichés. Si une des entrées est divisée en canaux mono, chaque entrée mono aura sa propre tranche de console.

L'écran LCD se met à jour dynamiquement lorsque d'autres modes sont sélectionnés à l'aide des boutons à droite de l'écran. Par exemple, lorsque vous appuyez sur le bouton EQ, l'écran LCD affichera les filtres bas médium et aigu, et les boutons et molettes contrôleront les paramètres EQ qui reflètent les commandes EQ de la page Audio.

Molettes de défilement

Si vous souhaitez modifier rapidement des paramètres spécifiques, ces molettes polyvalentes, également appelée encodeurs, vous offrent un contrôle précis. Pour augmenter le niveau d'une entrée, appuyez sur LEVEL et tournez la molette à droite.

Bouton ON

Ce bouton multifonction peut être utilisé pour sélectionner le bouton affiché à l'écran. Par exemple, lorsque LEVEL est sélectionné, ce bouton fait basculer le comportement audio entre AFV, ON et OFF. Lorsque LEVEL ou PAN est sélectionné, ce bouton s'allumera en rouge pour indiquer que l'entrée est à l'antenne.

Bouton SOLO

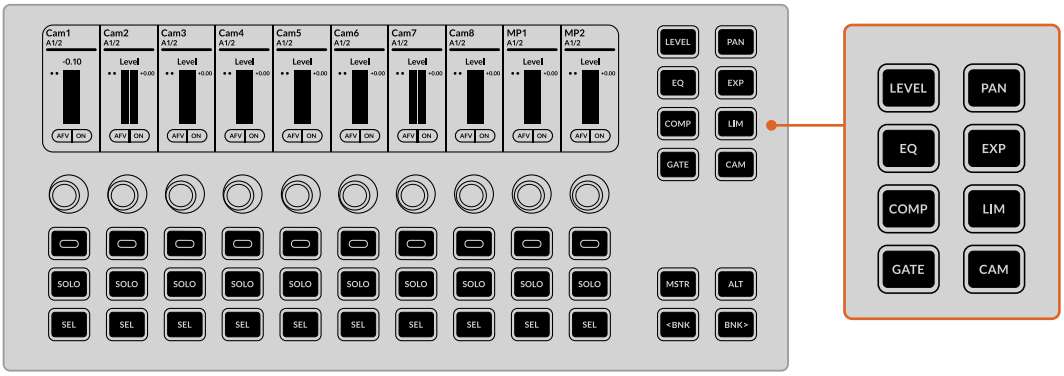
Appuyez sur le bouton SOLO pour entendre uniquement ce canal. Cela peut vous aider à peaufiner l'audio. Lorsqu'il est activé, une icône casque s'affichera sur l'écran du canal sélectionné.

Bouton SEL

Utilisez le bouton SEL pour sélectionner ou désélectioner un canal.

Boutons de mode

Utilisez ces boutons pour attribuer les paramètres correspondants aux tranches de console.



Appuyez sur EQ une seconde fois pour afficher les commandes passe-haut et passe-bas

Certains paramètres contiennent plus d'une page de commandes. Pour afficher les commandes supplémentaires, appuyez une seconde fois sur le bouton de mode. Par exemple, pour accéder aux filtres passe-haut et passe-bas, appuyez deux fois sur EQ.

Modes

Les modes audio disponibles à l'avant du mélangeur reflètent les paramètres de l'ATEM Software Control. Vous pouvez également utiliser le paramètre de contrôle caméra pour contrôler les caméras Blackmagic, dont la Blackmagic Studio Camera 6K Pro et la URSA Broadcast G2 depuis votre mélangeur ATEM.

Niveau (bouton LEVEL)	Ajustez le niveau audio de chaque canal à l'aide des molettes correspondantes. Le bouton multifonction de chaque tranche peut faire basculer le comportement audio entre AFV, ON et OFF. Lorsque le bouton ALT est sélectionné, vous pouvez ajuster le gain de chaque canal. L'ajustement du gain réduit ou augmente le volume de l'entrée sélectionnée.
Égaliseur (bouton EQ)	L'égaliseur comprend deux pages de commandes. Appuyez sur le bouton EQ pour charger la première page de commandes, mappée de gauche à droite via les encodeurs et les boutons SEL. Appuyez à nouveau sur EQ pour passer à la deuxième page. Ces commandes se concentrent sur les filtres passe-haut et passe-bas sur les bandes 1 et 6, et les boutons multifonctions correspondants activent/désactivent les filtres ou sélectionnent la forme. Appuyez à nouveau sur EQ pour retourner à la page 1. Réappuyez sur ce bouton pour basculer entre la page 1 et la page 2 si besoin est. Les commandes de l'égaliseur reflètent celles de la page audio de l'ATEM Software Control.
Compresseur (bouton COMP)	Les commandes du compresseur comprennent tous les paramètres disponibles dans la fenêtre Dynamique. Comme pour toutes les autres commandes, vous trouverez le commutateur On/Off attribué au bouton multifonction à l'emplacement du canal 1.
Gate (bouton GATE)	Les commandes du gate reflètent celles de la page audio de l'ATEM Software Control. Utilisez le bouton de sélection pour sélectionner la piste sur laquelle vous voulez vous concentrer. Le gate est un expanseur plus drastique, car il réduit le niveau et coupe même certaines parties d'un signal qui se situent au-dessous d'un niveau déterminé afin de réduire ou de supprimer le bruit dans les parties douces d'un enregistrement.
Pan (bouton PAN)	Chaque canal audio possède une commande stéréo PAN qui permet de faire un panoramique de cette entrée. Faites un pan à gauche ou à droite du canal en tournant la molette du canal correspondant. Lorsque vous ajustez chaque molette, le canal sera sélectionné comme l'indiquera le bouton SEL allumé.
Expanseur (bouton EXP)	Les commandes de l'expanseur reflètent celles de la page audio de l'ATEM Software Control. Utilisez le bouton SEL pour sélectionner la piste sur laquelle vous voulez vous concentrer. Les sept tranches de console suivantes comprennent une molette pour contrôler les paramètres de l'expanseur dans l'ordre où ils apparaissent dans la fenêtre Dynamique.
Limiteur (bouton LIM)	Comme pour les autres commandes de dynamique, les commandes du limiteur comprennent tous les paramètres du limiteur attribués aux molettes dans l'ordre où ils apparaissent dans la fenêtre Dynamique.
Contrôle caméra (bouton CAM)	Le mixeur audio comprend également une fonction de contrôle caméra pour que vous puissiez contrôler les caméras Blackmagic avec les molettes et boutons de votre mélangeur ATEM. Appuyez sur le bouton CAM pour afficher les paramètres. Les paramètres du contrôle caméra sont divisés en trois pages de menu. Vous pouvez naviguer entre ces pages en appuyant à nouveau sur le bouton CAM. Vous pouvez également ajuster les paramètres du contrôle caméra via le bouton **Contrôle caméra** du Contrôle système. Pour plus d'informations sur le contrôle caméra, consultez la section « Utiliser le contrôle caméra » de ce manuel.

Boutons des canaux et modificateurs

Sous les boutons de mode, vous trouverez les boutons des canaux et modificateurs.

Bouton MSTR

Le bouton MSTR révèle les commandes relatives aux sorties audio via le panneau arrière du mélangeur, dont les sorties casque, contrôle et studio. De plus, vous pouvez ajuster le niveau de la sortie master.

Bouton ALT

Utilisez le bouton ALT pour révéler d'autres paramètres ou fonctions. Par exemple, lorsque vous ajustez les commandes de niveau, un appui sur le bouton ALT permettra de révéler les commandes de gain.

Appuyez sur le bouton ALT pour révéler les commandes de gain

Boutons BNK

Utilisez les boutons BNK pour afficher le groupe d'entrées suivant sur l'écran LCD. Le bouton BNK> groupe les tranches de console de droite en groupes de 10. Le bouton <BNK groupe le lot précédent de 10 canaux.

Guide pour le workflow des commandes audio

Cette section décrit un workflow de base pour vous aider à utiliser le mixeur audio afin d'améliorer votre mixage audio.

1. En général, la première étape pour optimiser votre mixage consiste à normaliser toutes les entrées afin qu'elles soient à leur puissance maximale sans être écrêtées. Pour ce faire, il faut augmenter ou réduire le niveau de gain de chaque entrée afin que la crête du signal se situe juste au-dessous de 0dB sur l'indicateur de niveau de la tranche.
2. Si vous souhaitez diviser une des entrées mono en deux canaux séparés pour disposer d'une sortie stéréo, allez dans les paramètres généraux du mélangeur et naviguez sur l'onglet Audio. Activez ensuite les cases représentant les entrées mono que vous souhaitez changer en stéréo. Cliquez sur **Terminer**.

> **CONSEIL** Si vous souhaitez diviser les entrés mono en deux canaux séparés, il est préférable de le faire avant de normaliser l'entrée comme décrit dans l'étape 1, afin que vous puissiez normaliser les deux canaux après qu'ils aient été divisés.

3. Maintenant, appuyez sur le bouton EQ pour modifier l'égalisation sur chaque entrée.

4 Après avoir réglé l'égaliseur, ouvrez les commandes de dynamique à l'aide des boutons EXP et GATE. Apportez les changements de dynamique requis afin d'améliorer et de peaufiner l'entrée audio.

5 Une fois l'égaliseur et la dynamique réglés pour chaque entrée, vous pouvez ouvrir les commandes de l'égaliseur pour la sortie master dans l'ATEM Software Control et améliorer le mixage audio final.

6 Ouvrez maintenant les commandes de dynamique de la sortie master et apportez les changements nécessaires afin d'améliorer la sortie finale.

Une fois toutes les commandes du mixeur audio réglées, vous pouvez augmenter ou réduire les niveaux du mixeur audio afin qu'ils soient optimaux pour le mixage en direct et les ajustements durant la production. Vous pouvez retourner sur n'importe quel paramètre et apporter d'autres changements si nécessaire. Nous vous recommandons toutefois de suivre l'ordre des étapes décrites ci-dessus afin d'obtenir les meilleurs résultats pour chaque fonction. Par exemple, il est important de régler les commandes de l'égaliseur avant d'apporter des changements à la dynamique, car le mélangeur applique la dynamique à l'audio après l'égalisation.

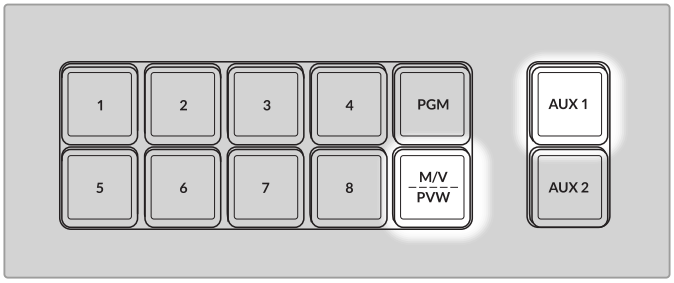
L'essentiel est d'appliquer des effets minutieusement afin d'obtenir un son de bonne qualité qui soit naturel !

Pour plus d'informations sur la façon d'ajuster les commandes Fairlight, consultez la section « Commandes Fairlight avancées » de ce manuel.

REMARQUE Veuillez noter que le mixeur audio est automatiquement désactivé lorsque la connexion USB est réglée sur **Audio numérique USB** et que le mélangeur détecte le retour audio provenant d'un mixeur audio USB, tel que Fairlight Live.

Boutons de sélection

Les mélangeurs ATEM Television Studio comprennent des sorties aux sur la face arrière, vers lesquelles diverses entrées et sources internes peuvent être routées. Elles ressemblent beaucoup à des sorties de grille de commutation, et toutes les entrées vidéo, les générateurs de couleurs, les lecteurs multimédia, le programme, la prévisualisation et même la mire peuvent être générés en sortie. Les dix boutons dédiés sur le panneau avant offrent des raccourcis pour sélectionner une des 8 entrées ou le programme, et un de ces boutons vous permet de basculer entre le multi view et la prévisualisation.



Le bouton M/V PVW s'allumera en blanc lorsque le multi view est sélectionné et en vert lorsque la prévisualisation est sélectionnée

Les autres sources internes et les lecteurs multimédia, y compris la mire, peuvent être sélectionnés à l'aide du menu Auxiliaire du Contrôle système pour toutes les sorties disponibles. Si vous avez besoin d'un clean feed avant tous les incrustateurs en aval, vous pouvez le sélectionner sur cette sortie. Vous obtiendrez alors un flux de programme sans logo ni graphique incrusté, que vous pourrez garder en tant que master pour le retravailler en post-production ou pour une retransmission ultérieure.

Pour sélectionner le clean feed sur la sortie aux 1 :

1. Appuyez sur le bouton **Aux** dans le Contrôle système.
2. Tournez la molette sous la sortie 1 jusqu'à ce que Clean feed apparaisse.

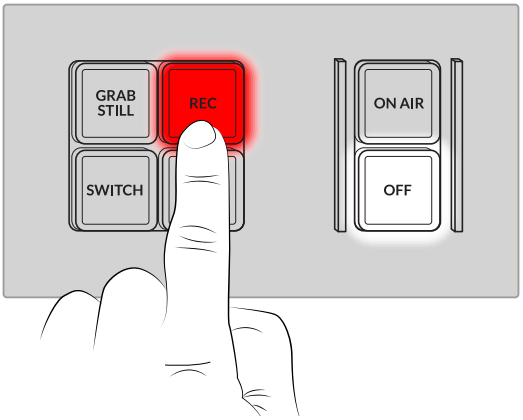
Routage des 3 sorties auxiliaires sur l'ATEM Television Studio HD8

Le mélangeur effectue toujours une commutation directe lorsqu'il y a un changement de source sur une sortie auxiliaire, ce qui signifie que vous pouvez utiliser le mélangeur pour faire une découpe nette et sans problèmes entre les sources.

Ces sorties sont extrêmement puissantes et peuvent être routées sur le panneau de contrôle logiciel. Le menu Sorties est disponible dans la barre de menu située sur le haut du panneau de contrôle logiciel indépendamment de la fenêtre sélectionnée afin qu'elles soient disponibles à tout instant. Pour plus d'informations sur le réglage des sorties avec l'ATEM Software Control, consultez la section « Sorties auxiliaires » de ce manuel.

Boutons de streaming et d’enregistrement

Les mélangeurs ATEM Television Studio vous permettent de streamer et d’enregistrer votre production à l’aide des boutons dédiés du panneau.



Utilisez les boutons dédiés du panneau pour streamer et enregistrer votre production

Grab Still	Pour capturer une image fixe de votre diffusion, il suffit d’appuyer sur le bouton Grab Still. Il fonctionne comme une diathèque qui vous permet d’ajouter les fichiers capturés à la bibliothèque de médias. Vous pouvez ensuite immédiatement charger une image fixe dans le lecteur multimédia et l’utiliser dans votre diffusion, ou enregistrer la bibliothèque de médias sur votre ordinateur.
Rec	Vous pouvez enregistrer votre stream via USB-C en utilisant un disque externe ou un disque flash, mais aussi via le stockage interne optionnel lorsque vous travaillez avec des modèles ISO. Commencez à enregistrer la production à l’aide du bouton Rec. Pour arrêter l’enregistrement, appuyez sur Stop.
Stop	
Switch	Lorsque deux disques externes sont connectés via USB, vous pouvez faire basculer l’enregistrement sur l’autre disque à l’aide du bouton Switch.
On Air	Comme le streaming est intégré au mélangeur, vous pouvez streamer directement sans utiliser de logiciel additionnel. Une fois que vous êtes connecté à un réseau et que vous avez sélectionné votre service de streaming à l’aide de l’ATEM Software Control, vous pouvez immédiatement commencer à streamer en appuyant sur le bouton On Air. Pour plus d'informations sur la façon de régler les paramètres du streaming, consultez la section « Streaming » de ce manuel.
Off	

Pour commencer le streaming, il vous faudra connecter le mélangeur à votre réseau. En plus de streamer sur des plateformes telles que Blackmagic Cloud, YouTube et Twitch, connecter le mélangeur à votre réseau vous permettra d’utiliser des panneaux matériels ATEM, comme l’ATEM Camera Control, et de connecter des sources à distance lorsque vous utilisez des mélangeurs ATEM Television Studio HD8 ISO.

Si la norme vidéo est réglée sur un format entrelacé, par exemple 1080i60, vous pouvez enregistrer ou streamer, mais pas les deux à la fois.

Pour plus d'informations sur la façon d’obtenir une clé de stream, consultez la section « Streaming » de ce manuel.

Supports de stockage

Les mélangeurs ATEM Television Studio vous permettent d'enregistrer votre programme à l'aide d'un disque externe ou d'un disque flash via les deux connexions USB-C situées à l'arrière de l'appareil. Vous pouvez également connecter des hubs USB-C multiports ou le MultiDock 10G afin de connecter un ou plusieurs SSD pour une plus grande capacité de stockage.

Il est aussi possible d'enregistrer en interne sur les mélangeurs ATEM qui comprennent un stockage interne optionnel. Cette section explique la façon de préparer les stockages externes et internes.

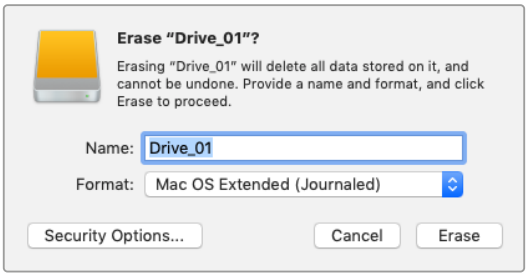
Préparer le stockage via un ordinateur

Les disques externes peuvent être formatés via un ordinateur Mac ou Windows. Nous conseillons d'utiliser le format HFS+, également connu sous le nom de Mac OS X Extended, car il prend en charge la journalisation. Les données stockées sur un support journalisé ont plus de chance d'être récupérées si le support est endommagé. Le format HFS+ est pris en charge nativement par Mac. Le format exFAT est pris en charge nativement par Mac et Windows sans logiciel supplémentaire, mais il ne prend pas en charge la journalisation. Cela peut être pratique si vous devez lire ou écrire sur un disque en utilisant à la fois des ordinateurs Mac et Windows.

Formater un support sur un ordinateur Mac

Utilisez l'utilitaire de disque de Mac pour formater un support au format HFS+ ou exFAT. N'oubliez pas de sauvegarder les informations importantes contenues sur votre support car toutes les données seront perdues lors du formatage.

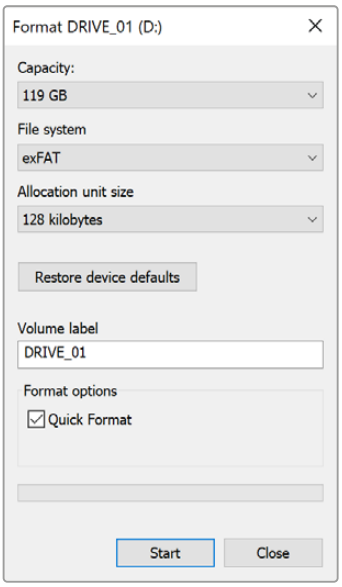
1. Connectez votre disque à votre ordinateur à l'aide d'un dock externe, d'un hub USB ou d'un câble. Ignorez les messages proposant d'utiliser le disque pour sauvegarder vos données à l'aide de Time Machine.
2. Sur votre ordinateur, allez dans le menu Applications/Utilitaires et lancez l'utilitaire de disque.
3. Cliquez sur l'icône de votre disque et cliquez sur l'onglet Effacer.
4. Choisissez le format Mac OS étendu (journalisé) ou exFAT.
5. Saisissez le nom du nouveau volume, puis cliquez sur **Effacer**. Votre support sera rapidement formaté et prêt à enregistrer.



Formater un support sur un ordinateur Windows

La boîte de dialogue **Formater** permet de formater un support en exFAT sur un ordinateur Windows. N'oubliez pas de sauvegarder les informations importantes contenues sur votre support car toutes les données seront perdues lors du formatage.

1. Connectez le disque à votre ordinateur à l'aide d'une baie d'accueil externe, d'un hub USB ou d'un adaptateur de câble.
2. Ouvrez le menu Démarrer ou l'écran d'accueil et choisissez l'option Ordinateur. Faites un clic droit sur votre disque.
3. Cliquez sur Formater à partir du menu contextuel.
4. Configurez le système de gestion des fichiers sur exFAT et la taille d'unité d'allocation sur 128 Kb.
5. Saisissez un nom de volume, sélectionnez l'option **Formatage rapide** puis cliquez sur **Démarrer**.
6. Votre disque sera rapidement formaté et prêt à enregistrer.



Utilisez la boîte de dialogue **Formater** de Windows pour formater votre disque externe au format exFaT.

Préparer le stockage avec un ATEM Television Studio

Le stockage interne peut être formaté via le Contrôle système situé sur le panneau avant ou via l'utilitaire ATEM Setup. De plus, vous pouvez également formater des disques externes en Mac OS Extended ou exFAT à l'aide du panneau de contrôle de votre mélangeur.

Formater le stockage avec le Système contrôle de l'ATEM Television Studio

Pour ouvrir le menu de formatage, appuyez sur le bouton **Settings** et utilisez les flèches afin de naviguer jusqu'à l'écran de formatage des supports.

Une fois le menu **Formater support** ouvert, vous pouvez choisir entre le formatage du stockage interne ou de n'importe quels disques externes connectés via USB.

1. Pour le stockage interne, tournez la molette **Support** et sélectionnez **Interne**.

   Pour les disques externes, tournez la molette **Support** sur le disque souhaité, puis tournez la molette **Format** pour sélectionner Mac OS Extended ou exFAT.

2. Appuyez sur le bouton **Formater** au-dessus de l'écran LCD.

3. Suivez les informations à l'écran et maintenez le bouton Formater enfoncé pendant 3 secondes jusqu'à ce qu'une coche apparaisse dans l'icône du compte à rebours. Le formatage commence.

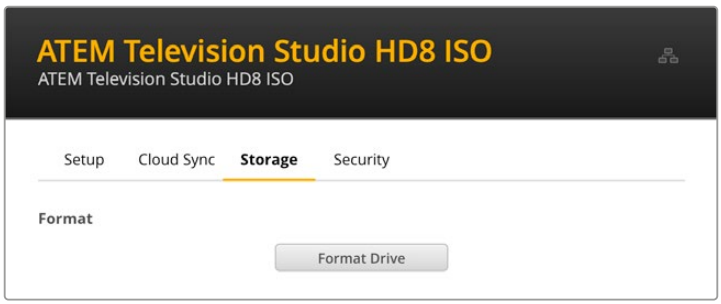
4. Une fois le formatage terminé, le stockage est prêt. Appuyez sur le bouton **Ok** au-dessus de l'écran LCD pour revenir au menu de formatage des supports.

Formater le stockage interne avec l'ATEM Setup

Vous pouvez également formater votre stockage à l'aide de l'utilitaire ATEM Setup installé avec le logiciel du mélangeur ATEM. Il vous faudra connecter votre mélangeur via USB pour formater le disque.

1. Ouvrez l'utilitaire ATEM Setup. Si vous utilisez un Mac, ce dernier se trouve dans le dossier Blackmagic ATEM Switchers dans Applications. Sur les ordinateurs Windows, accédez à l'ATEM Setup en allant dans Démarrer > Programmes > Blackmagic Design.

2. Une fois ouvert, cliquez sur **Storage**, puis sélectionnez **Format Drive**.



3 Un message d'avertissement s'affichera pour vous indiquer que le formatage effacera tous les fichiers du stockage si c'est la première fois que vous formatez le stockage. Cliquez sur **Format** pour continuer.

4 Un second message d'avertissement apparaîtra pour vous demander de confirmer. Cela vous évitera d'effacer accidentellement des médias sur le stockage. Cliquez sur **Erase**.

5 Une barre de progression apparaîtra durant le formatage. Une fois le formatage terminé, le stockage interne est prêt.

Accéder au stockage

Si vous utilisez des disques externes pour l'enregistrement, vous pouvez facilement accéder aux clips vidéo et aux projets DaVinci Resolve en déconnectant le disque de la face arrière du mélangeur et en le connectant à votre ordinateur. Vous pouvez également accéder aux fichiers via votre réseau.

Pour accéder au stockage sur un Mac :

1 Ouvrez le Finder et cliquez sur **Réseau** dans le menu de la barre latérale.

2 Dans la liste, double-cliquez sur l'ATEM Television Studio.

3 Double-cliquez sur Stockage interne.

Votre ATEM Television Studio apparaîtra dans la section Emplacements de la barre latérale. Pour accéder au stockage sur un PC Windows :

1 Cliquez sur **Réseau** dans le menu de la barre latérale de l'Explorateur de fichiers. Votre ATEM Television Studio apparaîtra dans la liste.

2 Double-cliquez sur votre ATEM Television Studio et une fenêtre de sécurité Windows apparaîtra pour vous demander les informations d'identification du réseau.

3 Saisissez votre nom d'utilisateur et votre mot de passe.

REMARQUE Windows 11 n'autorise plus les comptes « invités » ne nécessitant pas de nom d'utilisateur et de mot de passe pour se connecter au stockage réseau. Avant d'accéder au stockage de votre mélangeur ATEM sur un réseau, vous devez créer un nouvel utilisateur et définir un mot de passe à l'aide de l'ATEM Setup. Pour plus d'informations sur la création et la gestion des utilisateurs, consultez « Sécurité » dans la section « ATEM Setup » de ce manuel.

4 Cliquez sur **OK**.

Le dossier partagé de votre mélangeur s'affichera dans la fenêtre Explorer et vous pourrez y accéder comme à tout autre disque réseau.

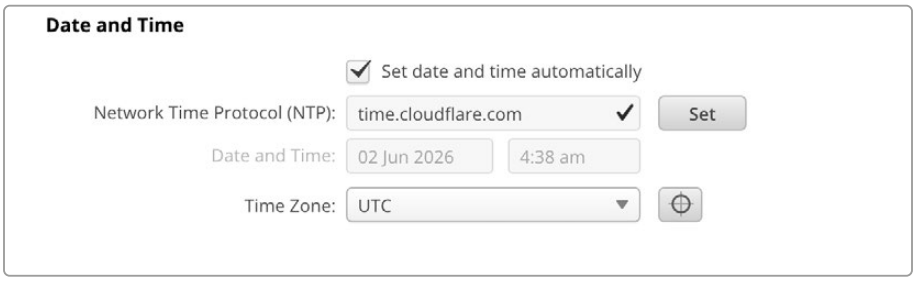
Vous pouvez également accéder à votre stockage depuis l'utilitaire. Sur un ordinateur Mac, cliquez sur le bouton **Afficher dans le Finder**. Sur un ordinateur Windows, ce bouton s'appelle **Afficher dans l'Explorateur de fichiers**.

Synchronisation du Cloud

Une autre façon d'accéder à vos médias est d'utiliser la synchronisation du Cloud qui vous permet de synchroniser le stockage interne ou les disques externes des modèles ATEM Television Studio avec DropBox.

Configuration de la date et de l'heure

Les services cloud tels que Dropbox ont besoin de la date et de l'heure correctes pour se synchroniser avec le stockage interne de votre mélangeur ATEM. Par défaut, votre ATEM Television Studio utilise le serveur Cloudflare NTP pour définir automatiquement la date et l'heure.

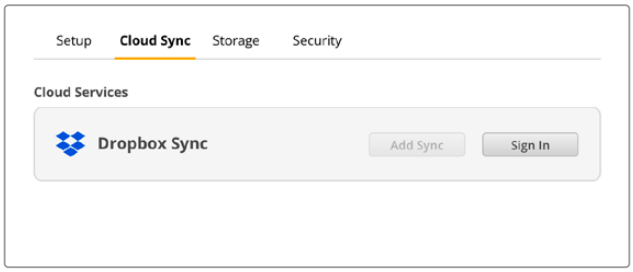


Pour synchroniser votre compte en ligne avec l'ATEM Television Studio, il suffit de vous connecter à votre compte en ligne à l'aide des paramètres de synchronisation, de définir le dossier vers lequel vous souhaitez synchroniser, puis de choisir le sens de synchronisation.

Se connecter à Dropbox

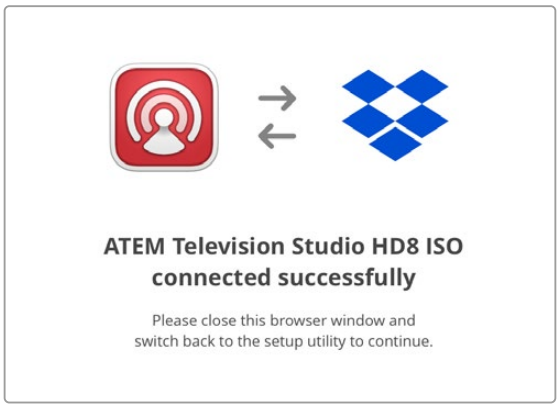
1 Cliquez sur le bouton **Sign in** pour le compte Dropbox. Une fenêtre de connexion apparaîtra.

2 Connectez-vous à Dropbox.



Cliquez sur le bouton **Allow** pour autoriser le Blackmagic Cloud Store à modifier et visualiser le contenu.

Un message de confirmation indiquant que vous vous êtes connecté avec succès apparaîtra. Si la connexion a échoué, assurez-vous que votre ordinateur est connecté à Internet.

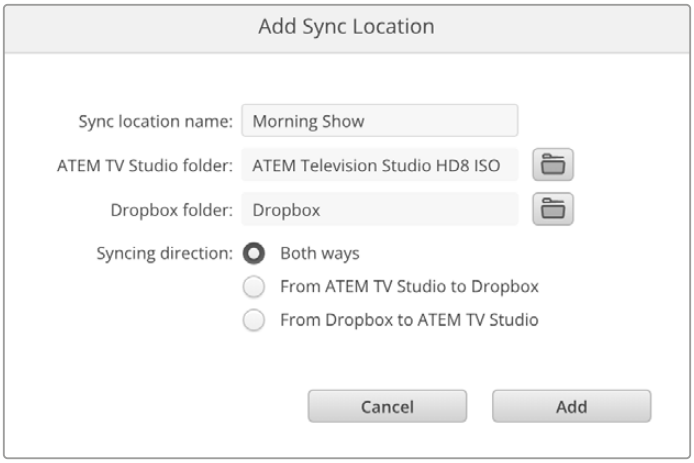


3 Cliquez sur **Close**.

Dossier et sens de synchronisation

1 Le bouton **Add sync** est désormais activé. Cliquez sur le bouton pour ouvrir la fenêtre **Add sync location**.

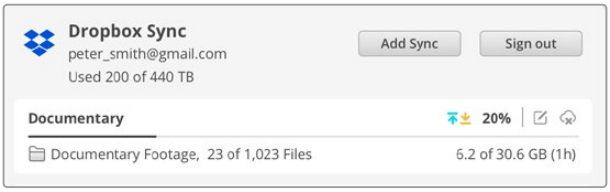
2 Nommez l'emplacement de synchronisation et cliquez sur les icônes des dossiers pour pointer vers les dossiers de synchronisation souhaités. Ils portent généralement le même nom.



3 Sélectionnez le sens de synchronisation. Par exemple, si vous synchronisez sur Dropbox et que vous souhaitez synchroniser des fichiers depuis votre mélangeur sur votre service Dropbox, mais pas depuis Dropbox vers votre mélangeur, sélectionnez **From ATEM TV Studio to Dropbox**.

4 Cliquez sur **Add**.

Votre service cloud est désormais synchronisé à votre ATEM Television Studio.



Les voyants d'état donnent des informations quant au processus de synchronisation.

Les flèches de synchronisation indiquent le sens de la synchronisation. Une flèche bleue indique que des données sont envoyées depuis votre Cloud Store et une flèche jaune indique que des données sont reçues. Si des données sont envoyées et reçues en même temps, une flèche bleue et jaune s'affichera. Une flèche grise indique quand les données ne sont pas synchronisées dans cette direction.

Le pourcentage à droite des flèches de synchronisation indique l'état de progression de la synchronisation.

Cliquez sur l'indicateur **Edit sync** pour modifier le nom et l'emplacement du dossier de synchronisation.

Cliquez sur cet indicateur pour supprimer l'emplacement de synchronisation. Dans la boîte de dialogue, cliquez sur **Continue** pour confirmer, ou sur **Cancel** pour annuler la suppression.

Si vous avez un Blackmagic Cloud Store ou Blackmagic Cloud Pod, vous pouvez ajouter ces synchros à votre propre stockage via l'utilitaire Blackmagic Cloud Setup et garder une copie live durant l'enregistrement.

Utiliser le multi view

Le multi view de votre mélangeur ATEM est une puissante fonctionnalité qui vous permet de visionner toutes les entrées avec les sorties de programme et prévisualisation, le tout sur un seul écran. Le multi view affiche également le lecteur multimédia, l'état du streaming, l'état de l'enregistrement du disque, les niveaux audio, ainsi que les indicateurs de l'égaliseur et de la dynamique Fairlight.

Grâce à cet aperçu complet, vous connaîtrez toujours le statut votre diffusion !

Le multi view est une puissante fonctionnalité qui vous permet de visionner toutes les sources et sorties simultanément

Description de chaque vue :

Vue de prévisualisation

La vue de prévisualisation vous permet de contrôler la source actuellement commutée sur la sortie de prévisualisation. Elle est très pratique pour commuter entre les sources, pour prévisualiser les transitions ou pour configurer et visionner une incrustation avant de l'envoyer sur la sortie programme. Vous devez changer le mode du mélangeur sur une commutation Programme/Prévisualisation pour utiliser cette vue. Vous trouverez davantage d'informations dans les prochaines sections de ce manuel.

Vue du programme

La vue du programme affiche ce qui est en cours sur la sortie programme. Vous pouvez ainsi savoir exactement ce qui est diffusé.

Vue des entrées

Cette vue affiche les sources connectées aux 8 entrées. Le fait d'avoir toutes les entrées sur le multi view vous permet de voir les images de chaque caméra et ainsi de prendre des décisions rapides. Toutefois, cela ne se limite pas aux caméras, vous pouvez également brancher un ordinateur sur la sortie vidéo ou un enregistreur HyperDeck sur les entrées de votre mélangeur, que vous pouvez contrôler grâce à la vue des entrées.

Lorsqu'une entrée est commutée sur la sortie de prévisualisation ou programme, la bordure du tally apparaîtra en vert ou en rouge autour de la vue de l'entrée respective. Le vert représente la sortie prévisualisation et le rouge représente la sortie programme, ou « On air ».

Vue du lecteur multimédia

Cette vue affiche le graphique actuellement chargé dans le lecteur multimédia. Pour charger un graphique, allez dans la bibliothèque de médias de l'ATEM Software Control et glissez-le dans le lecteur. Pour en savoir plus sur l'utilisation du lecteur multimédia et de la bibliothèque de médias, consultez la section « Bibliothèque de médias ATEM ».

Vue du streaming

Cette vue affiche l'état du streaming à l'antenne, dont les données de diffusion et l'état du cache. Vous pouvez également voir sur quelle plateforme vous diffusez votre contenu, car cela s'affiche en bas de la vue.

- **Indicateur On air** Avant d'enregistrer, l'indicateur affichera **Off** pour vous informer que votre mélangeur est en attente et prêt à diffuser. Lorsque le streaming commence, l'indicateur affiche l'état **On air** en rouge, jusqu'à l'arrêt du streaming.

  En cas d'interruption du streaming, par exemple si le débit internet est trop lent et que le cache est épuisé, l'indicateur **On air** va clignoter.

- **Débit de données de diffusion** Les données sont mesurées en mégabits par seconde. Sur les mélangeurs ATEM Television Studio, le débit de données doit être approximativement de 5 à 7 Mb/s pour diffuser de la vidéo en 1080p60 sans perte d'image.

- **État du cache** Affiche la capacité de la mémoire tampon du mélangeur. Le cache est une petite mémoire interne qui enregistre et lit en continu la sortie programme. Il agit en mémoire de secours si le débit de données de diffusion est trop bas et qu'il n'est plus capable de traiter la vidéo. Le débit Internet peut être aléatoire, car il dépend principalement de l'activité du réseau ou de la force du signal sans fil. Si le débit de diffusion diminue, les données mises en tampon vont augmenter en conséquence. Si le débit Internet devient trop bas pour supporter le streaming, le cache va se remplir avec les images vidéo pour compenser. Cependant, une fois le cache rempli à 100 %, le streaming sera compromis. Il faut donc éviter d'atteindre la capacité maximum du cache. Vous pouvez tester la vitesse de connexion lorsque vous configurez votre streaming. Effectuez un test de diffusion et regardez l'affichage du cache dans le multi view. Si le cache s'approche fréquemment de 100 %, choisissez une qualité de streaming plus basse.
- **État du partage de connexion** L'icône smartphone s'affiche lorsque le mélangeur ATEM est connecté à Internet grâce au partage de connexion mobile. L'icône deviendra rouge quand vous serez à l'antenne.

Vue de l'enregistrement

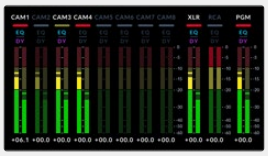
Si vous enregistrez sur un disque externe via USB-C ou sur le stockage interne, cette vue affichera l'état de l'enregistrement en cours.

- **Indicateur d'enregistrement** Avant d'enregistrer, ou si aucun disque n'est connecté, l'indicateur affichera **Stop**. Une fois les disques connectés, ils apparaîtront en icônes sous l'indicateur.

  Lorsqu'un disque enregistre, l'indicateur affiche **Rec** et s'allume en rouge.

- **Durée d'enregistrement** Le compteur de la durée se trouve sous l'indicateur d'enregistrement. Lorsque vous appuyez sur le bouton d'enregistrement du mélangeur, le compteur de la durée s'enclenche.
- **Indicateurs de l'état d'enregistrement** Ils affichent les détails de chaque disque et de leur état d'enregistrement. Par exemple, si vous utilisez deux disques, leur nom, ainsi que l'espace disponible et le temps d'enregistrement restant apparaîtront. Pendant qu'un disque enregistre, son indicateur s'allume en rouge et affiche l'espace restant.

  Les disques sont classés par capacité de stockage. Par exemple, si 4 SSD sont connectés via un Blackmagic MultiDock 10G, le disque avec la plus grande capacité de stockage restante sera numéroté 1. Le disque 2 sera le SSD avec la deuxième plus grande capacité de stockage, et ainsi de suite. Lorsque les disques 1 et 2 sont pleins, le disque 3 prendra la première place et le disque 4 la deuxième. Vous pouvez voir à tout moment le numéro de chaque disque car leur nom est indiqué sous les icônes.



Vue de l’audio

Durant la diffusion, vous pouvez contrôler les niveaux audio pour chaque source, ainsi que les niveaux de la sortie programme à l’aide de la vue audio.

- **Indicateurs audio** Les entrées et la sortie programme possèdent chacune leurs propres indicateurs audio, que vous pouvez contrôler simultanément. Si le niveau audio dépasse -10dB, l’indicateur s’allumera en rouge pour vous prévenir que vous vous approchez de la force maximale de 0dB. Si le niveau atteint 0dB, l’audio sera écrêté, ce qui signifie que le son sera distordu. Vous devrez alors baisser le niveau à l’aide des boutons des niveaux audio de votre mélangeur ou via le mixeur audio de l’ATEM Software Control. Vous trouverez plus d’informations sur l’ATEM Software Control dans la prochaine section de ce manuel.

  Les indicateurs audio sont des outils essentiels pour contrôler vos niveaux et vous assurer que vous travaillez toujours avec un son de qualité.
- **Icônes Fairlight** Ces icônes vous permettent de savoir si les commandes de l’égaliseur (EQ) et de la dynamique (DY) sont activées sur la page audio de l’ATEM Software Control.

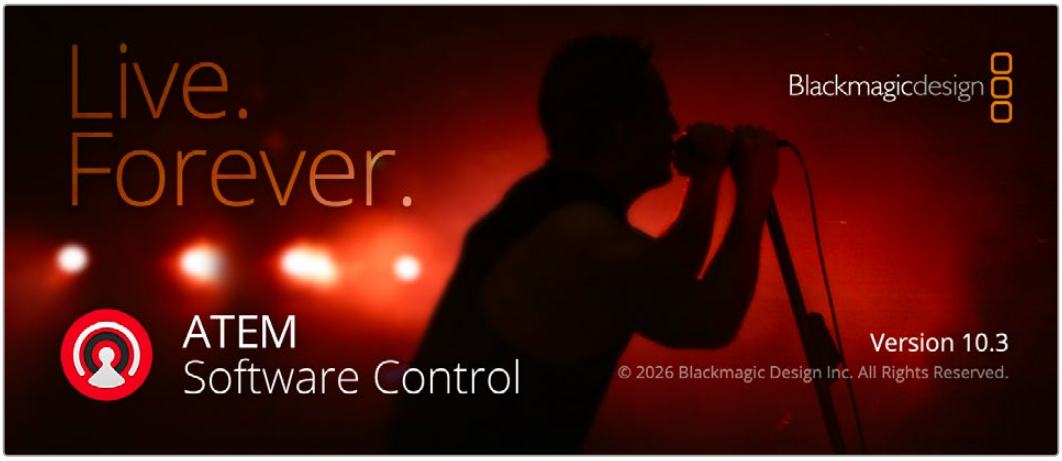
EQ DY	Si les icônes sont colorées et illuminées, l’égaliseur et la dynamique sont activés et l’entrée est à l’antenne.
EQ DY	Si les icônes sont colorées mais sombres, l’égaliseur et la dynamique sont activés mais l’entrée n’est pas à l’antenne.
EQ DY	Si les icônes sont grisées et sombres, l’égaliseur et la dynamique sont désactivés sur la page audio.

Le multi view est un excellent outil qui vous permettra de repérer chaque détail de votre diffusion à tout moment. Par exemple, il peut vous aider à prévisualiser certaines de vos idées dans la fenêtre de prévisualisation avant de les envoyer sur la sortie programme. Vous pouvez contrôler chaque source SDI et les tester entre elles, configurer une incrustation chroma, ou même prévisualiser une transition avant de l’envoyer sur la sortie programme !

ATEM Software Control

Le logiciel ATEM Software Control est inclus à votre mélangeur ATEM. Il vous permet de contrôler le mélangeur quasiment de la même façon que le panneau de contrôle intégré au mélangeur. Au lieu de posséder des boutons de menu, le logiciel est muni d'une série de palettes sur le côté droit qui indiquent toutes les fonctions de traitement de votre mélangeur. Cela vous permet de contrôler le mélangeur d'un autre endroit, par exemple lorsque le mélangeur est monté sur un rack dans une autre salle.

Vous devez installer le logiciel ATEM Software Control avant de pouvoir l'utiliser.

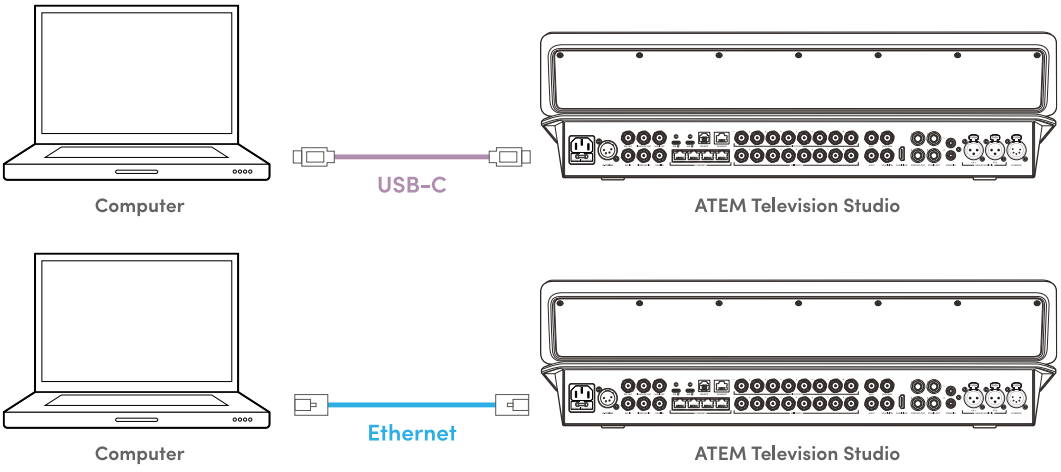


Pour installer l'ATEM Software Control :

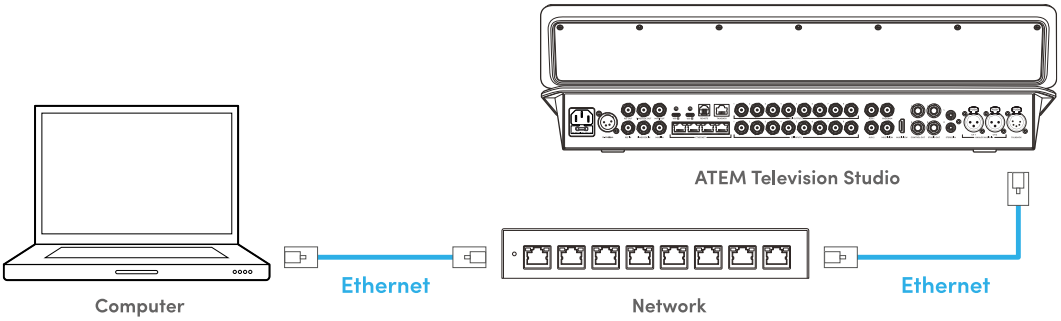
1. Ouvrez votre navigateur web, allez sur www.blackmagicdesign.com/fr/support, puis téléchargez les derniers pilotes pour les mélangeurs ATEM.
2. Une fois le fichier téléchargé, double-cliquez sur l'icône d'installation de l'ATEM pour exécuter le programme d'installation. Suivez les indications jusqu'à la fin, puis appuyez sur **Install** pour installer le logiciel.
3. Une fois le logiciel installé, naviguez vers le dossier **Blackmagic ATEM Switchers** dans votre dossier d'applications ou de programmes, puis double-cliquez sur **ATEM Software Control**.

Maintenant que le logiciel est installé, vous allez devoir connecter le mélangeur à l'ordinateur. Pour cela, connectez les appareils directement via Ethernet ou USB.

Se connecter directement



Se connecter via un réseau



Enfin, vous devez vous assurer que votre ordinateur est bien connecté et fonctionne sur votre réseau. Ensuite, lorsque vous lancerez l'application ATEM Software Control, vous serez invité à sélectionner un mélangeur. S'il est visible sur le réseau, vous pouvez le sélectionner depuis la liste, ou entrer une adresse IP manuellement. Utilisez l'adresse IP que vous venez de choisir pour le mélangeur. L'ATEM Software Control est ainsi en mesure de détecter le mélangeur et de communiquer avec lui.

Panneau de contrôle du mélangeur

Le panneau de contrôle logiciel possède quatre fenêtres : Mélangeur, Média, Audio et Caméra. Vous pouvez ouvrir ces fenêtres en cliquant sur le bouton approprié en bas de l'interface ou en appuyant sur les touches de raccourci majuscule et flèche gauche/droite. La fenêtre de paramétrage général s'ouvre en sélectionnant le symbole de la roue dentée en bas à gauche de l'interface. Les fenêtres Mélangeur, Média, Audio et Caméra contiennent des paramètres uniques pour le mélangeur, qui ne peuvent être configurés qu'à partir du panneau de contrôle logiciel.

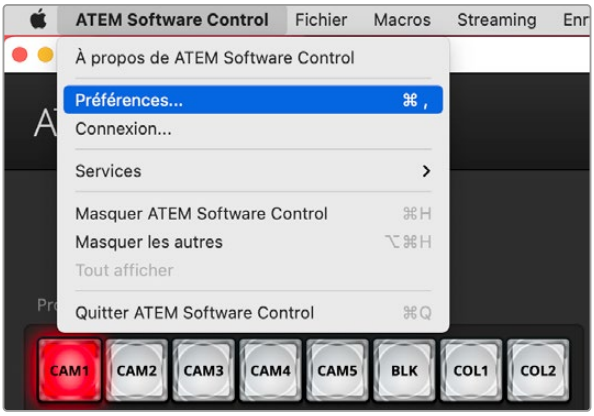
Fenêtre Mélangeur

Lors du premier démarrage, la fenêtre Mélangeur, qui est l'interface de contrôle principale du mélangeur est sélectionnée. Le panneau de contrôle logiciel doit être connecté à un mélangeur pour fonctionner.

Fenêtre de l'ATEM Software Control

Préférences

La fenêtre Préférences est composée de deux onglets : **Général** et **Mappage**. Dans les préférences générales, vous trouverez les réglages pour le contrôle des transitions, la sélection de la langue ainsi que l'activation et la désactivation du contrôle MIDI. Dans les préférences de mappage, vous pouvez assigner des entrées à des boutons spécifiques appartenant aux rangées Prévisualisation et Programme. Allez sur la barre de menu en haut de l'écran, sélectionnez **ATEM Software Control** et ouvrez les **Préférences**.



Ouvrez les préférences depuis le menu de l'ATEM Software Control

Préférences générales

Par défaut, votre mélangeur est configuré sur une commutation Programme/Prévisualisation, ce qui est la configuration standard des mélangeurs M/E. Vous pouvez changer cette préférence sur A/B Direct si vous désirez une commutation de type A/B.

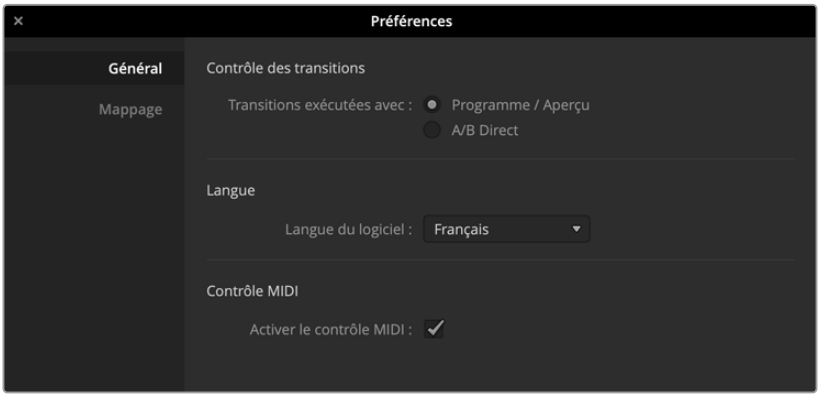
L'ATEM Software Control peut être affiché en anglais, allemand, espagnol, français, italien, japonais, coréen, polonais, portugais, russe, turc, ukrainien et chinois simplifié.

Lorsque vous utilisez ce logiciel pour la première fois, une boîte de dialogue apparaît pour vous permettre de régler la langue du logiciel. Vous pouvez toutefois modifier la langue à tout moment.

Sélectionnez la langue de votre choix dans le menu des langues. Un message d'avertissement apparaît et vous demande de confirmer la sélection. Cliquez sur **Modifier**.

L'ATEM Software Control se ferme et redémarre dans la langue choisie.

Pour opérer votre mélangeur ATEM à l'aide d'un contrôleur MIDI, cochez la case pour activer le contrôle MIDI.

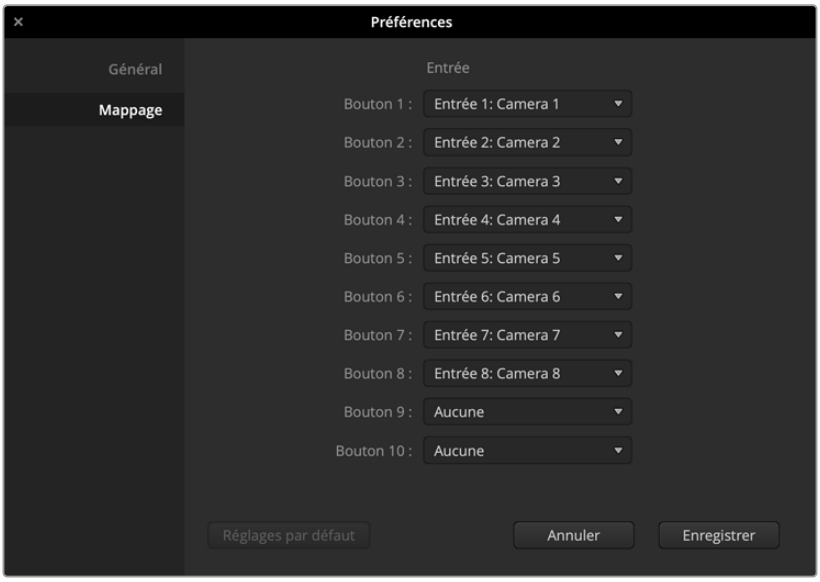


Configurer vos préférences générales

Mapper des boutons

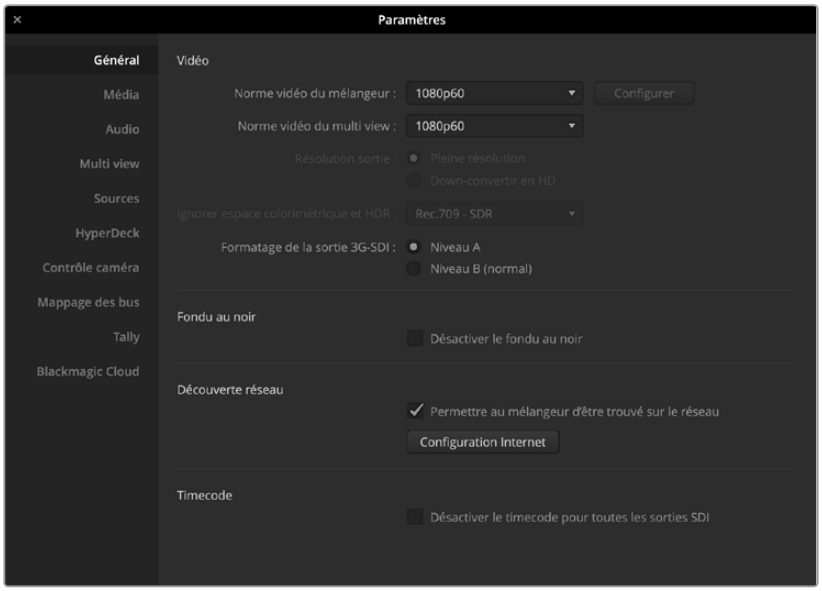
Sous l'onglet **Mappage**, vous pouvez assigner des entrées à des boutons spécifiques appartenant aux rangées Prévisualisation et Programme.

Les panneaux de contrôle logiciel et matériel ATEM prennent tous deux en charge le mappage des boutons afin que vous puissiez attribuer vos sources les plus importantes, particulièrement les caméras, aux boutons les plus accessibles sur les bus Programme et Prévisualisation. Les sources utilisées de façon occasionnelle peuvent être assignées à des boutons moins importants. Le mappage des boutons est réglé de manière indépendante pour chaque panneau de contrôle, ce qui signifie que le mappage des boutons réglé sur le panneau de contrôle logiciel n'affectera pas celui du panneau de contrôle matériel.



Modifier les paramètres du mélangeur

Lorsque vous cliquez sur le symbole de la roue dentée dans le coin inférieur gauche, la fenêtre de paramétrage s'ouvre pour vous permettre de changer les paramètres généraux du mélangeur, ainsi que les paramètres audio, du multi view, des sources, de l'HyperDeck et du contrôle caméra. Ces paramètres sont présentés sous forme d'onglets.



Paramètres généraux de l'ATEM Television Studio HD8 ISO

Paramètres généraux

L'onglet Général permet de régler la norme vidéo, la bibliothèque de médias ainsi que la sortie de monitoring pour le contrôle caméra.

Vidéo

Configurer la norme vidéo du mélangeur

Le paramètre vidéo est utilisé pour sélectionner la norme vidéo du mélangeur ATEM. Vous pouvez régler la norme vidéo correspondant à la région dans laquelle vous travaillez, par exemple 1080i59.94 ou 720p59.94 si vous faites de la diffusion dans des pays qui utilisent la norme NTSC. Vous pouvez également régler la norme vidéo sur des formats, tels que 1080i50 ou 720p50, si vous faites de la diffusion dans des pays qui utilisent la norme PAL. Une bonne façon de déterminer quelle norme vidéo vous devriez utiliser est de regarder sur les caméras, et de configurer la norme vidéo du mélangeur au même format.

Réglage de la norme vidéo

Les mélangeurs ATEM Television Studio supportent les normes vidéo suivantes :

Normes vidéo HD	720p50, 720p59.94, 720p60 1080p23.98, 1080p24, 1080p25, 1080p29.97, 1080p30, 1080p50, 1080p59.94, 1080p60 1080i50, 1080i59.94, 1080i60

Les mélangeurs ATEM Television Studio 4K8 supportent également les normes vidéo suivantes :

Normes Ultra HD	2160p23.98, 2160p24, 2160p25, 2160p29.97, 2160p30, 2160p50, 2160p59.94, 2160p60

Pour configurer la norme vidéo, sélectionnez cette dernière à partir du menu Configurer la norme vidéo. Sélectionnez ensuite le bouton Configurer. À chaque changement de norme vidéo, toutes les images téléchargées dans la bibliothèque de médias sont effacées.

Configurer la norme vidéo du multi view

Si votre norme vidéo de production est réglée sur 1080p25 ou plus, vous pouvez ajuster la sortie du multi view sur une fréquence d'images plus basse. Ainsi, pour une meilleure compatibilité avec les moniteurs, vous pouvez régler les sorties du multi view afin qu'elles soient down-converties. Par exemple, si votre norme vidéo est réglée sur 1080p60, vous pouvez régler la sortie multi view sur 1080p60.

Régler le niveau de la sortie 3G-SDI

Si vous acheminez de la vidéo 1080p50 ou HD vers des équipements qui prennent uniquement en charge les signaux 3G-SDI de niveau A ou de niveau B, il sera nécessaire de basculer entre ces normes de sortie afin qu'ils soient compatibles. Le niveau B est le paramètre par défaut qui fonctionne avec la plupart des équipements. Vous pourrez cependant utiliser le niveau A en cochant la case **A**.

Fondu au noir (FTB)

Pour désactiver le bouton FTB à l'avant du mélangeur avec l'ATEM Software Control, cochez la case **Désactiver le fondu au noir**.

Incrustation en aval

Vous pouvez ignorer le tally de la caméra lorsque l'opacité de l'incrustation en aval est à 100 %, par exemple lors d'un replay sportif avec le DaVinci Resolve Replay Editor. Cela permet d'indiquer à l'opérateur de la caméra qu'il n'est pas à l'antenne lorsque le replay est en cours. Toutefois, si l'incrustation en aval n'est pas complètement opaque, le tally restera actif.

Découverte réseau

Par défaut, les modèles ATEM Television Studio HD8 ISO sont visibles sur votre réseau local. Ainsi, si vous planifiez de streamer directement sur le mélangeur avec une Blackmagic Studio Camera 6K Pro ou URSA Broadcast G2, vous pouvez démarrer immédiatement. Pour désactiver cette fonction, décochez l'option **Permettre au mélangeur d'être trouvé sur le réseau**.

Paramètres des médias

Bibliothèque de médias

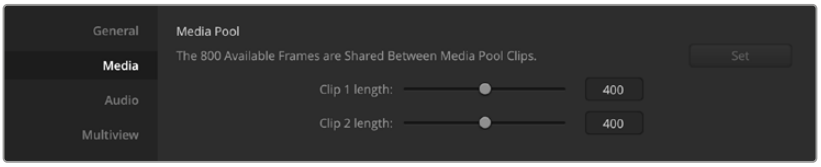
Ajustement de la longueur des clips de la bibliothèque de médias

Chaque modèle de mélangeur ATEM possède une mémoire pour les graphiques appelée bibliothèque de médias. Cette mémoire stocke les images avec un canal alpha ainsi que les clips vidéo qui peuvent être assignés à un lecteur multimédia pour votre production.

Modèle de mélangeur ATEM	Images fixes	Clips vidéo	Format vidéo	Longueur du clip
ATEM Television Studio HD8	20	2	720p	400 images
			1080p	200 images
ATEM Television Studio HD8 ISO	20	2	720p	400 images
			1080p	200 images
ATEM Television Studio 4K8	20	2	720p	1600 images
			1080p	800 images
			2160p	200 images

Capacité de la bibliothèque de médias

Par défaut, la même quantité de mémoire disponible est attribuée à chaque clip, ce qui détermine le nombre maximum d'images. Si vous souhaitez qu'un clip soit plus long, ajustez le nombre d'images en respectant l'équilibre. Notez que le fait d'allonger un clip va raccourcir l'autre.



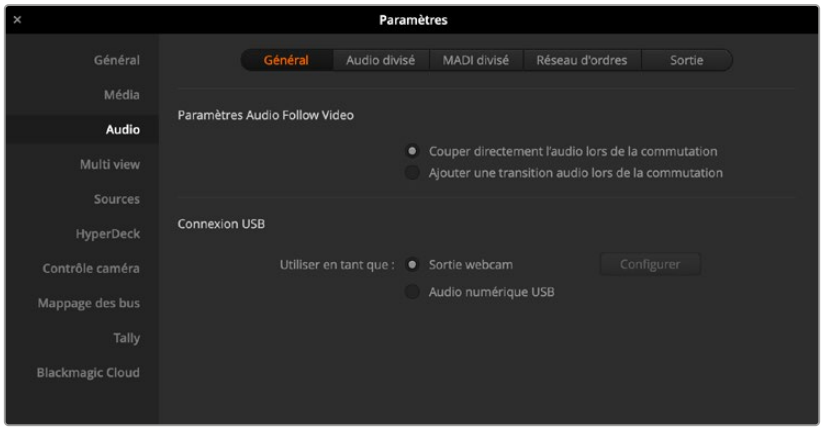
Partage de la bibliothèque de médias

Onglet Audio

L'onglet Audio contient tous les réglages répartis en cinq catégories : Général, Audio divisé, MADI divisé, Réseau d'ordres et sortie ou Mix minus.

Général

Utilisez l'onglet audio général pour régler les paramètres Audio Follow Video.



Paramètres Audio Follow Video

Lorsque vous utilisez l'AFV, vous pouvez sélectionner le comportement audio durant les transitions via les cases d'option. Pour effectuer un fondu enchaîné de l'audio lorsque les entrées changent, cochez la case d'option pour ajouter une transition. L'audio sera uniquement envoyé vers la sortie programme lorsque la source est à l'antenne.

Connexion USB

La connexion USB située à l'arrière des mélangeurs ATEM Television Studio permet d'installer les mises à jour logicielles et sert également de sortie webcam. Vous pouvez aussi configurer le port USB afin d'opérer une interface audio numérique USB pour une utilisation avec Fairlight Live. Fairlight Live est un puissant mixeur audio live logiciel prenant en charge des centaines de canaux. Il gère les formats standard, du stéréo au son surround, ainsi que les workflows audio ambisonique et immersif.

Pour utiliser Fairlight Live, sélectionnez **Audio numérique USB**, puis cliquez sur **Set**.

Quand la connexion USB est réglée sur **Audio numérique USB**, les commandes du mixeur audio dans l'ATEM Software Control et sur le mélangeur sont automatiquement désactivées dès qu'un retour audio provenant du mixeur audio USB est détecté par le mélangeur.

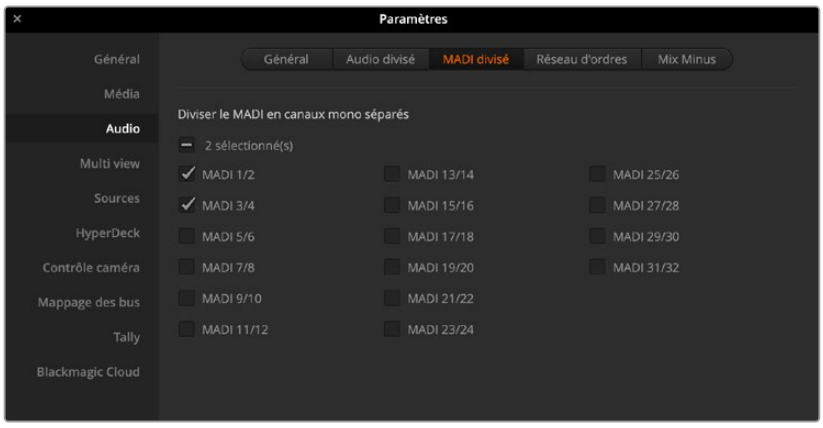
Si vous utilisez un modèle de show Fairlight Live, cela s'effectue dès que le show commence. Avec un modèle de show personnalisé ou une autre interface de mixage audio USB, cela s'effectue après avoir re-routé la sortie vers le mélangeur.

Pour Fairlight Live, le routage des sorties est configuré dans la fenêtre de Patching matrix.

Audio divisé

Les mélangeurs ATEM Television Studio peuvent diviser un signal d'entrée stéréo en deux canaux mono séparés. C'est très pratique pour mixer une entrée mono sur deux canaux dans la sortie master stéréo. Vous pouvez également choisir de diviser tout l'audio dans des canaux séparés, ou de sélectionner chaque entrée individuellement.

Vous pouvez aussi diviser les canaux MADI en canaux mono séparés.

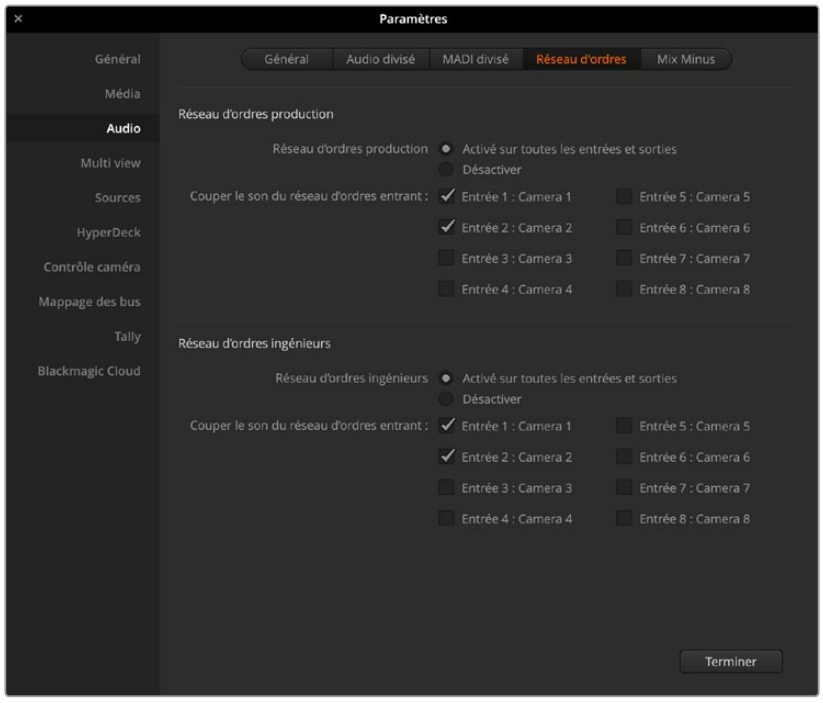


Utilisez les cases pour diviser les canaux MADI en canaux mono séparés

Réseau d'ordres

Configurez le comportement du réseau d'ordres via l'onglet du réseau d'ordres. Le réseau d'ordre dédié à la production est intégré aux canaux SDI 15 et 16, et le réseau d'ordres dédié aux ingénieurs est intégré aux canaux SDI 13 et 14. Le réseau d'ordres peut être activé ou désactivé en cochant la case.

Il se peut que vous deviez relier en boucle une des sorties de l'ATEM vers une entrée pour obtenir certains effets. Cette opération crée parfois une boucle de rétroaction sur les canaux de réseau d'ordres SDI. Le cas échéant, il suffit de couper le son des canaux SDI du réseau d'ordres SDI en cliquant sur les cases permettant de couper le réseau d'ordres à côté de chaque entrée. Si vous souhaitez couper le réseau d'ordres entrant, assurez-vous de cocher la case pour la production et l'ingénierie.



Couper le réseau d'ordres entrant sur les entrées

Sortie

Ajustez le retour audio pour le SDI, la source à distance et les auxiliaires à l'aide du menu Sortie des mélangeurs ATEM Television Studio HD8.

Audio SDI

Sélectionnez le paramètre du retour audio à l'aide du menu. Les options comprennent Mix programme, Moniteur, Réseau d'ordres production, Réseau d'ordres ingénieurs et Mix minus. Lorsque vous sélectionnez Mix minus, choisissez la source audio à l'aide du menu. Cela supprimera la source sélectionnée depuis le retour audio.

Auxiliaires audio

Lorsque vous routez des sorties auxiliaires vers des sources de caméra, activer le mix minus sur une entrée acheminera tout l'audio de programme du mixage, moins cette entrée.

Source audio à distance

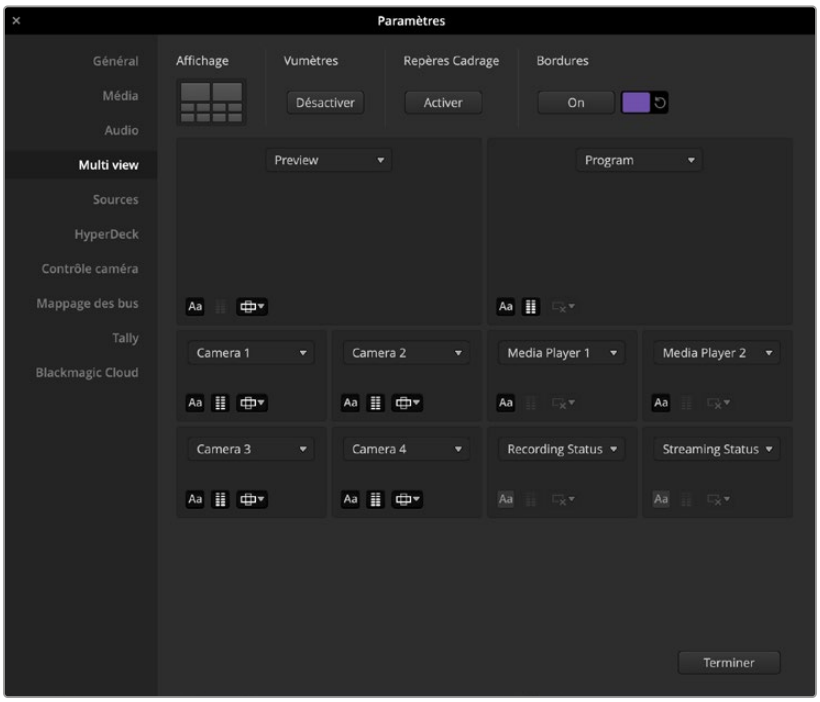
Lorsque vous utilisez des sources à distance avec les modèles ATEM Television Studio HD8 ISO, vous pouvez spécifier le retour audio à l'aide du menu **Régler le retour sur**. Lorsque vous sélectionnez Mix minus, choisissez la source audio à l'aide du menu. Cela supprimera la source sélectionnée depuis le retour audio.

Mix Minus

Le paramètre Mix minus de l'ATEM Television Studio 4K8 permet de couper le son du retour programme. Par exemple, lorsque vous réalisez un duplex sur le terrain avec un journaliste, celui-ci peut être perturbé par l'écho de sa propre voix envoyé sur le retour programme. Si vous activez le mix minus sur une entrée, tout l'audio de programme du mixage est acheminé, sauf cette entrée.

Paramètres du multi view

Les paramètres de l'onglet Multi View permettent de régler la disposition des fenêtres. La vue par défaut affiche deux grandes fenêtres en haut et huit petites fenêtres en dessous, mais chaque quadrant du multi view peut être défini sur une grande vue ou sur quatre vues plus petites afin que vous puissiez configurer 4, 7, 10, 13 ou 16 vues. Cliquez sur chaque quadrant dans **Affichage** pour basculer entre 1 et 4 vues.



Configuration du multi view

Les vumètres peuvent être activés ou désactivés simultanément sur toutes les sources du mélangeur et sur la fenêtre Programme en cliquant sur le bouton **Activer** ou **Désactiver** situé sous l'intitulé vumètres. Il est également possible d'activer ou de désactiver les vumètres individuellement en cliquant directement sur l'icône vumètre au sein de chaque fenêtre.

Sur chaque source et vue du programme, vous pouvez activer des marqueurs indiquant la zone de sécurité pour vérifier le rendu du programme sur n'importe quel moniteur. Les repères de cadrage s'affichent en 16:9 pour les workflows horizontaux et en 9:16 pour les workflows verticaux. Sélectionnez **Tous** pour activer les deux repères de cadrage.

Le multi view affichera également le tally. Si une source du multi view est utilisée dans une couche du signal de sortie programme ou prévisualisation, la bordure sera alors allumée en rouge ou en vert. Une bordure rouge indique que la source est utilisée sur le signal de sortie programme et une bordure verte signifie que la source est sélectionnée sur le signal de sortie prévisualisation. Les paramètres de bordure vous permettent de désactiver les bordures ou de sélectionner une couleur à l'aide du menu des couleurs. Les libellés du multi view passeront également au rouge ou au vert lorsqu'ils sont sur les sorties prévisualisation ou programme. Les libellés peuvent aussi être désactivés dans n'importe quelle fenêtre en cliquant sur l'icône **Aa**.

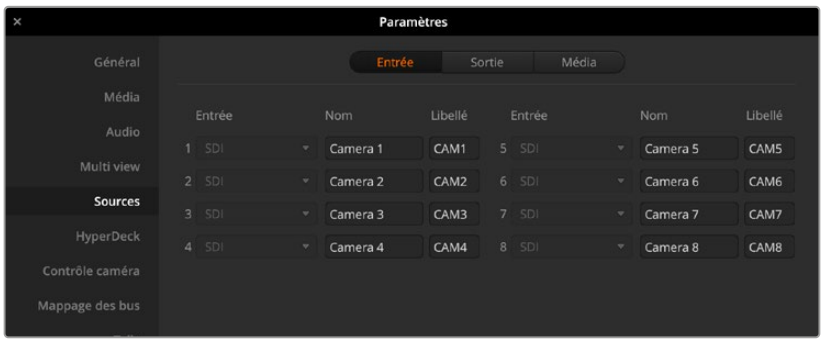
Le multi view comprend des fenêtres d'état additionnelles pour le streaming, l'enregistrement et l'audio afin que vous puissiez contrôler l'espace sur les disques durs ou le débit de données lors du streaming. Pour plus d'informations sur les fenêtres disponibles, consultez la section « Utiliser le multi view » de ce manuel.

Sources

L'onglet Sources peut être utilisé pour changer les libellés des entrées, des sorties et des lecteurs multimédia du mélangeur. Chaque entrée et chaque sortie auront un nom long et un nom court.

Les noms longs comprennent jusqu'à vingt caractères. Ils apparaissent dans les menus de sélection des sources sur le panneau de contrôle logiciel, sur les libellés à l'écran des fenêtres multi view, ainsi que sur les affichages LCD du mélangeur. Le nom court à 4 caractères est utilisé pour identifier les boutons d'entrée sur le panneau de contrôle logiciel.

Pour modifier le nom d'une entrée, cliquez dans le champ de texte, saisissez le nouveau nom et cliquez sur Enregistrer. Le nom de l'entrée sera mis à jour sur le multi view, sur le panneau de contrôle logiciel et sur le mélangeur si vous en avez connecté un. Il est préférable de changer en même temps les libellés courts et longs, afin qu'ils correspondent. Vous pouvez par exemple saisir Caméra 1 dans le libellé long et Cam1 dans le libellé court.



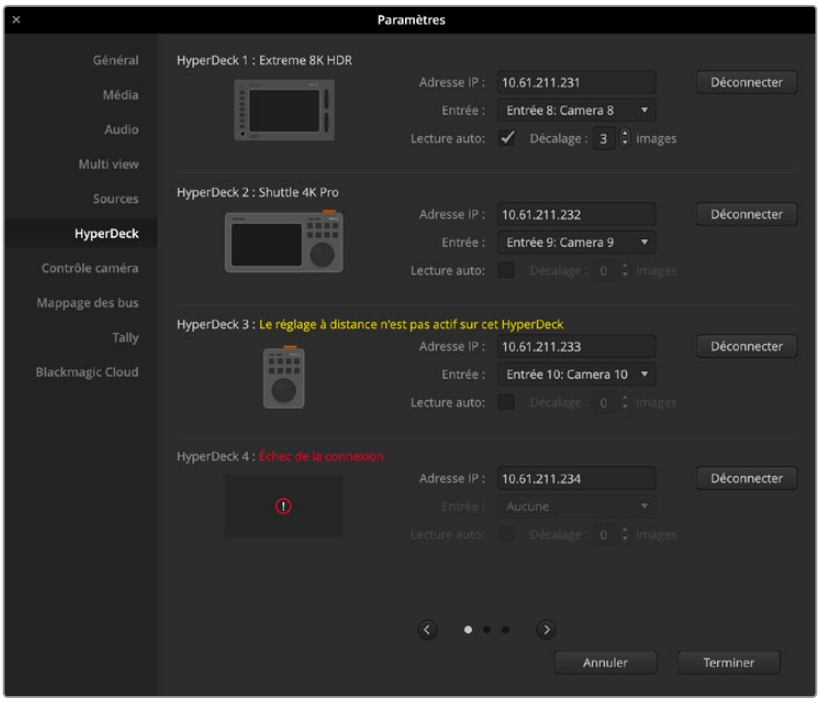
Entrez les noms longs et courts pour les entrées et les sorties

Sur les modèles ATEM Television Studio HD8 ISO, vous pouvez utiliser l'onglet Sources pour ajouter des caméras à distance sur votre réseau local ou via Internet. Pour plus d'informations, consultez la section « Fonctionnalités supplémentaires des modèles ISO » de ce manuel.

Paramètres de l'HyperDeck

Avec les mélangeurs ATEM Television Studio, vous pouvez connecter jusqu'à 10 enregistreurs à disque HyperDeck Studio et les contrôler à l'aide de l'ATEM Software Control. Lorsque vous connectez un HyperDeck, utilisez ces paramètres pour configurer l'adresse IP et sélectionner les entrées auxquelles il est connecté. De plus, ces paramètres permettent d'activer ou de désactiver la lecture automatique sur chaque appareil, et de régler le décalage des images pour une commutation propre.

L'état de l'appareil s'affiche à l'écran pour indiquer si la connexion et si le contrôle à distance fonctionnent.



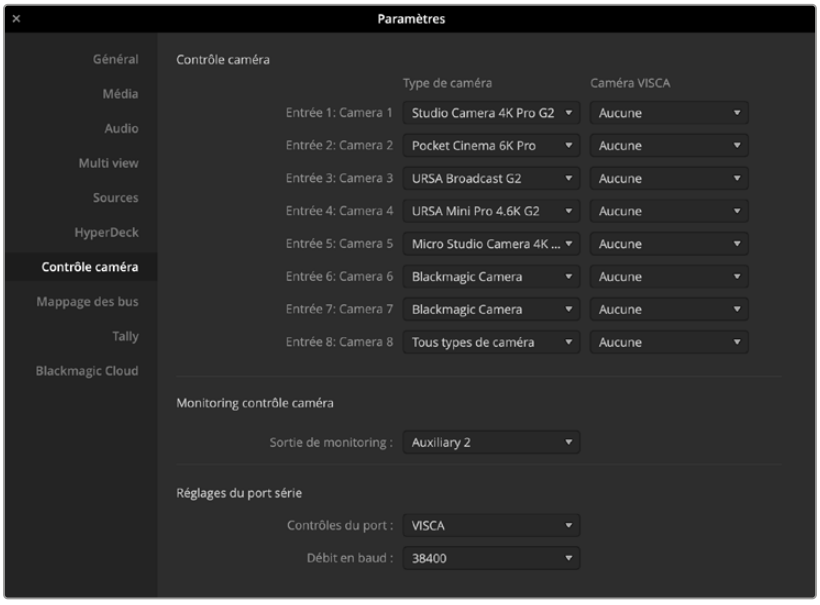
Ajoutez jusqu'à 10 HyperDecks

La personnalisation des libellés pour vos entrées HyperDeck peut faciliter leur sélection depuis la liste.

Pour plus d'informations sur l'installation et le réglage de l'HyperDeck avec un mélangeur ATEM, consultez la section « Contrôle de l'HyperDeck » de ce manuel.

Paramètres du contrôle caméra

L'onglet du contrôle caméra comprend des paramètres permettant d'assigner des caméras aux entrées et de sélectionner la sortie de monitoring.



Contrôle caméra

Le menu de type de caméra vous permet de sélectionner une caméra Blackmagic pour chaque entrée, ou vous pouvez sélectionner **Tous types de caméra** lors de l'ajout de caméras tierces. En sélectionnant la bonne caméra pour l'entrée, vous serez assuré que tous les paramètres pour cette caméra sont réglés correctement.

Pour ajouter des caméras PTZ et des têtes de caméra PTZ contrôlées par VISCA sur IP :

1. Dans le menu **Type de caméra**, sélectionnez **Tous types de caméra**.
2. Cliquez sur le menu de la caméra VISCA correspondante. Si vous avez déjà ajouté une caméra VISCA, elle apparaîtra dans la liste, ou vous pouvez cliquer sur l'option **Ajouter caméra VISCA IP**.
3. Dans le menu **Ajouter caméra VISCA IP**, saisissez l'adresse IP de la caméra ou de la tête de caméra PTZ. Vous pouvez aussi saisir un nom de caméra personnalisé. Cliquez sur **Ajouter**.

Monitoring du contrôle caméra

Vous pouvez sélectionner n'importe quelle sortie SDI ou la sortie webcam pour le monitoring du contrôle caméra. Lorsque vous contrôlez vos caméras via le panneau de contrôle caméra, vous pouvez vérifier les ajustements via la sortie de monitoring. Cliquez sur le menu pour choisir la sortie que vous souhaitez utiliser.

Réglages du port série

Vous pouvez choisir la façon d'utiliser le port série à l'aide du menu **Contrôle port**. Les options disponibles sont Désactiver, VISCA et GVG. L'option GVG utilise le GVG100, une interface standard permettant de communiquer avec des équipements tels que les systèmes de montage linéaires. Lorsque VISCA est sélectionné, choisissez un débit en baud de 9 600 ou 38 400.

Pour détecter des caméras VISCA distantes, cliquez sur le bouton **Réglages caméra VISCA**.

Une fenêtre s'affiche alors avec la liste des caméras VISCA en série disponibles. Vous pouvez également ajouter des caméras VISCA IP en cliquant sur l'icône +. Une fois que les caméras VISCA en série sont détectées, elles peuvent être sélectionnées via le menu **Caméra VISCA** pour chaque entrée. Pour supprimer une caméra VISCA sur IP, appuyez sur le bouton -.

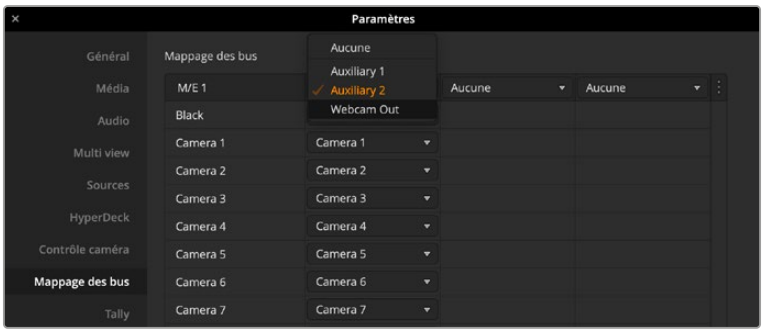
Mappage des bus

Avec les mélangeurs ATEM Television Studio, vous pouvez relier les sorties auxiliaires et webcam pour suivre l'opération du M/E principal. Cela vous permet de créer plusieurs sorties du même programme, avec des sorties suiveuses contrôlées par la rangée programme.

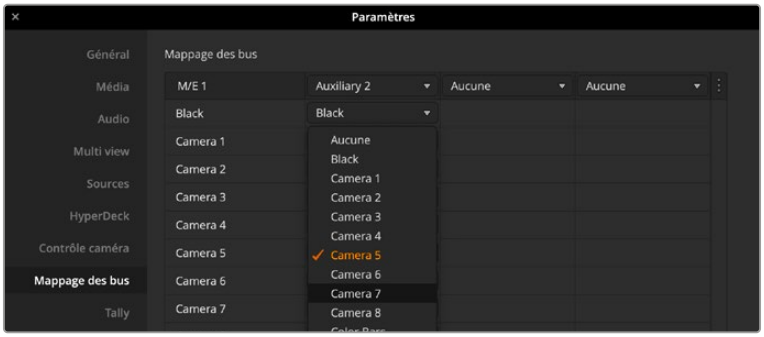
Depuis l'onglet de mappage des bus dans les paramètres, vous pouvez substituer des sources sur les sorties aux ou la sortie webcam suiveuse(s) pour remplacer les entrées sélectionnées. Une fois configurés, les éléments suiveurs répliqueront les coupes et les transitions de la rangée programme, mais pourront diffuser des sources différentes si nécessaire. Il est important de noter qu'il s'agit de sorties opérant uniquement des coupes simples ; elles n'incluront donc aucune des transitions que vous pourriez utiliser dans votre programme. Par exemple, vous pourriez localiser un programme en substituant les titres sur chaque sortie par des titres dans une autre langue. Le suiveur effectuera alors chaque transition en parfaite synchronisation avec le principal, remplaçant n'importe quelles transitions par de simples coupes, tout en affichant les graphiques localisés que vous avez assignés, permettant ainsi d'obtenir jusqu'à 4 sorties programme distinctes.

Pour configurer la substitution de source :

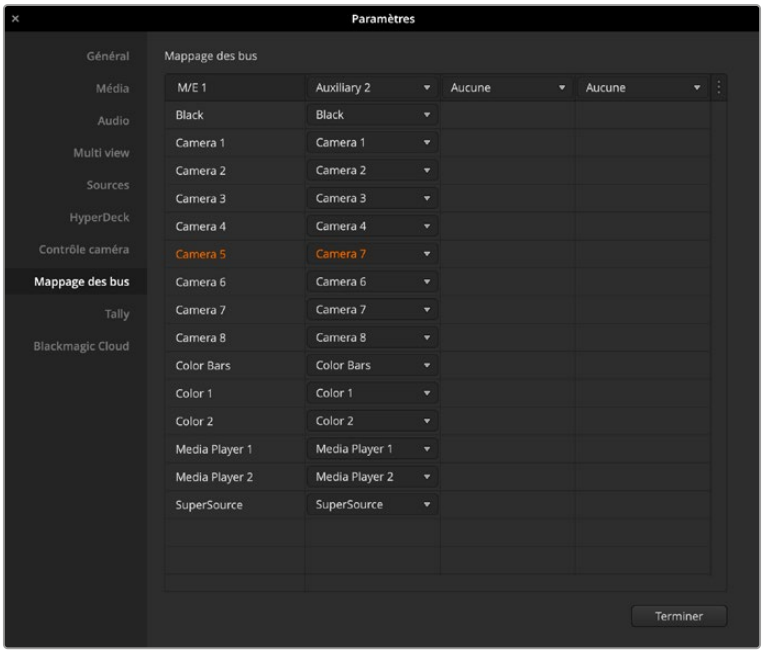
1. En utilisant le menu situé en haut de la deuxième colonne, sélectionnez une sortie auxiliaire ou webcam à utiliser comme suiveur, par exemple, la sortie auxiliaire 2. Les modèles ATEM Television Studio HD8 disposent de 2 sorties auxiliaires, alors que les mélangeurs ATEM Television Studio 4K8 en ont 10.



2 Dans cet exemple, la caméra 5 sera substituée. Accédez à la liste de sources correspondante sous l'auxiliaire 2 pour la caméra 5 et cliquez sur le menu de la liste.



3 Sélectionnez la caméra 7 dans la liste. La caméra 5 sous le M/E 1 s'affichera alors en orange pour indiquer qu'une substitution a été effectuée.



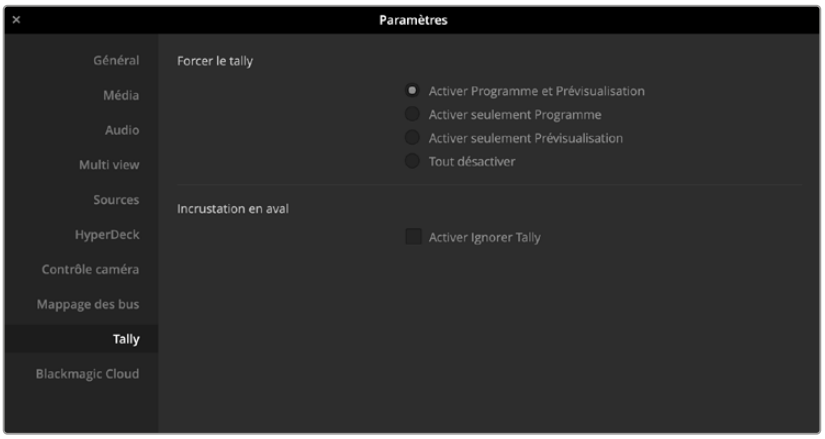
Désormais, lorsque vous effectuerez une coupe ou une transition vers la caméra 5 sur le programme du M/E, l'auxiliaire 2 effectuera une coupe vers la caméra 7. Le plus simple pour en visualiser l'effet est d'assigner le programme et la sortie aux 2 à la sortie multi view.

Il est important de noter qu'il s'agit de sorties opérant uniquement des coupes simples ; elles n'incluront donc aucune des transitions que vous pourriez utiliser dans votre programme.

Tally

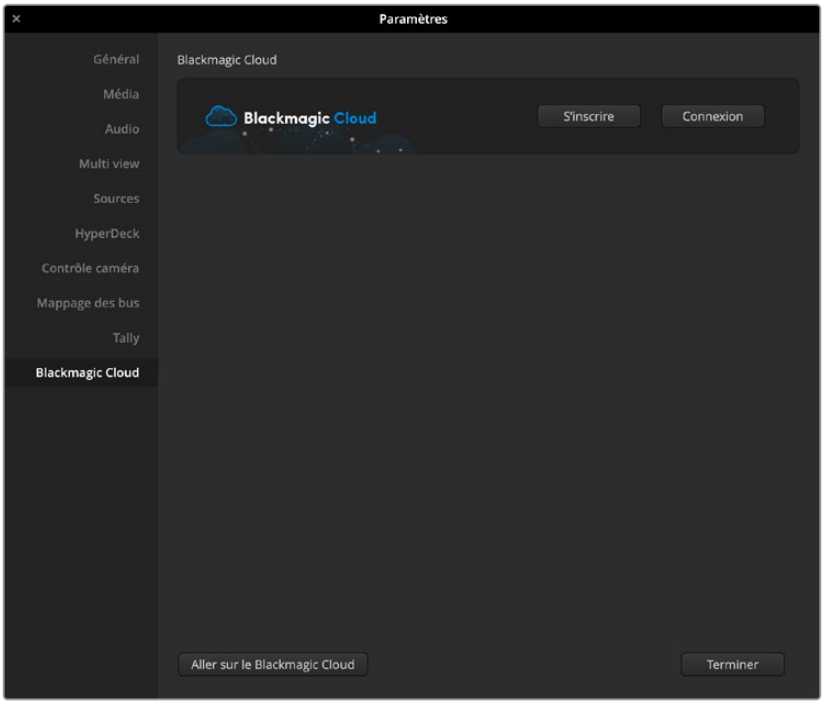
Activez le tally sur chaque M/E à l'aide du menu Tally. Ces réglages peuvent être définis indépendamment pour chaque M/E, et un M/E peut avoir une sortie tally différente d'un autre.

Pour désactiver le tally lorsqu'une incrustation en aval est à l'antenne, cochez la case **Enable tally override**.



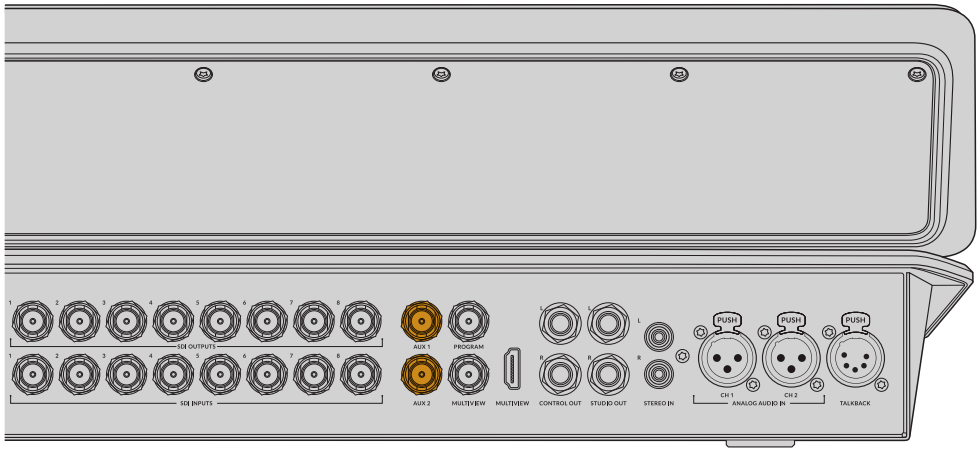
Blackmagic Cloud

Si vous streamez vers le Blackmagic Cloud Stream Router ou synchronisez des projets vers le Blackmagic Cloud, il faudra vous connecter au Blackmagic Cloud. Vous pouvez le faire à partir du menu Blackmagic Cloud dans la fenêtre de configuration ou à l'aide de la palette Stream en direct.

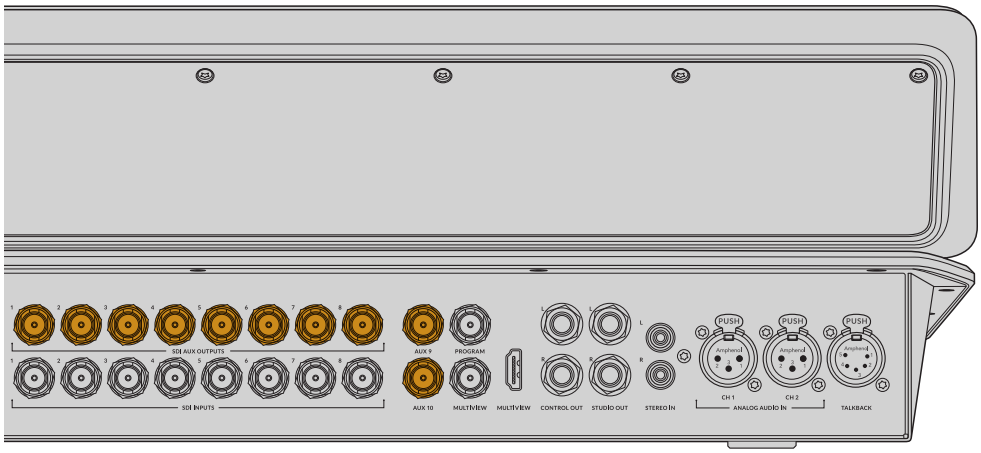


Sorties auxiliaires

Vous pouvez router divers signaux d'entrée et sources internes vers les sorties auxiliaires SDI et la sortie webcam du mélangeur ATEM. Elles ressemblent beaucoup à des sorties de grille de commutation, et toutes les entrées vidéo, les générateurs de couleurs, les lecteurs multimédia, le programme, la prévisualisation et même la mire peuvent être générés en sortie. Les ATEM Television Studio HD8 disposent de 3 sorties auxiliaires, et les ATEM Television Studio 4K8 en ont 11.



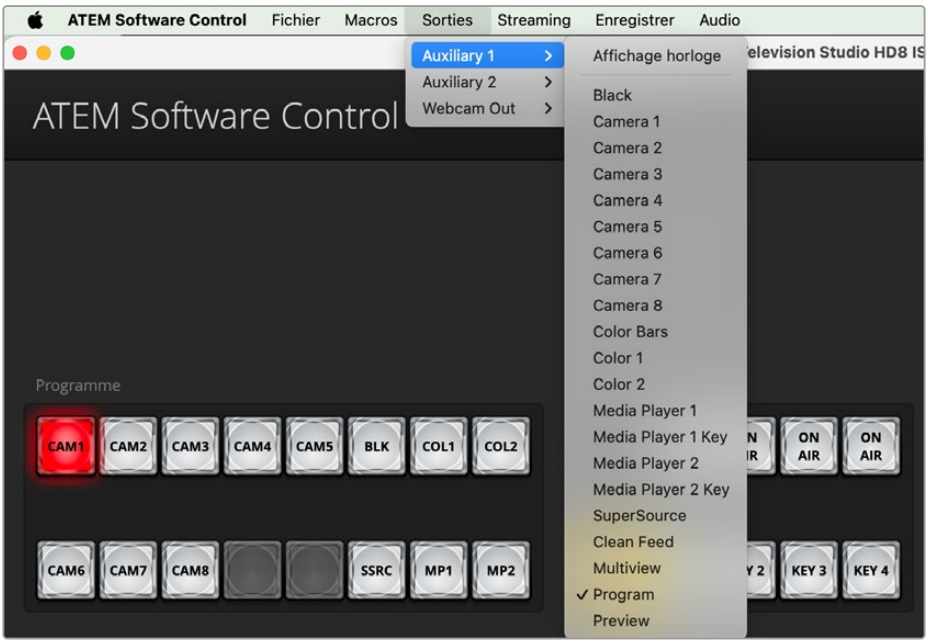
Sorties auxiliaires sur l'ATEM Television Studio HD8



Sorties auxiliaires sur l'ATEM Television Studio 4K8

Routage des sorties auxiliaires

Utiliser le menu Auxiliaire ou Sorties pour router les sorties auxiliaires. Il suffit de sélectionner le menu, puis de faire défiler la liste jusqu'à la source que vous souhaitez acheminer. Une fois la source sélectionnée, le signal de la sortie auxiliaire change immédiatement. Une coche apparaît alors à côté de la source activée dans le menu. Il y a toute une gamme de sources disponibles, notamment : noir, entrées vidéo, mire, signaux fill et key des lecteurs multimédia, programme, prévisualisation et clean feeds.



Menu Sorties de l'ATEM Television Studio HD8

Les sorties auxiliaires sont extrêmement puissantes et offrent une large gamme de possibilités telles que des sorties alternatives sur le mélangeur ; elles sont également fréquemment utilisées pour faire fonctionner des vidéoprojecteurs et des murs d'images sur scène lors de concerts et d'événements en direct. De nos jours, la plupart des événements en direct sont complexes en termes d'installation multimédia et les sorties auxiliaires sont conçues pour vous permettre de contrôler toutes les projections nécessaires à partir de votre ATEM !

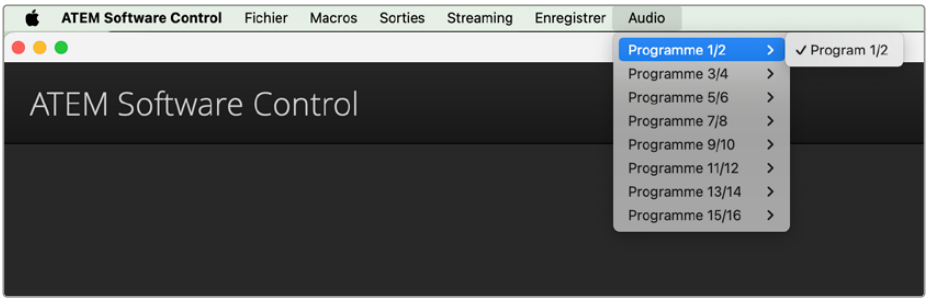
Mappage des canaux audio

Vous pouvez assigner les canaux audio intégrés à la sortie vidéo du mélangeur. Vous pouvez ainsi acheminer diverses sources audio vers les canaux de la sortie vidéo SDI afin qu'elles puissent être enregistrées sur les HyperDecks.

Par exemple, vous pouvez connecter un microphone à une caméra et acheminer cette entrée spécifique vers les canaux audio intégrés 3 et 4 de la sortie programme. Si vous sélectionnez l'enregistrement de 4 canaux audio ou plus dans les paramètres de l'HyperDeck, l'enregistrement comportera un enregistrement brut des micros de la caméra indépendamment du mixage audio, et tout ingénieur du son pourra accéder à ces sources audio spécifiques lorsqu'il effectuera un mixage audio en post-production.

Avec ce routage audio, vous pouvez contrôler tous les canaux audio intégrés à la sortie vidéo SDI. C'est une fonction très puissante.

Votre mélangeur ATEM peut router les canaux audio de la sortie programme individuellement à l'aide du menu Audio.



Options de routage audio de l'ATEM Television Studio avec l'ATEM Software Control

Le mix du programme sera toujours attribué aux canaux 1 et 2, le réseau d'ordres des ingénieurs aux canaux 13 et 14, et le réseau d'ordres de la production aux canaux 15 et 16. Toutefois, tous les autres canaux peuvent être mappés séparément à l'aide de n'importe quelle entrée SDI, MADI, XLR, RCA ou micro.

Router le programme audio avec l'ATEM Software Control

1. Cliquez sur le menu Audio dans la barre d'outils supérieure.
2. Sélectionnez une paire de canaux audio pour la sortie programme. Dans le menu à droite, sélectionnez l'entrée SDI vers laquelle vous souhaitez router l'audio. Par exemple, pour router les canaux 3 et 4 de l'entrée SDI 2 vers les canaux 3 et 4 de la sortie programme, sélectionnez **Sortie audio 3/4** dans la première liste et **Entrée SDI 2 audio 3/4** dans la deuxième liste.

Utilisation de la fonction SuperSource

Les mélangeurs ATEM Television Studio comprennent la fonction SuperSource qui vous permet d'arranger plusieurs sources sur votre moniteur en même temps. Par exemple, si vous diffusez une discussion avec quatre participants, vous avez l'option de tous les superposer sur un arrière-plan. Le processeur SuperSource apparaît sur votre mélangeur ATEM en tant qu'entrée vidéo unique.

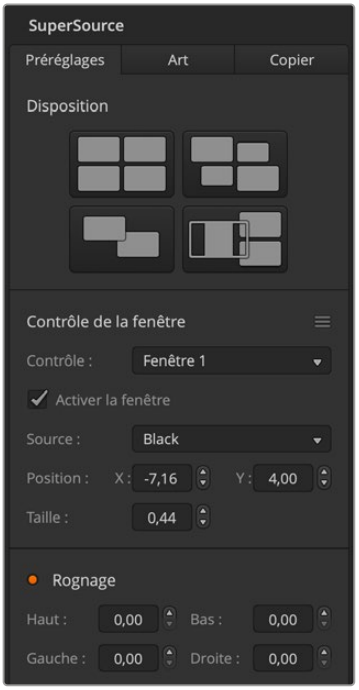
Configuration de la fonction SuperSource

Vous pouvez configurer la fonction SuperSource à l'aide de l'onglet Palettes de l'ATEM Software Control ou en appuyant sur le bouton SuperSource situé sur la gauche de l'écran LCD.

Visualisation de la SuperSource

Pour configurer la fonction SuperSource, vous devez d'abord pouvoir la visualiser sur votre moniteur. Assignez la fonction SuperSource à l'une des sorties SDI à l'aide du menu Sorties ou placez-la sur l'une des fenêtres de votre multi view.

Positionnement des sources



Paramètres de la fonction SuperSource

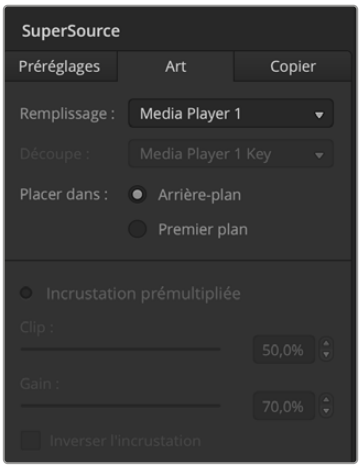
Ouvrez la palette SuperSource et choisissez parmi les 4 dispositions proposées celle qui correspond le plus au rendu que vous souhaitez. Les fenêtres seront ainsi placées automatiquement comme indiqué par le logiciel. À l'aide du menu de contrôle, sélectionnez la fenêtre que vous souhaitez ajuster. Vous pouvez désormais modifier les positions x et y, ainsi que la taille de chaque fenêtre, ou décocher la case **Activer la fenêtre** pour supprimer cette fenêtre de la SuperSource. Les paramètres de rognage vous permettent de recadrer les côtés des fenêtres. Cochez la case de rognage et ajustez les paramètres pour les côtés supérieur, inférieur, gauche ou droit. Pour réinitialiser la position, la taille ou le rognage de la fenêtre ou tous les paramètres, cliquez sur l'icône à droite du contrôle de la fenêtre.

Si vous utilisez un ATEM Television Studio, appuyez sur le bouton SuperSource et utilisez les flèches du Contrôle système pour naviguer dans les paramètres SuperSource. Sur la deuxième page du menu SuperSource, tournez la molette de préréglage pour sélectionner la disposition, puis appuyez sur le bouton multifonction **Appliquer le préréglage** au-dessus de l'écran LCD. Une fois qu'une fenêtre est sélectionnée, tous les paramètres supplémentaires s'appliquent à cette fenêtre ainsi qu'au contrôle du joystick.

Le réglage de la taille et de la position de la fenêtre peut être effectué à l'aide des molettes multifonctions situées sous l'écran LCD sur la troisième page de menu, mais il est beaucoup plus rapide d'utiliser le joystick du panneau. Poussez le joystick pour changer à la fois la position x et y. Tournez le joystick dans le sens des aiguilles d'une montre pour augmenter la taille de la fenêtre, ou dans le sens inverse pour la réduire.

Couches d’arrière-plan et de premier plan

Cliquez sur l’onglet **Art** pour dévoiler les paramètres. Choisissez ensuite votre remplissage depuis le menu. Si vous utilisez le panneau du mélangeur, vous pouvez choisir la source de remplissage à l’aide du bus de sélection des sources. Placez la source en avant ou en arrière-plan. Une fois l’avant-plan sélectionné, vous pouvez sélectionner la source d’incrustation dans le menu ou dans le bus de sélection des sources sur le panneau.

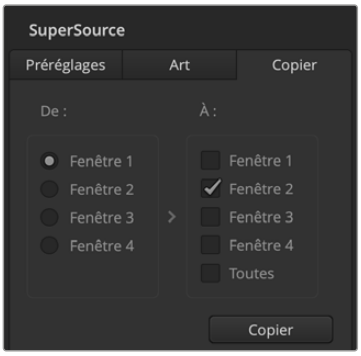


Commandes de la couche d’arrière-plan

En sélectionnant l’avant-plan, vous devrez choisir si votre graphique est prémultiplié ou non. S’il est prémultiplié, cochez la case. Cette opération permettra de placer la couche sur les fenêtres activées. Si votre couche n’est pas prémultipliée, vous pouvez alors utiliser les fonctions clip et gain présentées dans la section relative aux incrustations pour obtenir le résultat escompté. Vous pouvez également inverser l’incrustation.

Sur le panneau, utilisez les flèches dans le Contrôle système pour naviguer jusqu’aux paramètres. À l’aide de la molette de remplissage, sélectionnez votre incrustation, puis déterminez si vous la souhaitez à l’avant ou à l’arrière-plan avec les boutons multifonctions situés au-dessus de l’écran LCD. Si la source de remplissage est prémultipliée, passez à la page suivante et assurez-vous que le bouton **Incrustation prémultipliée** est affiché. Cette opération permettra de placer la couche sur la ou les fenêtres activée(s). Si votre couche n’est pas prémultipliée, vous pouvez alors utiliser les fonctions clip et gain présentées dans la section relative aux incrustations pour obtenir le résultat escompté. Il vous faudra peut-être également inverser l’incrustation.

Copier les paramètres



Copier les paramètres de la fenêtre 1 à la fenêtre 2

Pour utiliser la fonction Copier à l’aide de l’ATEM Software Control, il vous suffit de cliquer sur l’onglet **Copier** et la boîte de dialogue s’affichera. Vous pouvez ainsi facilement copier les paramètres de la fenêtre sélectionnée, et les appliquer à n’importe quelle autre fenêtre en un seul clic. Les fenêtres copiées apparaîtront directement derrière la fenêtre principale et partageront la même source que cette dernière.

Si vous réglez les paramètres à l’aide de l’ATEM Television Studio, naviguez jusqu’à la dernière page du menu SuperSource et, à l’aide des boutons multifonctions situés sous l’écran LCD, sélectionnez la fenêtre à copier,

ainsi que la fenêtre de destination. Vous pouvez aussi copier vers toutes les fenêtres à l’aide de la molette.

Passer une SuperSource à l’antenne

Le processeur SuperSource apparaît sur votre mélangeur en tant qu’entrée vidéo. Sélectionnez la SuperSource sur le bus programme à l’aide de l’ATEM Software Control ou le panneau du mélangeur pour utiliser la composition que vous venez de créer.

Sauvegarder et restaurer les paramètres du mélangeur

Une fois votre mélangeur ATEM configuré, vous avez deux options pour sauvegarder vos paramètres.

Sauvegarder les paramètres de démarrage

Si votre mélangeur utilise les mêmes paramètres pour toutes vos productions, vous pouvez les sauvegarder en tant que paramètres de démarrage par défaut. Une fois sauvegardés, tous vos préréglages et préférences seront chargés quand vous ouvrirez l'ATEM Software Control. Vous pouvez effacer ces paramètres en sélectionnant **Effacer les paramètres de démarrage**.

Sauvegarder les paramètres en tant que fichier XML

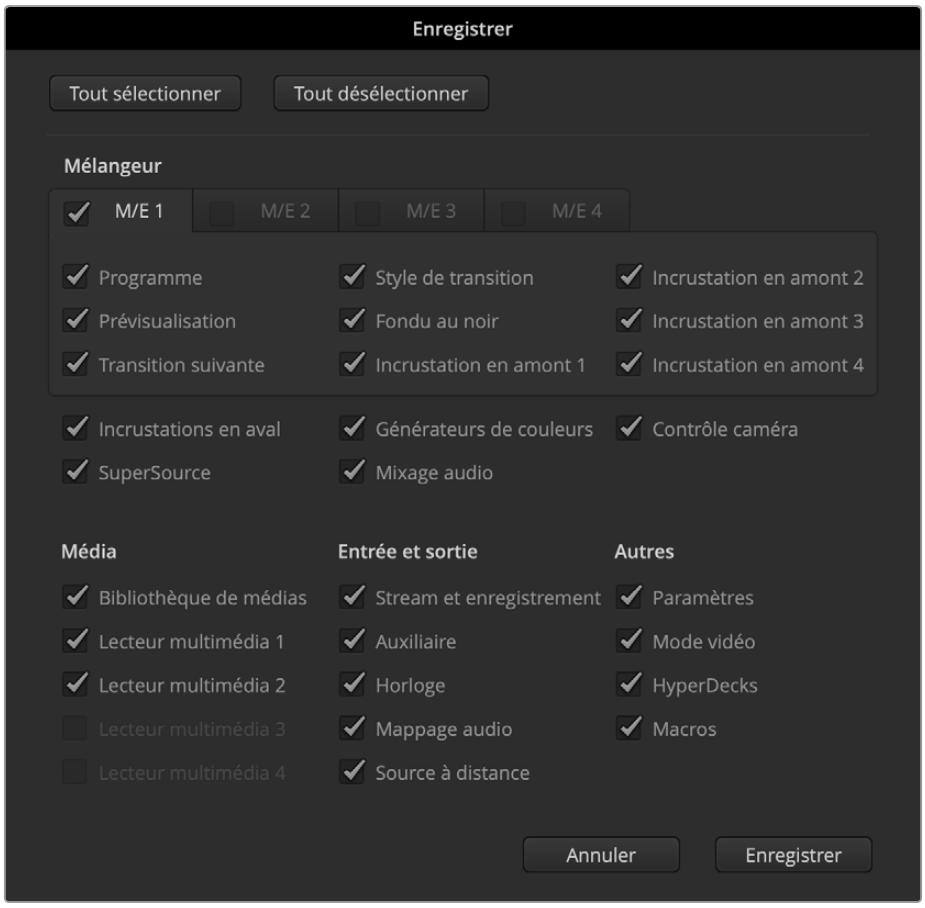
Pour les workflows avec de multiples productions qui ont chacune leurs propres réglages, vous pouvez utiliser la fonctionnalité **Enregistrer sous**. Cette formidable option permet un incroyable gain de temps lors de productions en direct où vous utilisez des réglages standard. Par exemple, vous pouvez directement restaurer les paramètres de la caméra, les synthés et les paramètres des incrustations sauvegardés par le biais d'un ordinateur portable ou d'une clé USB.

Pour sauvegarder les paramètres :

1. Allez sur la barre de menu de l'ATEM Software Control et sélectionnez Fichier>Enregistrer sous.
2. Une fenêtre s'affiche et vous demande de saisir un nom de fichier et la destination du dossier. Après avoir fait votre sélection, cliquez sur Enregistrer.
3. La fenêtre qui permet de sauvegarder la configuration du mélangeur apparaît. Cette dernière contient des cases de sélection pour tous les paramètres disponibles relatifs à chaque section de votre mélangeur ATEM. La case de sélection Tout sélectionner est activée par défaut. Si vous effectuez votre sauvegarde et que la case Tout sélectionner est activée, l'ATEM Software Control sauvegarde la totalité des paramètres de votre mélangeur. Si vous souhaitez sauvegarder des paramètres particuliers, vous pouvez désactiver les paramètres individuellement. Pour désactiver tous les paramètres, cliquez une fois sur Tout sélectionner. Vous pouvez à présent sélectionner les paramètres que vous souhaitez sauvegarder.
4. Cliquez sur le bouton Enregistrer. Un statut d'enregistrement apparaîtra dans le coin inférieur droit du panneau pour confirmer que l'enregistrement est terminé.

L'ATEM Software Control sauvegarde vos paramètres dans un fichier XML ainsi qu'un dossier comprenant le contenu de la bibliothèque de médias du mélangeur.

Une fois vos paramètres enregistrés, vous pouvez faire une sauvegarde rapide à tout moment en sélectionnant Fichier>Enregistrer, ou en appuyant sur Cmd S pour Mac, ou Ctrl S pour Windows. Cela ne remplacera pas votre précédente sauvegarde, mais ajoutera un nouveau fichier XML à votre dossier de destination qui est clairement identifié par l'horodatage. Vous pouvez ainsi toujours restaurer une sauvegarde précédente, si besoin est.



Grâce à l'ATEM Software Control vous pouvez sauvegarder et restaurer tous les paramètres de votre mélangeur pour votre production en direct, notamment les paramètres des incrustations, les styles de transition, le contenu de la bibliothèque de médias et autres.

Si les paramètres de votre mélangeur sont sauvegardés sur un ordinateur portable, il est facile d'emmener tous vos paramètres sur le lieu de tournage. Connectez votre ordinateur portable à n'importe quel mélangeur ATEM et restaurez rapidement vos paramètres.

La production en direct est une tâche passionnante et exigeante et comme vous devez toujours travailler sur le vif, il est facile d'oublier de sauvegarder vos fichiers une fois la production terminée.

Si vous souhaitez conserver certains paramètres, il suffit de les sauvegarder sur votre ordinateur ainsi que sur un disque dur externe, par exemple sur une clé USB. Cela vous permettra d'emmener vos paramètres avec vous et de disposer d'une sauvegarde supplémentaire au cas où vos paramètres seraient accidentellement effacés de votre ordinateur.

Pour restaurer les paramètres :

1. Allez sur la barre de menu de l'ATEM Software Control et sélectionnez Fichier>Restaurer.
2. Une fenêtre vous demande quel fichier vous souhaitez ouvrir. Sélectionnez le fichier sauvegardé et cliquez sur Ouvrir.
3. Vous voyez à présent une fenêtre contenant des cases de sélection actives représentant les paramètres sauvegardés pour chaque section de votre mélangeur ATEM. Laissez la case Tout sélectionner active pour restaurer tous les paramètres sauvegardés, ou sélectionnez uniquement les cases des paramètres que vous souhaitez restaurer.
4. Cliquez sur Restaurer.

Réinitialisation

Pour restaurer votre mélangeur ATEM sur ses paramètres par défaut, ouvrez l'utilitaire ATEM Setup et cliquez sur **Factory reset**. Les paramètres du mélangeur sauvegardés avant la réinitialisation seront conservés.

Commuter avec l'ATEM Software Control

La fenêtre Mélangeur est l'interface de contrôle principale du mélangeur. Lors de la production en direct, cette fenêtre peut être utilisée pour sélectionner des sources et les faire passer à l'antenne.

Grâce à cette interface, vous pouvez sélectionner le style de transition, gérer les incrustateurs en amont et en aval et activer ou désactiver le bouton Fade to Black (fondu au noir). Les palettes sur le côté droit de l'interface vous permettent de modifier les paramètres des transitions, d'ajuster les générateurs de couleurs, de contrôler les lecteurs multimédia, d'ajuster les incrustateurs en amont et en aval ainsi que de contrôler la durée des fondus au noir.

Contrôle avec la souris et le pavé tactile

Vous pouvez contrôler les boutons virtuels, les curseurs et le levier de transition sur le panneau de contrôle logiciel à l'aide de la souris ou du pavé tactile de votre ordinateur si vous utilisez un ordinateur portable.

Pour activer un bouton, cliquez une fois avec le bouton gauche de la souris. Pour activer un curseur, cliquez et maintenez le bouton gauche de la souris enfoncé tout en le déplaçant. Pour contrôler le levier de transition, cliquez et maintenez le bouton gauche de la souris enfoncé sur le levier et déplacez-le vers le haut ou vers le bas.

Utiliser les raccourcis clavier

Vous pouvez utiliser des raccourcis qui vous permettent un contrôle pratique de certaines fonctions du mélangeur à l'aide d'un clavier standard AZERTY en suivant les instructions ci-dessous:

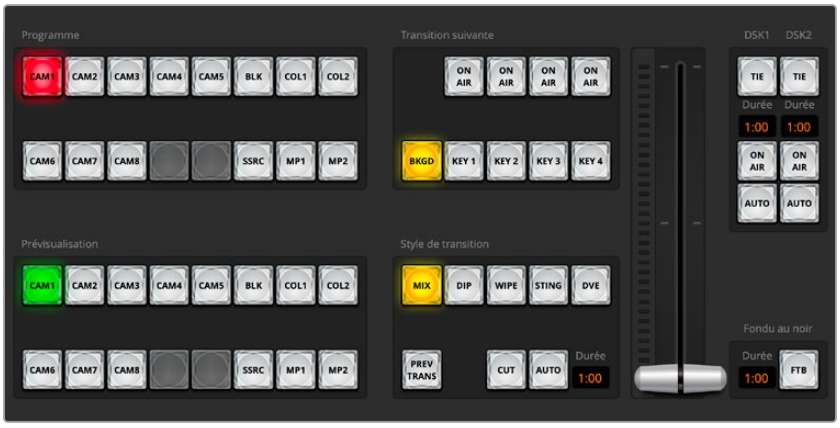
Raccourcis	Fonction
<1> - <0>	Prévisualisation de la source sur les entrées 1 - 10 du mélangeur. 0 = entrée 10.
<Majuscule> <1> - <0>	Prévisualisation de la source sur les entrées 11 - 20 du mélangeur. Majuscule 0 = entrée 20.
<Contrôle> <1> - <0>	Commutation directe de la source des entrées 1 - 10 du mélangeur au signal de sortie programme.
Appuyez et relâchez <Contrôle>, ensuite <1> - <0>	Commutation directe de la source des entrées 1 - 10 du mélangeur au signal de sortie programme. La commutation directe reste activée et le voyant rouge du bouton CUT est allumé.
<Contrôle> <Majuscule> <1> - <0>	Commutation directe de la source des entrées 11 - 20 du mélangeur au signal de sortie programme.

Appuyez et relâchez <Contrôle>, ensuite <Majuscule> <1> - <0>	Commutation directe de la source des entrées 11 - 20 du mélangeur au signal de sortie programme. La commutation directe reste activée et le voyant rouge du bouton CUT est allumé.
<Contrôle>	Désactive la commutation directe si elle est activée. Le voyant blanc du bouton CUT est allumé.
<Espace>	CUT
<Retour> ou <Entrée>	AUTO

De plus amples informations sur l'utilisation du panneau de contrôle du mélangeur sont inclues dans les sections suivantes.

Mix Effects

La section M/E de l'onglet Mélangeur contient tous les boutons de sélection des bus Programme et Prévisualisation. Elle vous permet de sélectionner des entrées externes ou des sources internes pour la prévisualisation de la transition suivante ou le passage à l'antenne.



Panneau Mix Effects sur l'ATEM Television Studio

Boutons de sélection des sources du bus Programme

Les boutons de sélection des sources du bus Programme permettent de commuter en direct des sources d'arrière-plan au signal de sortie du programme. La source à l'antenne est indiquée par un voyant rouge.

Boutons de sélection des sources du bus Prévisualisation

Les boutons de sélection des sources du bus Prévisualisation permettent de sélectionner une source d'arrière-plan sur le signal de sortie prévisualisation. Cette source est envoyée au bus Programme lors de la transition suivante. La source de prévisualisation sélectionnée est indiquée par un voyant vert.

Les boutons de sélection des sources sont identiques sur les bus Programme et Prévisualisation.

INPUTS	Il y a le même nombre de boutons d'entrée que d'entrées externes sur le mélangeur.
BLACK	Source de couleur noire générée de façon interne par le mélangeur.
SUPERSOURCE	Utilisez SuperSource pour arranger plusieurs sources sur le moniteur en même temps. Sélectionnez le bouton SHIFT pour obtenir la mire de barres couleurs.
BARS	Mire de barres couleurs générée en interne par le mélangeur. Appuyez sur les boutons SuperSource et SHIFT pour obtenir la mire de barres couleur.
COLOR 1 and 2	Sources de couleur générées en interne par le mélangeur.
MEDIA 1 and 2	Lecteurs multimédia internes qui permettent de visualiser les images fixes ou les clips stockés dans le mélangeur.

Section de contrôle des transitions et incrustateurs en amont

Contrôle des transitions

CUT

Le bouton CUT effectue une transition immédiate des signaux de sortie programme et prévisualisation, en neutralisant le style de transition sélectionné.

AUTO/DURÉE

Le bouton **Auto** exécute la transition sélectionnée pour la durée spécifiée dans la zone d'affichage **Durée**. La durée de transition de chaque style de transition est configurée dans la palette Transition du style en question et s'affiche dans la zone d'affichage **Durée** lorsque le bouton correspondant au style de transition est sélectionné.

Le voyant rouge du bouton **Auto** reste allumé pendant toute la transition et la zone d'affichage **Durée** se met à jour au fur et à mesure de la transition pour indiquer le nombre d'images restant. L'indicateur du levier de transition sur les ATEM Television Studio fournit un feedback visuel de la progression de la transition.

Levier de transition

Le levier de transition est une alternative au bouton AUTO et permet à l'opérateur de contrôler la transition manuellement à l'aide d'une souris. Le voyant rouge du bouton **Auto** reste allumé pendant toute la transition et la zone d'affichage **Durée** se met à jour au fur et à mesure de la transition pour indiquer le nombre d'images restant. L'indicateur du levier de transition sur le mélangeur fournit un feedback visuel de la progression de la transition.

Style de transition

Les boutons de style de transition permettent à l'opérateur de choisir l'un des cinq types de transitions : Mix, Wipe, Dip, DVE, ou Stinger. Le style de transition choisi est indiqué par un voyant lumineux jaune. La sélection de ces boutons sera reflétée dans l'onglet correspondant au sein de la palette Transitions. Par exemple, lorsque la palette des transitions est ouverte et que vous cliquez sur **Wipe**, la palette révèlera automatiquement l'onglet **Wipe** afin que vous puissiez apporter des modifications à la transition, telles que la durée ou le style de motif.

Arm

Le bouton ARM active la lecture automatique depuis un HyperDeck connecté et sélectionné dans le bus de prévisualisation suivant une transition. Comme avec la fonctionnalité Auto roll, l'HyperDeck sélectionné dans le bus de prévisualisation commencera la lecture lorsque vous appuierez sur le bouton CUT ou AUTO pour lancer la transition. Pour utiliser la fonctionnalité ARM, appuyez sur Shift et sélectionnez le bouton ARM qui apparaîtra à la place du bouton STING. En appuyant une fois, la lecture se lancera automatiquement pour la sortie HyperDeck sélectionnée sur la prochaine transition uniquement. Pour garder la fonctionnalité ARM activée, appuyez sur Shift sur votre clavier et double-cliquez sur le bouton ARM.

Veuillez noter que n'importe quel Pre roll réglé via l'onglet HyperDeck du menu de réglages sera ignoré lorsque la fonction ARM est activée.

PREV TRANS

Le bouton PREV TRANS active le mode prévisualisation de transition, ce qui donne l'occasion à l'opérateur de vérifier une transition mix, dip, wipe ou DVE en l'exécutant sur la sortie prévisualisation à l'aide du levier de transition. Lorsque la fonction PREV TRANS est sélectionnée, le signal de sortie prévisualisation coïncidera avec le signal de sortie programme. Vous pouvez ensuite facilement tester la transition sélectionnée à l'aide du levier de transition. C'est une fonction très efficace pour éviter de faire passer des erreurs à l'antenne !

Transition suivante

Les boutons BKGD, KEY 1, KEY 2, KEY 3 et KEY 4 permettent de sélectionner les éléments qui vont transiter à l'antenne ou hors antenne avec la transition suivante. Le nombre d'incrustateurs disponibles varie selon les modèles de mélangeur. Il est possible de créer des fondus en entrée et en sortie de toutes les incrustations lors de la transition principale. Vous pouvez également sélectionner des incrustations et les faire passer à l'antenne individuellement, et utiliser la commande de transition principale pour créer des fondus en entrée et en sortie.

Lorsque vous sélectionnez les éléments de la transition suivante, il est recommandé de prévisualiser le signal de sortie. Vous saurez ainsi exactement comment le signal de sortie programme sera représenté après la transition. Lorsque vous sélectionnez uniquement le bouton BKGD, vous effectuerez une transition de la source actuelle sur le bus Programme à la source sélectionnée sur le bus Prévisualisation sans incrustations. Vous pouvez également ne faire transiter que les incrustations, tout en gardant le même arrière-plan en direct pendant la transition.

ON AIR

Les boutons ON AIR indiquent les incrustations qui sont à l'antenne. Ils permettent également de mettre une incrustation à l'antenne ou hors antenne de façon immédiate.

Section Incrustateurs en aval

TIE

Le bouton TIE active la DSK (Downstream Key : incrustation en aval) ainsi que les effets de la transition suivante sur la sortie Prévisualisation et la lie à la commande de transition principale afin que la DSK passe à l'antenne avec la transition suivante.

La zone d'affichage Durée située dans la section de contrôle des transitions indique la durée de la transition de la DSK. Lorsque la DSK est liée, le signal routé au clean feed 1 n'est pas affecté.

ON AIR

Le bouton ON AIR permet de mettre la DSK à ou hors antenne et indique si la DSK est actuellement à l'antenne ou pas. Le bouton est allumé lorsque la DSK est à l'antenne.

AUTO

Le bouton AUTO mixe la DSK à l'antenne ou hors antenne pour la durée spécifiée dans la zone d'affichage Durée. Cette zone ressemble à la zone d'affichage principale AUTO située dans la section de contrôle des transitions, à la différence qu'elle se cantonne à un incrustateur en aval spécifique. Cette fonction permet d'effectuer des fondus en entrée et en sortie de graphiques et de logos durant la production, sans interférer avec les transitions du programme principal.

Incrustation en aval et fondu au noir

Fondu au noir (FTB)

Le bouton FTB effectue un fondu au noir de l'intégralité du signal de sortie programme pour la durée spécifiée dans la zone d'affichage Durée de la section Fondu au noir. Une fois que la sortie de programme a été fondue au noir, le bouton FTB clignote en rouge jusqu'à ce que vous appuyiez à nouveau dessus. En appuyant à nouveau sur le même bouton, vous effectuerez un fondu au noir en entrée pour la même durée. Vous pouvez également saisir une autre durée dans la palette de la durée. La plupart du temps, le fondu au noir est utilisé en début ou en fin de production, mais aussi avant les pages de publicités. Cette fonction vous permet d'appliquer un fondu de sortie à toutes les couches du mélangeur en même temps. Les fondus au noir ne peuvent pas être prévisualisés. Vous pouvez également régler le mixeur audio intégré afin qu'il effectue un fondu de l'audio en même temps que le fondu au noir. Pour ce faire, il suffit de sélectionner le bouton AFV sur le fader de la sortie audio master.

Palettes de fonctions

Le panneau de contrôle logiciel comprend les onglets Palettes, Lecteur multimédia et Sortie. Les palettes indiquent l'ordre du traitement des signaux du mélangeur. Vous pouvez agrandir et diminuer la taille des palettes pour gagner de la place et les faire défiler d'un bout à l'autre pour visualiser les paramètres que vous souhaitez configurer.

Onglet Palettes

L'onglet Palettes contient les commandes suivantes :

Générateurs de couleurs

Le mélangeur ATEM possède deux générateurs de couleurs qui peuvent être configurés à partir de la palette Générateurs de couleur à l'aide du sélecteur de couleur ou en choisissant le niveau de teinte, de saturation et de luminance.

SuperSource

Les mélangeurs ATEM Television Studio comprennent la fonction SuperSource qui vous permet d'arranger plusieurs sources sur votre moniteur en même temps. Pour plus d'informations, consultez la section « SuperSource » de ce manuel.

Incrustations en amont

Il y a quatre incrustateurs en amont qui peuvent être configurés depuis les palettes d'incrustation en amont. Chaque incrustation possède sa propre palette. Au sein de chaque palette, l'incrustation peut être configurée en tant qu'incrustation en luminance (Luma), en chrominance (Chroma), en forme géométrique (Motif) ou DVE (effets vidéo numériques).

La palette sélectionnée affiche tous les paramètres disponibles pour configurer l'incrustation. De plus amples informations concernant les incrustations en amont sont inclues ultérieurement dans ce manuel.

Transitions

La palette Transitions permet de configurer les paramètres de chaque type de transition. Par exemple, pour la transition Dip la palette possède un menu qui vous permet de sélectionner la source Dip. Pour la transition Wipe, la palette affiche toutes les formes géométriques disponibles. Il y a une

grande variété de transitions, et bon nombre d'entre elles peuvent être créées en combinant les paramètres et les fonctions situés dans la palette Transitions.

REMARQUE Gardez bien à l'esprit que la sélection d'un type de transition dans cette palette permet seulement de modifier les paramètres de la transition en question et qu'il faudra encore sélectionner le type de transition que vous souhaitez effectuer dans la section de contrôle des transitions du mélangeur logiciel ou matériel. Pour simplifier les choses, certaines personnes préfèrent utiliser un panneau de contrôle matériel pour la commutation, et les palettes du panneau de contrôle logiciel pour configurer la transition. Les panneaux de contrôle logiciel et matériel fonctionnent conjointement et ils disposent des mêmes paramètres, vous pouvez donc utiliser l'un ou l'autre à n'importe quel moment !

Incrustations en aval

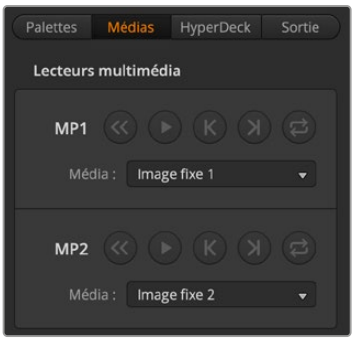
Les deux incrustateurs en aval peuvent être configurés à partir de la palette Incrustations en aval. La palette possède des menus déroulants pour sélectionner les signaux de remplissage et de découpe de l'incrustation, des curseurs pour régler les valeurs du clip et du gain, mais aussi les paramètres Incrustation prémultipliée et Masque. Les mélangeurs ATEM Television Studio intègrent 2 incrustateurs en aval.

Fondu au noir

La palette Fondu au noir vous permet de régler la durée de transition du fondu au noir. Vous y trouverez la case de sélection **Audio Follow Video** qui fait office de raccourci pour le bouton AFV situé sur le fader principal du mixeur audio intégré. En sélectionnant cette fonction, vous effectuerez un fondu de l'audio en même temps que le fondu au noir.

Onglets Médias

L'onglet Médias contient des commandes pour les lecteurs multimédia du mélangeur et les HyperDeck connectés.



Lecteurs multimédia

Le mélangeur ATEM est doté de deux lecteurs multimédia qui lisent les clips et les images fixes stockés dans la mémoire de la bibliothèque de médias intégrée au mélangeur. La liste déroulante permet de sélectionner les images fixes ou les clips qui seront lus ou disponibles sur la source lecteur multimédia du mélangeur. Lorsqu'un clip est sélectionné, les commandes de transport du lecteur multimédia permettent de lire le clip, de le mettre en pause et de le mettre en boucle. Il y a également des commandes pour faire défiler les images du clip en avant et en arrière. L'ATEM Television Studio dispose de 2 lecteurs multimédia.

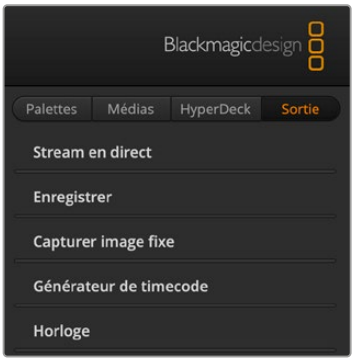
Onglet HyperDeck

L'onglet HyperDeck vous permet de contrôler jusqu'à 10 HyperDecks.

HyperDecks

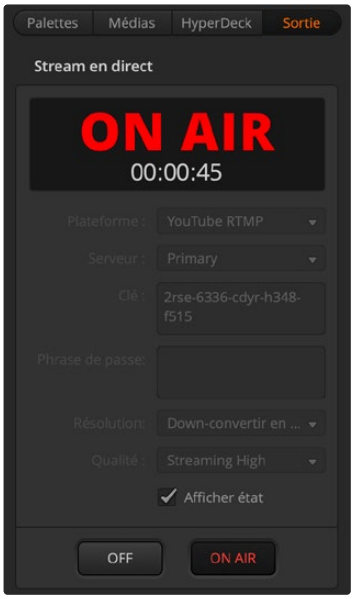
Vous pouvez brancher jusqu'à 10 enregistreurs à disque HyperDeck et les contrôler à l'aide de la palette HyperDecks du logiciel ATEM. Pour changer le nombre d'HyperDecks affichés, cliquez sur la roue dentée et sélectionnez un chiffre depuis la liste. Pour plus d'informations, consultez la section « Contrôle de l'HyperDeck » de ce manuel.

Onglet Sortie



Utilisez l'onglet Sortie pour régler les paramètres de stream en direct et d'enregistrement. Vous pouvez également utiliser l'onglet Sortie pour ajuster le timecode et les réglages de l'horloge, ainsi que pour capturer des images fixes.

Stream en direct



Lorsque vous utilisez votre mélangeur, cette fenêtre vous permet de configurer votre streaming en direct en saisissant les détails de streaming depuis votre plateforme de streaming. Une fois tous les paramètres configurés, vous pouvez commencer la diffusion en cliquant sur le bouton **On air** et l'arrêter en cliquant sur le bouton **Off**.

Lorsque vous êtes en direct, l'indicateur **On air** s'affiche en gros et en rouge, ainsi que le générateur de timecode, que vous pouvez régler à partir des options du générateur de timecode.

Plateforme	Cliquez sur le menu **Plateforme** et sélectionnez la plateforme de streaming pour votre diffusion. Vous avez le choix parmi Facebook Live, YouTube Live et Twitch.
Serveur	Sélectionnez le serveur le plus proche de vous depuis le menu de la fenêtre **Paramètres**.
Clé	Entrez la clé de stream qui a été assignée à votre diffusion par votre plateforme de streaming. Pour plus d'informations sur l'obtention de votre clé de stream, veuillez consulter « Obtenir une clé de stream » dans la section « Connexion à un réseau ».
Phrase de passe	Si vous utilisez un service de streaming avec le protocole SRT, saisissez la phrase de passe assignée par votre compte de plateforme de streaming.
Résolution	Lorsque les ATEM Television Studio 4K8 sont réglés sur 2160p, vous pouvez down-convertir le stream en direct en HD ou le garder sur la norme du mélangeur à l'aide de l'option de résolution.

Qualité	Sélectionnez la qualité du streaming et d'enregistrement du streaming. Vous avez le choix parmi les options suivantes : ▪ HyperDeck High 45 to 70 Mb/s ▪ HyperDeck Medium 25 to 45 Mb/s ▪ HyperDeck Low 12 to 20 Mb/s ▪ Streaming High 6 to 9 Mb/s ▪ Streaming Medium 4.5 to 7 Mb/s ▪ Streaming Low 3 to 4.5 Mb/s Vous trouverez plus d'informations sur les options de qualité dans cette section du manuel.

Pour plus d'informations sur l'utilisation de ces options lorsque vous configurez un streaming en direct via Ethernet, dont l'obtention d'une clé de stream, veuillez consulter la section « Streaming » de ce manuel.

Ces options sont simples et pratiques, mais si vous souhaitez personnaliser le menu de streaming ou ajouter d'autres plateformes, un fichier XML est disponible. Pour plus d'informations sur la sauvegarde et la restauration d'un fichier XML, Veuillez consulter le paragraphe « Modification des paramètres du mélangeur » de la section « Sauvegarde et restauration des paramètres du mélangeur ».

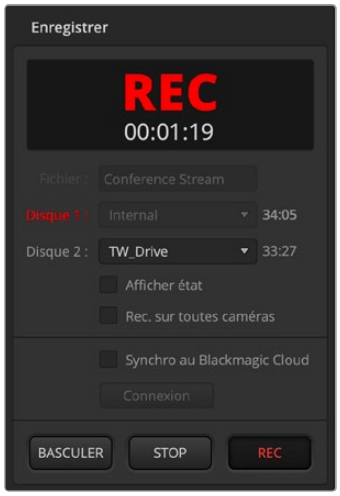
Options de la qualité du streaming et de l'HyperDeck

Le débit de données utilisé par le paramètre de qualité change selon la norme vidéo de votre mélangeur. Par exemple, si vous sélectionnez une qualité de streaming élevée (High), et que vous opérez à 1080p24, le débit de données sera de 6 Mb/s.

Le débit est de 45 à 70 Mb/s pour l'option HyperDeck High, de 25 à 45 Mb/s pour l'option HyperDeck Medium, et de 12 à 20 Mb/s pour l'option HyperDeck Low. Le débit pour le streaming est plus bas pour faciliter la transmission des données via Internet. Ainsi, le débit de streaming est de 6 à 9 Mb/s pour le paramètre Streaming High, de 4,5 à 7 Mb/s pour le paramètre Streaming Medium, et de 3 à 4,5 Mb/s pour le paramètre Streaming Low.

Vous remarquerez que chaque option comprend 2 débits. Le débit le plus bas est utilisé pour les fréquences d'images les plus basses de 24p, 25p et 30p. Le débit le plus élevé est utilisé pour les fréquences d'images les plus élevées de 50p et 60p. Veuillez noter que le débit pour le streaming est réglé par défaut sur Streaming High 6 à 9 Mb/s, car il offre une très haute qualité de streaming et une assez bonne qualité d'enregistrement.

Si vous ne diffusez pas votre contenu en streaming, choisissez parmi les options de qualité de l'HyperDeck. Les options disponibles sont les mêmes que sur l'HyperDeck Studio Mini et elles offrent un bon débit pour des enregistrements de qualité broadcast. Toutefois, depuis la dernière mise à jour logicielle de l'HyperDeck Studio Mini, les débits de streaming les plus bas sont également supportés.



Enregistrement

Si vous enregistrez votre stream, vous pouvez contrôler vos disques, ainsi que démarrer et arrêter l'enregistrement depuis cette palette. Vous pouvez également définir le nom d'un fichier et déclencher l'enregistrement sur toutes les caméras Blackmagic connectées. Pour plus d'informations sur le formatage des supports pour l'enregistrement, consultez la section « Préparer les supports ».

Nom du fichier	Avant d'enregistrer, définissez le nom d'un fichier depuis le champ de saisie du fichier. Cliquez n'importe où en dehors du champ de saisie pour confirmer le nom. Si vous arrêtez et démarrez l'enregistrement, le nom du fichier sera incrémenté de numéros de version.
Disques	Les disques formatés connectés à votre mélangeur apparaîtront en liste dans la fenêtre d'enregistrement. Vous pouvez assigner des disques en les sélectionnant depuis le menu. La fenêtre du disque affiche sa capacité de stockage et son temps d'enregistrement restant. L'enregistrement démarrera toujours sur le disque avec la plus grande capacité de stockage, puis continuera sur le disque avec la deuxième plus grande capacité de stockage. Cependant, vous pouvez changer manuellement le disque sur lequel vous voulez enregistrer en cliquant sur le bouton **Basculer**. Cela peut être pratique s'il ne reste que 5 minutes d'enregistrement sur le disque en cours et que vous souhaitez basculer sur le prochain disque à un moment précis de votre diffusion.
Basculer	Ce bouton permet de faire basculer le disque en cours d'enregistrement vers un autre disque avec une capacité de stockage plus grande.

CONSEIL Vous pouvez également changer de disque en appuyant sur le bouton **Switch** sur le panneau de contrôle de l'ATEM Television Studio.

Bouton Stop	Cliquez sur **Stop** pour arrêter l'enregistrement.
Bouton Rec	Cliquez sur le bouton **Rec** pour commencer l'enregistrement.
Afficher état	Activez ou désactivez cette fonction en cochant la case Afficher état dans les options de la palette Enregistrer. L'état d'enregistrement apparaîtra en bas à gauche de l'interface de l'ATEM Software Control. Lorsque vous enregistrez, l'indicateur d'enregistrement s'allumera en rouge et affichera le disque en cours d'utilisation ainsi que le temps d'enregistrement restant.
Enregistrer sur toutes les caméras	Activez cette fonctionnalité pour enregistrer sur toutes les caméras Blackmagic connectées lorsque vous appuyez sur le bouton d'enregistrement. C'est très utile pour effectuer des enregistrements indépendants de chaque caméra que vous monterez plus tard. Les caméras vont automatiquement se régler sur l'enregistrement en Blackmagic RAW à la qualité actuellement configurée sur les caméras.

Synchro au Blackmagic Cloud

Le Blackmagic Cloud est une plateforme collaborative vous permettant de travailler avec vos équipes et de partager des projets DaVinci Resolve partout dans le monde.

Lorsque vous vous connectez au Blackmagic Cloud sur votre mélangeur ATEM, vous pouvez choisir de charger vos enregistrements ou projets ISO et clips depuis votre disque externe ou disque flash directement sur un projet DaVinci Resolve Cloud. Sinon, l'enregistrement du stream peut être chargé directement sur votre espace de stockage Blackmagic Cloud privé sans avoir à le synchroniser avec un projet Blackmagic Cloud.

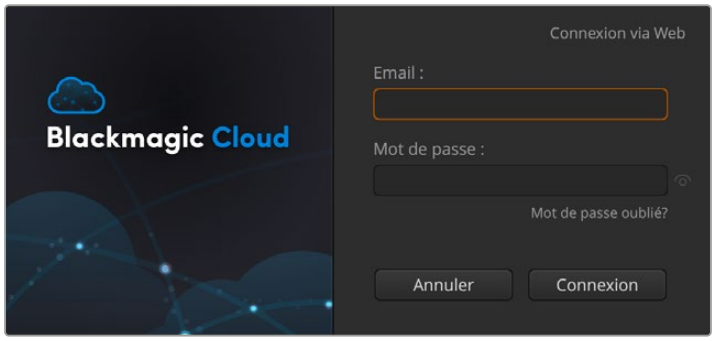
Connexion au Blackmagic Cloud

Avant de vous connecter au Blackmagic Cloud sur votre mélangeur ATEM, le mélangeur doit être connecté à Internet en branchant un câble réseau du port Ethernet à un routeur Internet ou un commutateur réseau.

Pour vous connecter à votre compte Blackmagic Cloud avec l'ATEM Television Studio :

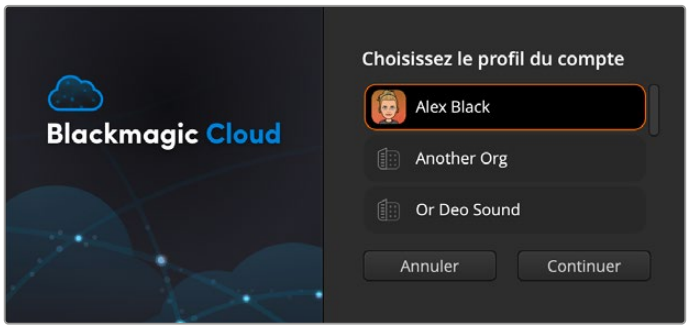
1 Cliquez sur l'onglet **Sortie** et sélectionnez le menu **Enregistrer**.

2 Cochez la case pour se synchroniser au Blackmagic Cloud et cliquez sur le bouton **Log In** pour ouvrir la fenêtre de connexion du Blackmagic Cloud.



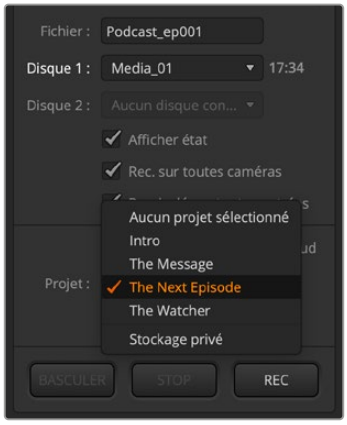
3 Saisissez vos détails dans les champs Email et Mot de passe, puis cliquez sur **Log In**. Vous pouvez également cliquer sur l'option **Login via web** en haut à droite, et vous connecter via un navigateur web.

4 Une fenêtre apparaîtra pour vous permettre de choisir entre un profil Blackmagic Cloud personnel ou d'entreprise. Cliquez sur le profil de votre choix, puis sur **Continue**.



Vous êtes désormais connecté au Blackmagic Cloud. Utilisez le menu du projet pour sélectionner le projet que vous souhaitez synchroniser à votre support. Le menu affichera les projets Blackmagic DaVinci Cloud existants.

Si votre projet n'apparaît pas dans la liste, ou que vous souhaitez travailler sur un nouveau projet, vous devrez ajuster vos réglages ou créer un nouveau DaVinci Resolve Cloud Project via DaVinci Resolve.

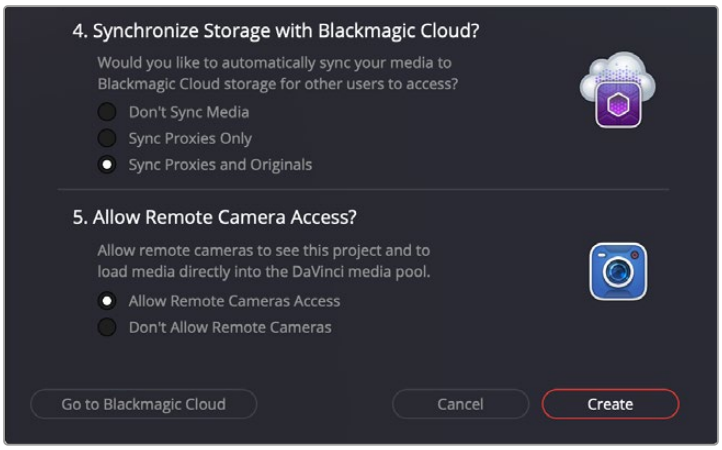


Autoriser l'accès dans DaVinci Resolve

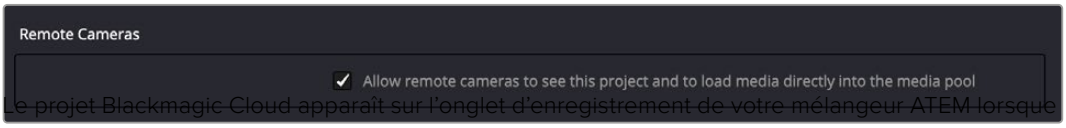
Vous pouvez télécharger du contenu sur des nouveaux projets Blackmagic Cloud ou déjà existants depuis votre mélangeur ATEM en autorisant l'accès des caméras à distance dans les paramètres de Resolve. Une fois l'accès à distance activé pour un projet, il apparaîtra dans le menu des projets dans l'onglet d'enregistrement.

Autoriser l'accès à un nouveau projet :

1. Ouvrez DaVinci Resolve. Dans la fenêtre du gestionnaire de projets, sélectionnez l'onglet **Cloud** et entrez vos détails de connexion Blackmagic Cloud.
2. Sélectionnez une bibliothèque de projets Blackmagic Cloud depuis la bibliothèque de projets et cliquez sur **New project**.
3. Une fois la fenêtre du nouveau projet ouverte, saisissez les détails du projet. Activez **Sync proxies and originals** et **Allow remote camera access** dans la fenêtre du nouveau projet Cloud, puis cliquez sur **Create**.



Si vous souhaitez télécharger les clips sur un projet DaVinci Resolve Cloud existant, ouvrez les paramètres du projet et sélectionnez **Blackmagic Cloud**. Activez l'option **Allow remote cameras to see this project to load media directly into the media pool** dans les paramètres **Remote Cameras**.



Le projet Blackmagic Cloud apparaît sur l'onglet d'enregistrement de votre mélangeur ATEM lorsque votre mélangeur est connecté à Internet et à votre compte Blackmagic Cloud.

Pour plus d'informations sur les projets DaVinci Resolve Cloud, veuillez consulter le manuel d'utilisation DaVinci Resolve. Vous pouvez le télécharger sur www.blackmagicdesign.com/fr/support/family/davinci-resolve-and-fusion

Capturer une image fixe

Pour capturer une image fixe de votre diffusion, il suffit de cliquer sur le bouton correspondant. Il fonctionne comme une diathèque qui vous permet d'ajouter les fichiers capturés à la bibliothèque de médias. Vous pouvez ensuite immédiatement charger une image fixe dans le lecteur multimédia et l'utiliser dans votre diffusion, ou enregistrer la bibliothèque de médias sur votre ordinateur.

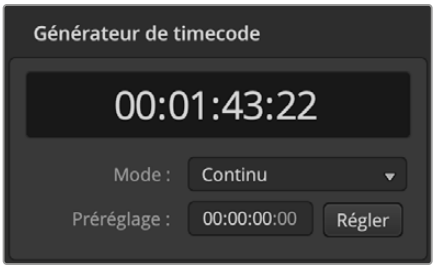
Pour enregistrer la bibliothèque de médias :

1. Allez dans la barre de menu en haut de l'écran et cliquez sur **Fichier/Enregistrer sous**.
2. Choisissez un emplacement pour la sauvegarde.
3. Cliquez sur **Enregistrer**.

Maintenant que votre bibliothèque de médias est enregistrée sur votre ordinateur, vous pouvez accéder aux images fixes capturées et les utiliser dans votre logiciel graphique.

Générateur de timecode

Le générateur de timecode génère automatiquement le timecode de l'heure de la journée à partir du moment où vous lancez l'ATEM Software Control. Cependant, vous pouvez réinitialiser le compteur sur zéro, ou entrer manuellement un nouveau timecode de départ.



Le générateur de timecode peut être réglé sur l'heure de la journée ou en continu, ce qui vous permet de régler le préréglage d'un timecode manuellement.

Pour configurer le préréglage d'un timecode manuellement :

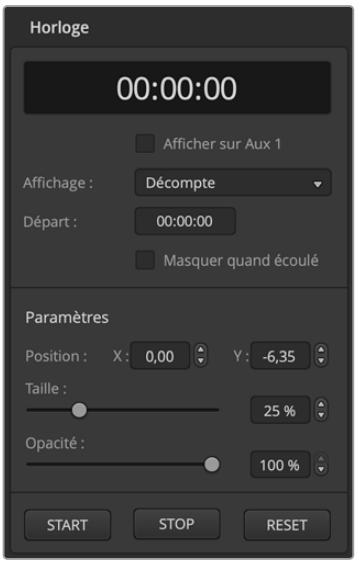
1. Cliquez sur le menu **Mode**, et sélectionnez **Continu**.
2. Dans le petit champ de saisie du timecode, entrez une valeur de timecode. Alors que vous tapez, les nouvelles valeurs apparaîtront en vert.
3. Pour confirmer le changement et lancer le timecode, cliquez sur **Régler**.

Heure de la journée

Lorsque l'ATEM Television Studio est connecté à votre ordinateur, l'appareil va synchroniser le timecode de l'heure de la journée avec votre ordinateur. L'appareil a une horloge interne qui peut continuer à faire tourner le timecode pendant environ 6 jours. Ainsi, une fois le mélangeur déconnecté de votre ordinateur, le timecode de l'heure de la journée va continuer jusqu'à ce que la batterie soit déchargée. La batterie se charge lorsqu'elle est connectée à votre ordinateur via USB.

Horloge

Vous pouvez utiliser l'option horloge de l'ATEM Television Studio HD8 pour superposer un compteur à la sortie 1. Cela peut être utile pour le moniteur d'un présentateur, car vous pouvez afficher un décompte s'il y a une limite de temps ou un chronomètre s'il n'y a pas de limite, mais que vous souhaitez connaître la durée de la conférence.

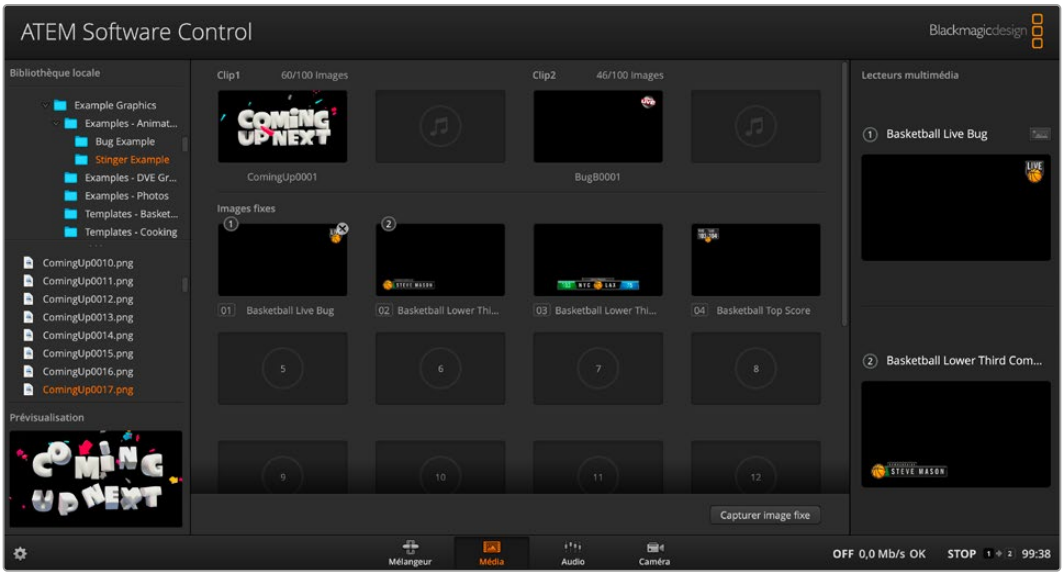


Pour régler l'horloge :

1. Choisissez Décompte ou Chronomètre.
2. Pour régler une limite pour le décompte, saisissez un temps de départ.
3. À l'aide des paramètres, vous pouvez positionner l'emplacement de l'horloge, mais aussi régler sa taille et son opacité.
4. Une fois les paramètres réglés, vous pouvez faire démarrer l'horloge. Veillez à ce que l'affichage de l'horloge soit sélectionné dans le menu Sorties de la barre d'outils supérieure et qu'il soit réglé sur la sortie 1.

Bibliothèque de médias de l'ATEM

Appuyez sur l'icône des médias dans la barre d'outils inférieure de la vue du mélangeur pour ouvrir la fenêtre des médias. La fenêtre des médias des mélangeurs ATEM vous permet d'ajouter des images telles que des images fixes et des clips vidéo et de les attribuer à n'importe quel lecteur multimédia de vos mélangeurs. Il y a deux zones principales dans la fenêtre du mélangeur ; la fenêtre de navigation à gauche et la fenêtre de la bibliothèque de médias et des lecteurs multimédia à droite.



Cliquez sur l'onglet Médias en bas du panneau pour ouvrir la bibliothèque de médias

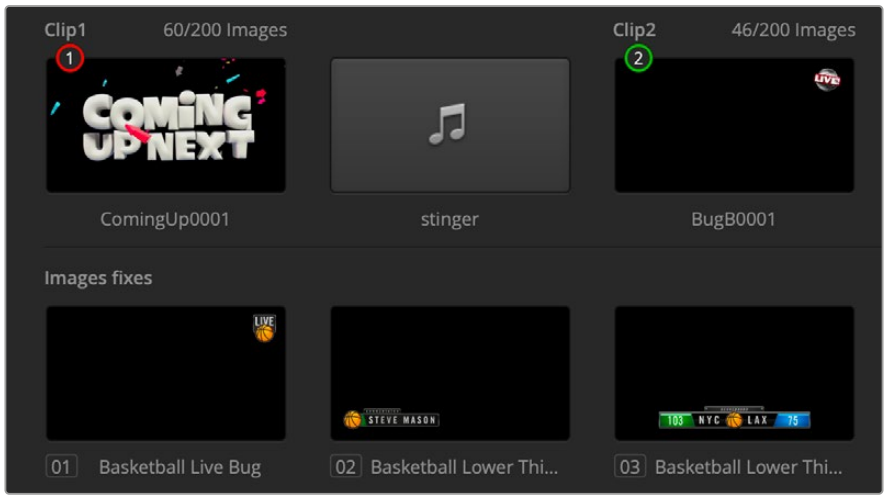
La fenêtre de navigation

La fenêtre de navigation est un gestionnaire de fichiers simplifié qui vous permet de chercher des fichiers d'image sur votre ordinateur. Tous les lecteurs de votre ordinateur sont affichés, et vous pouvez sélectionner des dossiers à partir de ces derniers. Pour visualiser les sous-dossiers, il suffit de cliquer sur les flèches situées à côté de chaque dossier. La fenêtre de prévisualisation en bas à gauche affichera tous les fichiers sélectionnés. La bibliothèque de médias de l'ATEM prend en charge les formats PNG, TGA, BMP, GIF, JPEG, et TIFF. Les formats audio compatibles sont WAV, MP3 ou AIFF. Ces fichiers peuvent être ajoutés à la bibliothèque de médias.

Fenêtre de la bibliothèque de médias

Lorsque les images et les clips ont été chargés dans la bibliothèque de médias, une image miniature apparaît sur leurs emplacements. Les emplacements qui comprennent des clips affichent l'image située au milieu de la séquence chargée. Au-dessus de l'emplacement de chaque clip, on peut lire le nombre d'images chargées ainsi que le nombre maximal d'images qui peuvent être chargées en fonction des différents formats vidéo. Les images fixes sont représentées par un numéro d'emplacement afin de les identifer facilement lorsque vous assignez une image fixe. Le nom de fichier de chaque image ou clip est affiché sous l'emplacement afin de localiser les clips et les images que vous avez chargés. La liste des clips et des images fixes chargés ainsi que leur nom et leur numéro apparaîtront dans la palette du lecteur multimédia dans l'onglet du mélangeur, dans la vue des lecteurs multimédia sur les panneaux matériels ATEM, ainsi que dans le plug-in Photoshop. Sur le panneau avant du mélangeur, seul le nom de l'image fixe apparaîtra, à moins que l'emplacement ne soit vide.

Les numéros apparaîtront en haut à droite de la vignette pour montrer clairement quels emplacements sont assignés à quels lecteurs multimédia. Lorsqu'une fenêtre attribuée à un lecteur multimédia commute vers la sortie programme, le cercle entourant le numéro devient rouge afin d'indiquer que le signal de cette fenêtre passe à l'antenne. Lorsqu'un emplacement est branché sur la sortie prévisualisation, la couleur passe au vert.



Navigation et téléchargement de fichiers

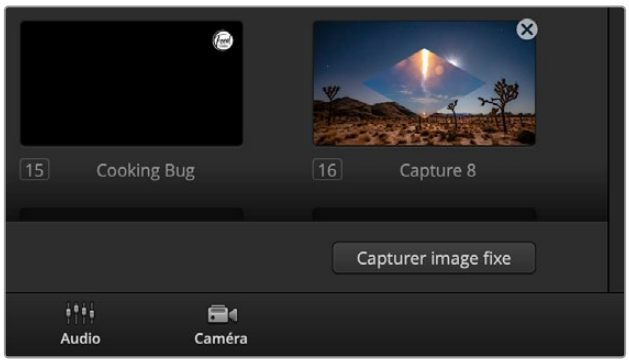
Pour charger une image fixe, il suffit de la faire glisser de la fenêtre de navigation vers un emplacement vide de la bibliothèque de médias. Pour charger un clip, il faut charger une séquence d'images fixes. Si la séquence se trouve dans un dossier, cliquez sur le dossier depuis la fenêtre de navigation et faites-le glisser sur l'un des deux emplacements de clips. Si la séquence n'est pas dans son propre dossier, cliquez sur le premier fichier de la séquence, faites la défiler, puis cliquez sur le dernier fichier en maintenant le bouton Shift appuyé. Toute la séquence peut désormais être glissée vers l'un des deux emplacements vides de la bibliothèque de médias. Il est également possible de charger des fichiers audio avec les clips : par exemple, pour appliquer une transition stinger, il faut faire glisser le fichier audio du navigateur vers l'emplacement audio situé à côté de l'emplacement du clip. L'emplacement audio est représenté par une icône audio.

Lorsque vous déplacez une image, un clip ou un fichier audio vers un emplacement, une barre de progression affiche le temps de chargement restant. Il est possible de déplacer plusieurs fichiers dans la bibliothèque de médias, même si le transfert des premières images n'est pas terminé, en effet, elles se téléchargeront les unes après les autres. Si vous faites glisser un clip ou une image fixe dans une fenêtre qui possède déjà du contenu, le contenu existant sera remplacé.

Vous pouvez changer l'attribution du lecteur multimédia dans la palette Lecteurs multimédia en sélectionnant le clip ou l'image que vous voulez utiliser dans le menu **Média**. Cliquez simplement sur la flèche située dans la palette Lecteurs multimédia afin de sélectionner une autre fenêtre.

Vous pouvez également modifier l'attribution des médias à l'aide du menu des lecteurs multimédia dans le System Control ou lors de l'exportation via l'option ATEM Switcher Media Pool dans Photoshop. Pour plus d'information sur le plug-in d'exportation Photoshop, veuillez consulter la section « Utiliser Adobe Photoshop avec votre ATEM » de ce manuel.

Capturer image fixe



Cliquez sur le bouton Capturer image fixe pour enregistrer une image fixe de la diffusion

Vous pouvez également capturer une image fixe de votre diffusion à l'aide du bouton Capturer image fixe situé en bas à droite de la bibliothèque de médias. Cliquez sur le bouton et l'image fixe sera insérée dans le prochain emplacement d'image disponible dans votre bibliothèque de médias.

Utiliser le mixeur audio

L'onglet Audio permet de mixer des sources audio connectées au mélangeur ATEM via SDI, audio analogique, audio MADI, mais aussi à partir des lecteurs multimédia intégrés.

Les caméras, lecteurs multimédia, sources audio externes et MADI sont listés sur le haut du mixeur audio ainsi que le signal de sortie audio master des sorties programme du mélangeur.

Au-dessous de chaque source audio, vous trouverez un vumètre, un fader pour régler le niveau audio maximum, et une molette pour régler la balance audio gauche/droite de ce canal. Le fader principal situé sur le côté droit du mixeur audio permet de régler le gain du niveau audio sur les sorties programme SDI et possède son propre vumètre. Le fader ainsi que les boutons de contrôle se trouvent au-dessous du fader maître et permettent de régler des niveaux audio indépendants et également de contrôler en mode solo des sorties audio sélectionnées.

Les boutons situés au-dessous de chaque vumètre déterminent si l'audio est toujours disponible pour le mixage ou s'il l'est seulement lorsque la source est à l'antenne. Le bouton Solo représenté par un casque permet de déterminer si la source audio doit être utilisée pour un monitoring audio solo.

Le mixeur audio affiche des voyants tally pour toutes les sources audio qui sont actuellement à l'antenne ou lorsque la fonction AFV est sélectionnée. Il comporte également les niveaux audio, la balance audio et des boutons permettant de sélectionner l'audio qui doit être utilisé.

Tally

Toute source dont l'audio est à l'antenne est indiquée par un voyant rouge tally dans le logiciel. L'audio externe est à l'antenne par défaut, c'est pourquoi le voyant tally rouge EXT est en général allumé. Dans l'exemple ci-contre, les zones Cam4 et Cam7 sont allumées car leur audio est configuré pour être constamment à l'antenne. Le voyant s'allume en jaune ambré lorsque la fonction AFV est sélectionnée et que la caméra associée à ce canal est hors antenne. Cela s'applique également au voyant tally du fader principal lorsque son bouton AFV est sélectionné. Lorsque la fonction FTB est activée, le voyant tally du fader principal clignote en rouge.

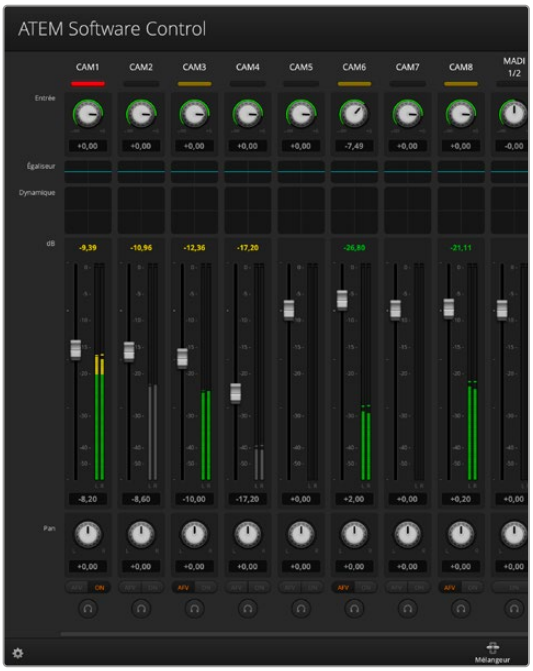
Niveau audio

Utilisez le fader du niveau audio pour régler le niveau de gain audio pour chaque caméra et source audio. Le numéro orange situé au-dessous de chaque vumètre affiche le niveau audio maximal réglé par le fader.

Le nombre situé au-dessus du vumètre affiche le niveau de crête atteint par la source audio. Un nombre vert représente les niveaux audio bas à moyen. Si le vumètre se trouve régulièrement dans le rouge, et que le nombre rouge situé au-dessus ne change pas, réduisez le niveau audio pour éviter une distorsion du son. Après avoir ajusté le niveau audio, il est préférable de réinitialiser le nombre rouge en cliquant une fois dessus. Observez le nouveau nombre un instant et vérifiez qu'il change et qu'il ne monte pas directement en flèche pour finir par se bloquer dans le rouge. Si cela arrive, vous devrez réduire encore un peu plus le niveau audio.

Balance audio

Le mixeur audio prend en charge l'audio stéréo de chaque source audio. Si vous désirez changer la balance des canaux audio gauche ou droit pour une caméra ou une autre source audio, ajustez la molette jusqu'à la balance désirée.



Le vumètre de la Cam1 est grisé pour indiquer que ce canal audio ne sera pas utilisé car ses boutons ON et AFV ne sont pas activés. La fonction AFV de la Cam2 est sélectionnée mais son audio n'est pas utilisé actuellement, car la caméra n'est pas à l'antenne comme l'indique le voyant tally jaune ambré. La fonction ON est activée sur les Cam4 et Cam7, ce qui signifie que leur audio est toujours utilisé. Leur voyant tally reste allumé, même lorsqu'une autre caméra est à l'antenne. Les vumètres des Cam3, Cam5, Cam6 et Cam8 indiquent qu'il n'y a aucun signal audio sur ces caméras.

Sélection des sources audio

Au-dessous de chaque vumètre, vous trouverez les boutons ON et AFV qui permettent de sélectionner les sources audio qui sont envoyées au signal de sortie programme du mélangeur.

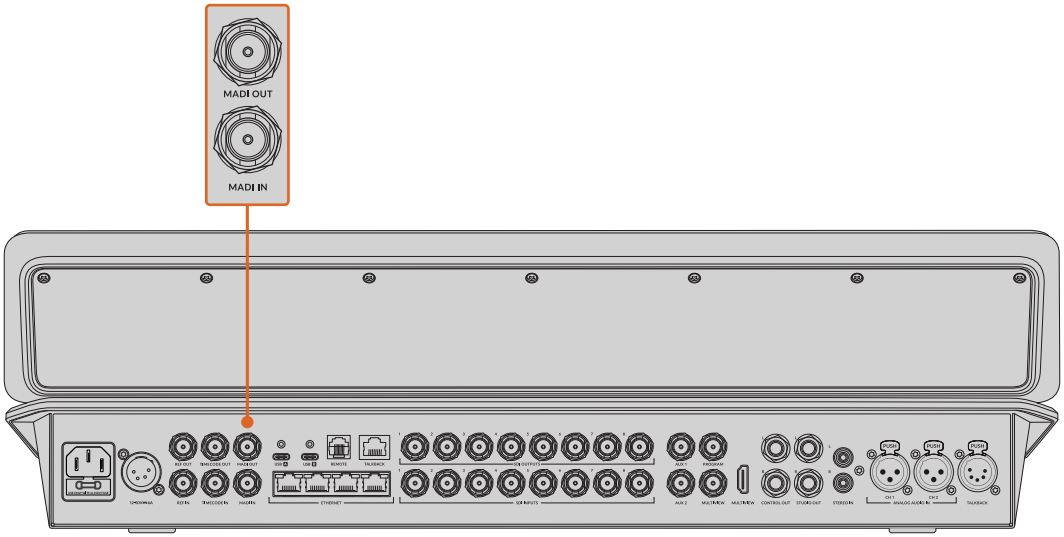
ON	Sélectionner ON permet de mixer une entrée audio au signal de sortie programme de façon permanente, même lorsque la source vidéo qui lui est associée n'est pas à l'antenne. Le voyant tally rouge reste allumé car l'audio est toujours à l'antenne. Sélectionner cette option désactive automatiquement l'option AFV.
AFV	L'option Audio-follow-video (AFV) permet d'effectuer un fondu enchaîné de l'audio lors d'un changement de source. L'audio sera uniquement envoyée au signal de sortie programme lorsque la source est à l'antenne, ce qui allume le voyant tally situé au-dessus. Lorsqu'elle est hors antenne, le voyant tally est jaune ambré. Sélectionner cette option désactive automatiquement la fonction ON.

Niveau audio de la sortie master

Le fader principal situé sur le côté droit du mixeur audio permet de régler le gain du niveau audio sur les sorties programme SDI et possède son propre vumètre. Sélectionnez le bouton AFV sur le fader de la sortie audio master pour activer la fonction de fondu au noir AFV. Cela vous permet d'effectuer un fondu de la sortie audio master lorsque vous cliquez sur le bouton FTB.

Utiliser le MADI

Le mélangeur ATEM prend en charge l'audio numérique avec le protocole MADI (Multichannel Audio Digital Interface). Ce dernier est très populaire parmi les fabricants d'équipements audio professionnels, les diffuseurs et pour les studios d'enregistrements haut de gamme. Les ports MADI comprennent des connecteurs BNC solides et transmettent les données audio sur des câbles coaxiaux 75 ohm d'une longueur maximale de 100 mètres.



Connecteurs BNC pour l'audio MADI et connecteurs TRS 1/4" pour les entrées et sorties audio analogiques.

Entrée MADI

Les canaux MADI 1 à 32 peuvent recevoir des signaux audio numériques à une profondeur de 24 bits et à une fréquence d'échantillonnage de 48 kHz. Ils sont connectés à 16 canaux stéréo dans le mixeur audio, que vous pouvez mixer dans la sortie programme avec les mêmes égaliseurs et dynamiques que les canaux de mixage audio de l'entrée vidéo. Grâce à ces 16 canaux stéréo supplémentaires, vous pouvez réaliser des mixages audio très complexes directement à l'intérieur de votre mélangeur ATEM.

Sortie MADI 1

Sortie MADI 1 achemine ces sources :

Canaux 1-16	Canaux 1 et 2 des entrées SDI 1-8
Canaux 17/18	Audio du lecteur multimédia 1
Canaux 19/20	Audio du lecteur multimédia 2
Canaux 20/21	Micro externe
Canaux 22/23	XLR externe
Canaux 23/24	RCA externe
Canaux 25/26	Mix du programme
Canaux 27/28	Mix moniteur
Canaux 29/30	Mix Aux 1
Canaux 31/32	Mix Aux 2
Canaux 33-48	Canaux 3 et 4 des entrées SDI 1-8
Canaux 49-64	-

Réglages du casque

Les paramètres du casque permettent d'ajuster le mix audio pour la sortie casque. Un casque peut être connecté au connecteur XLR à 5 broches sur le panneau arrière pour communiquer avec les cadreurs. Cependant, le casque n'est pas uniquement dédié à l'utilisation du réseau d'ordres. En effet, vous pouvez également utiliser le micro du casque pour enregistrer les voix off ou les écouteurs pour contrôler l'audio du programme.

Les paramètres du casque permettent de mixer les niveaux de chaque sortie de monitoring. Par exemple, il se peut que vous vouliez augmenter ou diminuer le niveau audio du réseau d'ordres par rapport à l'audio du programme.

Master

Faites glisser le curseur Master pour régler le volume de l'audio du programme. Si vous ne souhaitez pas entendre le son du programme, déplacez le curseur complètement vers la gauche.

Réseau d'ordres

Le curseur Réseau d'ordres permet de régler le volume de la voix des cadreurs. Grâce au curseur Master et Réseau d'ordres, vous pouvez personnaliser la balance du réseau d'ordres et du programme audio dans votre casque.

Effet local

Le curseur Effet local permet de mélanger la voix provenant du micro du casque avec la sortie de monitoring. C'est très utile lorsque vous utilisez un casque qui prend en charge la réduction de bruit.

Commandes Fairlight avancées

Les mélangeurs ATEM Television Studio intègrent des commandes audio Fairlight avancées qui permettent d'améliorer la qualité du son de chaque entrée et de la sortie principale. Ces commandes comprennent notamment le contrôle du niveau des entrées, un égaliseur paramétrique à six bandes et des paramètres de dynamique puissants. Cette section du manuel présente les différentes commandes audio Fairlight que vous pouvez utiliser pour optimiser le mixage audio de votre production en direct.

Niveau des signaux d'entrée

En général, la première étape du mixage audio consiste à normaliser toutes les entrées. Pour ce faire, il suffit d'ajuster la molette représentant le niveau de chaque entrée afin d'optimiser tous les niveaux sans les écrêter.

Cette commande se situe en haut de chaque piste sous le voyant tally. Modifiez le niveau en cliquant sur la molette et en la déplaçant vers la gauche pour réduire le niveau, ou vers la droite pour l'augmenter. Réglez la commande de chaque entrée afin que les entrées aient la même intensité sans les écrêter. Vous pourrez ensuite apporter des modifications avancées.

Une fois que vous avez normalisé tous les niveaux des entrées, vous pouvez commencer à optimiser les qualités de chaque entrée audio à l'aide de l'égaliseur paramétrique à 6 bandes et des commandes de dynamique.

Égaliseur paramétrique à 6 bandes

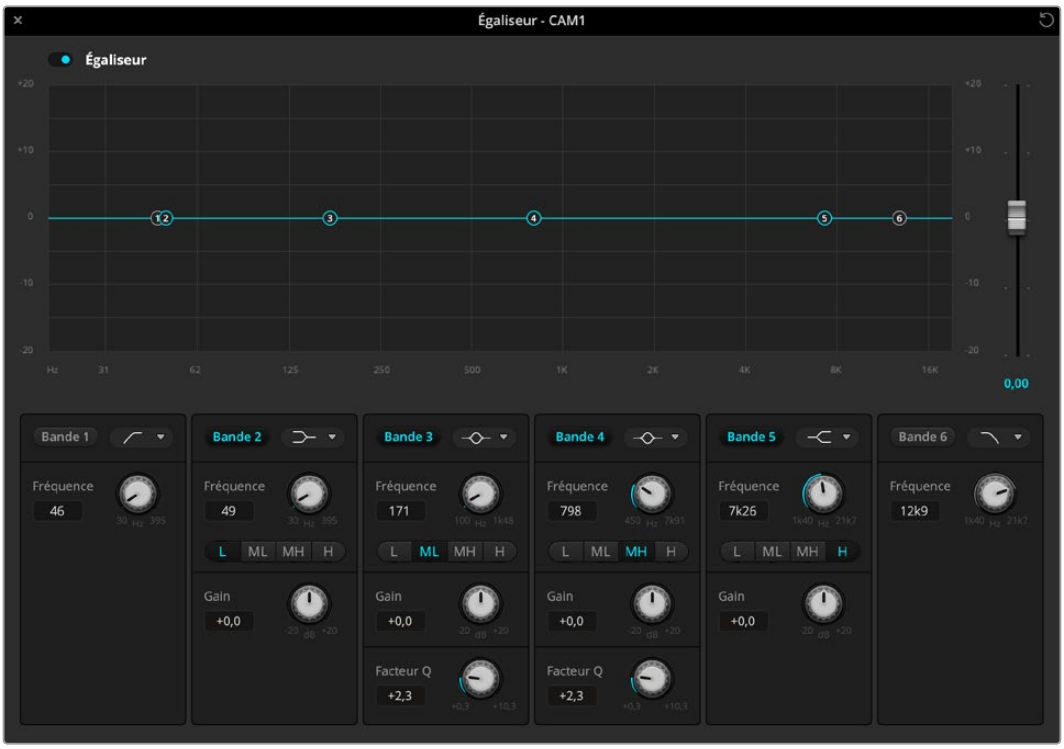
Les entrées et la sortie master possèdent toutes un égaliseur paramétrique à 6 bandes qui permet de contrôler des fréquences spécifiques. Il peut par exemple réduire les basses fréquences du bruit de fond ou le bruit d'une entrée micro, mais aussi booster les basses fréquences sur une piste au son faible. Il permet également d'ajouter des particularités à chaque entrée afin qu'elles soient plus distinctes dans le mixage final. Vous disposez de nombreuses options créatives.

Pour ouvrir l'égaliseur paramétrique d'une entrée ou de la sortie master, cliquez sur l'indicateur correspondant.

Cliquez sur l'indicateur de l'égaliseur d'une entrée pour ouvrir l'égaliseur paramétrique à 6 bandes.

La première chose que vous verrez est le graphique comportant les numéros 1 à 6 en haut de la fenêtre. Ces numéros sont des poignées réglables qui correspondent aux bandes 1 à 6.

Chacune des 6 bandes de l'égaliseur paramétrique possède une colonne de paramètres. Ces paramètres diffèrent selon la bande que vous contrôlez et le type de filtre que vous utilisez.



Chaque entrée audio possède son propre égaliseur paramétrique à 6 bandes.

Si vous souhaitez modifier un paramètre, il faudra d'abord vous assurer que la bande est activée. Cliquez sur le libellé d'une bande pour l'activer. Lorsque que la bande est activée, le libellé de son bouton s'allume en bleu. Vous pouvez à présent modifier les paramètres de cette bande, ou cliquer sur les poignées et les déplacer pour faire des ajustements rapides.

CONSEIL Vous pourrez en apprendre davantage sur les filtres à bande dans cette section.

Poignées

La poignée de chaque bande est positionnée sur la courbe affichée sur le graphique. Vous pouvez cliquer sur chaque poignée et la déplacer pour choisir la fréquence de la bande correspondante, mais aussi pour régler le gain. Lorsque vous déplacez une poignée avec votre souris, les paramètres de fréquence et de gain sont affectés simultanément. Vous pouvez ainsi effectuer des ajustements de fréquence rapides à chaque bande.

REMARQUE Pour apporter des modifications à l'aide d'une poignée, veillez à ce que la bande soit activée. Cliquez simplement sur la bande que vous souhaitez ajuster. Lorsque que la bande est activée, son libellé s'allume en bleu.

Lorsque vous déplacez une poignée vers la gauche ou vers la droite, vous remarquerez que la fréquence et les décibels se mettent à jour dans les paramètres de la bande. Ces changements seront également reflétés dans les boutons préréglés L, ML, MH et H relatifs à la plage de fréquences.

Molettes de fréquence

Vous pouvez également utiliser les molettes de fréquence de chaque bande pour sélectionner une fréquence spécifique.

Préréglages de la plage de fréquences

La plage de fréquences de chaque bande est définie par des boutons préréglés. Par exemple, la lettre L (Low) couvre la plage de fréquences de 30 à 395 Hz.

Pour comprendre comment ces préréglages définissent la plage de fréquences, sélectionnez un filtre notch dans la liste, puis cliquez sur chaque préréglage de plage de fréquences. Vous verrez l'effet de filtre se déplacer à l'emplacement de la courbe du graphique qui correspond au préréglage choisi. Vous pouvez ainsi rapidement définir une plage de fréquences spécifique pour le filtre.

Vous trouverez ci-dessous un tableau représentant la plage de fréquences pour chaque préréglage de plage de fréquences.

Préréglage de plage de fréquences	Plage de fréquences
L (bas)	30 Hz à 395 Hz
ML (bas médiums)	100 Hz à 1,48 kHz
MH (hauts médiums)	450 Hz à 7,91 kHz
H (hautes fréquences)	1,4 kHz à 21,7 kHz

Molettes de gain

Cliquez sur la molette de gain et déplacez-la vers la gauche ou vers la droite pour réduire ou augmenter le volume de la fréquence sélectionnée.

Facteur Q

La commande facteur Q est disponible lorsque le filtre bell est appliqué aux bandes 2, 3, 4 et 5. Elle règle la plage de fréquences affectée par le filtre. Par exemple, si vous la réglez sur le paramètre minimum, le filtre affectera une large plage de fréquences. Par contre, si vous la réglez sur le paramètre maximum, l'effet se limitera à un point précis. C'est important si vous souhaitez inclure ou exclure certaines qualités du son dans les fréquences environnantes lors de vos changements.

Quand vous ajustez le facteur Q, regardez la forme de la courbe passer d'un bord arrondi à un point précis. Cela vous montrera comment les fréquences qui entourent la fréquence cible sont affectées.

CONSEIL Comparez l'audio modifié avec l'original en cliquant sur le bouton situé dans le coin gauche de la fenêtre de l'égaliseur. Ce bouton vous permet d'activer et de désactiver l'égaliseur.

Filtres de bande

Vous pouvez choisir entre six différents types de filtre de bande, notamment bell, high shelve, low shelve, notch, passe-haut et passe-bas. Grâce à ces filtres, vous pouvez contrôler des zones spécifiques dans une plage de fréquences. Par exemple, le filtre low shelve permet d'augmenter ou de réduire le volume des basses fréquences sur le graphique, tandis que le filtre high shelve contrôle les hautes fréquences.

Essayez de mettre un filtre low shelve sur la bande 3 et d'apporter des changements au paramètre gain. Vous remarquerez que les changements sont portés sur les basses fréquences du graphique.

Vous trouverez ci-dessous une description pour chaque type de filtre.

Bell

Ce filtre permet d'augmenter ou de réduire la plage de fréquences située autour d'une fréquence définie.

High Shelve

Ce filtre permet d'augmenter ou de réduire le volume des hautes fréquences du graphique.

Low Shelve

Ce filtre permet d'augmenter ou de réduire le volume des basses fréquences du graphique.

Notch

Ce filtre permet de supprimer ou de couper une fréquence définie.

Passe-haut

Ce filtre supprime les très basses fréquences, sans affecter les hautes fréquences.

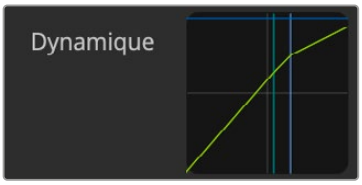
Passe-bas

Ce filtre supprime les très hautes fréquences, sans affecter les basses fréquences.

CONSEIL Il arrive parfois que les filtres de chaque bande se chevauchent sur la courbe du graphique et que les modifications apportées se complètent. Par exemple, vous aurez peut-être appliqué un filtre Low Shelve sur la bande 4, et un filtre Notch sur la bande 5 qui réduisent une fréquence dans la même plage.

Commandes de dynamique

En plus de l'égaliseur paramétrique à 6 bandes, vous pouvez également améliorer et peaufiner l'audio de l'entrée et de la sortie master à l'aide des commandes de dynamique. Alors que l'égaliseur permet de contrôler les fréquences d'un signal, les commandes de dynamique permettent de régler les différents niveaux du signal. Vous pouvez par exemple étendre la plage dynamique entre les bas et les hauts niveaux à l'aide de l'expanseur, définir les niveaux les plus forts ou les plus faibles du signal à l'aide du gate, ou utiliser le compresseur et le limiteur afin d'augmenter le niveau du signal sans l'écrêter.



Les commandes de dynamique peuvent être ouvertes pour chaque entrée ainsi que pour la sortie master en cliquant sur l'indicateur de dynamique correspondant.

Associées aux commandes de l'égaliseur, ces fonctions sont très puissantes, car elles vous permettent de définir l'audio avec précision pour optimiser le son de la sortie master.

La section suivante décrit les commandes de l'expanseur, du gate, du compresseur et du limiteur.

Paramètres de dynamique communs

L'expanseur/gate, le compresseur et le limiteur ont des paramètres en commun. Ces paramètres vous permettent de définir la façon dont chaque fonction affecte le son, notamment le niveau auquel la fonction se déclenche, mais aussi la durée d'application et la force de la fonction. Les paramètres disponibles dépendent de la commande de dynamique que vous utilisez.

Seuil	Ce paramètre règle le niveau sonore auquel la fonction s'active. Par exemple, lorsque vous réglez le seuil du compresseur sur -20dB, le mélangeur active la compression lorsque le signal dépasse -20dB. De même, lorsque vous réglez l'expanseur sur -40dB, le mélangeur active l'expanseur uniquement lorsque le niveau du signal descend au-dessous de -40dB.
Plage	Ce paramètre définit la plage de décibels affectée par la fonction.
Ratio	Ce paramètre définit la force maximale de la fonction une fois qu'elle a été déclenchée.
Attack	Ce paramètre règle l'intensité de la fonction lorsqu'elle est déclenchée. Par exemple, une longue attaque permettra à la fonction de se fondre au signal, sans trop attirer l'attention. En revanche, une courte attaque sera plus appropriée à un environnement sonore complexe comprenant des variations rapides, car une attaque plus longue pourrait provoquer des artefacts.
Hold	Ce paramètre maintient la fonction dynamique pendant une durée réglable.
Release	Ce paramètre est similaire à l'attaque. Toutefois, il a lieu à la fin de l'activité de la fonction. Par exemple, il permet d'atténuer progressivement ou rapidement la fonction dynamique une fois que le niveau a dépassé le seuil.

Expanseur/Gate

Le premier lot de commandes de dynamique permet de basculer entre l'expanseur et le gate.

L'expansion accentue les différences de volume en réduisant le niveau des parties douces du signal par rapport au niveau des parties plus fortes. Vous pouvez utiliser un expanseur pour accentuer les différences entre les niveaux faibles et les niveaux forts d'une piste, ou pour augmenter la plage dynamique d'un signal et minimiser le bruit indésirable.

Le gate est un expanseur plus drastique, car il réduit le niveau et coupe même certaines parties d'un signal qui se situent au-dessous d'un niveau déterminé afin de réduire ou de supprimer le bruit dans les parties douces d'un enregistrement. Par exemple, une plage de 15 à 20 dB permet de réduire la respiration dans une piste voix mais en laisse une quantité suffisante pour que le son reste naturel.

Le gate est un outil très efficace, mais comme il est puissant, il faut l'utiliser méticuleusement. Si le seuil du gate est trop élevé, cela peut provoquer des artefacts, comme couper le début d'une syllabe ou la fin d'un mot. Vous pouvez compenser cela en réduisant légèrement le seuil, ou en augmentant le temps de montée ou le temps de retour.

Compresseur

La compression permet de réduire les crêtes d'un signal audio en réduisant sa plage dynamique. Vous pouvez ainsi amplifier le niveau général sans écrêter le signal. C'est très pratique pour veiller à ce que les éléments forts du signal ne réduisent pas la force des sons plus faibles, ou pour créer des changements de niveaux audio fluides dans le signal.

CONSEIL Il est judicieux d'appliquer le compresseur après avoir réglé les commandes de l'égaliseur.

Make Up

Ce paramètre permet d'augmenter le niveau général du signal en corrélation avec les paramètres de compression. Comme les niveaux forts de l'audio ont été réduits avec la compression, vous pouvez maintenant utiliser la commande Make up pour amplifier le son général sans l'écrêter.

Limiteur

Le limiteur empêche les crêtes du signal de dépasser le niveau maximum préétabli. Le limiteur est très pratique pour éviter tout écrêtage. Par exemple, si vous réglez le limiteur sur -8 dB, le signal d'entrée ne dépassera jamais ce niveau. En ajustant les paramètres Attack, Hold et Release, vous pourrez déterminer la façon dont le limiteur affecte le signal.

Caractéristiques des commandes de dynamique

Commande	Minimum	Par défaut	Maximum
Expanseur/Gate			
Commandes de l'expanseur*			
Seuil	-50dB	-45dB**	0dB
Plage	0dB	18dB	60dB
Ratio	1.0:1	1.1:1	10:1
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Commandes du gate*			
Seuil	-50dB	-45dB**	0dB
Plage	0dB	18dB	60dB
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Compresseur			
Commandes du compresseur			
Seuil	-50dB	-35dB	0dB
Ratio	1.0:1	2.0:1	10:1
Attack	0.7ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Limiteur			
Commandes du limiteur			
Seuil	-50dB	-12dB	0dB
Attack	0.7ms	0.7ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s

* Les commandes expanseur/gate de la dynamique master ne sont pas disponibles dans la dynamique master.

** Le seuil de l'expanseur/gate de la dynamique master réglé par défaut est de -35dB.
Le seuil de l'expanseur/gate de la dynamique micro et XLR réglé par défaut est de -45dB.

Utiliser la fonction de contrôle des caméras

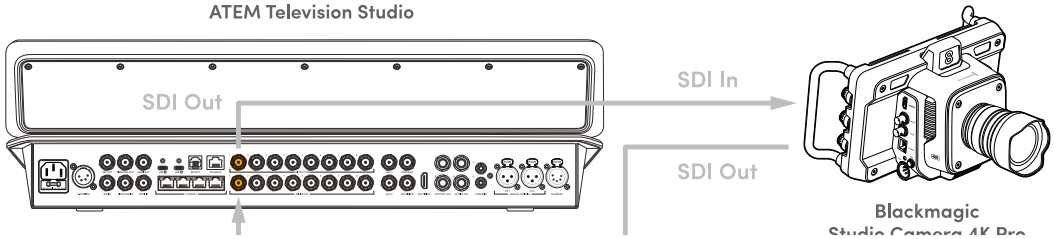
Il suffit de cliquer sur le bouton **Caméra** de l'ATEM Software Control pour accéder à la fonction de contrôle des caméras. Cette dernière vous permet de contrôler les caméras Blackmagic, dont les Blackmagic Studio Camera 6K Pro et URSA Broadcast G2 depuis votre mélangeur ATEM. Les paramètres des caméras Blackmagic, tels que l'iris, le gain, la mise au point, le niveau de détail et le contrôle du zoom sont facilement ajustables avec des objectifs compatibles. Vous pouvez également harmoniser les couleurs des caméras et créer des rendus fabuleux à l'aide du correcteur colorimétrique primaire DaVinci Resolve intégré à la caméra.

Le contrôle des caméras ATEM diffuse des paquets de contrôle via toutes les sorties SDI de votre mélangeur ATEM qui ne sont pas down-converties. Cela signifie que vous pouvez connecter une sortie SDI de votre mélangeur à l'entrée retour SDI de la caméra afin que cette dernière détecte les paquets de contrôle dans la connexion SDI et vous permette de contrôler les fonctionnalités de la caméra.

ATEM Camera Control.

Pour connecter des caméras :

1. Connectez la sortie SDI de la caméra Blackmagic à une des entrées SDI de votre mélangeur ATEM.
2. Connectez n'importe quelle sortie SDI de votre mélangeur ATEM, excepté les sorties multi view, à l'entrée programme SDI de votre caméra. Les signaux du contrôle des caméras ne sont pas acheminés via les sorties multi view.
3. Dans les paramètres de la caméra, faites correspondre le numéro de la caméra à l'entrée du mélangeur. Par exemple, si la Studio Camera 1 est connectée à **l'entrée 1** sur le mélangeur ATEM, le numéro de la caméra doit également être configuré sur 1 au sein des paramètres de la caméra. Ainsi, le tally est envoyé à la caméra appropriée.



Panneau de contrôle pour caméra

Lancez le logiciel ATEM Software Control et cliquez sur le bouton **Caméra** situé au bas de la fenêtre du logiciel. Vous apercevrez une rangée de fenêtres qui contiennent des outils permettant d'ajuster et d'affiner l'image de chaque caméra Blackmagic. Les commandes sont très faciles à utiliser. Il vous suffit de cliquer sur les boutons à l'aide de votre souris, ou de cliquer et déplacer les curseurs pour effectuer des ajustements.

Sélection de la caméra à commander

La rangée de boutons située sur le haut de la fenêtre de contrôle de la caméra vous permet de sélectionner le numéro de la caméra que vous souhaitez commander. Si vous avez de nombreuses caméras sur cette fenêtre, ou que vous utilisez la fenêtre de correction colorimétrique, il vous suffit d'appuyer sur ces boutons pour sélectionner la caméra que vous souhaitez commander. Si vous utilisez une sortie pour le monitoring du contrôle des caméras, les modifications apportées aux signaux de chaque caméra seront également envoyées vers la sortie auxiliaire choisie dans les préférences du mélangeur.

État du canal

La section État du canal est située dans la partie supérieure de chaque fenêtre de contrôle de caméra et affiche le libellé de la caméra, l'indicateur de passage à l'antenne et le bouton de verrouillage. Appuyez sur le bouton de verrouillage pour verrouiller toutes les commandes relatives à une caméra spécifique. Lorsque la caméra est à l'antenne, la section État du canal s'allume en rouge et affiche l'alerte On Air.

Paramètres de la caméra

Le bouton de paramétrage de la caméra situé en bas à gauche de la roue maîtresse vous permet d'activer le paramètre mire sur les Blackmagic Studio Camera, URSA Mini et URSA Broadcast, mais aussi d'ajuster les détails du signal d'image de chaque caméra.

Chaque fenêtre de contrôle de caméra affiche l'état du canal afin que vous sachiez quelle caméra est à l'antenne. Utilisez les roues chromatiques pour ajuster les paramètres Lift, Gamma et Gain de chaque canal YRGB.

Afficher/masquer la mire de barres couleurs

Les Blackmagic Studio Cameras intègrent le paramètre mire de barres couleurs que vous pouvez activer et désactiver en sélectionnant **Afficher la mire de barres couleurs** ou **Masquer la mire de barres couleurs**. Cette fonction est très utile pour identifier individuellement les caméras lors de la mise en place de votre production en direct. La mire de barres couleurs fournit également une tonalité pour vous permettre de vérifier et de régler les niveaux audio de chaque caméra.

Détail

Ce paramètre permet de régler la netteté de l'image en direct des caméras. Réduisez ou augmentez le niveau de netteté en sélectionnant : Désactiver les Détails, Détails par défaut pour une netteté faible, Détails moyens et Détails élevés.

Roues chromatiques

La roue chromatique est une fonctionnalité puissante du correcteur de couleurs DaVinci Resolve. Elle permet d'effectuer des ajustements de couleur pour les paramètres lift, gamma et gain de chaque canal YRGB. Pour sélectionner le paramètre à ajuster, il vous suffit de cliquer sur un des trois boutons de sélection situés au-dessus de la roue chromatique.

Roue maîtresse

Utilisez la roue maîtresse située sous la roue chromatique pour effectuer des ajustements de contraste sur tous les canaux YRGB en même temps, ou uniquement de luminance pour les paramètres lift, gamma ou gain.

Boutons de réinitialisation

Le bouton de réinitialisation situé en bas à droite de la fenêtre de contrôle de la caméra vous permet de choisir aisément les paramètres de correction colorimétrique que vous souhaitez réinitialiser,

copier ou coller. Chaque roue chromatique possède également son propre bouton de réinitialisation. Appuyez sur ce bouton pour restaurer le paramètre par défaut, ou pour copier/coller un paramètre. Les fenêtres de contrôle de caméra verrouillées ne sont pas affectées par la fonction Coller.

Le bouton de réinitialisation principal est situé en bas à droite de la fenêtre de correction colorimétrique. Il vous permet de réinitialiser les roues chromatiques Lift, Gamma et Gain ainsi que les paramètres Contraste, Teinte, Saturation et Lum Mix. Vous pouvez coller les paramètres de correction colorimétrique à des fenêtres de contrôle de caméra individuelles ou à toutes les fenêtres en même temps pour créer un rendu uniforme. Les paramètres relatifs à l'iris, à la mise au point et au niveau de noir ainsi que le paramètre Limite ne sont pas affectés par la fonction Coller. Lorsque vous appliquez la fonction Coller tout, un message apparaît pour confirmer cette action. De cette façon, vous ne collez pas de nouveaux paramètres accidentellement aux caméras non verrouillées en cours de diffusion.

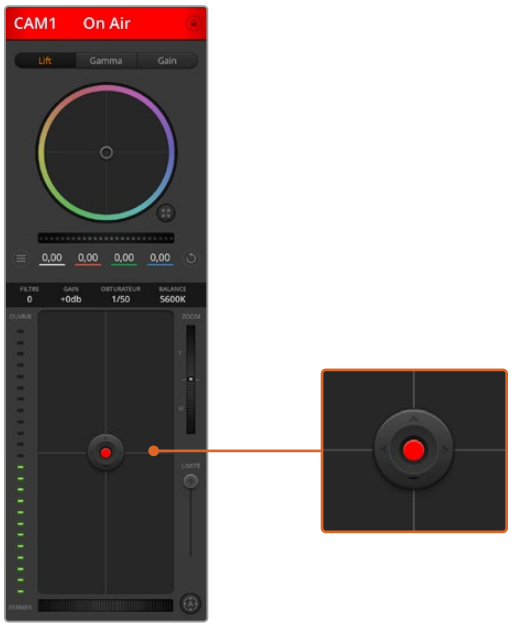
Lorsque vous souhaitez appliquer la fonction **Tout coller**, un message apparaît pour vous demander de confirmer votre action. De cette façon, vous ne collez pas de nouveaux paramètres accidentellement aux caméras non verrouillées en cours de diffusion.

Contrôle de l'iris et du niveau de noir

Le contrôle de l'iris et du niveau de noir est situé au sein de la croix de centrage de chaque fenêtre de contrôle de caméra. Le contrôle s'allume en rouge lorsque la caméra est à l'antenne.

Pour ouvrir ou fermer l'iris, déplacez le contrôle vers le haut ou vers le bas. En maintenant la touche MAJ enfoncée, vous pourrez ajuster uniquement l'iris.

Pour assombrir ou éclaircir le niveau de noir, déplacez le bouton vers la gauche ou vers la droite. En maintenant la touche Command (Mac) ou Control (Windows) enfoncée, vous pourrez ajuster uniquement le niveau de noir.



Le contrôle de l'iris/niveau de noir s'illumine en rouge lorsque la caméra est à l'antenne.

Contrôle du Zoom

Lorsque vous utilisez des objectifs compatibles dotés d'un zoom électronique, vous pouvez effectuer des zooms avant et arrière à l'aide de la fonction de contrôle du zoom. Cette commande fonctionne de la même manière que la bague de zoom sur un objectif, avec le téléobjectif d'un côté et le grand-angle de l'autre. Cliquez sur le contrôle du zoom situé au-dessus du curseur Limite, et déplacez-le vers le haut pour faire un zoom avant ou vers le bas pour faire un zoom arrière.

Paramètre Limite

Le paramètre Limite est situé à droite du contrôle de l'iris/niveau de noir et permet de limiter l'ouverture de l'iris. Cette fonctionnalité vous aide à ne pas faire passer des images surexposées à l'antenne.

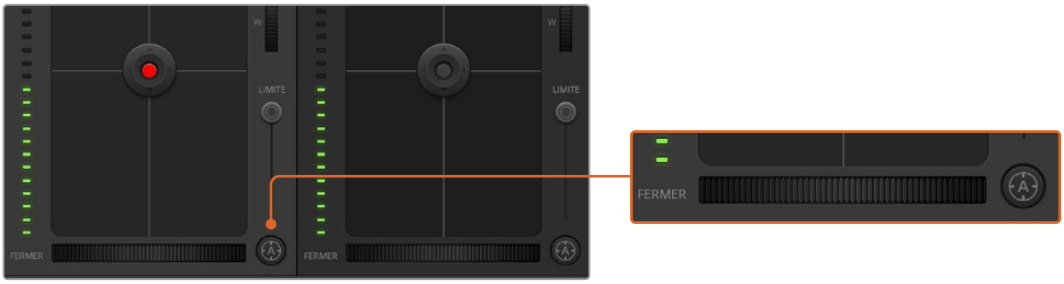
Pour configurer cette limite, ouvrez complètement l'iris à l'aide de la fonction de contrôle de l'iris, puis déplacez le curseur vers le haut ou vers le bas pour configurer l'exposition optimale. À présent, lorsque vous ajustez l'iris, la limite que vous avez configurée à l'aide du paramètre Limite l'empêchera de dépasser l'exposition optimale.

Indicateur de l'iris

L'indicateur de l'iris est situé à gauche du contrôle de l'iris/niveau de noir et fait office de référence visuelle vous permettant de visualiser l'ouverture de lentille. L'indicateur de l'iris est affecté par le paramètre **Limite**.

Bouton de mise au point automatique

Le bouton de mise au point automatique est situé en bas à droite de chaque fenêtre de contrôle de caméra. Appuyez sur ce bouton pour un réglage automatique de la mise au point lorsque vous utilisez un objectif actif qui prend en charge les ajustements de mise au point électronique. La plupart des objectifs prennent en charge la mise au point automatique, cependant, certains d'entre eux peuvent être réglés en mode manuel ou automatique. Il vous faudra donc vérifier que votre objectif est réglé en mode automatique. Pour ce faire, il suffit parfois de faire glisser la bague de mise au point vers l'avant ou vers l'arrière.



Cliquez sur le bouton de mise au point automatique ou déplacez le curseur de mise au point manuelle vers la gauche ou vers la droite pour effectuer la mise au point d'un objectif compatible.

Ajustement manuel de la mise au point

Lorsque vous souhaitez ajuster manuellement la mise au point sur votre caméra, vous pouvez utiliser l'ajustement de mise au point situé au bas de chaque fenêtre de contrôle de caméra. Déplacez la roue vers la gauche ou vers la droite pour ajuster manuellement la mise au point tout en visualisant l'image pour vous assurer qu'elle est nette.

Gain de la caméra

Le paramètre relatif au gain de la caméra vous permet d'ajouter du gain supplémentaire à la caméra. C'est très important lorsque vous travaillez dans des conditions où la lumière est minime et que vous avez besoin de gain supplémentaire au niveau du capteur pour éviter que vos images ne soient sous-exposées. Vous pouvez réduire ou augmenter le gain en cliquant sur les flèches gauche ou droite situées à côté du paramètre gain (dB).

Il est possible d'ajouter du gain à tout moment, par exemple lorsque la lumière baisse au coucher du soleil lors d'un tournage en extérieur et qu'il vous faut augmenter la luminosité de votre image. Il faut bien garder à l'esprit que le fait d'ajouter du gain augmentera le bruit dans vos images.

Contrôle de la vitesse d'obturation

Le contrôle de la vitesse d'obturation est situé dans la section entre la roue chromatique et le contrôle de l'iris/niveau de noir. Réduisez ou augmentez la vitesse d'obturation en faisant passer le pointeur de votre souris sur l'indicateur de la vitesse d'obturation, puis cliquez sur les flèches gauche ou droite.

Si vous observez des scintillements, vous pouvez diminuer votre vitesse d'obturation pour les éliminer. Diminuer la vitesse d'obturation est un bon moyen d'éclaircir vos images sans utiliser le gain de la caméra, car vous augmentez ainsi le temps de pose du capteur d'image. Le fait

d’augmenter la vitesse d’obturation réduira le flou de bougé, ce qui est idéal lorsque vous souhaitez obtenir des scènes d’action nettes avec un flou de bougé minimal.

Balance des blancs

Le paramètre de balance des blancs est situé à côté du contrôle de la vitesse d’obturation. Il peut être réglé en utilisant les flèches gauche et droite situées de chaque côté de l’indicateur de température de couleur. Les sources lumineuses émettent des couleurs plus ou moins chaudes ou froides, vous pouvez compenser cela en ajustant la balance des blancs. Les blancs de votre image resteront ainsi réellement blancs.

Faites passer le pointeur de votre souris sur les indicateurs de filtre, de gain, de vitesse d’obturation et de balance des blancs pour faire apparaître les flèches qui vous permettront d’ajuster leurs paramètres respectifs.

Correcteur colorimétrique primaire DaVinci Resolve

Si vous avez de l’expérience dans le domaine de la correction colorimétrique, il est possible de changer l’interface de commande des caméras pour obtenir un style d’interface qui ressemble à celle d’un correcteur colorimétrique primaire que l’on trouve communément sur les systèmes d’étalonnage.

Les caméras Blackmagic intègrent le correcteur colorimétrique primaire DaVinci Resolve. Si vous avez utilisé DaVinci Resolve auparavant, créativement parlant, l’étalonnage sur la caméra Blackmagic sera identique à celui de DaVinci, vous aurez donc l’opportunité de mettre votre expérience d’étalonnage à profit pour la production en direct. La fenêtre de correction colorimétrique peut être agrandie et fournit un contrôle de correction colorimétrique plus étendu comprenant des paramètres supplémentaires ainsi qu’une interface de correction colorimétrique primaire complète.

Cliquez sur le bouton DaVinci Resolve pour agrandir la fenêtre de correction colorimétrique et ajuster les paramètres.

Vous disposez à présent de roues chromatiques et de paramètres, tels que la saturation. Vous pouvez également visualiser tous les paramètres relatifs aux basses lumières, aux tons moyens et aux hautes lumières en même temps. Il vous suffit de commuter entre les caméras à l’aide des commandes de sélection situées sur le haut de la fenêtre lorsqu’il est nécessaire.

Roues chromatiques Lift, Gamma et Gain dans la fenêtre de correction colorimétrique.

Roues chromatiques

Cliquez et déplacez votre pointeur n'importe où dans le cercle de couleur
Notez qu'il n'est pas nécessaire de positionner votre pointeur sur l'indicateur de la balance des couleurs. Lorsque l'indicateur de la balance des couleurs se déplace, les paramètres RGB situés sous la roue chromatique se modifient pour refléter les ajustements apportés à chaque canal.

Cliquez en maintenant le bouton SHIFT enfoncé et déplacez-vous n'importe où dans le cercle de couleur :
L'indicateur de la balance des couleurs se positionnera à l'endroit même où se trouve le pointeur, ce qui vous permet de faire des ajustements plus rapides et extrêmes.

Double-cliquez n'importe où dans le cercle de couleur
Réinitialise l'ajustement apporté à la couleur sans réinitialiser l'ajustement apporté à la roue maîtresse pour la commande en question.

Cliquez sur la commande de réinitialisation située en haut à droite du cercle de couleur
Réinitialise le contrôle de la balance des couleurs ainsi que la roue maîtresse correspondante.

Roues maîtresses

Utilisez les roues maîtresses situées sous les roues chromatiques pour ajuster les commandes Lift, Gamma et Gain de chaque canal YRGB.

Un déplacement vers la gauche assombrit le paramètre sélectionné de l'image alors qu'un déplacement vers la droite éclaircit ce même paramètre. Lors de l'ajustement, les paramètres YRGB situés au-dessous de la roue maîtresse se modifient pour refléter l'ajustement en cours. Pour effectuer un ajustement n'affectant que la luminance, maintenez la touche ALT ou Command enfoncée et déplacez la roue vers la gauche ou vers la droite. Comme le correcteur colorimétrique prend en charge un traitement YRGB, il vous permet de faire preuve de créativité et de créer des effets uniques en ajustant uniquement le canal Y. Les ajustements du canal Y fonctionnent mieux lorsque le paramètre Lum Mix est réglé sur le côté droit pour un traitement YRGB et sur le côté gauche pour un traitement RGB standard. En général, la plupart des étalonneurs DaVinci Resolve utilisent le correcteur colorimétrique YRGB car on obtient une meilleure maîtrise de la balance des couleurs sans affecter le gain général. Il vous faudra ainsi moins de temps pour obtenir le rendu désiré.

Paramètre Contraste

Le paramètre Contraste vous permet de contrôler la distance entre les valeurs les plus sombres et les plus claires d'une image. L'effet ressemble à celui effectué lorsque vous utilisez les roues maîtresses Lift et Gain. Par défaut, ce paramètre est réglé sur 50%.

Paramètre Pivot

Une fois le contraste ajusté, modifier la valeur du pivot ajustera les tons moyens du contraste. Le paramètre Pivot établit la balance du contraste en plaçant la priorité sur tel ou tel côté de l'échelle de luminance. En poussant le curseur, vous augmenterez la luminosité générale et la clarté de l'image, mais les ombres seront réduites.

Paramètre Saturation

Le paramètre Saturation augmente ou réduit la quantité de couleur de l'image. Par défaut, ce paramètre est réglé sur 50%.

Paramètre Lum Mix

Le correcteur colorimétrique intégré aux caméras Blackmagic a été conçu à partir du logiciel d'étalonnage primaire DaVinci Resolve. DaVinci crée des logiciels de correction colorimétrique depuis le début des années 80 et la plupart des films hollywoodiens sont étalonnés sur DaVinci Resolve.

Cela signifie que le correcteur colorimétrique intégré à la caméra possède des fonctionnalités uniques et puissantes sur le plan créatif. Le traitement YRGB est l'une de ces fonctionnalités.

Lorsque vous étalonnez, vous pouvez choisir entre un traitement RGB ou un traitement YRGB. Les étalonneurs professionnels utilisent le traitement YRGB, car ils obtiennent ainsi un contrôle plus précis de la couleur et peuvent ajuster les canaux de façon indépendante avec une meilleure séparation et davantage d'options créatives.

Lorsque le paramètre Lum Mix est réglé sur le côté droit, vous avez une sortie provenant à 100% du correcteur colorimétrique YRGB. Lorsque le paramètre Lum Mix est réglé sur le côté gauche, vous obtenez une sortie provenant à 100% du correcteur RGB. Vous pouvez régler le paramètre Lum Mix sur n'importe quelle position entre la gauche et la droite pour obtenir un mélange de sortie provenant des deux correcteurs RGB et YRGB.

Quelle est la configuration idéale ? Cela dépend de vous. En effet, l'étalonnage est un processus créatif, il n'y a donc pas de bonne ou de mauvaise configuration. La configuration idéale est celle qui vous convient le mieux !

Paramètre Teinte

Le paramètre Teinte fait tourner toutes les teintes de l'image sur le périmètre complet de la roue chromatique. Le paramètre par défaut de 180 degrés affiche la distribution originale des teintes. L'augmentation ou la diminution de cette valeur fait tourner toutes les teintes vers l'avant ou vers l'arrière selon la distribution des teintes d'une roue chromatique.

Paramètre Ton

Ajustez ce paramètre pour ajouter du vert ou du magenta à l'image afin d'équilibrer les couleurs. Cela peut vous aider lorsque vous filmez avec des sources d'éclairage artificiel, telles que des lampes fluorescentes ou à vapeur de sodium.

Déplacez les curseurs vers la gauche ou vers la droite pour ajuster les paramètres Contraste, Saturation, Teinte et Lum Mix.

Synchronisation des paramètres

Lorsque les deux appareils sont connectés, les signaux du contrôle des caméras sont envoyés du mélangeur ATEM à votre caméra Blackmagic. Si un paramètre est accidentellement ajusté à partir de votre caméra, la fonction de contrôle des caméras réinitialisera automatiquement le paramètre en question pour maintenir la synchronisation.

Fonctionnement de votre mélangeur ATEM

Sources vidéo internes

En plus de ses entrées SDI, le mélangeur possède également 8 sources internes qui peuvent être utilisées lors de productions. Les sources internes sont représentées par un nom long et un nom court sur le panneau de contrôle logiciel. Sur l'ATEM, les sources internes sont représentées par un nom long. Les libellés indiquent le type de source afin d'éviter toute confusion.

Noir

Le noir généré en interne est disponible en tant que source et peut être utilisé en tant qu'arrière-plan dans la production.

Mire

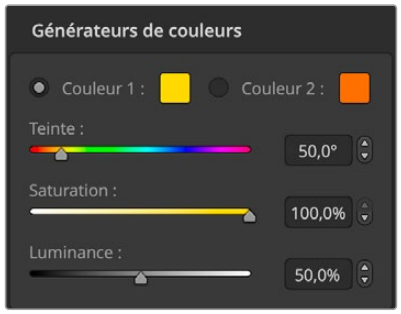
La mire générée en interne est disponible en tant que source. Elle est utile pour vérifier les signaux sortant du mélangeur et peut également s'avérer utile lorsque vous réglez une incrustation chromatique à l'aide du vecteurscope.

Générateurs de couleurs

Les mélangeurs ATEM possèdent deux sources de couleur qui peuvent être paramétrées pour créer n'importe quel cache couleur pour votre production. Les sources de couleur peuvent être utilisées pour ajouter des bordures de couleur pour les transitions Wipe ou en tant que couleur intermédiaire pour une transition Dip comme un fondu au blanc par exemple.

Pour régler une source de couleur sur le panneau de contrôle logiciel, allez tout simplement sur la palette Générateurs de couleurs, cliquez sur la pastille de couleur et le sélecteur de couleur apparaîtra. Vous pourrez ainsi sélectionner la couleur désirée. Sur l'ATEM, sélectionnez le bouton COLOR dans la section System Control, et ajustez la teinte (hue), la saturation et la luminance.

Il est important de savoir que les couleurs les plus profondes sont réglées à un niveau de luminance de 50%.



Les mélangeurs ATEM possèdent deux sources de couleur qui peuvent être paramétrées pour créer n'importe quel cache couleur pour votre production

Lecteurs multimédias

Chaque source possède un signal Fill (remplissage) et un signal Key (découpe). Les sources Fill des lecteurs multimédia sont appelées Media player 1 ou 2. Les sources Key sont appelées Media player 1 key, media player 2 key, etc.

Les sources lecteur multimédia qui sont des images fixes ou des clips de la bibliothèque de médias sont lues par le lecteur multimédia. Les sources fill indiquent les canaux de couleur du clip ou de l'image sélectionnés alors que les sources key indiquent le canal alpha noir et blanc du clip ou de l'image sélectionnés. Les lecteurs multimédia peuvent être utilisés à plusieurs reprises au cours de la phase de production.

Pour contrôler les lecteurs multimédia sur les mélangeurs ATEM Television Studio :

1. Dans la section Contrôle système, appuyez sur le bouton **Media Player** pour naviguer dans le menu des lecteurs multimédia.
2. Sélectionnez le lecteur multimédia que vous souhaitez contrôler à l'aide des boutons multifonctions situés au-dessus de l'écran LCD.
3. Utilisez la molette pour sélectionner le clip ou l'image fixe depuis la bibliothèque de médias.
4. Si vous avez sélectionné un clip, appuyez sur la flèche droite. Les commandes lecture/stop, en boucle, retour arrière et d'image seront activées pour contrôler le clip.

Pour contrôler les lecteurs multimédia sur le panneau de contrôle logiciel :

1. Sur la fenêtre Mélangeur, sélectionnez la palette Lecteurs multimédia.
2. Utilisez le menu déroulant Média pour sélectionner un clip ou une image fixe dans la bibliothèque de médias.
3. Si vous avez sélectionné un clip, les commandes de transport seront activées pour pouvoir l'exploiter. Si vous désirez mettre un clip en boucle, appuyez sur le bouton de lecture en boucle et sur le bouton de lecture. Le lecteur multimédia lira le clip en boucle jusqu'à ce que appuyiez à nouveau sur le bouton pour l'arrêter.

Un clip est chargé sur les lecteurs multimédias sur l'ATEM Software Control

Tous les types de transition

Une des fonctions principales d'un mélangeur broadcast est d'effectuer des transitions d'une source vidéo à l'autre. L'association de différents effets et styles de transitions vous offre de nombreuses options créatives qui amélioreront la qualité de vos productions.

Vous pouvez effectuer des transitions via le logiciel ATEM Software Control ou le mélangeur ATEM. Cette section vous explique comme effectuer toutes les transitions disponibles sur votre mélangeur.

Transitions Cut

Le Cut est la transition la plus simple à réaliser sur le mélangeur. Une transition Cut est un basculement direct d'une source à une autre sur le signal de sortie programme.

Signal de sortie programme lors d'une transition Cut.

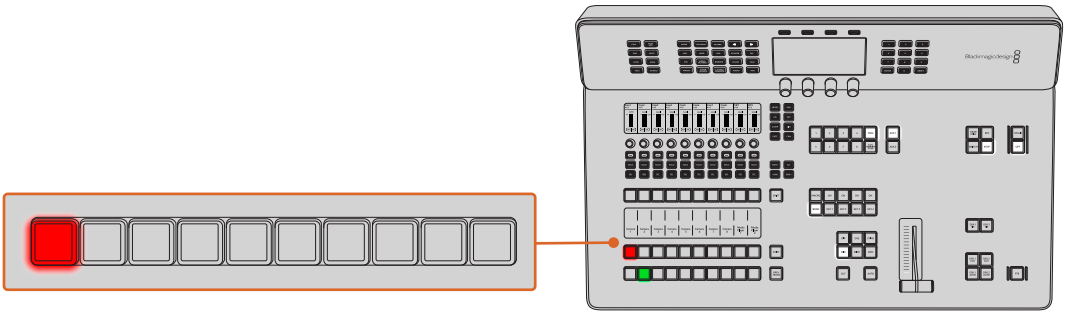
Une transition Cut peut être effectuée directement à partir du bus Programme ou au moyen du bouton CUT dans la section de contrôle des transitions.

Bus Program/Programme

Lorsqu'une transition Cut est effectuée à partir du bus Program/Programme, c'est uniquement l'arrière-plan qui change, il n'y a donc aucun changement au niveau des incrustations en amont et en aval.

Effectuer une transition à partir du bus Programme sur l'ATEM Television Studio :

Sur le bus Program, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme. La nouvelle source passera immédiatement sur le signal de sortie programme.



Appuyez sur un des boutons source dans la rangée Program pour effectuer une transition Cut depuis le bus Program

Effectuer une transition Cut depuis le bus Programme sur le panneau de contrôle logiciel

Sur le bus Programme, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme. La nouvelle source passera immédiatement sur le signal de sortie programme.

Effectuer une transition Cut sur le panneau de contrôle logiciel au moyen d'un clavier

1. Activez la touche **Verr Maj** ou appuyez et maintenez la touche **Maj** enfoncée.
2. Appuyez sur la touche du clavier qui correspond au numéro de la source vidéo que vous désirez voir figurer sur le signal de sortie programme. La nouvelle source passera immédiatement sur le signal de sortie programme.

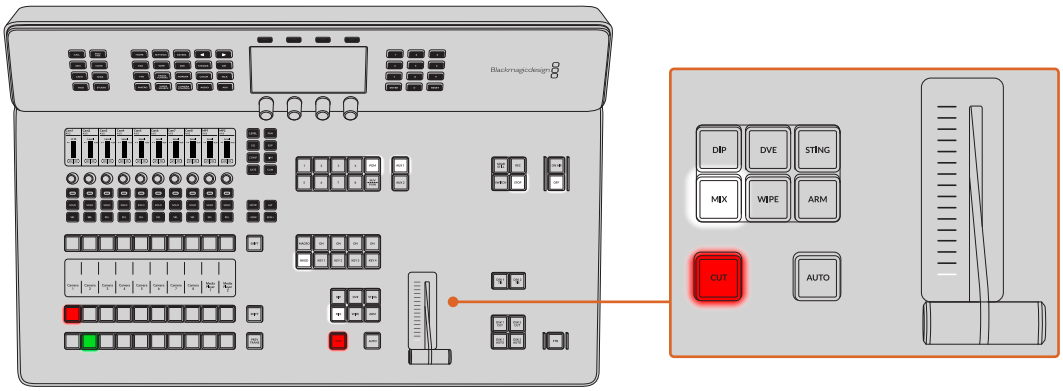
Bouton CUT

Lorsque vous effectuez une transition Cut à l'aide du bouton CUT, toutes les incrustations en amont qui étaient sélectionnées dans la transition suivante et toutes les incrustations en aval qui étaient liées à la section de contrôle des transitions changeront d'état. Par exemple, une incrustation en aval liée à la section de contrôle des transitions apparaîtra à l'antenne si elle était préalablement hors antenne, inversement, elle disparaîtra de l'antenne si elle était préalablement à l'antenne. Cela est également valable pour les incrustations en amont.

Effectuer une transition Cut à l'aide du bouton CUT de l'ATEM Television Studio :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme. Le signal de sortie du programme ne sera pas affecté.
2. Dans la section de contrôle des transitions, appuyez sur le bouton CUT. Les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Il est préférable d'utiliser la section de contrôle des transitions pour effectuer les transitions, car elle permet de vérifier le contenu vidéo sur le signal de sortie prévisualisation avant de l'envoyer au signal de sortie programme. Vous pourrez ainsi, par exemple, vérifier la mise au point de la caméra.



Effectuer une transition Cut à l'aide du bouton CUT sur le panneau de contrôle logiciel

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme. Le signal de sortie du programme ne sera pas affecté.
2. Dans la section de contrôle des transitions, appuyez sur le bouton CUT. Les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Le bouton de transition CUT fait partie de la section Style de transition

Effectuer une transition Cut sur le panneau de contrôle logiciel au moyen d'un clavier

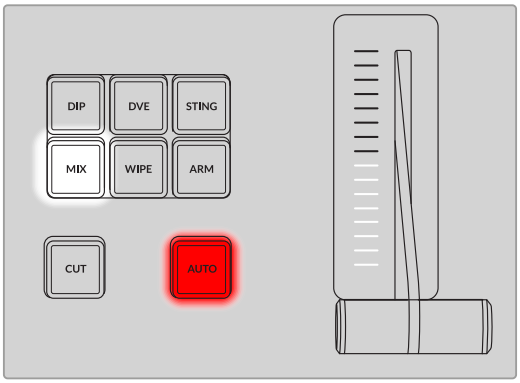
1. Vérifiez que la touche **Verr maj** est désactivée.
2. Appuyez sur la touche du clavier qui correspond au numéro de la source vidéo que vous désirez voir figurer sur le signal de sortie programme. La source sera sélectionnée en mode prévisualisation et le signal de sortie programme ne sera pas affecté.
3. Appuyez sur la barre d'espace. Les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Transitions Auto

Une transition automatique vous permet d'effectuer une transition d'une durée prédéterminée entre les sources programme et prévisualisation. Toutes les incrustations en amont qui étaient sélectionnées dans la transition suivante et toutes les incrustations en aval qui étaient assignées à la section de contrôle des transitions changeront d'état. Les transitions automatiques sont effectuées à l'aide du bouton AUTO dans la section de contrôle des transitions. Les transitions Mix, Dip, Wipe, DVE et Stinger peuvent toutes être effectuées automatiquement.

Effectuer une transition automatique sur l'ATEM Television Studio :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Sélectionnez le type de transition à l'aide des boutons de la section de contrôle des transitions.
3. Dans la section Contrôle système, réglez la durée de la transition et ajustez les autres paramètres si nécessaire.
4. Appuyez sur le bouton AUTO dans la section de contrôle des transitions pour lancer la transition.



Chaque type de transition a son propre bouton de sélection (Dip, Mix, Wipe, etc.).

Durant la transition, les boutons rouge et vert des bus Program/Programme et Preview/Prévisualisation s'allument en rouge pour indiquer qu'une transition est en cours. L'indicateur du levier de transition suit automatiquement la progression de la transition et affiche la durée pour indiquer le nombre d'images restant.

À la fin de la transition, les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Chaque type de transition possède sa propre durée de transition, ce qui permet à l'opérateur d'effectuer des transitions plus rapidement en sélectionnant le type de transition désiré et en appuyant sur le bouton AUTO. La durée de transition qui a été utilisée précédemment est gardée en mémoire pour le type de transition en question jusqu'à ce qu'elle soit à nouveau modifiée.

Un mélangeur de production vous procure plusieurs méthodes pour effectuer des transitions d'une prise de vue à une autre. De manière générale, on utilise une découpe simple pour passer d'une source d'arrière-plan à une autre. Les transitions Mix, Dip, Wipe et DVE vous permettent quant à elles de faire une transition entre deux sources d'arrière-plan : la première disparaît alors que la deuxième apparaît progressivement. Les transitions Stinger et Graphic Wipe sont particulières et elles seront abordées dans une autre section. Les transitions Mix, Dip, Wipe et DVE peuvent être effectuées en tant que transitions automatiques ou en tant que transitions manuelles au moyen de la section de contrôle des transitions.

Le bouton de transition AUTO fait partie de la section Style de transition.

Effectuer une transition automatique sur le panneau de contrôle logiciel

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Sélectionnez le type de transition dans la section de contrôle des transitions.
3. Dans la palette Transitions, sélectionnez l'onglet représentant le même type de transition que celui sélectionné dans la section de contrôle des transitions.
4. Réglez la durée de la transition et ajustez les autres paramètres de la transition si nécessaire.
5. Appuyez sur le bouton AUTO dans la section de contrôle des transitions pour lancer la transition.
6. Durant la transition, les boutons rouge et vert des bus Program/Programme et Preview/Prévisualisation s'allument en rouge pour indiquer qu'une transition est en cours. Le levier de transition à l'écran suit automatiquement la progression de la transition et affiche la durée pour indiquer le nombre d'images restant.
7. À la fin de la transition, les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Effectuer une transition automatique sur le panneau de contrôle logiciel au moyen d'un clavier

1. Vérifiez que la touche **Verr maj** est désactivée.
2. Appuyez sur la touche du clavier qui correspond au numéro de la source vidéo que vous désirez voir figurer sur le signal de sortie programme. La source sera sélectionnée en mode prévisualisation et le signal de sortie programme ne sera pas affecté.
3. Sélectionnez le type de transition dans la section de contrôle des transitions.
4. Dans la palette Transitions, sélectionnez l'onglet représentant le même type de transition que celui sélectionné dans la section de contrôle des transitions.
5. Réglez la durée de la transition et ajustez les autres paramètres de la transition si nécessaire.
6. Appuyez sur la touche **Retour** ou **Entrée** pour lancer la transition.

Durant la transition, les boutons rouge et vert des bus Program/Programme et Preview/Prévisualisation s'allument en rouge pour indiquer qu'une transition est en cours. Le levier de transition à l'écran suit automatiquement la progression de la transition et affiche la durée pour indiquer le nombre d'images restant.

À la fin de la transition, les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation seront inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

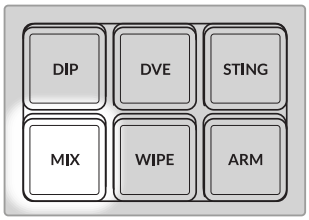
Transitions Mix

Un Mix est une transition progressive d'une source à l'autre. On la réalise en mélangeant deux sources progressivement et en les faisant se chevaucher pour la durée de l'effet. La durée de la transition ou celle du chevauchement peut être ajustée en modifiant la durée du Mix.

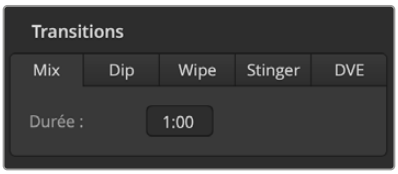
Signal de sortie programme lors d'une transition Mix.

Effectuer une transition Mix sur l'ATEM Television Studio HD8 :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Appuyez sur le bouton DIP/MIX ou MIX pour sélectionner le type de transition Mix. Le Contrôle système navigue automatiquement jusqu'au menu Transition.
3. Utilisez la molette et l'écran LCD pour ajuster la durée de la transition Mix. La zone d'affichage Durée de la section de contrôle des transitions du mélangeur sera mise à jour dynamiquement. Vous pouvez également saisir la durée à l'aide du pavé numérique.
4. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.



Appuyez sur le bouton **MIX**, puis réglez la durée de la transition sur l'écran LCD avec la molette.



Paramètres de la transition Mix

Effectuer une transition Mix sur le panneau de contrôle logiciel

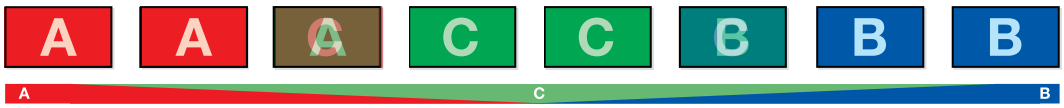
1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Sélectionnez le style de transition Mix dans la section de contrôle des transitions.
3. Agrandissez la palette Transitions et sélectionnez Mix.
4. Saisissez un nombre dans la zone d'affichage Durée pour modifier la durée du Mix. La zone d'affichage Rate/Durée de la section de contrôle des transitions sera mise à jour.
5. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.

Paramètres de la transition Mix

Durée	La durée de la transition Mix en secondes:images.

Transitions Dip

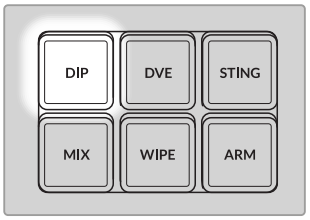
La transition Dip ressemble à la transition Mix, car c'est également une transition progressive d'une source à une autre. Cependant, la transition Dip mélange progressivement une troisième source, la source Dip. Par exemple, on peut utiliser la transition Dip pour effectuer un flash blanc ou pour faire apparaître le logo du sponsor rapidement sur l'écran. La durée de la transition Dip et la source Dip peuvent être configurées.



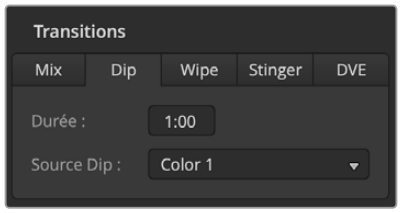
Signal de sortie programme lors d'une transition Dip.

Effectuer une transition Dip sur l'ATEM Television Studio :

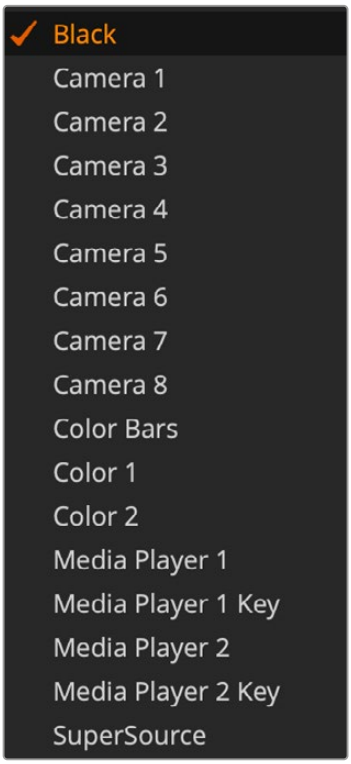
1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Appuyez sur le bouton DIP pour sélectionner le type de transition Dip. Les paramètres de la transition s'afficheront automatiquement sur l'écran LCD.
3. Utilisez la molette située sous l'écran LCD pour ajuster la durée de la transition Dip. Vous pouvez également saisir la durée à l'aide du pavé numérique.
4. Tournez les molettes correspondantes pour sélectionner la source Dip. Vous pouvez également utiliser le bus de sélection des sources.
5. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.



Appuyez sur le bouton **DIP** dans la section de contrôle des transitions, puis réglez la source Dip et la durée de la transition sur l'écran LCD à l'aide de la molette



Paramètres de la transition Dip



Menu de la source Dip

Effectuer une transition Dip sur le panneau de contrôle logiciel

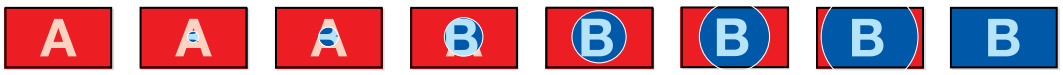
1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Sélectionnez le style de transition Dip dans la section de contrôle des transitions.
3. Agrandissez la palette Transitions et sélectionnez Dip.
4. Modifiez la durée de la transition en saisissant un nombre dans la zone d'affichage Rate/Durée. La zone d'affichage Durée de la section de contrôle des transitions sera mise à jour.
5. Sélectionnez la source Dip.
6. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.

Paramètres de la transition Dip

Durée	La durée de la transition Dip en secondes et en images.
Source Dip	La source Dip est représentée par n'importe quel signal vidéo du mélangeur qui sera utilisé en tant qu'image intermédiaire de la transition Dip, en général un générateur de couleurs ou un lecteur multimédia.

Transitions Wipe

Une transition Wipe est une transition d'une source à une autre, obtenue en remplaçant la source actuelle par une source comprenant un motif. Ce motif représente souvent une forme géométrique, par exemple un cercle ou un losange qui devient de plus en plus grand.

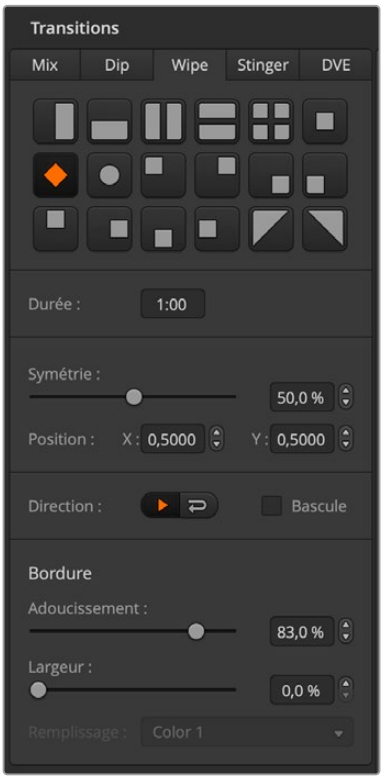


Signal de sortie programme lors d'une transition Wipe.

Effectuer une transition Wipe sur l'ATEM Television Studio :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Appuyez sur le bouton WIPE pour sélectionner le type de transition Wipe. Les paramètres de la transition s'afficheront automatiquement sur l'écran LCD.
3. Utilisez la molette du Contrôle système pour sélectionner le motif désiré pour votre transition Wipe. Les boutons peuvent être utilisés pour sélectionner la direction de la transition Wipe.
4. Utilisez les boutons à gauche de l'écran LCD pour naviguer dans les propriétés de la transition Wipe, dont la position, la symétrie et la bordure.

5 Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.



Paramètres de la transition Wipe

Effectuer une transition Wipe sur le panneau de contrôle logiciel

1 Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.

2 Sélectionnez WIPE dans la section de contrôle des transitions.

3 Agrandissez la palette Transitions et sélectionnez Wipe.

4 Utilisez les paramètres de la palette Wipe pour configurer la transition.

5 Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.

Paramètres de la transition Wipe

Durée	La longueur de la transition Wipe en secondes et en images.
Symétrie	Ce paramètre permet de contrôler les proportions du motif. Par exemple, la modification de ce paramètre vous permettra de changer un cercle en ellipse. Sur l'ATEM, la symétrie peut être ajustée à l'aide de la molette.
Position	Lorsque le motif Wipe est positionné, vous pouvez déplacer son centre à l'aide de la molette sur le mélangeur, ou en modifiant la valeur des champs Position X: et Y: de la palette Transitions sur le panneau de contrôle logiciel.
Inverser la direction	Ce paramètre modifie la progression des motifs fermés, tels que les cercles, losanges et rectangles, afin que la forme partant des bords extérieurs se referme au centre de l'écran. Le texte s'allume en orange lorsqu'il est sélectionné.
Bascule	Lorsque ce mode est activé, la transition passe du paramètre Normal au paramètre Inverser chaque fois que la transition est effectuée. Le texte s'allume en orange lorsqu'il est sélectionné.
Adoucissement de la bordure	Le contour des motifs peut être ajusté du plus net au plus flou en modifiant le paramètre d'adoucissement.
Bordure	Largeur de la bordure.
Source de remplissage de la bordure	La source de la bordure utilisée lors d'une transition Wipe peut être choisie parmi n'importe quelle source du mélangeur. Par exemple, une bordure épaisse ayant le lecteur multimédia en tant que source peut être utilisée pour les sponsors ou les logos.

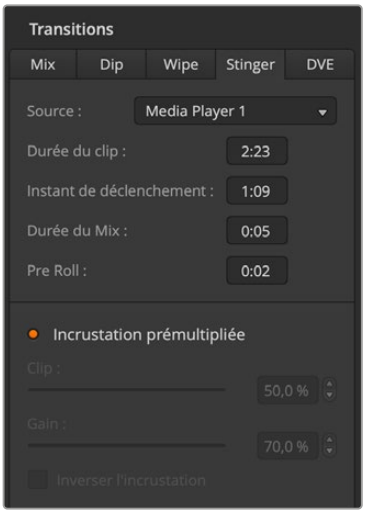
Transitions Stinger

La transition Stinger est effectuée avec un clip du lecteur multimédia. Ce clip est en général une animation graphique incrustée sur l'arrière-plan. Lors de la lecture de l'animation en mode plein écran, une transition Cut ou Mix de l'arrière-plan est effectuée sous l'animation. Ce type de transition est très populaire lors de retransmissions sportives, par exemple pour effectuer des transitions entre le match et les ralentis. Les transitions Stinger bénéficient d'un incrustateur spécial intégré à la section Transition, ce qui laisse tous les incrustateurs en amont et en aval disponibles pour le compositing du signal de sortie. La section suivante explique comment créer et effectuer des transitions Stinger.

Création d'une transition Stinger

Effectuer une transition Stinger sur l'ATEM Television Studio :

1. Appuyez sur le bouton STING dans la section de contrôle des transitions.
2. Tournez la molette multifonctions **Source** du menu de l'écran LCD et sélectionnez le lecteur multimédia de votre choix. Utilisez les flèches pour ajuster les paramètres preroll, déclenchement, mix et durée si nécessaire.
3. Appuyez sur le bouton **Media Players** du Contrôle système, à côté de l'écran LCD, pour paramétrer le lecteur multimédia.
4. Dans le menu du lecteur multimédia, tournez la molette multifonctions **Média** pour sélectionner l'image ou le clip que vous souhaitez utiliser depuis la bibliothèque mutlimédia. Si nécessaire, vous pouvez sélectionner à quelle image commencera le clip via la molette multifonctions **Image**.
5. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section de contrôle des transitions.



Paramètres de la transition Stinger

Effectuer une transition Stinger sur le panneau de contrôle logiciel

1. Appuyez sur le bouton STING dans la section de contrôle des transitions.
2. Dans le menu source, sélectionnez le lecteur multimédia pour la transition. Vérifiez que la source Lecteur multimédia a le clip que vous allez utiliser.
3. Réglez les paramètres Durée du clip, Instant de déclenchement, Durée du mix, et Pre roll si nécessaire.
4. Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section de contrôle des transitions.

   Vous ne pouvez pas effectuer de transition Stinger manuellement au moyen du levier de transition.

Paramètres de la transition Stinger

Source	Lecteur multimédia utilisé pour la lecture du clip lors d'une transition animée.
Durée du clip	Cette fonction fait référence à la longueur de l'animation et devrait normalement être égale à cette dernière. Elle peut également être utilisée pour rogner la fin d'un clip.
Instant de déclenchement	Fait référence au moment où le mélangeur va commencer la transition d'arrière-plan Mix qui aura lieu au-dessous de l'animation. En général, c'est le moment où l'animation est en mode plein écran.
Durée de Mix	Cette fonction précise la durée de la transition Mix qui aura lieu au-dessous de l'animation, entre la prévisualisation et le programme. Pour effectuer une transition Cut au lieu d'une transition Mix réglez simplement la durée à 1 image (frame).
Pre Roll	Valeur qui permet la réduction du début d'un clip. La valeur maximale de cette fonction est de 3:00 secondes.
Incrustation prémultipliée	Identifie le signal key du clip du lecteur multimédia en tant qu'incrustation prémultipliée.
Clip	Le niveau Clip permet d'ajuster la valeur à laquelle l'incrustation découpe son trou dans le clip lu par le lecteur multimédia. Le fait de réduire le niveau Clip expose une plus grande partie de l'arrière-plan. Si la vidéo en arrière-plan est complètement noire, cela signifie que la valeur Clip est trop basse.
Gain	Le paramètre gain modifie électroniquement la valeur qui permet d'adoucir les contours de l'incrustation dans le clip lu par le lecteur multimédia. Ajustez la valeur gain jusqu'à l'obtention de l'adoucissement de contour désiré sans affecter la luminance (luminosité) de la vidéo en arrière-plan.
Inverser l'incrustation	Inverse l'incrustation.

Il est important de garder à l'esprit que les paramètres déclenchement, mix et durée dépendent les uns des autres. Par exemple, la durée du Déclenchement + Mix ne peut pas excéder la durée totale. Notez également que le temps affiché dans la zone d'affichage Durée correspond aux nombres saisis dans les fonctions Durée + Preroll.

Transitions DVE

Votre mélangeur comprend un processeur d'effets vidéo numériques très puissant pour les transitions DVE. Une transition DVE déplace l'image de diverses façons pour effectuer une transition d'une image à une autre. Par exemple, on peut utiliser cette transition pour écraser l'image actuelle hors de l'écran et en révéler une autre dissimulée au-dessous.

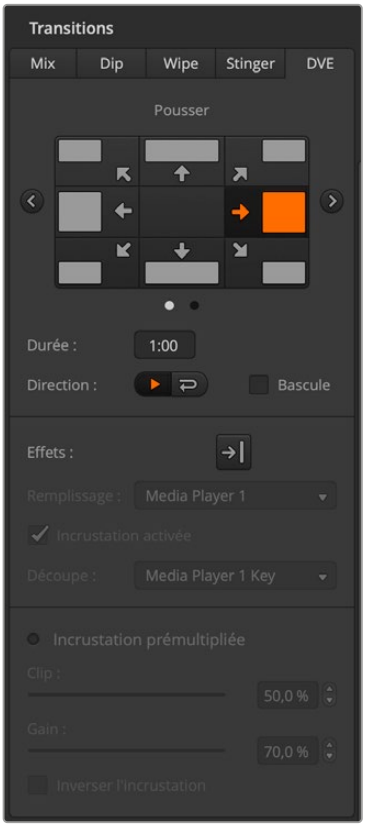
Effectuer une transition DVE sur l'ATEM Television Studio :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Appuyez sur le bouton DVE pour sélectionner le type de transition DVE. Les paramètres de la transition DVE s'affichent sur l'écran LCD.

REMARQUE Si le DVE est utilisé dans une incrustation en amont, le style de transition DVE ne sera pas sélectionnable jusqu'à ce que l'incrustation soit mise hors antenne et ne soit plus présente sur la transition suivante. Consultez la section « Partage des ressources DVE » pour en savoir plus.

3 Utilisez les molettes et les boutons multifonctions pour configurer les paramètres du DVE. Par exemple, vous pouvez choisir le motif, le mouvement et la direction du DVE, et régler la durée de la transition. Utilisez les boutons flèche droite et gauche sur le côté de l'écran LCD pour accéder à des paramètres supplémentaires.

4 Effectuez la transition en tant que transition automatique en appuyant sur le bouton AUTO, ou en tant que transition manuelle à l'aide du levier de transition.



Paramètres de la transition DVE

Effectuer une transition DVE sur le panneau de contrôle logiciel :

1 Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.

2 Appuyez sur le bouton DVE dans la section du contrôle des transitions.

3 Agrandissez la palette Transition et sélectionnez DVE sur la barre représentant les différents types de transition.

Si le DVE est utilisé dans une incrustation en amont, le bouton du DVE ne sera pas disponible jusqu'à ce que l'incrustation soit mise hors antenne et ne soit plus présente sur la transition suivante. Consultez la section « Partage des ressources DVE » ci-après pour en savoir plus.

Utilisez les paramètres de la palette DVE pour configurer la transition.

4 Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.

Paramètres de la transition DVE

Motif	Permet de sélectionner Push ou Squeeze pour le motif du DVE.
Mouvement	Permet de définir la direction de la transition du motif.
Durée du DVE	La durée de la transition DVE en secondes et en images. Tournez la molette située sous l'intitulé Durée du menu DVE pour ajuster la durée de la transition DVE. La nouvelle durée de transition est directement affichée sur la zone d'affichage Transition Rate/Durée de la section de contrôle des transitions.
Direction	L'effet DVE est appliqué dans la direction normale ce qui signifie que le canal prévisualisation est révélé.
Inverser la direction	Ce paramètre change la direction de l'effet DVE afin qu'il soit appliqué au canal prévisualisation. Dans ce cas-là, le programme sera recouvert par la vidéo en prévisualisation à l'aide d'un effet DVE.
Bascule	Lorsque ce mode est activé, la transition passe du paramètre Normal au paramètre Reverse/Inversé chaque fois que la transition est effectuée.

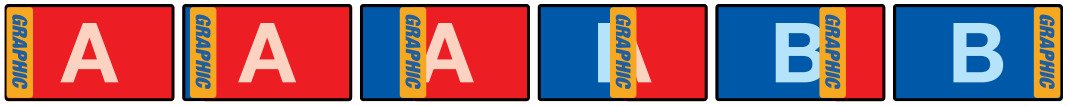
Paramètres de l’incrustation DVE

Activer l’incrustation	Active ou désactive l'incrustation DVE. L'incrustation DVE est activée lorsque le bouton est allumé.
Incrustation prémultipliée	Sélectionne l'incrustation DVE en tant qu'incrustation prémultipliée.
Clip	Le niveau Clip ajuste la valeur à laquelle l'incrustation découpe son trou. Le fait de réduire le niveau Clip expose une plus grande partie de l'arrière-plan. Si la vidéo en arrière-plan est complètement noire, cela signifie que la valeur Clip est trop basse.
Gain	Le paramètre Gain modifie électroniquement la valeur qui permet d'adoucir les contours de l'incrustation. Ajustez la valeur gain jusqu'à l'obtention de l'adoucissement de contour désiré sans affecter la luminance (luminosité) de la vidéo en arrière-plan.
Inverser l’incrustation	Inverse le signal Key (découpe) lorsqu'une incrustation n'est pas prémultipliée.

Partage des ressources DVE

L’ATEM comprend des canaux DVE qui peuvent être utilisés dans une incrustation en amont ou pour effectuer des transitions DVE. Lorsque vous sélectionnez une transition DVE, si le DVE est utilisé autre part dans le système, la transition de type DVE ne sera pas disponible et le bouton du DVE sera désactivé sur le mélangeur. Pour pouvoir effectuer une transition DVE vous devez désactiver le DVE de son emplacement actuel. Vérifiez que les incrustations en amont actuellement sur le programme ou la prévisualisation ne sont pas des incrustations DVE et que la fonction Flying key/Incrustation volante est désactivée. Pour désactiver le DVE de l’incrustateur en amont, changez le type d’incrustation ou désactivez la fonction Flying key/Incrustation volante. Le DVE sera alors à nouveau disponible pour une transition DVE.

La transition Graphic est une transition populaire qui utilise le DVE et qui fait glisser un graphique à travers l’écran sur une transition en arrière-plan. Par exemple, la transition Graphic Wipe fait glisser un graphique sur un volet horizontal. Lors de cette transition, le graphique remplace la bordure du volet. La transition Graphic Mix fait tourner le graphique sur lui-même à travers l’écran avec une transition Mix en arrière-plan. Les transitions Graphic sont idéales pour créer des volets avec le logo de la chaîne ou pour faire tournoyer un ballon de foot à travers l’écran et révéler un nouvel arrière-plan. Les transitions Graphic utilisent un incrustateur spécial qui est intégré à la section Transition, ce qui laisse tous les incrustateurs en amont et en aval disponibles pour le compositing du signal de sortie. La section suivante explique comment créer et effectuer des transitions Graphic.



La séquence d’images ci-dessus fournit un exemple du signal de sortie programme lors d’une transition Graphic Wipe.

Création d’une transition Graphic

Effectuer une transition Graphic sur l’ATEM Television Studio :

1 Appuyez sur le bouton DVE dans la section de contrôle des transitions. Le menu de la transition DVE s’affiche alors sur l’écran LCD.

Si le DVE est utilisé dans une incrustation en amont, le style de transition DVE ne sera pas sélectionnable jusqu’à ce que l’incrustation soit mise hors antenne et ne soit plus présente sur la transition suivante. Consultez la section « Partage des ressources DVE » pour en savoir plus.

2 Appuyez sur le bouton multifonction **Effet** pour ouvrir les paramètres des effets.

La direction de cet effet est réglé par défaut de gauche à droite, mais vous pouvez l’inverser en appuyant sur le bouton multifonction **Inverser Direction/Reverse direction**. Vous pouvez

également activer le paramètre **Bascule/Flip flop**, qui permet à la transition de passer du mode Normal au mode Inversé chaque fois que la transition est effectuée, au lieu de répéter à chaque fois la même direction.

3 Appuyez sur la flèche de droite du Contrôle système pour ajuster les paramètres de l'incrustation. Activez l'incrustation, puis sélectionnez les sources de remplissage et de découpe. Si vous souhaitez modifier des paramètres, comme le clip ou le gain, appuyez sur la flèche de droite du Contrôle système pour accéder aux paramètres de l'incrustation.

CONSEIL Pour une transition Graphic, la source est en général un graphique chargé dans un lecteur multimédia. Par défaut, lorsque vous sélectionnez un lecteur multimédia en tant que source de remplissage, la source de découpe sélectionnera automatiquement le canal de découpe du lecteur multimédia et activera l'incrustation prémultipliée. Cela signifie qu'un graphique comportant un cache de découpe au sein du canal alpha sera automatiquement sélectionné par le mélangeur. Vous pouvez désactiver l'incrustation prémultipliée et changer la source si vous souhaitez utiliser un fichier sur un lecteur multimédia différent, ou une source différente.

4 Appuyez sur le bouton Auto pour effectuer une transition automatique, ou utilisez le levier de transition pour effectuer une transition manuelle.

Effectuer une transition Graphic sur le panneau de contrôle logiciel

1 Appuyez sur le bouton DVE dans la section du contrôle des transitions.

Si le DVE est utilisé dans une incrustation en amont, le bouton du DVE ne sera pas disponible jusqu'à ce que l'incrustation soit mise hors antenne et ne soit plus présente sur la transition suivante. Consultez la section « Partage des ressources DVE » ci-après pour en savoir plus.

2 Agrandissez la palette Transition et sélectionnez le type de transition DVE. Utilisez les flèches pour sélectionner la transition DVE de votre choix.

3 Parmi les options des effets, sélectionnez la transition Graphic Wipe.

4 Sélectionnez les sources Remplissage et Découpe du graphique à partir du menu déroulant.

5 Ajustez les paramètres de l'incrustation si nécessaire.

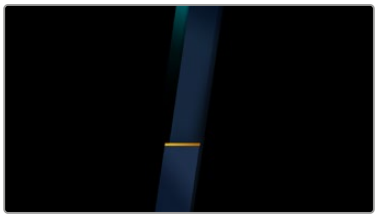
6 Effectuez la transition en tant que transition automatique ou en tant que transition manuelle à partir de la section Style de transition.

Description des paramètres du Graphic Wipe

Durée	Spécifie la durée de la transition en secondes et en images. Cette durée peut être ajustée à l'aide de la molette ou en saisissant un nombre au moyen du pavé numérique puis en appuyant sur la touche Entrée.
Normale	La direction normale de la transition fait passer l'élément graphique de gauche à droite. Dans le Contrôle système du mélangeur, la direction normale est indiquée par un paramètre Inverser Direction blanc.
Inverser la direction	Cette fonction inverse la direction du déplacement du graphique de droite à gauche. Sur le mélangeur ATEM, la direction inverse est orange pour indiquer qu'elle est activée.
Bascule	Lorsque ce mode est activé, la transition passe du paramètre Normal au paramètre Reverse/Inversé chaque fois que la transition est effectuée. Le voyant lumineux du bouton Normal ou du bouton Reverse indique la direction de la transition suivante.
Remplissage	Ce signal est le graphique que vous ferez passer sur la transition.
Découpe	Ce signal est une image en niveaux de gris qui définit la zone du graphique qui sera supprimée pour que le signal de remplissage puisse être correctement superposé sur la transition Wipe.

Images pour la transition Graphic Wipe

La fonction Graphic Wipe comprend un graphique statique qui est utilisé en tant que bordure mobile lors d'une transition volet horizontal. Cet élément graphique devrait ressembler à une sorte de bandeau vertical qui ne représente pas plus de 16% de la largeur totale de l'écran.



Largeur d'écran requise pour une transition Graphic Wipe

2160p	Si les modèles ATEM Television Studio 4K8 ont été configurés sur 2160p, la largeur du graphique ne devrait pas excéder 230 pixels.
1080i	Si le mélangeur a été configuré sur 1080i, la largeur du graphique ne devrait pas excéder 116 pixels.
720p	Si le mélangeur a été configuré sur 720p, la largeur du graphique ne devrait pas excéder 77 pixels.

Transitions manuelles

Effectuez des transitions manuelles entre les sources Programme et Prévisualisation à l'aide du levier de transition situé dans la section Transition control/Style de transition. Les transitions Mix, Dip, Wipe et DVE peuvent toutes être effectuées en tant que transitions manuelles.

Effectuer une transition manuelle sur le panneau de contrôle logiciel ou sur un ATEM Television Studio :

1. Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.
2. Sélectionnez le type de transition à l'aide des boutons de la section de contrôle des transitions.
3. Actionnez manuellement le levier de transition pour exécuter la transition.La prochaine fois que vous déplacerez le levier de transition vous créerez une nouvelle transition.

4 Durant la transition, les boutons rouge et vert des bus Program et Preview s'allument en rouge pour indiquer que vous êtes au milieu d'une transition. Sur le mélangeur, les voyants du levier de transition affichent également la position et la progression de la transition. Sur le panneau de contrôle logiciel, le levier de transition virtuel affiche la position et la progression de la transition.

5 À la fin de la transition, les sources sélectionnées sur les bus Program/Programme et Preview/Prévisualisation sont inversées pour indiquer que la source vidéo qui se trouvait préalablement sur le bus de prévisualisation se trouve à présent sur le bus du programme et vice versa.

Prévisualisation des transitions

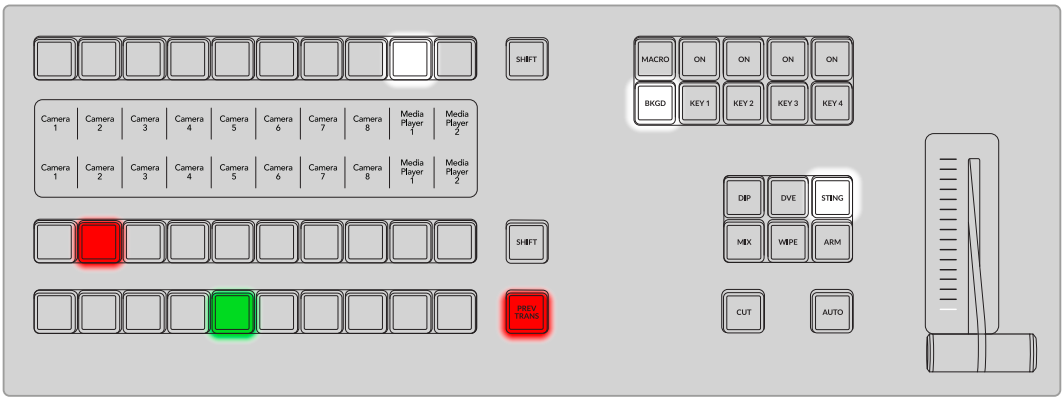
Les mélangeurs ATEM possèdent une fonction très efficace qui vous permet d'examiner et de modifier une transition sur le signal de sortie prévisualisation. Le mode prévisualisation de transition vous permet de vérifier une transition avant son passage à l'antenne.

Prévisualiser une transition sur le panneau de contrôle logiciel ou sur un ATEM Television Studio :

1 Sur le bus Preview/Prévisualisation, sélectionnez la source vidéo que vous désirez voir figurer sur le signal de sortie programme.

2 Sélectionnez le type de transition à l'aide des boutons de la section de contrôle des transitions.

3 Appuyez sur le bouton PREV TRANS pour mettre le mélangeur en mode prévisualisation de transition. Le voyant rouge du bouton PREV TRANS s'allume et le signal de sortie prévisualisation est modifié pour devenir une copie conforme du signal de sortie programme.



4 Déplacez le levier de transition manuellement afin de prévisualiser la transition sur le signal de sortie prévisualisation. Le signal de sortie programme ne sera pas affecté.

5 Appuyez sur le bouton PREV TRANS pour éteindre le mode prévisualisation de transition.

Incrustations avec les mélangeurs ATEM

Les incrustateurs sont des outils de production très puissants qui permettent d'arranger des éléments visuels provenant de sources différentes sur la même image vidéo.

Pour ce faire, de multiples couches de vidéo ou de graphiques sont superposées sur la vidéo en arrière-plan. Le fait de modifier la transparence de diverses parties appartenant à ces couches permet de révéler la couche en arrière-plan. Ce procédé est appelé incrustation. Diverses techniques sont utilisées pour créer cette transparence sélective et ces dernières correspondent aux différents types d'incrustateurs disponibles sur votre mélangeur.

La section suivante parle des incrustateurs en luminance et linéaires, qui sont disponibles en amont ou en aval. Elle aborde également les incrustations chromatiques, de motifs et DVE, qui font partie des incrustateurs en amont.

Comprendre les incrustations

Une incrustation nécessite deux sources vidéo : le signal Fill/Remplissage et le signal Key/Découpe. Le signal de remplissage contient une image vidéo qui va être superposée à l'arrière-plan, alors que le signal de découpe permet de sélectionner les zones du signal de remplissage qui seront transparentes. Ces deux signaux peuvent être sélectionnés à partir de n'importe quelle entrée externe ou source interne du mélangeur, ce qui permet à des images fixes ou à des clips d'être utilisés en tant que sources de remplissage ou de découpe.

Les signaux fill et key peuvent être sélectionnés à partir des menus déroulants des palettes Upstream Key (incrustations en amont) et Downstream Key (incrustations en aval) du panneau de contrôle logiciel. Sur le mélangeur ATEM, les signaux fill et key sont sélectionnables à partir du bus de sélection.

Le mélangeur comporte deux types d'incrustateurs : les incrustateurs en amont et les incrustateurs en aval. Il y a quatre incrustateurs en amont, appelés également incrustateurs d'effets, disponibles dans la section M/E du mélangeur. Chaque incrustateur en amont peut être configuré en tant qu'incrustation luma (en luminance), linear (linéaire), pre-multiplied (prémultipliée), chroma (chromatique), pattern (de motif) ou DVE (effets vidéo numériques). Deux incrustateurs en aval sont disponibles dans la section DSK. Chaque incrustateur en aval peut être configuré en tant qu'incrustation en luminance ou linéaire.

Incrustation en luminance

Une incrustation en luminance (luma key ou self key) se compose d'une source vidéo contenant l'image vidéo qui viendra se superposer à l'arrière-plan. Toutes les zones noires définies par la luminance dans le signal vidéo seront supprimées ou découpées afin de révéler l'arrière-plan se trouvant au-dessous. Comme les zones à découper ne sont définies que sur une seule image, l'incrustation en luminance utilise le même signal pour le remplissage (fill) et pour la découpe (key). Les images suivantes vous donnent une représentation des signaux d'arrière-plan et d'incrustation en luminance ainsi que de l'image combinée qui en résulte.

Combiner un arrière-plan aux signaux de remplissage et de découpe dans une incrustation en luminance.

Arrière-plan

Image plein écran, provenant souvent de la caméra.

Remplissage

Graphique que vous désirez superposer à votre vidéo d'arrière-plan. Notez que la composition finale ne contient pas de couleur noire appartenant aux graphiques, car toutes les zones noires ont été découpées et supprimées de l'image.

Incrustation linéaire

Une incrustation linéaire se compose de deux sources vidéo : le signal fill (remplissage) et le signal key ou cut (découpe). Le signal de remplissage contient une image vidéo qui va être superposée sur l'arrière-plan, alors que le signal de découpe permet de sélectionner les zones du signal de remplissage qui seront transparentes. Comme les signaux de remplissage et de découpe sont tous les deux des signaux d'entrée vidéo, ils peuvent tous deux être en mouvement sur l'écran. Les images suivantes vous donnent une représentation du signal d'arrière-plan, des signaux de remplissage et de découpe ainsi que de l'image combinée qui en résulte.

Combiner un arrière-plan ainsi que des signaux de remplissage et de découpe dans une incrustation linéaire.

Arrière-plan

Image plein écran, provenant souvent de la caméra.

Remplissage

Graphique que vous désirez superposer à votre vidéo d'arrière-plan. Notez que les zones blanches du graphique restent intactes, car le signal de découpe permet de découper un trou pour le signal de remplissage. Le signal de remplissage est souvent fourni par un système graphique.

Découpe

Image en niveaux de gris qui définit la zone de l'image qui sera supprimée pour que le signal de remplissage puisse être correctement superposé à l'arrière-plan. Le signal de découpe est souvent fourni par un système graphique.

Incrustation prémultipliée

Un système graphique ou générateur de caractères moderne qui offre les signaux de sortie fill et key procurera dans la plupart des cas ce que l'on appelle une incrustation prémultipliée. Une incrustation prémultipliée est une combinaison spéciale des signaux fill et key où le signal fill a été prémultiplié avec le signal key sur un arrière-plan noir. Les images générées par Photoshop qui contiennent un canal alpha sont prémultipliées.

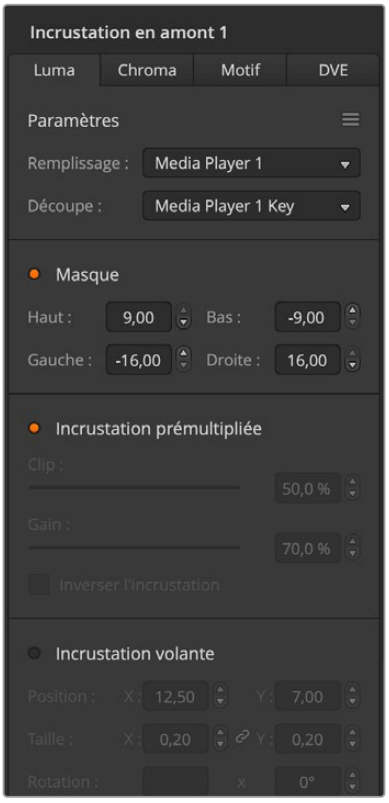
Les mélangeurs ATEM possèdent un réglage automatique pour les incrustations prémultipliées. Il suffit d'activer la fonction incrustation prémultipliée (Pre Multiplied Key) pour que les paramètres clip et gain soient automatiquement réglés par le système.

Lorsque vous utilisez une image générée par Photoshop, il vous faut générer les graphiques sur une couche d'arrière-plan noire et placer tout le contenu sur les couches supérieures. Ajoutez un canal alpha à votre document Photoshop qui puisse être utilisé par l'ATEM pour incruster le graphique à la vidéo en direct. Lorsque vous le sauvegardez en tant que fichier image Targa, ou le téléchargez directement à partir de la bibliothèque de médias, vous pouvez sélectionner l'option Incrustation prémultipliée pour obtenir une incrustation de bonne qualité.

Les documents Photoshop sont prémultipliés de nature, il vous faut donc toujours activer la fonction Incrustation prémultipliée sur votre mélangeur ATEM lorsque vous les incrustez.

Effectuer une incrustation en luminance ou linéaire en amont

Comme les incrustations en luminance et les incrustations linéaires possèdent les mêmes paramètres, elles peuvent être réglées sur le panneau de contrôle logiciel et le mélangeur ATEM à l'aide du même menu. Ce dernier est intitulé Luma. C'est la sélection des sources de remplissage et de découpe qui définit l'incrustation en tant qu'incrustation en luminance ou linéaire. Dans une incrustation en luminance, les sources de remplissage et de découpe sont les mêmes. Dans une incrustation linéaire, les sources de remplissage et de découpe sont différentes.



La palette Incrustation en amont possède un menu permettant de réinitialiser les paramètres situés en haut de chaque onglet. Sélectionnez les sections que vous souhaitez réinitialiser à partir du menu.

Régler une incrustation en luminance/linéaire sur l'incrustateur en amont 1 de l'ATEM Television Studio :

1. Appuyez sur le bouton **Key 1** pour activer l'incrustateur sur le signal de sortie prévisualisation. Cette opération sélectionne automatiquement le menu Incrustateurs sur l'écran du Contrôle système. Vous pouvez également appuyer sur le bouton **Keyers** afin d'accéder directement au menu.
2. Utilisez la molette située sous l'indicateur **Type d'incrustation** afin de sélectionner l'incrustation **Luma**.
3. Utilisez les molettes **Remplissage** et **Découpe** pour sélectionner les sources de remplissage et de découpe.

CONSEIL vous pouvez également appuyer sur les boutons correspondants sur le bus de sélection des sources pour sélectionner les sources de remplissage et de découpe.

4. Une fois que vous avez choisi le type d'incrustation et les sources de découpe et de remplissage, appuyez sur la flèche de droite pour naviguer dans le menu suivant. Utilisez les molettes pour ajuster le masque, le gain, le clip, pour activer ou désactiver l'incrustation prémultipliée, etc.

Régler une incrustation en luminance ou linéaire sur l'incrustateur en amont 1 à l'aide du panneau de contrôle logiciel :

1. Ouvrez la palette incrustation en amont 1 et sélectionnez l'onglet Luma.
2. Sélectionnez la source de remplissage et la source de découpe.

Si vous souhaitez effectuer une incrustation en luminance, sélectionnez la même source pour les sources de remplissage et de découpe.

Ajustez les paramètres de l'incrustation pour l'affiner. Pour une description des paramètres de l'incrustation en luminance, référez-vous au tableau ci-après.

Paramètres de l'incrustation en luminance ou linéaire en amont :

Masque	Permet de créer un masque rectangulaire qui peut être ajusté à l'aide des paramètres Top/Haut, Bottom/Bas, Left/Gauche et Right/Droit.
Incrustation prémultipliée	Identifie le signal de découpe en tant qu'incrustation prémultipliée.
Clip	Le niveau Clip ajuste la valeur à laquelle l'incrustation découpe son trou. Le fait de réduire le niveau Clip expose une plus grande partie de l'arrière-plan. Si la vidéo en arrière-plan est complètement noire, cela signifie que la valeur Clip est trop basse.

Gain	Le paramètre Gain modifie électroniquement la valeur qui permet d'adoucir les contours de l'incrustation. Ajustez la valeur gain jusqu'à l'obtention de l'adoucissement de contour désiré sans affecter la luminance ou la luminosité de la vidéo en arrière-plan.
Inverser l'incrustation	Inverse le signal de l'incrustation.
Incrustation volante	Active/désactive les effets DVE.

Effectuer une incrustation en luminance ou linéaire en aval

Régler une incrustation en luminance/linéaire sur l'incrustateur en aval 1 de l'ATEM Television Studio :

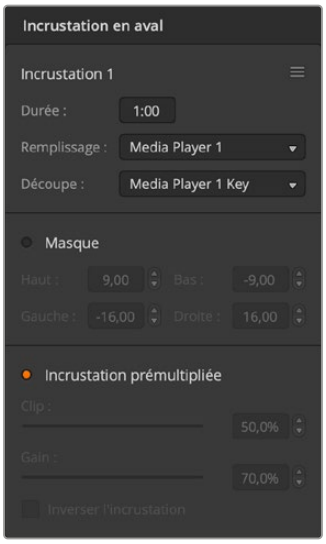
1. Appuyez sur le bouton DSK 1 TIE pour activer l'incrustateur en aval sur le signal de sortie prévisualisation. Cette opération sélectionne automatiquement le menu Incrustation en aval sur l'écran du Contrôle système. Vous pouvez également appuyer sur le bouton Keyers afin d'accéder directement au menu.
2. Appuyez sur le bouton multifonction **DSK 1** ou **DSK 2** pour sélectionner l'incrustateur en aval que vous souhaitez utiliser.

> **CONSEIL** Vous n'avez pas besoin de sélectionner le type d'incrustation car l'incrustation en aval est toujours une incrustation en luminance.

3. Utilisez les molettes sous le menu à l'écran pour sélectionner les sources de découpe et de remplissage. Vous pouvez également appuyer sur les boutons de sélection des sources correspondants afin de sélectionner les sources de remplissage et de découpe.
4. Une fois que vous avez choisi les sources de remplissage et de découpe, appuyez sur les flèches gauche et droite pour naviguer dans les menus contenant les paramètres de l'incrustation tels que le masque, le gain, le clip, l'incrustation prémultipliée etc.

Régler une incrustation en luminance ou linéaire sur l'incrustateur en aval 1 à l'aide du panneau de contrôle logiciel :

1. Sélectionnez la palette Incrustation en aval 1.
2. Utilisez les menus déroulants Remplissage et Découpe pour spécifier les sources de l'incrustation. Si vous souhaitez effectuer une incrustation en luminance, sélectionnez la même source pour les sources de remplissage et de découpe.
3. Ajustez les paramètres de l'incrustation pour l'affiner.

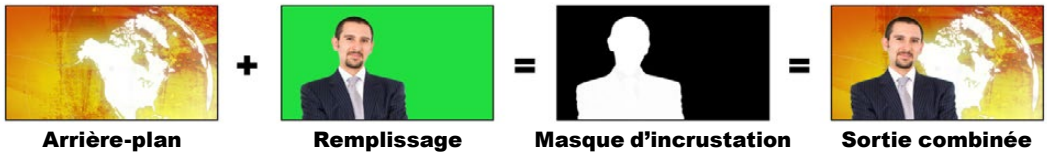


Paramètres Incrustation en aval

Incrustation chroma

Les incrustations chromatiques sont souvent utilisées pour les bulletins météo télévisés, où le présentateur se trouve devant une carte géographique. En réalité, en studio, ce dernier se trouve devant un fond bleu ou vert. Lors d'une incrustation chromatique, deux images sont combinées à l'aide d'une technique spéciale et une couleur de l'image est supprimée afin de révéler une autre image en arrière-plan. Cette technique est également appelée incrustation couleur, ou incrustation sur fond vert/bleu.

Les arrière-plans des incrustations chromatiques sont souvent des images de synthèse. Il est très facile de connecter un ordinateur à votre mélangeur ATEM à l'aide de la sortie HDMI de l'ordinateur en question ou d'une carte d'acquisition et de lecture vidéo telle que DeckLink ou Intensity de Blackmagic Design et de lire les clips vidéo sur votre mélangeur ATEM. Si vous placez un fond vert sous vos animations, vous pouvez ensuite remplacer ce vert pour créer des animations nettes et rapides de n'importe quelle durée. Il est très simple de créer une incrustation sur fond vert lorsque ce dernier est une image de synthèse de couleur unie. Plus la couleur sera uniforme, plus l'incrustation sera facile à effectuer.



Combiner un arrière-plan avec une source de remplissage et une source de découpe chromatique

Arrière-plan

Image plein écran : dans le cas d'une incrustation chromatique, cette image est souvent une carte des prévisions météo.

Remplissage

Image que vous désirez superposer à votre vidéo d'arrière-plan. Dans le cas d'une incrustation chromatique, c'est le signal vidéo de la caméra qui filme le présentateur devant l'écran vert.

Découpe

Dans le cas d'une incrustation chromatique, le signal de découpe (Key/Cut) est généré à partir du signal de remplissage (Fill).

Effectuer une incrustation chromatique avancée

L'ATEM possède un incrustateur chromatique avancé, offrant des échantillons chromatiques précis et des options de réglage. Cet incrustateur améliore l'intégration de l'avant-plan avec l'arrière-plan pour vous permettre de créer des effets visuels de haute qualité.

Régler une incrustation chromatique sur l'incrustateur en amont 1 de l'ATEM Television Studio :

1. Appuyez sur le bouton **Key 1** pour activer l'incrustateur 1 sur le signal de sortie prévisualisation. Le menu des incrustations s'affichera automatiquement sur l'écran LCD. Vous pouvez également appuyer sur le bouton **Keyers** sur Contrôle Système pour afficher ce menu.
2. Sélectionnez l'incrustation **Chroma** à l'aide de la molette correspondante.
3. Sélectionnez la source de remplissage en tournant la molette correspondante. En général, cette source provient d'une caméra filmant un présentateur devant un fond vert, ou un graphique chargé dans le lecteur multimédia. Vous pouvez également sélectionner une source de remplissage en appuyant sur le bouton correspondant dans le bus de sélection des sources.
4. Utilisez les boutons flèche droite pour accéder à l'écran des ajustements chromatiques.
5. Cliquez sur le bouton **Échantillonner Chroma**.

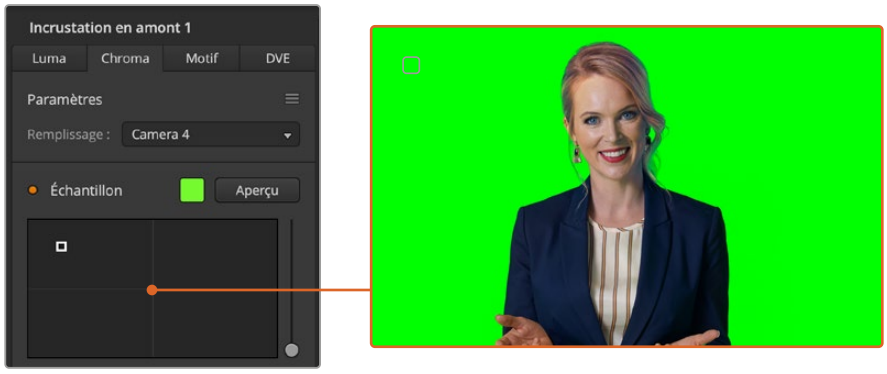
Réglage d'une incrustation chromatique sur l'incrustateur en amont 1 à l'aide du panneau de contrôle logiciel :

1 Agrandissez la palette **Incrustation en amont 1** et sélectionnez l'option **Chroma** depuis la barre des types d'incrustations.

2 Sélectionnez la source de remplissage. En général, cette source provient d'une caméra filmant un présentateur devant un fond vert, ou un graphique chargé dans le lecteur multimédia.

3 Cliquez sur le bouton **Échantillon**.

Une nouvelle fenêtre apparaîtra, affichant un carré de sélection et un curseur. Ce carré est également visible sur la sortie prévisualisation.



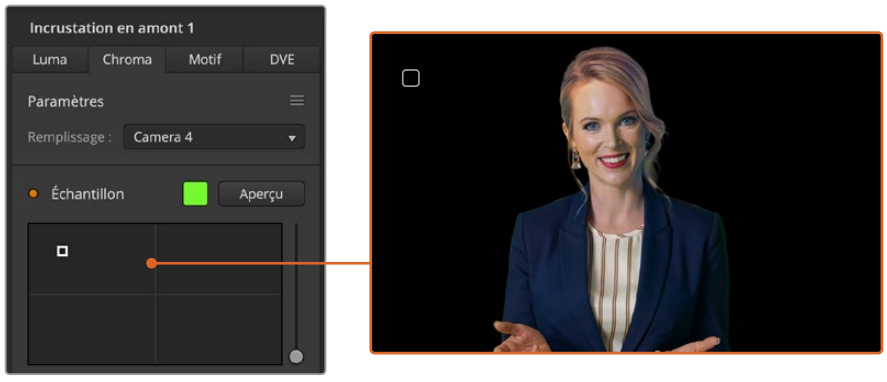
Les réglages des échantillons chromatiques vous permettent de positionner un carré de sélection sur la zone de l'écran à échantillonner

4 Cliquez et déplacez le carré de sélection jusqu'à la zone à échantillonner.

Choisissez une zone représentative du fond vert qui couvre le plus de luminance possible. La taille par défaut du carré de sélection est adapté aux fonds verts relativement homogènes. Cependant, si votre fond vert est inégal, vous pouvez ajuster la taille du carré. Pour cela, cliquez sur le curseur situé sur la droite de la fenêtre d'échantillonnage, et déplacez-le vers le haut pour agrandir le carré, ou vers le bas pour le diminuer. Sur le mélangeur, utilisez les molettes correspondantes pour déplacer la boîte et l'axe Z afin d'augmenter ou de diminuer la taille.

CONSEIL Lorsque vous échantillonnez des fonds verts irréguliers, nous vous recommandons de commencer par la zone la plus sombre avant d'agrandir la fenêtre d'échantillonnage. Cela vous permettra d'effectuer des incrustations plus précises.

Vous pouvez prévisualiser votre incrustation à tout moment en cliquant sur le bouton **Aperçu/Preview** au-dessus de la fenêtre d'échantillonnage ou en appuyant sur le bouton **Preview Chroma** au-dessus de l'écran LCD du Contrôle système.



Appuyez sur **Aperçu** pour voir comment votre incrustation apparaîtra sur la sortie.

Peaufiner les incrustations grâce aux paramètres d'incrustation

Une fois que vous avez effectué un échantillon chromatique satisfaisant, qui aura supprimé la plupart du fond vert tout en conservant les éléments principaux du premier plan, il est temps de peaufiner votre incrustation en utilisant les outils **Réglage de l'incrustation**. Sur l'ATEM Television Studio, appuyez sur la flèche droite pour naviguer vers le menu **Réglages Chroma**.

Avant-plan

Utilisez le curseur de l'Avant-plan ou la molette pour régler l'opacité du masque de l'avant-plan. Cela détermine l'intensité de l'avant-plan par rapport à l'arrière-plan. Plus vous augmentez la valeur de l'avant-plan en déplaçant le curseur, plus les petites zones de transparence à l'intérieur de l'image en avant-plan seront remplies. Nous vous recommandons de déplacer le curseur, et de vous arrêter dès que l'avant-plan devient solide.

Arrière-plan

Le curseur de l'arrière-plan et la molette règlent l'opacité de la zone incrustée. Utilisez ce curseur pour remplir les artéfacts de l'arrière-plan laissés dans la zone de l'image que vous souhaitez supprimer. Nous vous recommandons de déplacer le curseur jusqu'à ce que la zone incrustée devienne uniformément opaque.

Contour

Le curseur du Contour et la molette permettent de déplacer le contour de votre zone incrustée, pour vous aider à supprimer des éléments de l'arrière-plan dans les bords de l'image d'avant-plan ou d'étendre un peu l'avant-plan si l'incrustation est trop agressive. C'est très pratique pour traiter des petits détails, comme les cheveux. Nous vous recommandons de déplacer le curseur jusqu'à ce que le bord de votre incrustation soit propre, sans qu'aucun artéfact de l'arrière-plan ne soit visible.

En utilisant les commandes de réglage de l'incrustation ou chromatiques, il devrait y avoir une nette séparation entre vos éléments d'avant-plan et d'arrière-plan.

Correction chromatique avec les outils de débordement et de suppression des reflets

Lorsque que la lumière rebondit sur un fond vert, cela peut créer un contour vert sur les éléments d'avant-plan et une teinte générale sur l'avant-plan, ou l'image de remplissage. On appelle cela le débordement de couleurs et les reflets. Les réglages de **Correction chromatique** vous permettent d'améliorer les zones de l'avant-plan qui sont affectés par les effets de débordement et de reflet. Vous pouvez traiter ces zones dans l'incrustation en utilisant les réglages de **Correction chromatique**.

Débordement

Ajustez le curseur du débordement pour supprimer les teintes indésirables qui apparaissent sur les bords des éléments de l'avant-plan. Par exemple, les reflets verts sur les bords.

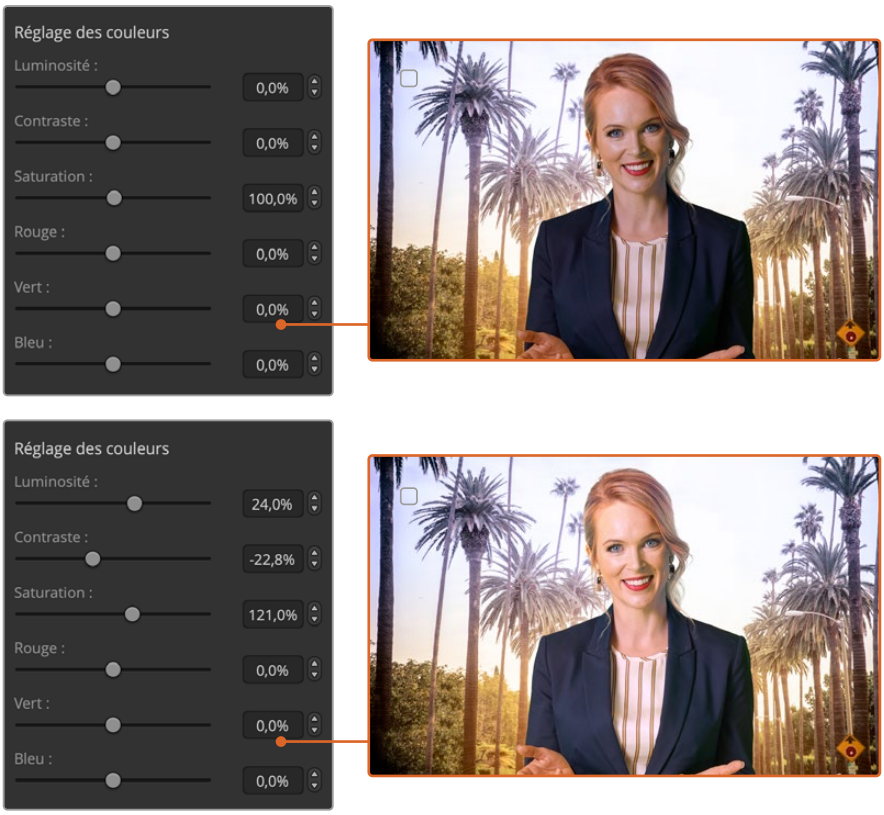
Suppression des reflets

L'outil de suppression des reflets permet de supprimer les teintes vertes de manière uniforme sur tous les éléments de l'avant-plan.

Harmoniser l'avant-plan et l'arrière-plan

Une fois que votre avant-plan est correctement séparé de votre fond vert, et que vous avez supprimé les débordements et les reflets, utilisez les outils **Réglage des couleurs** pour harmoniser l'avant-plan et l'arrière-plan.

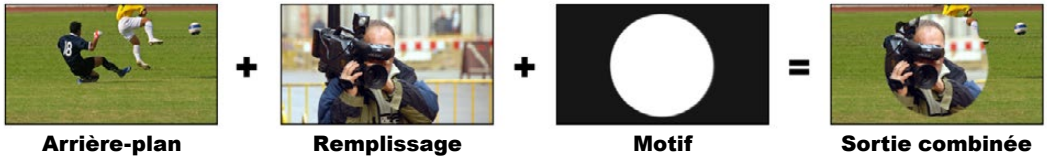
Régler la luminosité, le contraste, la saturation et la balance des couleurs vous aidera à intégrer l'image d'avant-plan à l'arrière-plan de manière harmonieuse, pour un résultat convaincant.



Utilisez les outils de réglage des couleurs pour harmoniser l'avant-plan avec l'arrière-plan

Incrustation de motif

Les incrustations de motif permettent de superposer la découpe géométrique d'une image sur une autre image. Lors d'une incrustation de motif, le signal de découpe (Key ou Cut) est généré à l'aide du générateur de motif intégré au mélangeur. Le générateur de motif intégré peut créer jusqu'à 18 formes qui peuvent être redimensionnées et positionnées afin de produire le signal de découpe désiré.



Combiner un arrière-plan avec un signal de remplissage et un motif.

Arrière-plan

Une image plein écran.

Remplissage

Une autre image plein écran que vous désirez superposer à l'arrière-plan.

Découpe

Dans le cas d'une incrustation de motif, le signal Key ou Cut/Découpe est généré à l'aide du générateur de motif intégré au mélangeur.

Effectuer une incrustation de motif en amont

Régler une incrustation de motif sur l'incrustateur en amont 1 de l'ATEM Television Studio :

1. Appuyez sur le bouton KEY 1 pour activer l'incrustation sur le signal de sortie prévisualisation. Cette opération sélectionne automatiquement le menu Incrustateurs sur l'écran du Contrôle système. Appuyer sur le bouton KEY 1 lie l'incrustation à la transition suivante. Elle passera ainsi à l'antenne avec la transition suivante.
2. Dans le menu à l'écran Incrustateurs, sélectionnez **Motif** à l'aide de la molette multifonction correspondante.
3. Choisissez la source de remplissage à l'aide de la molette correspondante ou via un bouton source dans le bus de sélection des sources.
4. Tournez les molettes correspondantes pour sélectionner le motif souhaité pour l'incrustation et réglez sa taille.
5. Appuyez sur les flèches gauche et droite du Contrôle système afin de naviguer dans les paramètres de l'incrustation de motif et ajustez-les à l'aide des molettes multifonctions. Regardez le signal de sortie prévisualisation lorsque vous affinez l'incrustation.

CONSEIL Vous pouvez repositionner le point central de certains motifs. Utilisez les molettes correspondantes pour déplacer le motif. Si vous souhaitez réinitialiser sa position, allez sur le type de motif, choisissez un autre motif, puis revenez sur le motif choisi pour réinitialiser sa position par défaut.

Paramètres de l'incrustation de motif

Régler une incrustation de motif sur l'incrustateur en amont 1 à l'aide du panneau de contrôle logiciel :

1. Agrandissez la palette Incrustation en amont 1 et sélectionnez l'option Motif.
2. Sélectionnez la source de remplissage.
3. Sélectionnez le motif de l'incrustation.
4. Ajustez les paramètres de l'incrustation pour l'affiner. Pour une description des paramètres de l'incrustation de motif, consultez le tableau ci-après.

Taille	Augmente et diminue la taille du motif sélectionné.
Symétrie	Il est possible d'ajuster la symétrie ou les proportions de certains motifs. Les motifs en forme de cercle peuvent être ajustés pour devenir des ellipses horizontales ou verticales.
Adoucissement	Modifie l'adoucissement de contour du motif.
Inverser le motif	Ce paramètre inverse la zone remplie avec la source de remplissage. Par exemple, remplissez une zone située à l'extérieur d'un cercle en positionnant le cercle de votre transition Wipe comme vous le désirez et sélectionnez ensuite l'option inverse.
Incrustation volante	Active ou désactive les effets DVE.

Ajuster la position X/Y d'un motif

Vous pouvez repositionner le point central de certains motifs. Pour positionner un motif, naviguez jusqu'à la page de sélection des motifs de l'incrustateur que vous êtes en train de configurer. Déplacez ensuite le motif horizontalement ou verticalement à l'aide des molettes. Pour recentrer le motif, appuyez sur le bouton de sélection du motif actuel dans le menu. Cette action va réinitialiser la position et la symétrie du motif.

Incrustation DVE

Les DVE (effets vidéo numériques) permettent de créer des rectangles munis de bordures pour les incrustations d'image dans l'image. La plupart des modèles possèdent un canal DVE 2D qui offre le redimensionnement d'image, les bordures et les ombres portées.

Combiner un arrière-plan avec une source de remplissage DVE et une source de découpe DVE.

Arrière-plan

Une image plein écran.

Remplissage

Autre image plein écran qui a été redimensionnée ou à laquelle on a ajouté des bordures et qui va être superposée à l'arrière-plan.

Découpe

Dans le cas d'une incrustation DVE, le signal de découpe est généré par le processeur DVE intégré au mélangeur.

Effectuer une incrustation DVE en amont

Régler une incrustation DVE sur l'incrustateur en amont 1 de l'ATEM Television Studio :

1. Appuyez sur le bouton KEY 1 dans la section des transitions suivantes pour activer l'incrustateur sur le signal de sortie prévisualisation.
2. Dans les paramètres d'incrustation, sélectionnez DVE à l'aide de la molette multifonction correspondante.
3. Choisissez la source de remplissage à l'aide de la molette correspondante ou via un bouton source dans le bus de sélection des sources.
4. Appuyez sur les flèches gauche et droite du Contrôle système afin de naviguer dans les paramètres du DVE, et utilisez les molettes multifonctions pour ajuster les paramètres, tels que la position, la taille, le masque, la source de lumière, la bordure et les images clés pour le mouvement.

CONSEIL Lorsque vous utilisez le pavé numérique pour saisir les valeurs numériques des paramètres, appuyez quelques secondes sur le bouton **Réinitialiser/Reset** afin d'activer les valeurs négatives. Appuyez une nouvelle fois pour revenir aux valeurs standard.

Régler une incrustation DVE sur l'incrustateur en amont 1 à l'aide du panneau de contrôle logiciel :

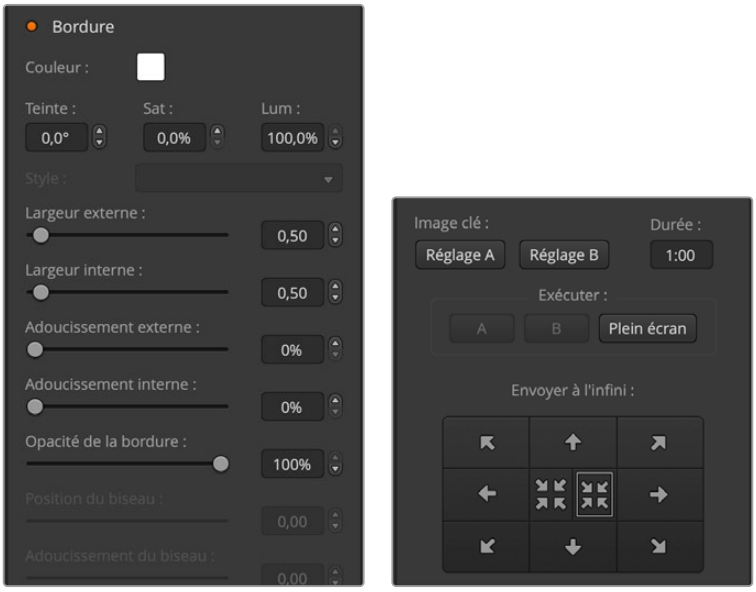
1. Agrandissez la palette Incrustation en amont 1 et sélectionnez l'option DVE sur la barre représentant les types d'incrustation.
2. Sélectionnez la source de remplissage.
3. Ajustez les paramètres de l'incrustation pour l'affiner. Pour une description des paramètres de l'incrustation DVE, consultez le tableau ci-après.

Paramètres de l'incrustation DVE

Paramètres du DVE

Remplissage	La source pour le DVE doit être ajustée.
Taille	Les valeurs X et Y ajustent la taille horizontale et verticale du DVE.
Masque	Permet de créer un masque rectangulaire qui peut être ajusté à l'aide des paramètres Top/Haut, Bottom/Bas, Left/Gauche et Right/Droit.
Basses Lum	Ajuste la direction de la source de lumière sur le DVE ou sur l'image dans l'image. La bordure et l'ombre portée seront toutes deux affectées par la modification de ce paramètre.

Ajouter une bordure DVE



Paramètres de la bordure DVE

Les molettes et les boutons multifonctions de la section Contrôle système permettent d'ajuster les paramètres de la bordure. Comme vous avez la possibilité de régler de nombreux paramètres, les boutons Soft/Color et SHIFT vous permettent de basculer entre les différentes commandes des molettes.

Bordure	Active ou désactive la bordure.
Couleur	Ajuste la couleur de la bordure.
Teinte	Change la couleur de la bordure. La valeur Teinte fait référence à un emplacement sur la roue chromatique.
Sat	Change l'intensité de la couleur de la bordure.
Lum	Change la luminosité de la couleur de la bordure.
Largeur externe	Ajuste la largeur extérieure de la bordure.
Largeur interne	Ajuste la largeur intérieure de la bordure.
Adoucissement externe	Ce paramètre ajuste l'adoucissement du bord extérieur de la bordure, celui qui touche la vidéo d'arrière-plan.
Adoucissement interne	Ajuste l'adoucissement intérieur. Ce paramètre ajuste l'adoucissement du bord intérieur de la bordure, celui qui touche la vidéo.
Opacité de la bordure	Ce paramètre ajuste la transparence de la bordure. Utilisez-le pour créer des bordures intéressantes par exemple des bordures transparentes colorées.

Masque d’incrustation

Les incrustateurs en amont et en aval possèdent tous deux un masque rectangulaire ajustable qui permet de rogner les éléments indésirables et tout autre artefact du signal vidéo. Le masque possède des commandes qui permettent de rogner les côtés gauches, droits, hauts et bas. Le masque peut également s’avérer être un outil créatif pour effectuer des découpes rectangulaires à l’écran.

Sur le panneau matériel, le masque pour chaque incrustation en amont et en aval est configurable à partir du menu Masque dans la section Contrôle système. Ce dernier est disponible à partir des menus EFFECTS KEYS ou DSK KEYS.

Sur le panneau de contrôle du logiciel, le masque pour chaque incrustation en amont et en aval est configurable à partir des palettes de l’onglet Réglages.

Incrustation volante

Les incrustations en amont en luminance, chromatiques et de motif comprennent le paramètre Incrustation volante. Si un canal DVE est disponible, le paramètre Incrustation volante permet d’appliquer les effets DVE à l’incrustation.

Effectuer des transitions d’incrustations en amont

Les incrustateurs en amont sont accessibles à partir de la section de contrôle des transitions. Ils sont ajoutés ou retirés du signal de sortie programme à l’aide des boutons Next Transition/Transition suivante ou des boutons ON/On Air.

Boutons ON

Procédure pour ajouter ou retirer les incrustateurs en amont du signal de sortie du programme à l’aide des boutons ON (on air) :

1. Appuyez sur le bouton ON qui correspond au bouton KEY de la section Transition suivante pour activer ou désactiver immédiatement l’incrustation en amont sur le signal de sortie programme.
2. Le bouton ON indique également si l’incrustateur en amont est actuellement sur le signal de sortie programme.

Boutons Transition suivante

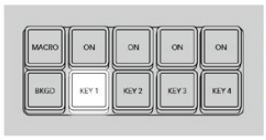
Procédure pour ajouter ou retirer les incrustateurs en amont du signal de sortie programme à l’aide des boutons Transition suivante :

1. Sélectionnez les éléments que vous désirez faire transiter à l’aide des boutons BKGD, KEY 1, KEY 2, KEY 3 et KEY 4 de la section Transition suivante.
2. Vérifiez le signal de sortie prévisualisation, qui vous indiquera à quoi ressemblera votre signal de sortie programme après avoir effectué la transition.
3. Appuyez sur CUT, AUTO ou utilisez le levier de transition pour effectuer la transition.

Voici quelques exemples pour vous aider à comprendre comment vous pouvez ajouter et retirer plusieurs incrustations du signal de sortie programme. Dans les exemples ci-dessous l’incrustation KEY 1 contient un graphique intitulé live en haut à gauche de l’écran tandis que KEY 2 contient un graphique au bas à droite de l’écran.

Exemple 1 :

Dans cet exemple aucune incrustation en amont n'est actuellement à l'antenne. La touche KEY 1 est sélectionnée dans la section Transition suivante, ce qui veut dire que l'état de l'incrustation KEY 1 va être modifié lors de transition suivante et que l'incrustation va passer sur le signal de sortie programme et donc à l'antenne.



La section Transition suivante du panneau de contrôle avant la transition.

Signal de sortie programme avant la transition.

Signal de sortie programme après la transition.

Exemple 2 :

Dans cet exemple, l'incrustation KEY 1 est actuellement à l'antenne, comme l'indique le bouton ON lumineux. La touche KEY 1 est sélectionnée dans la section Transition suivante, ce qui veut dire que l'état de l'incrustation KEY 1 va être modifié lors de la transition suivante et que l'incrustation va être retirée du signal de sortie du programme et donc de l'antenne.

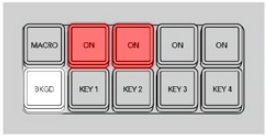
La section Transition suivante du panneau de contrôle avant la transition.

Signal de sortie programme avant la transition.

Signal de sortie programme après la transition.

Exemple 3 :

Dans cet exemple, les incrustations KEY 1 et KEY 2 sont à l'antenne, comme l'indiquent les boutons ON lumineux. L'arrière-plan de la transition suivante est déjà sélectionné, comme l'indique le bouton lumineux BKGD. Cela signifie que seul l'arrière-plan va transiter lors de la transition suivante tandis que les deux incrustations resteront à l'antenne.



La section Transition suivante du panneau de contrôle avant la transition.

Signal de sortie programme avant la transition.

Signal de sortie programme après la transition.

Exemple 4 :

Dans cet exemple, les incrustations KEY 1 et KEY 2 sont à l'antenne. L'arrière-plan ainsi que l'incrustation KEY 2 sont sélectionnés pour la transition suivante, ce qui signifie que l'arrière-plan ainsi que l'état de l'incrustation KEY 2 vont être modifiés lors de la transition suivante. L'incrustation KEY 2 ne sera alors plus visible sur le signal de sortie du programme après la transition.

La section Transition suivante du panneau de contrôle avant la transition.

Signal de sortie programme avant la transition.

Signal de sortie programme après la transition.

Il y a de multiples transitions pour insérer des incrustations sur le signal de sortie programme. Il peut s'agir d'une transition Cut (découpe), Mix (fondu enchaîné) ou Mix avec transition en arrière-plan. Les incrustations en amont sont activées sur le signal de sortie programme à l'aide de la section Transition suivante. Les incrustations en aval peuvent être transitées à l'aide de leur propre bouton de transition ou à l'aide du bouton DSK TIE qui permet de lier la transition à la section de contrôle des transitions principale.

Effectuer des transitions d'incrustations en aval

Les incrustateurs en aval possèdent leur propre bouton de transition ainsi qu'un champ pour régler la durée de transition. Une fois que l'incrustateur en aval est configuré, il est facile de l'ajouter ou de le retirer du signal de sortie programme à l'aide d'une des méthodes suivantes :

1. Appuyez sur le bouton DSK CUT pour activer ou désactiver de façon immédiate l'incrustation en aval du signal de sortie programme.
2. Utilisez le bouton DSK AUTO pour faire un fondu en entrée ou en sortie de l'incrustation en aval sur le signal de sortie programme pour la durée affichée dans la fenêtre Durée DSK.
3. Utilisez le bouton DSK TIE pour lier l'incrustation en aval à la section de contrôle principale des transitions. Une fois lié, le DSK transitera avec le type de transition sélectionné dans la section de contrôle principale des transitions pour la durée spécifiée dans cette même section.

   Pour visualiser l'incrustation en aval sur le signal de sortie prévisualisation, appuyez sur le bouton DSK TIE.

   Il n'est pas possible de prévisualiser une transition d'incrustation en aval lorsqu'elle est liée à la section de contrôle principale des transitions. Si le bouton DSK TIE est activé lorsque vous passez en mode prévisualisation de transition, la fonctionnalité TIE sera ignorée jusqu'à ce que le mode prévisualisation de transition soit désactivé.

Paramètres du DSK

Clip	Le niveau Clip ajuste la valeur à laquelle l'incrustation découpe son trou. Le fait de réduire le niveau Clip expose une plus grande partie de l'arrière-plan. Si la vidéo en arrière-plan est complètement noire, la valeur Clip est trop élevée.
Gain	Le paramètre Gain modifie électroniquement la valeur qui permet d'adoucir les contours de l'incrustation. Ajustez la valeur gain jusqu'à l'obtention de l'adoucissement de contour désiré sans affecter la luminance (luminosité) de la vidéo en arrière-plan.
Durée	La durée de transition de l'incrustation en aval.
Inverser l'incrustation	Inverse le signal de l'incrustation.
Incrustation prémultipliée	Identifie le signal de découpe en tant qu'incrustation prémultipliée.

Streaming

Votre mélangeur ATEM vous permet de streamer directement depuis des plateformes telles que YouTube et Twitch via les boutons dédiés du panneau de contrôle. Pour lancer le streaming, il vous faudra d'abord régler la clé de stream dans l'ATEM Software Control.

Obtenir une clé de stream

Vous pouvez sélectionner la plateforme de votre choix dans l'ATEM Software Control et configurer les paramètres pour le streaming. Si vous paramétrez une diffusion sur votre chaîne et que vous allez l'utiliser régulièrement, ces réglages vont être stockés dans votre mélangeur. Vous pourrez ensuite vous brancher à n'importe quelle connexion Internet et diffuser à tout moment directement depuis l'appareil.

Dans cette section, vous découvrirez comment configurer les paramètres pour YouTube Studio et Twitch.

CONSEIL Pendant que vous réglez les paramètres de votre diffusion, nous vous conseillons de charger un graphique dans le lecteur multimédia de l'ATEM Software Control et de l'envoyer sur la sortie programme, pour tester que tout fonctionne avant de passer au direct.

Configurer les paramètres du Blackmagic Cloud

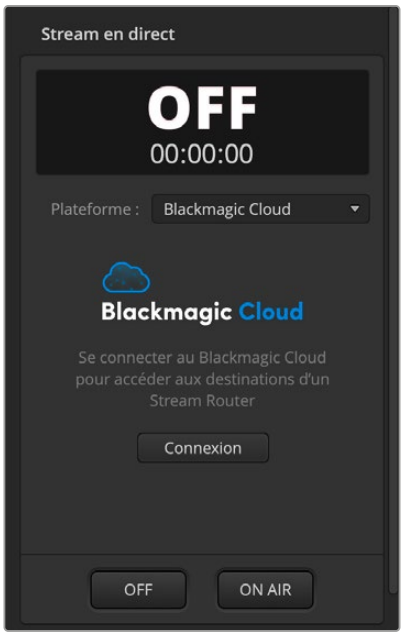
Le Blackmagic Cloud Stream Router est une grille de commutation vidéo virtuelle qui vous permet de connecter et de router des flux vidéo SRT et RTMP live via le Blackmagic Cloud.

Avant de pouvoir démarrer le streaming, il faudra vous attribuer une source de la grille dans le Blackmagic Cloud à l'aide d'un profil personnel ou d'un profil d'organisation associé à votre compte Blackmagic Cloud. Elle peut également vous être attribuée par un autre utilisateur Blackmagic Cloud.

Une fois la source configurée, vous pouvez démarrer le streaming.

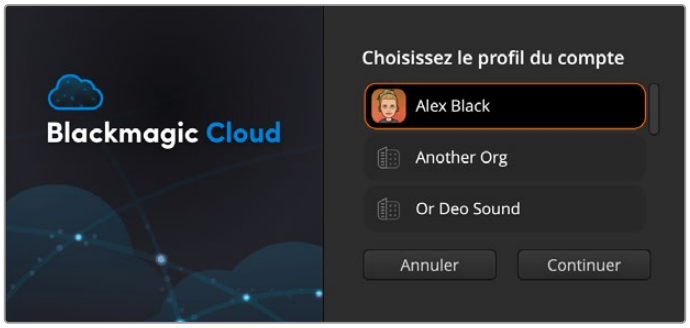
Pour streamer vers le Blackmagic Cloud :

1. Ouvrez les palettes de streaming et cliquez sur le menu **Plateforme**.
2. Sélectionnez **Blackmagic Cloud** dans la liste. Si vous n'êtes pas connecté au Blackmagic Cloud, cliquez sur le bouton **Se connecter**.



3 Dans la fenêtre de connexion, saisissez vos détails dans les champs **Email** et **Mot de passe**, puis cliquez sur **Se connecter**. Vous pouvez également cliquer sur l'option **Connexion via web** en haut à droite, et vous connecter via un navigateur web.

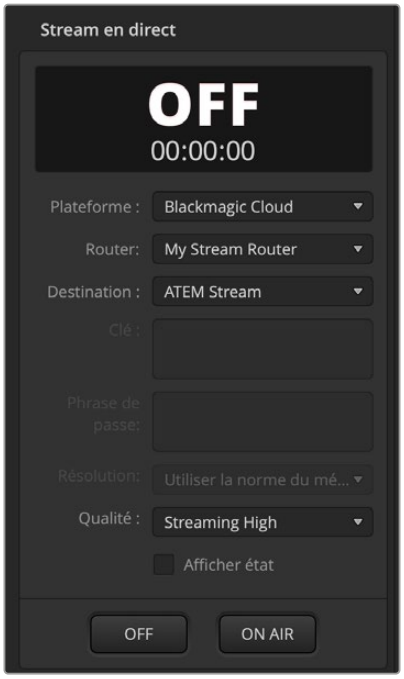
4 Choisissez le profil de compte Blackmagic vers lequel vous souhaitez streamer. Cela peut être un profil personnel ou d'organisation.



5 Cliquez sur **Terminer** pour fermer la fenêtre de paramétrage et retourner sur la palette de streaming.

Une fois connecté, les destinations du Stream Router disponibles seront affichées dans la liste.

6 Sélectionnez la grille et la destination vers lesquelles vous souhaitez streamer dans les menus. Si une seule destination vous a été attribuée, le menu affichera cette destination par défaut.



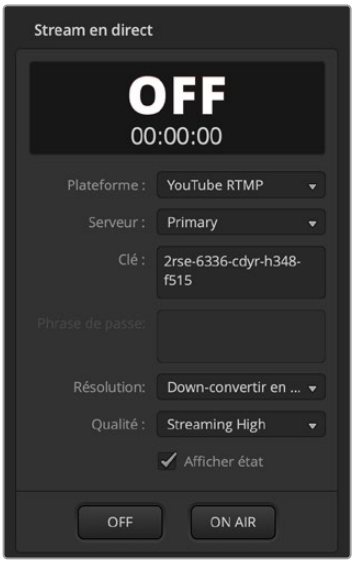
Pour démarrer le streaming, cliquez sur **On Air** ou appuyez sur le bouton **On Air** du mélangeur. Une fois votre production terminée, cliquez sur **Off** ou appuyez sur le bouton **Off** du mélangeur pour arrêter la diffusion. Une fois que vous avez sélectionné une entrée du Stream Router, la connexion sera conservée même lorsque votre stream en direct est désactivé. Si vous souhaitez libérer l'entrée du Stream Router à la fin de votre production, sélectionnez **Aucune** dans la liste de la grille ou de la destination.

CONSEIL Pendant la configuration des paramètres de votre diffusion, nous vous conseillons de charger un graphique dans le lecteur multimédia de l'ATEM Software Control et de l'envoyer sur la sortie programme, pour tester que tout fonctionne avant de passer au direct.

Configurer les paramètres pour YouTube Studio

1. Allez sur votre compte YouTube. Cliquez sur **Passer au direct** dans le menu **Créer**.
2. Si on vous le demande, choisissez de commencer votre stream directement ou ultérieurement. Sélectionnez **Logiciel de streaming** parmi les options offertes.
3. Cliquez sur **Modifier** à côté du titre de la diffusion afin de modifier ses détails, notamment son titre, sa description et son audience.
4. Réglez l'audience sur le paramètre approprié et sauvegardez.
5. Une clé de stream générée automatiquement apparaîtra en haut à droite de la fenêtre d'aperçu, cliquez sur l'icône pour copier la clé de stream.

Maintenant que vous avez copié la clé de stream pour votre diffusion, vous avez besoin de la coller dans les détails de streaming de l'ATEM Software Control.



1. Dans les palettes de fonctions de l'ATEM Software Control, cliquez sur l'onglet Sortie. Ouvrez la palette Stream en direct.
2. Réglez la plateforme sur YouTube en cliquant sur le menu et en sélectionnant YouTube depuis le menu déroulant. Réglez le serveur sur **Primaire**.
3. Dans le paramètre **Clé**, copiez la clé de stream depuis YouTube.
4. Sélectionnez une qualité de streaming basse, moyenne ou élevée. Cela réglera également la qualité pour l'enregistrement via USB-C.
5. Une fois tous les réglages effectués, il est recommandé d'effectuer un petit test pour être sûr que tout fonctionne correctement. Appuyez sur le bouton **On air** de votre mélangeur ATEM ou de la palette Stream en direct.

YouTube Studio est désormais prêt à diffuser. L'initialisation de la mémoire tampon peut prendre un petit moment. Une fois la mise en tampon effectuée, le bouton **Passer au direct** apparaîtra sur YouTube Studio. Il ne vous reste plus qu'à appuyer dessus.

Bravo, vous êtes en train de diffuser !

Pour vérifier que tout fonctionne correctement, cliquez sur l'icône de partage, copiez le lien et collez-le dans une nouvelle fenêtre ou un nouvel onglet dans votre navigateur Internet. Vous pouvez désormais visionner votre streaming en direct comme n'importe quel viewer.

Une fois votre production terminée, cliquez sur le bouton de stream **Off** du mélangeur pour arrêter la diffusion.

Configurer les paramètres pour Twitch

1. Allez sur votre compte Twitch. Cliquez sur l'avatar de votre compte dans le coin supérieur droit.
2. Cliquez sur **Tableau de bord**.
3. Dans les options de paramétrage, sélectionnez **Stream**.
4. Une clé de stream primaire sera automatiquement générée. Cliquez sur **Copier**.

Maintenant que vous avez copié la clé de stream pour votre diffusion, vous avez besoin de la coller dans les détails de streaming de l'ATEM Software Control.

1. Dans les palettes de fonctions de l'ATEM Software Control, cliquez sur l'onglet **Sortie**. Ouvrez la palette **Stream en direct**.
2. Réglez la plateforme sur Twitch en cliquant sur le menu et en sélectionnant Twitch depuis le menu.
3. Cliquez sur le menu du **Serveur** et sélectionnez le serveur le plus proche.
4. Dans le paramètre **Clé**, copiez la clé de stream depuis Twitch.
5. Sélectionnez une qualité de streaming basse, moyenne ou élevée. Cela réglera également la qualité pour l'enregistrement via USB-C.
6. Une fois tous les réglages effectués, il est recommandé d'effectuer un petit test pour être sûr que tout fonctionne correctement. Appuyez sur le bouton **On air** de votre mélangeur ATEM ou de la palette Stream en direct.

Vous êtes à l'antenne ! Pour contrôler votre diffusion, cliquez sur l'avatar de votre compte et sélectionnez l'option pour retourner sur Twitch. De retour sur la fenêtre principale de Twitch, cliquez une nouvelle fois sur l'avatar et sélectionnez **Chaîne**. Votre diffusion apparaîtra sur votre chaîne et l'indicateur de direct apparaîtra en haut de la fenêtre.

Streaming via Ethernet en partageant la connexion Internet de votre ordinateur

Une fois l'ATEM Software Control connecté à votre mélangeur, vous pouvez effectuer le streaming directement via la connexion Internet de votre ordinateur. Ainsi, vous pouvez utiliser la connexion sans fil de votre ordinateur si une connexion filaire n'est pas disponible.

Régler votre mélangeur ATEM pour le contrôle logiciel et le streaming via Ethernet :

1. Branchez votre mélangeur ATEM à un port Ethernet disponible sur votre ordinateur. Patientez le temps que le DHCP trouve l'appareil et lui assigne une adresse IP.
2. Lancez le logiciel ATEM Software Control.
3. Votre mélangeur ATEM Television Studio apparaîtra dans la liste des mélangeurs ATEM connectés à votre réseau. Sélectionnez votre mélangeur dans la liste.
4. Cliquez sur **Connecter**.
5. Configurez votre ordinateur pour qu'il partage sa connexion Internet via son port Ethernet.

Pour configurer le partage Internet depuis un ordinateur Mac : Dans Préférences Système, cliquez sur **Partage**, puis sélectionnez **Partage Internet** dans la liste **Service**. Dans le menu **Partager votre connexion depuis**, choisissez **Wi-Fi** si votre Mac est connecté à Internet via WiFi. Dans la liste **Aux ordinateurs via**, sélectionnez **Ethernet**. Dans la liste **Service**, cochez la case **Partage Internet**. Lorsque l'on vous demande si vous êtes sûr de vouloir activer le partage Internet, cliquez sur **Démarrer**.

Pour configurer le partage Internet depuis un ordinateur Windows : Dans la fenêtre de recherche Windows, saisissez **Afficher les connexions réseau** et appuyez sur Entrée. Faites un clic droit sur la connexion Internet et sélectionnez **Propriétés**. Dans l'onglet **Partage**, cochez **Autoriser d'autres utilisateurs du réseau à se connecter via la connexion Internet de cet ordinateur**. Sélectionnez une connexion réseau dans le menu, puis cliquez sur **OK**.

L'ATEM Software Control va s'afficher avec des boutons et des voyants allumés. Vous pouvez à présent opérer votre mélangeur de la même façon que vous le feriez via USB-C. Votre mélangeur ATEM est maintenant configuré pour le streaming en direct via votre ordinateur.

Partage de connexion via un smartphone

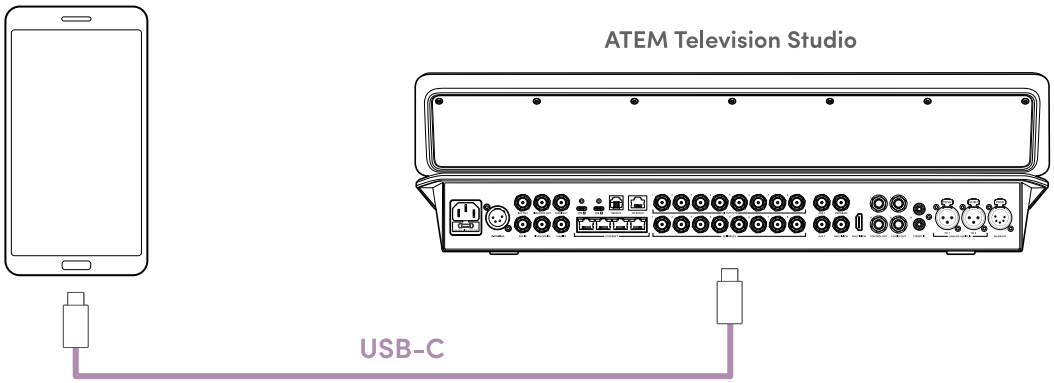
Une fois que votre mélangeur ATEM a été réglé pour streamer sur YouTube, Twitch ou une autre plateforme, vous pouvez streamer en direct à l'aide de votre smartphone. Ainsi, vous pouvez rapidement streamer partout dans le monde depuis n'importe quel endroit où votre smartphone dispose d'une connexion mobile 4G ou 5G, ou s'il prend en charge le partage de connexion WiFi inversé.

1. Il suffit de connecter un câble de votre smartphone à un des ports USB-C du mélangeur.
2. Une fois connecté, veillez à ce que le point d'accès de votre smartphone soit activé.

Sur votre appareil iOS ouvrez Réglages> Partage de connexion et veillez à ce que l'option **Autoriser d'autres utilisateurs** soit activée.

Sur les appareils Android, balayez l'écran pour afficher le menu. Appuyez longuement sur l'icône de point d'accès, puis activez le partage de connexion via USB.

Vous pouvez maintenant appuyer sur le bouton On air de votre mélangeur ATEM pour passer en direct !



Si votre mélangeur ATEM est à la fois connecté à Ethernet et à votre smartphone, vous pouvez choisir quelle connexion sera utilisée pour le streaming dans les options de priorité de connexion de l'ATEM Setup.

Fonctionnalités supplémentaires sur les modèles ISO

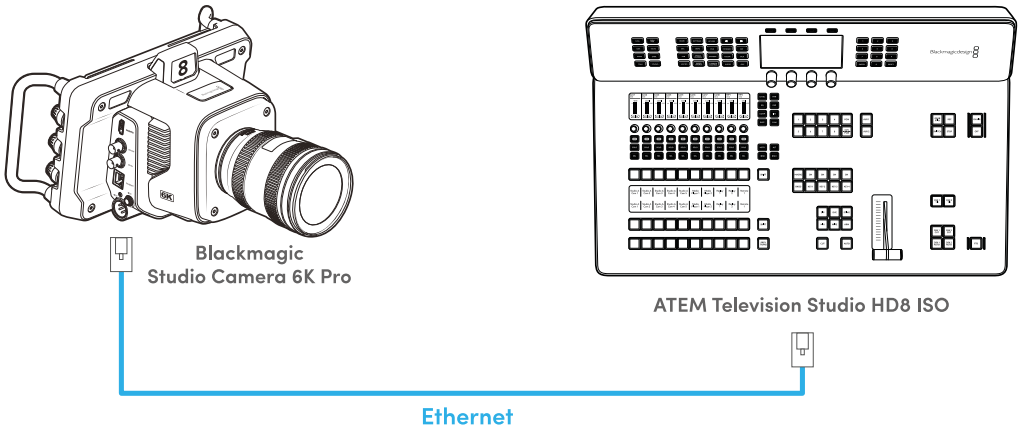
Les mélangeurs ATEM Television Studio HD8 ISO possèdent des fonctionnalités supplémentaires vous offrant davantage d'options de broadcast, dont l'enregistrement ISO sur chaque entrée et la connexion à des sources à distance lors du streaming via Ethernet. Cela vous permet d'ajouter des caméras sur votre réseau local ou depuis n'importe où dans le monde.

Certaines caméras Blackmagic Design, telles que la Blackmagic Studio Camera 6K Pro et la URSA Broadcast G2, comprennent un moteur de streaming intégré qui permet à la caméra de streamer directement sur l'ATEM Television Studio HD8 ISO.

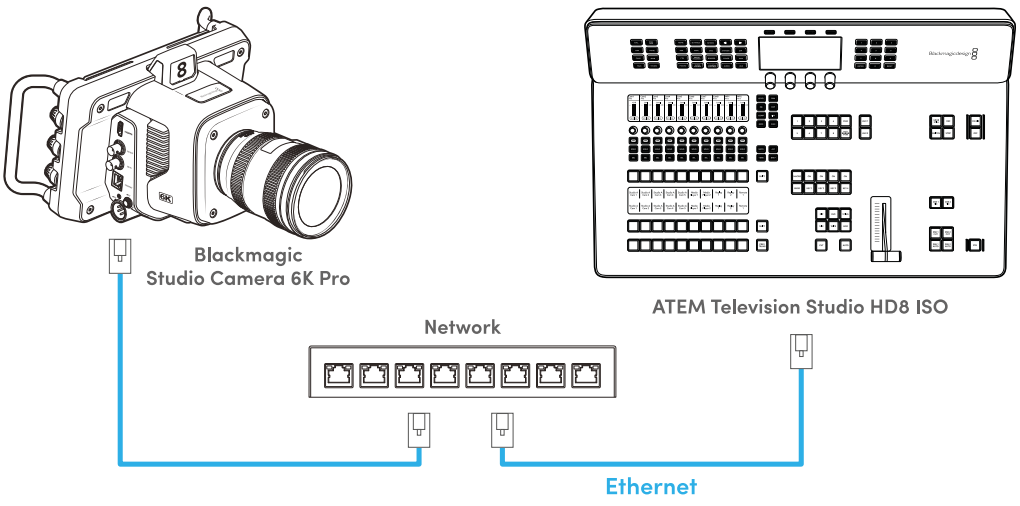
Connecter des sources à distance via un réseau local

L'ATEM Television Studio HD8 ISO et la Blackmagic Studio Camera 6K Pro sont tous deux réglés sur DHCP par défaut. Ainsi, une fois connectés via Ethernet, le lancement du streaming se fait en quelques étapes.

Se connecter directement

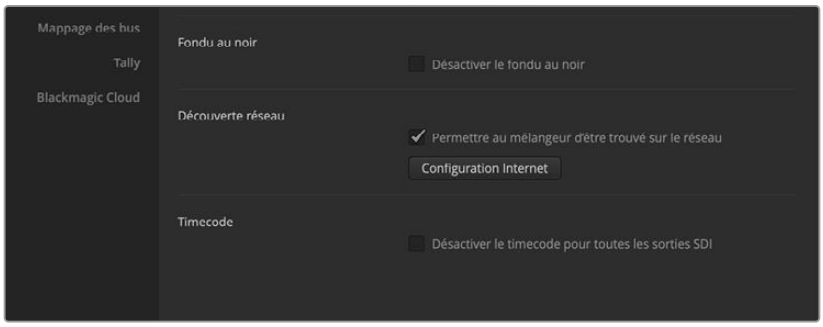


Se connecter via un commutateur réseau



Tout d'abord, assurez-vous que votre mélangeur est visible sur le réseau depuis les paramètres généraux de l'ATEM Software Control.

1. Lancez le logiciel ATEM Software Control.
2. Ouvrez le menu de paramétrage en cliquant sur l'icône de la roue dentée en bas à gauche.
3. Naviguez jusqu'au dernier paramètre situé sous l'onglet **Général** et assurez-vous d'avoir coché l'option autorisant le mélangeur à être trouvé sur le réseau.

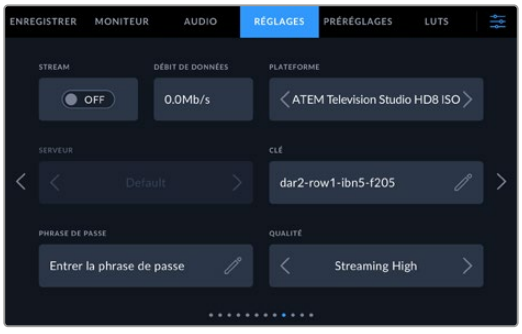


Réglages du réseau des sources à distance dans l'ATEM Software Control

Après avoir vérifié que votre mélangeur est bien visible sur le réseau, vous pouvez configurer vos caméras. Sur un réseau local, chaque caméra sera identifiée par le mélangeur via le nom de la caméra sur le clap numérique. Ainsi, si vous connectez plus d'une source, il est conseillé de nommer chaque caméra avec un nom différent, par exemple A, B, C ou Cam 1, Cam 2 etc. afin de les identifier plus facilement sur le mélangeur. Pour plus d'informations sur le réglage des noms de caméra, veuillez consulter la section « Saisie des métadonnées » du manuel de votre caméra.

Pour commencer à streamer depuis la caméra :

1. Sur votre caméra, appuyez sur le bouton de menu, puis touchez l'onglet **Réglages**.
2. Une fois dans l'onglet **Réglages**, naviguez vers les paramètres de streaming live et sélectionnez le mélangeur ATEM Television Studio HD8 ISO depuis le paramètre **Plateforme**.



3. Touchez le bouton **Stream** pour lancer le streaming. La mention **Live** va s'allumer en bleu au-dessus du paramètre pour indiquer que vous êtes en train de streamer. Si vous avez activé les informations du stream sur votre caméra, vous verrez les débits de données apparaître sur l'affichage HUD.

Sélectionner l'entrée

Une fois que vous avez commencé à streamer depuis une caméra, vous pouvez la sélectionner en tant qu'entrée via l'onglet des sources de l'ATEM Software Control.

Pour sélectionner la source à distance en tant qu'entrée :

1. Dans le menu de paramètrage de l'ATEM Software Control, sélectionnez l'onglet **Source**.

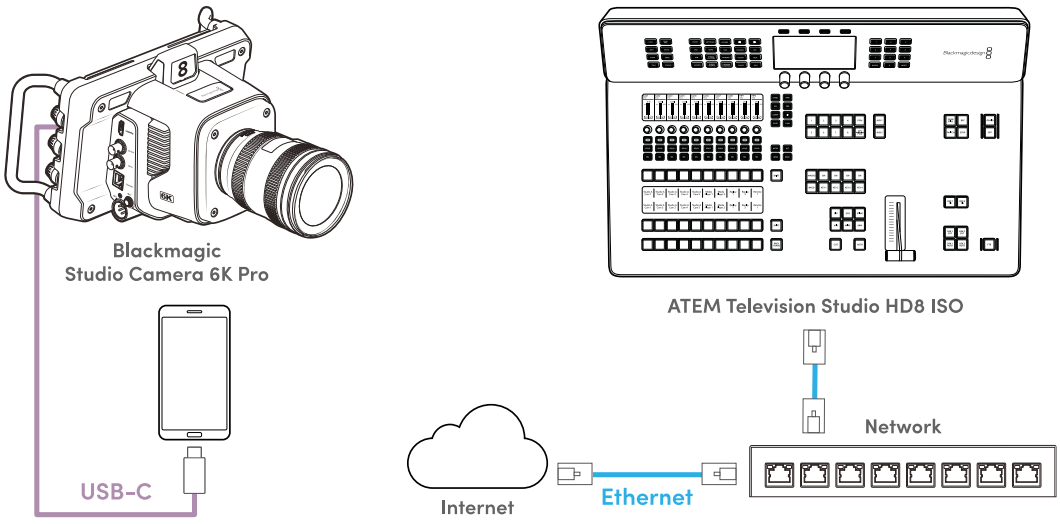
2 Cliquez sur le menu situé sour l'entrée 1. La caméra va apparaître dans la liste avec l'identifiant caméra du clap numérique.

3 Sélectionnez la source. Une fois la source sélectionnée, le signal caméra devrait apparaître dans votre multi view. Vous pouvez désormais traiter l'entrée de la même manière qu'une entrée SDI.

Pour activer le tally et le contrôle caméra, l'identifiant de la caméra sur l'ATEM doit avoir le même numéro que l'entrée à laquelle vous l'avez assigné sur le mélangeur. Ainsi, la caméra détectera le tally pour l'entrée et vous pourrez utiliser les réglages du contrôle caméra sur le mélangeur ou depuis l'ATEM Software Control pour effectuer des ajustements. Une fois que la caméra commence à streamer et que l'entrée est assignée, les Blackmagic Studio Cameras règleront l'identifiant de la caméra afin qu'il corresponde à l'entrée. Pour les autres caméras, comme l'identifiant de la caméra ne peut pas être ajusté lorsque la caméra est en train de streamer, l'opérateur devra peut-être arrêter et redémarrer une fois l'identifiant réglé. Pour plus d'informations sur le réglage de l'identifiant caméra sur l'ATEM, consultez le manuel de votre caméra Blackmagic Design.

Connecter des sources à distance via Internet

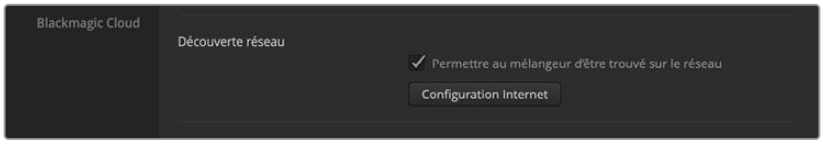
Avec les mélangeurs ATEM Television Studio HD8 ISO, vous pouvez également ajouter des sources à distance situées n'importe où dans le monde. Ainsi, un utilisateur à distance peut streamer le signal de sa caméra via Internet à l'aide d'une connexion Ethernet fixe ou via le partage de connexion de son smartphone. En utilisant l'ATEM Software Control pour générer une clé, vous pouvez exporter un fichier XML contenant toutes les informations de connexion nécessaires. Envoyez le fichier XML par e-mail à l'opérateur caméra, puis, une fois le fichier importé dans sa caméra, il pourra commencer à streamer sans attendre.



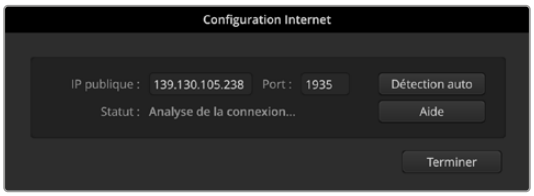
La première étape pour générer une clé de stream consiste à confirmer que votre mélangeur est visible sur les réseaux externes.

1 Lancez l'ATEM Software Control et ouvrez la fenêtre de réglages via l'icône de la roue dentée en bas à gauche.

2 Sélectionnez l'onglet **Général** et cliquez sur **Configuration Internet** sous les paramètres **Découverte réseau**.



3 Cliquez sur **Détection auto**. Votre ATEM Television Studio HD8 ISO va analyser la connexion Internet et afficher l'adresse publique du mélangeur, le port sélectionné, ainsi que l'état Internet. Si **Visible publiquement** apparaît, vous pouvez continuer. Si **Erreur de redirection de port** apparaît dans l'indicateur de l'état Internet, il sera peut-être nécessaire d'effectuer des réglages plus approfondis avec votre réseau ou auprès de votre fournisseur d'accès Internet. Il faudra donc demander à un fournisseur d'accès Internet, ou à votre administrateur réseau de régler la redirection de port de votre connexion Internet sur « TCP port 1935 ». Ils sauront ce qu'il faut faire !



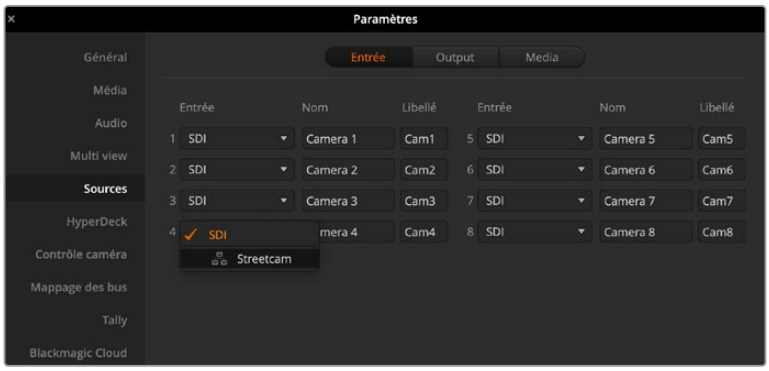
4 Une fois que l'état Internet affiche **Visible publiquement**, cliquez sur **Terminer**. Vous pouvez maintenant générer une clé de stream à l'aide de l'onglet Sources de la fenêtre de paramétrage.

5 Sélectionnez **Sources** à gauche et cliquez sur **Configurer source à distance** au bas de la fenêtre.

6 Cliquez sur **Ajouter source manuellement** au bas de la fenêtre. Une clé apparaîtra dans la fenêtre de configuration. Vous pouvez modifier le nom de la source en cliquant sur le champ de texte. Modifier le nom par défaut peut aider à identifier l'entrée lorsque vous sélectionnez la source à distance dans l'onglet des sources. Cliquez sur la clé pour générer un nouveau mot de passe.

7 Cliquez sur le bouton de partage et suivez les instructions pour sauvegarder les réglages sur un fichier XML. Une fois le fichier XML sauvegardé, envoyez-le par e-mail à l'opérateur caméra. Ce dernier pourra ensuite copier le fichier sur un support USB ou une carte SD, puis l'importer dans la caméra.

8 Une fois qu'une clé de stream a été générée, vous pouvez sélectionner la source via le menu des entrées. Ainsi, vous pouvez assigner l'entrée avant que la caméra à distance ait commencé le streaming. Une fois que la caméra aura commencé le streaming, cela apparaîtra sur votre multi view. Dans l'onglet Entrée de la fenêtre Sources, sélectionnez une entrée depuis le menu et cliquez sur le nom de la source correspondant à la clé de stream que vous venez d'exporter.



9 En plus d'envoyer la clé de stream par e-mail, vous pouvez communiquer à l'opérateur l'entrée que vous avez assignée, afin qu'il règle l'identifiant caméra sur l'ATEM sur le numéro correspondant. Si l'identifiant de la caméra correspond au numéro de l'entrée du mélangeur, votre caméra pourra détecter les données tally pour cette entrée et le voyant tally fonctionnera correctement sur votre caméra. Vous pourrez aussi effectuer des ajustements via les réglages du contrôle caméra sur le mélangeur ou via l'ATEM Software Control. L'identifiant de la caméra sur les Blackmagic Studio Cameras sera mis à jour automatiquement une fois que la caméra sera assignée à une entrée et que le streaming aura commencé.

Pour plus d'informations sur le réglage de l'identifiant caméra ou sur l'importation d'un XML, veuillez consulter le manuel Blackmagic du modèle de caméra souhaité.

Connecter des sources depuis un Stream Router

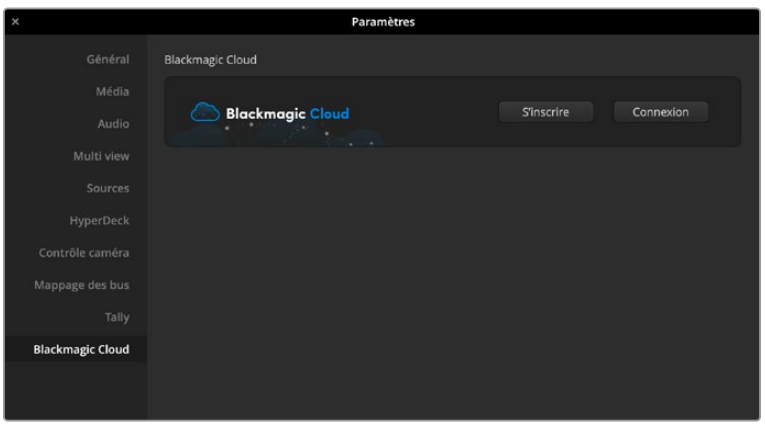
Le Blackmagic Cloud Stream Router est une grille de commutation vidéo virtuelle qui vous permet de connecter et de router des flux vidéo SRT et RTMP live via le Blackmagic Cloud. Le Stream Router prend en charge le contrôle caméra et le tally.

Avant de pouvoir connecter une source, il faudra vous attribuer une sortie de la grille dans le Blackmagic Cloud à l'aide d'un profil personnel ou d'un profil d'organisation associé à votre compte Blackmagic Cloud. Elle peut également vous être attribuée par un autre utilisateur Blackmagic Cloud.

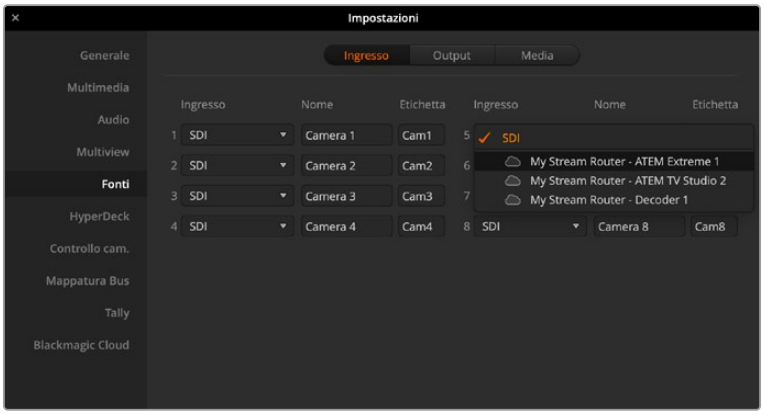
Une fois qu'une sortie du Stream Router a été configurée, elle peut être ajoutée via l'onglet **Sources**.

Ajouter une source depuis le Stream Router :

1 La première étape pour ajouter une source au Stream Router consiste à vous assurer que vous êtes connecté au Blackmagic Cloud.



2 Une fois connecté, sélectionnez l'onglet **Sources**. Cliquez sur le menu à côté de l'entrée à laquelle vous souhaitez vous connecter, par exemple l'entrée 5. Toutes les sorties qui vous sont attribuées apparaîtront dans la liste. Une icône nuage sera affichée à gauche de leur nom. Le nom du Stream Router et le nom de la sortie seront affichés à côté.



3 Le stream devrait s'afficher dans votre multi view. S'il n'apparaît pas, il vous faudra peut-être confirmer qu'une source est routée vers le Stream Router dans le Blackmagic Cloud. L'entrée connectée apparaîtra au-dessus du nom de la sortie.

Répétez les étapes pour ajouter jusqu'à 8 sources de streaming à l'ATEM Television Studio HD8 ISO.

CONSEIL Lorsque vous choisissez une source depuis le Stream Router, cette connexion sera conservée, même après votre déconnexion. Ainsi, la prochaine fois que vous vous reconnecterez au Blackmagic Cloud, l'entrée de votre Stream Router sera déjà réglée.

Si vous souhaitez libérer cette sortie du Stream Router afin que d'autres équipements Blackmagic puissent l'utiliser, par exemple un Blackmagic Streaming Decoder ou un mélangeur ATEM Mini Extreme ISO G2, il suffit de faire basculer l'entrée sur une source HDMI. Et le tour est joué !

Si vous avez oublié de modifier l'entrée avant de vous déconnecter, connectez-vous au Blackmagic Cloud via un navigateur web et réglez l'attribution de l'utilisateur du Stream Router sur **Non attribué**, puis à nouveau sur vous.

Si la sortie vous a été initialement attribuée par un autre utilisateur, vous devrez contacter votre administrateur Blackmagic Cloud ou un utilisateur disposant des autorisations de configuration afin qu'il vous la réattribue.

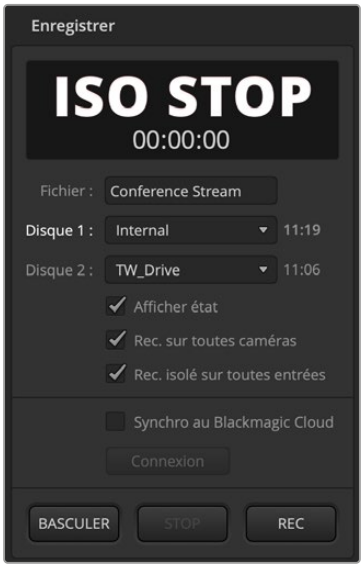
Enregistrer des fichiers ISO

L'ATEM Television Studio HD8 ISO peut enregistrer des fichiers vidéo depuis toutes ses entrées vidéo. Ces fichiers sont appelés fichiers isolés ou fichiers « ISO ».

Par défaut, les modèles ATEM ISO enregistreront un fichier vidéo de la sortie programme. Toutefois, si vous choisissez d'enregistrer des fichiers ISO, ils enregistreront un dossier contenant les fichiers vidéo des entrées, les fichiers audio et un fichier projet DaVinci Resolve.

Comment enregistrer des fichiers ISO

Pour enregistrer un dossier de fichiers ISO et d'autres éléments, il suffit d'aller sur la palette d'enregistrement de l'ATEM Software Control et de sélectionner le paramètre **Rec. isolé sur toutes entrées**. Désormais, votre mélangeur enregistrera le dossier de contenu lorsque vous appuierez sur Enregistrer dans la palette ou sur le panneau avant.



Pour activer les enregistrements ISO, cochez la case **Rec. isolé sur toutes entrées** dans la palette **Enregistrement**.

Il est important d'utiliser un disque suffisamment rapide. Nous vous recommandons de vous servir d'un bon disque flash car les disques mécaniques ne sont souvent pas assez rapides pour enregistrer 9 streams de vidéo HD H.264. Pour consulter la liste la plus récente des disques flash USB-C recommandés, veuillez vous rendre sur www.blackmagicdesign.com/fr/support.

REMARQUE Si le standard vidéo de votre mélangeur est réglé sur un format entrelacé tel que 1080i60, l'enregistrement isolé sera désactivé.

Contenu du dossier ISO

Le dossier d'enregistrement prendra le nom de la palette d'enregistrement. Bien que ce dossier contienne plusieurs fichiers ISO, il comprend également l'enregistrement du programme. Lors d'enregistrements isolés, il sera placé dans ce dossier avec les autres éléments.

Les fichiers vidéo ISO sont enregistrés depuis chaque entrée et placés dans un sous-dossier appelé Video ISO Files. Chaque fichier vidéo est enregistré depuis une entrée. C'est exactement le même enregistrement que la vidéo connectée à cette entrée SDI spécifique. Les fichiers ISO contiennent également le timecode synchronisé et les métadonnées des numéros de caméra. Vous pouvez donc utiliser n'importe quelle fonctionnalité multicaméra d'un logiciel de montage. Pour faciliter le montage, tous les fichiers ISO contiennent l'audio du programme, comme dans le fichier vidéo master.

Comme les fichiers ISO comprennent les métadonnées des numéros de caméra et le timecode synchronisé, vous pouvez également utiliser le Sync Bin de DaVinci Resolve pour sélectionner rapidement un affichage et créer un montage.

Il est important de noter que si vous utilisez des graphiques de la bibliothèque de médias, ils seront automatiquement sauvegardés dans un sous-dossier appelé Media Files, situé dans le dossier Video ISO Files. Vous pourrez ainsi recréer les titres utilisés durant le programme live dans votre montage.

Les fichiers audio de chaque entrée ainsi que les entrées micro seront également enregistrés. Ils seront placés dans un sous-dossier appelé Audio Source Files. Ces fichiers sont au format broadcast WAV. Ce sont des fichiers audio stéréo professionnels qui excluent tout traitement ou EQ du mixeur audio intégré.

Ces fichiers sont donc propres et vous pouvez les utiliser pour créer un nouveau mix audio à l'aide d'un logiciel audio professionnel. Les titres audio comprennent également le timecode, ils sont donc synchronisés aux fichiers vidéo.

Le fichier projet DaVinci Resolve est l'élément le plus intéressant sauvegardé dans le dossier projet. Ce fichier a été créé selon les actions du mélangeur durant l'enregistrement. Il permet à plusieurs fonctions du mélangeur d'être enregistrées et lorsque vous double-cliquez sur le fichier, DaVinci Resolve s'ouvrira avec une timeline contenant tous ces montages.

Les fonctions du mélangeur ATEM qui sont actuellement supportées sont les montages Cut et Mix entre les entrées vidéo et le lecteur multimédia, les titres en aval et les fondus au noir. Ce sont les fonctions les plus courantes et elles seront restaurées dans le montage vidéo DaVinci Resolve. D'autres fonctions seront ajoutées lors de prochaines mises à jour.

Ajout d'enregistrements

Si vous ne modifiez pas le nom du projet lors de l'enregistrement, le montage sera ajouté au fichier projet DaVinci Resolve enregistré précédemment sur le disque. C'est très pratique, car cela vous permet d'arrêter si vous avez fait une erreur ou simplement de prendre une pause, puis de reprendre l'enregistrement. Les deux enregistrements s'ouvriront dans la même timeline et vous pourrez les unir afin qu'ils s'affichent parfaitement. Si vous ne voulez pas ajouter les enregistrements au fichier projet, veillez à changer le nom du projet, ou utilisez un disque USB vierge.

Avantages de monter un projet live

Les avantages de monter un événement en direct sont nombreux. Certains montages devront être effectués très rapidement et vous pourrez créer un nouveau fichier master avant le chargement. Vous n'avez donc pas besoin d'accepter le montage live que vous avez effectué durant le streaming, car vous pouvez le modifier avant le chargement.

Vous pouvez également utiliser les fonctions d'enregistrement et de montage ISO pour créer des programmes plus rapidement en utilisant les modèles ATEM Television Studio HD8 ISO comme enregistreurs multipistes pour acheminer des vues de caméra vers des stations de montage.

Si vous importez un projet DaVinci Resolve, votre production en direct sera recréée en tant que montage quasi-instantanément. Vous pouvez donc effectuer rapidement des ajustements créatifs à votre événement avant le chargement.

Explication des couches

Le traitement d'un mélangeur progresse généralement des entrées du mélangeur sur la gauche du panneau de contrôle aux sorties sur sa droite. Le mélangeur offre un traitement en direct des entrées vidéo à la sortie vidéo, en passant par toutes les fonctionnalités de l'appareil.

Le montage fonctionne très différemment. Dans les logiciels de montage, vous obtenez de nombreuses couches, toutes superposées les unes aux autres. Cela signifie que tous les clips de la couche 2 seront placés sur les clips de la couche 1. En général, on applique des cuts et des fondus enchaînés sur la couche 1, et d'autres éléments sur les couches supérieures. Tous les clips de la couche 3 seront placés sur les clips des couches 1 et 2. Les montages complexes comprennent des dizaines de couches.

Pour comprendre le fonctionnement de DaVinci Resolve lorsqu'il importe votre fichier projet, il suffit de regarder le projet après son importation. On voit les différents types de traitement appliqués aux couches de montage.

Couche 1	La couche 1 comprend tous les montages principaux entre les sources. Vous verrez le bout à bout. Parfois, les points de montage seront des cuts, et parfois des fondus enchaînés. Cette couche a été créée à partir de la commutation de l'entrée principale. Tous les montages des entrées vidéo et des images fixes seront placés sur la couche 1.
Couche 2	La couche 2 concerne l'incrustateur en aval. Dans le mélangeur ATEM, l'incrustateur en aval est situé après le bloc de transition. En montage, comme il est placé sur la couche 2, il a la priorité sur la commutation de la couche 1. Si vous placez un graphique avec un canal alpha sur l'incrustateur en aval et que vous le faites passer à l'antenne, le titre sera ajouté à la sortie vidéo. Cette deuxième couche superpose donc ce graphique et son canal alpha à la couche 1.
Couche 3	La couche 3 concerne le fondu au noir. Le fondu au noir est le dernier traitement du mélangeur. Toutes les couches sont donc fondues vers le noir. Ce traitement est couramment utilisé à la fin d'un programme, ou juste avant les pauses publicitaires. Le fondu au noir se trouve sur la couche 3, car il aura la priorité sur toutes les couches du dessous, comme sur le mélangeur. Le fondu au noir est un générateur de vidéo noire qui applique un fondu enchaîné au début et à la fin.

Déplacer des points de coupe

Un des avantages du montage est que vous pouvez déplacer les points de coupe. Lors d'une production en direct, les actions peuvent être très rapides et difficiles à suivre. Imaginez par exemple une interview où plusieurs personnes parlent rapidement et s'interrompent. Il se peut que la commutation en direct ait eu du mal à suivre la conversation.

Ajuster les points de coupe vous permettra de positionner une coupe juste avant qu'une personne prenne la parole. Comme il faut suivre l'action durant la commutation en direct, les coupes ont souvent du retard par rapport à la prise de parole des personnes. Toutefois, vous pouvez désormais les déplacer dans le temps afin que les coupes coïncident avec les prises de parole. Cela transformera l'ambiance de votre programme.

Pour déplacer la coupe vers l'avant, scrollez le point de coupe dans la timeline, puis déplacez votre souris sur le point de coupe dans la timeline inférieure. Une double barre d'outils apparaîtra. Pour déplacer le point de coupe plus tôt dans le temps, cliquez dessus et faites-le glisser vers la gauche. Si vous effectuez cette opération vers la droite, le point de coupe sera déplacé plus tard dans le temps.

Veillez à ne pas cliquer sur les petites flèches dans la barre d'outils, car ce sont des outils de rognage. Lorsque vous déplacez la souris autour des points de coupe, les outils changent automatiquement. Si vous utilisez les outils de rognage, vous augmenterez ou réduirez la durée de toute la piste vidéo et l'audio ne sera plus synchronisé avec la piste audio verte du dessous.

Remplacer des plans

Le Sync Bin vous permet de retrouver des plans synchronisés à l'endroit où vous êtes positionné sur la timeline. Vous pouvez ainsi résoudre des problèmes, par exemple si vous avez commuté sur la mauvaise caméra, mais aussi rechercher de meilleurs plans, car vous avez plus de temps pour voir les alternatives dont vous disposez.

Pour utiliser le Sync Bin, il suffit de le sélectionner en haut à gauche de la page Cut. Une fois sélectionné, la bibliothèque de médias s'affichera en haut à gauche et votre viewer changera. La bibliothèque de médias affichera une timeline des clips disponibles et le viewer affichera un multi view de vos plans. Ce sont uniquement les plans synchronisés à l'endroit de la timeline où vous vous trouvez. Si vous déplacez la timeline, ces plans resteront en synchro.

Voyez le Sync Bin comme un assistant monteur qui recherche des plans pour vous et qui les affiche dans un multi view afin que vous puissiez vous en servir pour le montage.

Comme les modèles de mélangeurs ATEM Television Studio HD8 ISO savent quelle entrée est connectée et qu'ils ont enregistré ces entrées sur des fichiers vidéo, ils auront placé les métadonnées des numéros de caméra dans les fichiers. Ainsi, la caméra 1 dans le Sync Bin est l'entrée vidéo que vous aviez connectée à l'entrée 1 du mélangeur. La caméra 2 est l'entrée 2, etc.

Pour sélectionner un autre montage, suivez ces deux étapes : sélectionnez d'abord le plan souhaité et réglez ses points de coupe. Montez-le ensuite dans votre timeline, sur le plan en cours.

Scrollez à l'endroit de la timeline où commence le plan que vous souhaitez remplacer. Vous allez monter par-dessus ce clip. Vous devriez voir les autres plans possibles dans le multi view. Ce sont les autres options dont vous disposez. Vous verrez tous les fichiers vidéo des entrées qui ont été enregistrés depuis les entrées du mélangeur ISO.

Cliquez sur le plan souhaité. Il s'affichera en mode plein écran. Le point d'entrée sera réglé à la position actuelle de la timeline. Un point de sortie sera placé à 4 secondes de celui-ci. Il est peu probable que vous souhaitiez utiliser ce point de sortie. Il suffit donc de scroller le long de la timeline pour trouver l'endroit où vous voulez que le nouveau plan se termine et d'appuyer sur O. Le point de sortie sera déplacé à cet endroit.

Si vous n'avez pas sélectionné le plan correct, il suffit d'appuyer sur la touche Esc pour retourner sur le multi view. Vous pourrez ensuite choisir un autre plan.

Maintenant que votre plan est sélectionné, il faut le placer dans la timeline. Pour ce faire, vous devrez utiliser le mode de montage Écraser la source. Les modes de montage sont situés sous la bibliothèque de médias. Le mode le plus à droite est appelé Écraser la source. Vous pouvez repérer les modes de montage en plaçant la souris sur ces boutons pour afficher les libellés.

La fonction Écraser la source est intelligente, car elle prendra en compte le clip sélectionné en fonction de la timeline afin de le monter au timecode exact dans celle-ci. Ainsi, tous les plans que vous montez dans la timeline à l'aide de cette fonction resteront synchronisés. De plus, vous n'avez pas besoin de régler les point d'entrée et de sortie dans la timeline, car il suffit de scroller, de rechercher des plans et de les ajouter dans la timeline comme des plans de coupe.

Le mode Écraser la source placera toujours le clip sur la couche au-dessus du clip en cours dans la timeline. S'il n'y a pas de couche, il en ajoutera une avant d'y placer le clip. Il sera donc facile de retrouver vos plans de coupe, car il seront sur les couches au-dessus du montage original.

Il suffit de scroller le long de la timeline, de sélectionner les plans de coupe dans le multi view du Sync Bin et de remplacer autant de plans qu'il le faudra.

Ajouter des fondus enchaînés

Une autre excellente fonctionnalité pour votre montage est de pouvoir ajouter des fondus enchaînés dans la timeline. Souvent, lors du streaming à faible bande passante, les fondus enchaînés ne rendent pas bien. Vous ne les utiliserez donc peut-être pas pour votre stream en direct. Mais lorsque vous chargez votre programme, il se peut que vous vouliez ajouter des fondus enchaînés pour rendre le programme plus doux et élégant.

Vous pouvez désormais ajouter des fondus enchaînés pour plus de fluidité. DaVinci vous permet de faire glisser des transitions de la palette Transitions sur chaque point de coupe, mais il existe une façon plus rapide d'ajouter des fondus enchaînés. En bas à droite de la bibliothèque de médias sur la page Cut, vous trouverez 3 boutons de transition. Le premier supprimera la transition et changera le point de coupe en cut, et le deuxième ajoutera un fondu enchaîné. Vous pouvez simplement scroller et appuyer sur le bouton du milieu pour ajouter des fondus enchaînés.

Vous verrez un petit triangle qui rebondit sur la règle temporelle pour vous indiquer le point de coupe où DaVinci pense que vous souhaitez ajouter le fondu enchaîné. Vous n'avez donc pas besoin d'ajouter des points d'entrée dans la timeline, car lorsque vous appuyez sur le bouton de fondu enchaîné, il ajoutera cette transition à l'endroit sélectionné. C'est très rapide car il suffit de scroller et d'ajouter des fondus enchaînés où vous en avez besoin.

Supprimer des passages ennuyeux ou des erreurs

Il se peut que certains passages de votre émission soient un peu lents, ou que vous ayez dû arrêter car vous avez fait une erreur. Il est possible de supprimer ces parties à l'aide de l'outil ciseaux. Sous la bibliothèque de médias à gauche, vous trouverez un outil qui ressemble à une paire de ciseaux. Cliquez sur cet outil pour scinder toutes les couches de votre timeline. Il suffit de cliquer sur les clips entre les cuts et d'appuyer sur supprimer pour les supprimer. L'écart dans la timeline se refermera automatiquement.

Il est donc très facile d'apporter des petites corrections à votre événement en direct. Sélectionnez Exportation rapide en haut à droite de la page Cut pour disposer d'un nouveau fichier master contenant tous ces changements.

Monter dans DaVinci Resolve

Pour comprendre comment utiliser DaVinci Resolve, nous vous recommandons de regarder quelques tutoriels en ligne et de télécharger la version gratuite pour vous y former. DaVinci Resolve est un logiciel très sophistiqué utilisé par les studios d'Hollywood haut de gamme pour les longs-métrages. Toutefois, la page Cut est beaucoup plus facile d'utilisation. Pour plus d'informations, consultez notre site.

Enregistrer sur les caméras

Les mélangeurs ATEM Television Studio HD8 ISO peuvent contrôler les Blackmagic Studio Camera 4K Pro, URSA Mini Pro et URSA Broadcast G2 via SDI à l'aide d'un deuxième câble SDI connecté entre l'entrée de la caméra et une des sorties du mélangeur. Les mélangeurs ATEM Television Studio HD8 ISO peuvent aussi contrôler des caméras à distance connectées via Ethernet avec un réseau local ou via Internet.

Vous pouvez donc faire de la correction colorimétrique et ajuster les paramètres de l'objectif via le panneau de contrôle pour caméra du logiciel ATEM Software Control. Veuillez consulter la section de ce manuel qui décrit comment cela fonctionne.

Un autre avantage de ce contrôle est que vous pouvez sélectionner le paramètre Rec. sur toutes caméras dans la palette Enregistrement afin d'enregistrer sur les caméras en même temps que sur le disque USB.

L'avantage d'enregistrer sur les caméras est que ces dernières enregistreront en Blackmagic RAW, qui est un fichier au mode Film parfait pour appliquer de la correction colorimétrique avancée. De plus, comme ces fichiers sont en 4K, vous pourrez masteriser votre production en direct en Ultra HD. Bien que ce soient des mélangeurs HD, vous pouvez quand même exporter des master Ultra HD pour le chargement ou la diffusion.

Les connexions branchées à la caméra chargeront le timecode, ainsi que le numéro de caméra et le nom de fichier. Ainsi, les fichiers Blackmagic RAW seront synchronisés au timecode du mélangeur. Il est donc très facile de s'en servir.

Pour utiliser les fichiers Blackmagic RAW des caméras, veillez à sélectionner le paramètre Rec. sur toutes caméras dans la palette Enregistrement. Une fois l'enregistrement terminé, veillez à copier les fichiers des caméras dans le dossier Video ISO Files du mélangeur. C'est important, car DaVinci Resolve a besoin de voir ces fichiers lorsque vous ouvrirez le fichier projet DaVinci Resolve pour la première fois.

Le seul problème si vous utilisez les fichiers ISO du mélangeur et les fichiers Blackmagic RAW de la caméra est qu'ils seront en conflit. En effet, les deux types de fichiers ont le même timecode et le même numéro de caméra. Toutefois, ce problème peut être résolu, car DaVinci Resolve utilise les fichiers ISO par défaut.

Pour utiliser les fichiers à plus haute résolution Blackmagic RAW dans votre projet, il suffit de sélectionner le bouton des fichiers originaux de la caméra en haut à droite de la page Cut. Cette icône ressemble à une petite caméra. Une fois l'icône sélectionnée, votre timeline changera car les fichiers Blackmagic RAW, qui sont en mode Film, sont sélectionnés.

Il vous faudra éventuellement ajouter de la correction colorimétrique à ces fichiers pour peaufiner votre montage. Comme les couleurs des fichiers Blackmagic RAW n'ont pas été modifiées, vous pouvez utiliser les puissants outils de correction colorimétrique de DaVinci Resolve pour créer un fabuleux master étalonné.

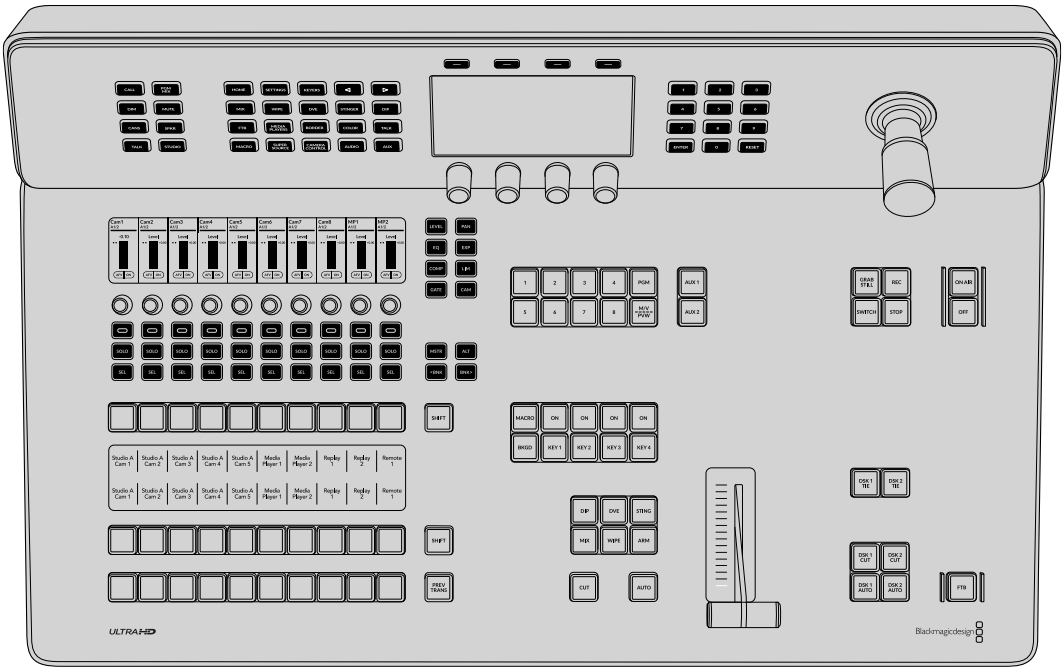
Si vous souhaitez exporter vos fichiers en Ultra HD, il suffit de sélectionner le menu de résolution situé à côté de l'icône caméra pour choisir différentes résolutions et formats d'image. Le paramètre du haut représente l'Ultra HD. Une fois que vous l'avez sélectionné, tout votre projet sera changé en Ultra HD et vos images devraient être plus nettes.

Toutes les entrées qui ne sont pas des caméras, comme les slides d'un ordinateur, seront automatiquement redimensionnées. Les images HD de la bibliothèque de médias seront également automatiquement redimensionnées. Remplacez les images du dossier médias si vous souhaitez avoir des versions à plus haute résolution des graphiques présents dans votre bibliothèque de médias.

Lorsque vous faites une exportation rapide, vous exporterez alors un master Ultra HD depuis un mélangeur HD !

Joystick sur l'ATEM Television Studio 4K8

Le joystick possède 3 axes qui permettent de redimensionner et de positionner les incrustations, les DVE et d'autres éléments. Vous pouvez également utiliser le joystick pour le contrôle à distance des caméras PTZ via VISCA.



Contrôle à l'aide du joystick

Contrôler les caméras avec le joystick

Lorsque le joystick est connecté à votre mélangeur, il peut contrôler une caméra à distance via le protocole VISCA.

Le contrôle PTZ est un outil très puissant pour contrôler à distance les fonctions Pan, Tilt et Zoom des caméras. Vous pouvez facilement contrôler plusieurs caméras l'une après l'autre en appuyant sur le bouton **Camera control** puis en sélectionnant chaque caméra à l'aide de la molette. Ajustez ensuite le pan et le tilt avec le joystick.

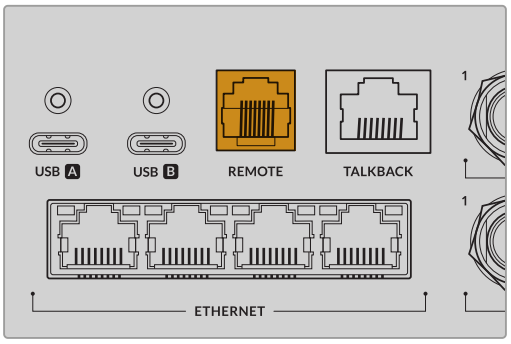
Si vous souhaitez choisir la direction du tilt de votre joystick, sélectionnez **Inversé** ou **Normal** dans la page **Tilt de la caméra** du menu de paramétrage du panneau. La fonction **Inversé** inverse l'action du joystick.

Connecter une tête de caméra robotisée

L'ATEM Television Studio 4K8 communique à distance avec les têtes de caméra via le port RS-422 intitulé **Remote**. Le port RS-422 de l'ATEM Television Studio 4K8 est un connecteur RJ12 qui ressemble à celui d'un téléphone fixe standard.

Il faudra également veiller à ce que le contrôle à distance du port RS-422 de votre mélangeur soit réglé sur **VISCA** ou **GVG** à l'aide du menu **Port série** de l'écran LCD.

Lorsque vous connectez plus d'une tête de caméra robotisée, elles sont généralement reliées en chaîne via les sorties et entrées RS-422.



Activer les fonctions PTZ pour les têtes de caméras robotisées

Vous pouvez configurer tous les réglages des fonctions PTZ via le menu **Settings** du Contrôle système. Appuyez sur les flèches ou sur la touche 8 du clavier pour afficher le menu de configuration du port série et le régler sur VISCA. Faites correspondre le débit en baud du mélangeur au débit de votre caméra PTZ. Veuillez consulter la documentation de votre caméra pour vous assurer du débit en baud approprié.

Appuyez sur le bouton **Camera control** pour afficher les paramètres de la caméra. Vous pourrez ainsi sélectionner VISCA et choisir la caméra que vous souhaitez configurer. Mais tout d'abord, vous devez vous assurer que les caméras connectées sont bien détectées.

Pour détecter les appareils série connectés :

1. Appuyez sur le bouton **Settings** et utilisez les flèches pour naviguer jusqu'aux paramètres **Port série**.
2. Appuyez sur le bouton multifonction **Détecter**.

La première caméra connectée à votre mélangeur apparaîtra sur l'écran LCD en tant que « Camera 1 ». Si vous avez plusieurs caméras connectées, vous pouvez les sélectionner en tournant la molette du paramètre **Caméra**. Les caméras sont numérotées en respectant l'ordre de la chaîne.

Si le nombre d'appareils connectés sur l'écran LCD et sur les boutons multifonction ne correspond pas au matériel connecté, vérifiez que toutes les têtes de caméras sont alimentées et que leur port RS-422 est correctement branché. Quand les caméras apparaissent correctement sur l'ATEM Television Studio 4K8, sélectionnez-les à l'aide des boutons de la section Contrôle système et faites quelques petits ajustements avec le joystick pour vérifier qu'elles fonctionnent.

CONSEIL Le contrôle de la caméra est réglé par défaut sur SDI. Si vous souhaitez utiliser le contrôle via VISCA, assurez-vous d'appuyer sur le bouton multifonction VISCA pour accéder aux caméras PTZ via VISCA.

Contrôle PTZ via SDI

Vous pouvez également contrôler les têtes de caméra PTZ via SDI. Par exemple, en connectant le flux du programme de retour de votre mélangeur à une caméra, puis en connectant la sortie SDI depuis le câble expansion de votre caméra à votre tête PTZ, vous pourrez contrôler la tête via le signal SDI.

Commande PTZ du joystick

Les commandes PTZ du joystick sont très intuitives. Tournez la molette du joystick dans le sens des aiguilles d'une montre ou dans le sens inverse pour effectuer un zoom avant ou arrière. Poussez le joystick vers le haut ou vers le bas pour faire basculer la caméra. Un mouvement vers la gauche et vers la droite activera le mouvement panoramique. Les commandes sont sensibles, les mouvements de caméras sont donc extrêmement souples. La sensibilité peut varier en fonction des caméras connectées à distance.

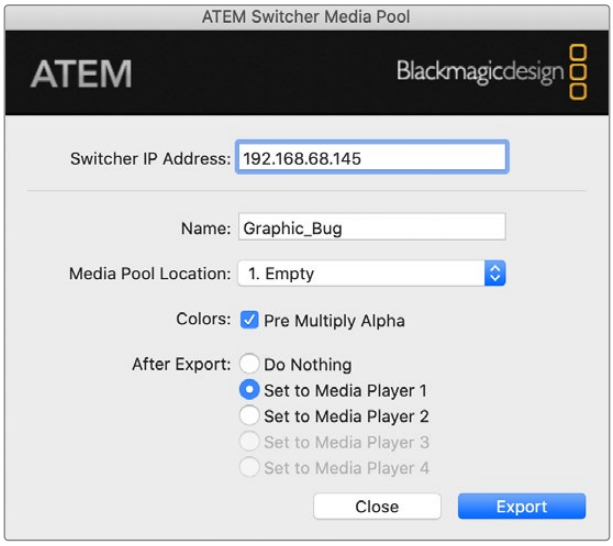
Si vous souhaitez connecter des commandes PTZ personnalisées à l'aide du connecteur DB-9 RS-422, veuillez consulter la section intitulée « Connexions des broches du port série pour le contrôle par câbles ».

Utiliser Adobe Photoshop avec votre ATEM

Lorsque vous installez le logiciel ATEM sur votre ordinateur vous installerez également un plug-in Photoshop qui vous permettra de charger directement des graphiques de Photoshop dans la bibliothèque de média de votre ATEM.

Cette application est donc compatible avec les graphiques provenant du logiciel Adobe Photoshop, désormais utilisé par la grande majorité des professionnels. Vous pouvez conserver les différentes couches d'une image Photoshop pour disposer de toutes les variantes d'un graphique, par exemple différents titres. Il vous suffit ensuite de sélectionner les couches que vous désirez dans le logiciel Photoshop et de les télécharger aisément en appuyant sur un bouton. Avant le téléchargement, les couches sont automatiquement aplaties en temps réel. Tout cela se passe en arrière-plan et l'exportation ne modifiera pas votre document Photoshop.

Le plug-in d'exportation de l'ATEM nécessite l'utilisation du logiciel Adobe Photoshop. Installez ou réinstallez le logiciel ATEM après avoir installé Photoshop pour vous assurer que le plug-in d'exportation ATEM est bien installé.



Plug-in d'exportation de l'ATEM

Configuration de l'emplacement du mélangeur pour le plug-in

La première fois que vous exécutez le plug-in d'exportation Photoshop, ce dernier vous demandera de sélectionner l'emplacement de votre mélangeur. Cet emplacement fait référence à l'adresse IP du mélangeur pour que le plug-in puisse trouver le mélangeur avec lequel il va communiquer. Par défaut, l'adresse IP est configurée sur 192.168.10.240, ce qui est l'adresse IP du mélangeur à l'achat. Si vous désirez exporter plusieurs versions du même fichier Photoshop, vous pouvez utiliser la fenêtre d'exportation du plug-in pour nommer chaque fichier exporté et choisir d'attribuer les fichiers à un lecteur multimédia après l'exportation.

Préparation des graphiques pour le téléchargement

Pour obtenir de bons résultats, il vous faudra utiliser une résolution de document Photoshop qui coïncide avec le standard vidéo que vous avez configuré sur votre mélangeur ATEM. Pour les formats 1080 HD, il est conseillé d'utiliser une résolution de 1920 x 1080 pixels. Pour les formats 720p HD, il est conseillé d'utiliser une résolution de 1280 x 720 pixels.

Lorsque vous travaillez sur l'ATEM avec des documents Photoshop, il est préférable de ne pas mettre de contenu sur la couche d'arrière-plan. Il vous faudra donc disposer tout le contenu sur les couches situées au-dessus. Pour pouvoir incruster des graphiques provenant de Photoshop, la couche d'arrière-plan devrait toujours être d'un noir uni, et il vous est conseillé d'utiliser le paramètre d'incrustation prémultipliée.

Pour vous aider, nous avons joint un guide et quelques templates de graphiques dans le dossier Example Graphics qui a été installé sur votre ordinateur avec le logiciel ATEM Switchers.

Pour télécharger un graphique dans la bibliothèque de média de votre ATEM, il vous suffit de sélectionner le menu d'exportation de Photoshop et de sélectionner l'option ATEM Switcher Media Pool. Une fenêtre apparaîtra et vous demandera de choisir à quel emplacement de la bibliothèque de médias vous désirez télécharger cet élément. La liste proposée comprendra tous les noms de fichiers graphiques préalablement téléchargés dans la bibliothèque de médias. Sélectionnez l'emplacement désiré, puis sélectionnez l'option Export.

Si vous êtes pressé par le temps et que vous devez passer vos graphiques au plus vite à l'antenne, vous pouvez sélectionner l'option de copie automatique sur n'importe lequel des lecteurs multimédia après l'exportation. Cela vous permettra de faire passer vos images à l'antenne en un clin d'œil ! Si vous ne voulez pas modifier les sources graphiques du lecteur multimédia, il suffit de choisir de ne pas copier le lecteur multimédia à ce graphique.

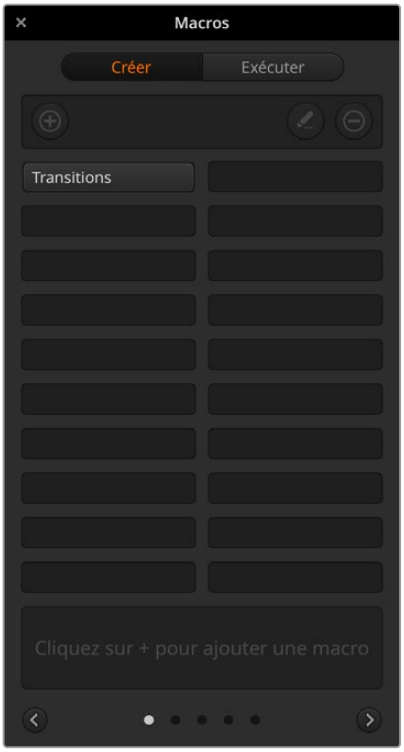
Dans la plupart des cas, il est préférable d'activer la fonction Pre Multiply Alpha. Mais attention, si vous activez cette fonction, il vous faudra également activer le paramètre Incrustation prémultipliée sur le mélangeur ou via l'ATEM Software Control. Cette fonction mélange la couleur du graphique avec son canal alpha lors de l'exportation pour lui permettre d'avoir des contours lisses qui se fondent à la vidéo.

Utiliser des macros

Qu’est-ce qu’une macro ?

Une macro est une solution simple permettant d’automatiser une suite d‘opérations effectuées sur un mélangeur afin de répéter ces opérations à l’aide d’un seul bouton. Vous pouvez par exemple enregistrer une suite de transitions entre différentes sources vidéo, y compris les effets d’incrustation, les réglages du mixeur audio, les paramètres de commande de la caméra et bien d’autres. Enregistrez toutes les opérations sur un bouton macro, puis appuyez sur ce bouton pour exécuter instantanément toutes les opérations enregistrées. Les macros sont enregistrées à partir de la fenêtre Macros au sein de l’ATEM Software Control, du Contrôle système de l’ATEM Television Studio, ou avec les deux appareils, et elles sont conservées dans le mélangeur ATEM. Les macros étant les mêmes pour tous les panneaux de contrôle, elles peuvent être activées à partir de n’importe quel panneau.

La fenêtre Macros de l’ATEM Software Control



Pour ouvrir la fenêtre Macros dans l’ATEM Software Control, cliquez sur l’onglet Macros dans la barre de titre, ou utilisez le raccourci Shift/Cmd/M pour Mac ou Shift/Ctrl/M pour Windows. La fenêtre Macros peut être déplacée sur l’écran. Cela vous permet d’y accéder facilement lorsque vous naviguez entre les différents onglets : Mélangeur, Média, Audio et Caméra. Lorsque vous enregistrez une macro, vous pouvez également réduire la taille de la fenêtre en cliquant sur l’icône Réduire en haut à droite.

Il est possible d’enregistrer jusqu’à 100 macros différentes dans n’importe quel emplacement pour macros. Chaque page peut accueillir jusqu’à 20 macros différentes. Naviguez entre les différentes pages à l’aide des flèches gauches et droites situées en bas de la fenêtre. Cliquez sur les boutons Créer et Exécuter pour naviguer entre ces deux pages et ainsi enregistrer et exécuter les macros pendant la production en direct.

Enregistrer des macros

Les macros doivent être enregistrées entièrement. Il est primordial de définir clairement la suite d’opérations du début à la fin, sans erreur. Cette procédure doit être rigoureusement suivie, car chaque paramètre, chaque bouton sélectionné et chaque opération effectuée sur le mélangeur seront enregistrés dans la macro. Lorsque vous exécutez une macro, toutes les opérations effectuées sur le mélangeur qui ont été enregistrées dans cette macro seront reproduites à l’identique.

Il est important de noter que seuls les paramètres que vous modifiez seront enregistrés dans la macro. Par exemple, si vous souhaitez enregistrer une transition de 3:00 secondes et que la durée de transition du mélangeur est déjà réglée sur 3:00 secondes, vous devrez tout d’abord changer la durée, puis la régler de nouveau sur 3:00 secondes pour enregistrer ce paramètre. Si vous n’effectuez pas ces différentes étapes, la durée de transition que vous souhaitez enregistrer ne sera pas sauvegardée et lorsque la macro sera exécutée, la durée de transition utilisée sera celle sur laquelle votre mélangeur était réglé précédemment. Vous comprenez désormais pourquoi il est important d’être précis.

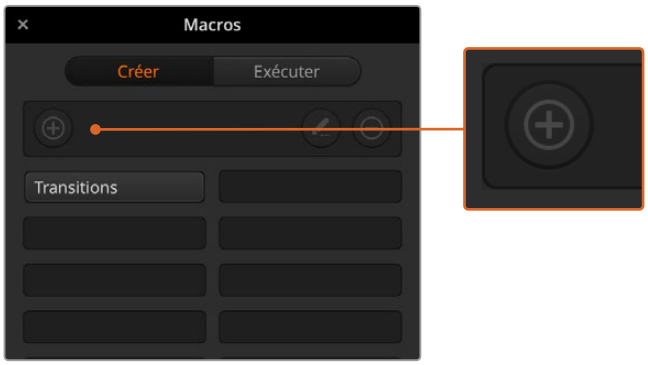
Si les paramètres sont modifiés au cours de l’enregistrement d’une macro, et si vous souhaitez les restaurer à une étape précédente, restaurez-les simplement pendant l’enregistrement des dernières étapes de la macro. Vous pouvez également enregistrer des macros pour restaurer les paramètres pour différents projets. Vous disposez d’une large gamme d’options. Il est important de se souvenir qu’au cours de l’enregistrement d’une macro, il faut modifier tous les paramètres requis pour créer les effets souhaités.

Enregistrer une macro à l'aide de l'ATEM Software Control

Dans l'exemple donné ci-dessous, vous allez créer une macro qui permettra au mélangeur ATEM d'effectuer une transition Mix de 3 secondes entre la mire de barres couleurs et Color 1, une pause de 2 secondes, et une transition Mix de 3 secondes vers Black. Exercez-vous à créer cette macro sur votre mélangeur ATEM pour comprendre son fonctionnement.

1. Lancez l'ATEM Software Control et ouvrez la fenêtre Macros.
2. Cliquez sur le bouton Créer dans la fenêtre Macros pour ouvrir la page Créer.
3. Sélectionnez l'emplacement pour macro sur lequel vous souhaitez l'enregistrer. Dans cet exemple, cliquez sur l'emplacement pour macro 1. Une bordure orange entoure alors l'emplacement que vous avez sélectionné.
4. Cliquez sur le bouton de création de la macro + pour ouvrir la fenêtre.

   Vous pouvez saisir le nom de votre macro et écrire une description. Cela vous permet de facilement reconnaître les macros et leurs différentes opérations. Lorsque vous cliquez sur une macro, la description apparaîtra dans la fenêtre d'état.

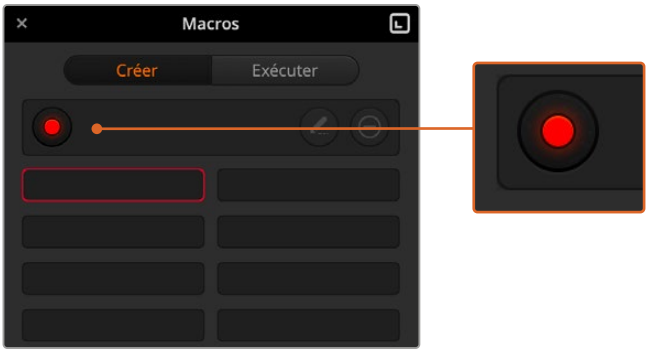


Pour commencer l'enregistrement d'une macro, sélectionnez un emplacement pour macro, puis cliquez sur le bouton de création de macro. Saisissez la description et cliquez sur **Enregistrer**.

5. Cliquez sur le bouton **Enregistrer**.

   La fenêtre se refermera et une bordure rouge entourera l'écran de l'ATEM Software Control. La macro est prête pour l'enregistrement. Vous trouverez un bouton rouge **Ajouter une pause** sur la bordure supérieure.

   Votre macro est prête pour l'enregistrement. Vous pouvez désormais effectuer les opérations sur le mélangeur.



Pendant l'enregistrement, le bouton de création de macro changera en un bouton d'enregistrement. Lorsque vous avez fini d'entrer les opérations sur votre mélangeur, cliquez sur le bouton d'enregistrement pour arrêter l'enregistrement.

6 Dans la fenêtre Mélangeur, cliquez sur le bouton Bars du bus Programme. Le bouton Bars ainsi réglé permet d'envoyer le signal vers les sorties du mélangeur.

7 Sélectionnez Color 1 dans le bus Prévisualisation.

8 Ouvrez la palette Transitions et sélectionnez le mode Mix.

   Si le mode Mix est déjà sélectionné, assurez-vous que la macro enregistre le paramètre en sélectionnant un autre mode de transition, par exemple le mode Wipe, puis en sélectionnant de nouveau le mode Mix.

9 Réglez à présent la durée de la transition sur 3:00 secondes. Cette étape règle la durée de la transition Mix à 3 secondes.

10 Cliquez sur le bouton Auto dans la section Style de transition. Le mélangeur exécute alors une transition Mix de la mire de barre couleur vers Color 1.

11 Pour que le mélangeur marque une pause de 2 secondes avant d'appliquer une autre transition, cliquez sur Ajouter une pause en haut de la bordure rouge. La fenêtre pour ajouter une pause s'ouvre. Réglez la durée de la pause sur 5 secondes et 0 image et cliquez sur **Ajouter une pause** pour confirmer.

   Pourquoi régler une pause de 5 secondes si vous n'avez besoin que d'une pause de 2 secondes ? La raison est simple, la transition Mix est exécutée en 3 secondes. Donc, si vous souhaitez ajouter une pause, vous devez tenir compte de la durée de la transition et de celle de la pause que vous souhaitez ajouter avant la transition suivante.

   Dans cet exemple, la transition prend 3 secondes, auxquelles s'ajoutent 2 secondes pour la pause. Il faut donc saisir une pause de 5 secondes. Il est également possible de créer 2 pauses indépendantes, une pour la durée de la transition et une pour la durée de la pause. À vous de choisir !

12 Appuyez sur le bouton Blk dans le bus Prévisualisation, et cliquez sur le bouton Auto dans la section Style de transition. Votre mélangeur effectuera une transition Mix vers Black.

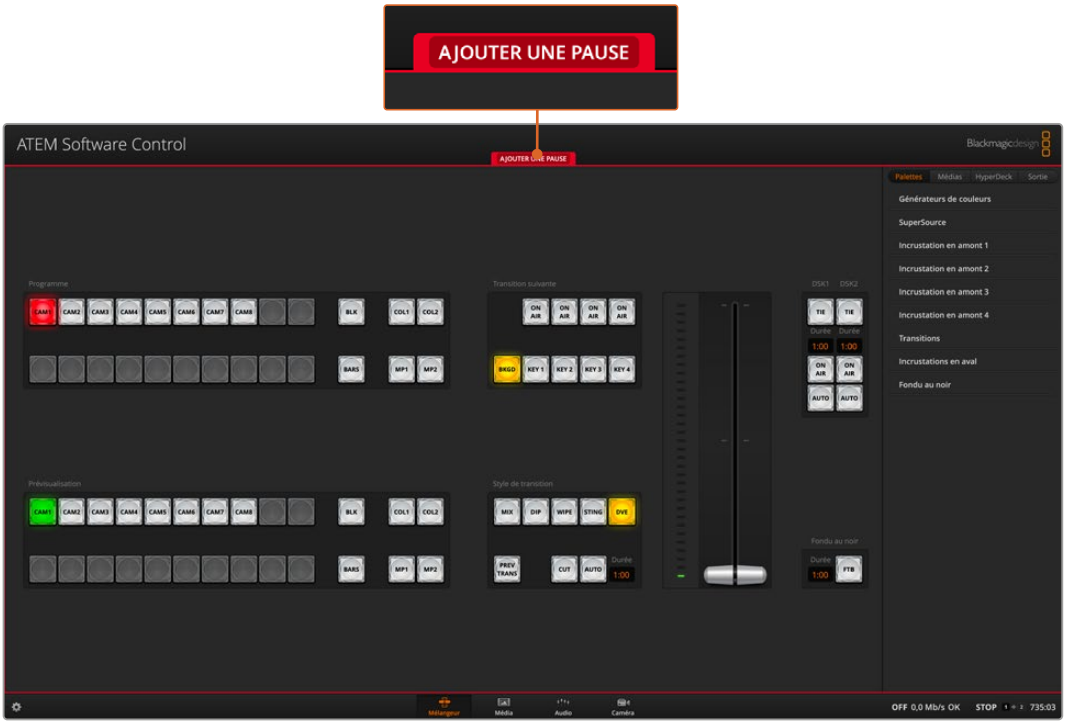
13 Appuyez sur le bouton multifonction d'enregistrement de la section Macros pour arrêter l'enregistrement de votre macro.

   La macro que vous venez de créer est enregistrée en tant que bouton dans l'emplacement pour macro sélectionné. Pour prévisualiser votre macro, cliquez sur le bouton Exécuter dans la fenêtre Macros pour ouvrir la boîte de dialogue Exécuter. Sélectionnez la fonction Rappeler et exécuter afin d'exécuter une macro dès que vous cliquez sur un bouton macro. Cliquez à présent sur le nouveau bouton macro **Transitions**.

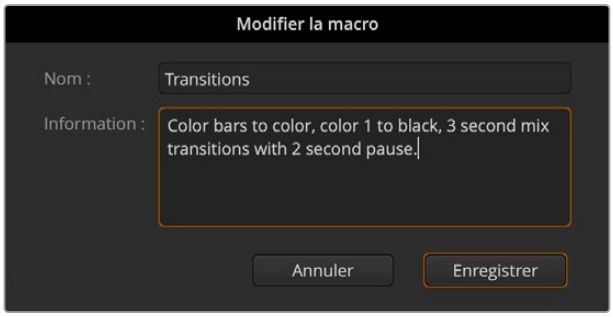
14 Si vous souhaitez que la macro soit exécutée dès que vous cliquez sur le bouton, sélectionnez la fonction **Rappeler et exécuter**. L'activation de cette fonction vous permet de charger et d'exécuter vos macros en appuyant simplement sur un bouton.

Si la macro fonctionne correctement, vous devriez voir une transition Mix de la mire de barres couleurs à Color 1 d'une durée de 3 secondes, puis une pause de 2 secondes et finalement une autre transition Mix de 3 secondes vers Black, le tout en appuyant sur un seul bouton. Une bordure orange doit également entourer le panneau de contrôle logiciel afin d'indiquer que la macro est en cours d'exécution.

Si la macro ne fonctionne pas correctement, réenregistrez la macro que vous venez de créer en répétant les étapes ci-dessus.



Lorsqu'une macro est en cours d'enregistrement, une bordure rouge entoure l'écran de l'ATEM Software Control. Le bouton Ajouter une pause situé en haut de la bordure rouge vous permet de saisir la durée des pauses entre les opérations du mélangeur.



Saisissez le nom de la macro et une description pour afficher les opérations effectuées sur le mélangeur.

Créer des macros complexes

Les macros enregistrées peuvent également déclencher d'autres macros. Cela vous permet de créer des macros complexes à partir de plusieurs macros simples. Il est par exemple possible d'enregistrer des macros dont les opérations sont limitées, puis de les combiner pour en faire des macros complexes. Cette procédure est particulièrement utile, car elle vous évite d'avoir à recommencer l'enregistrement de votre macro, ce qui arriverait si vous vous trompiez lors de l'enregistrement d'une macro complexe en une seule étape. Il est bien plus pratique d'enregistrer des segments qui comprennent peu d'opérations.

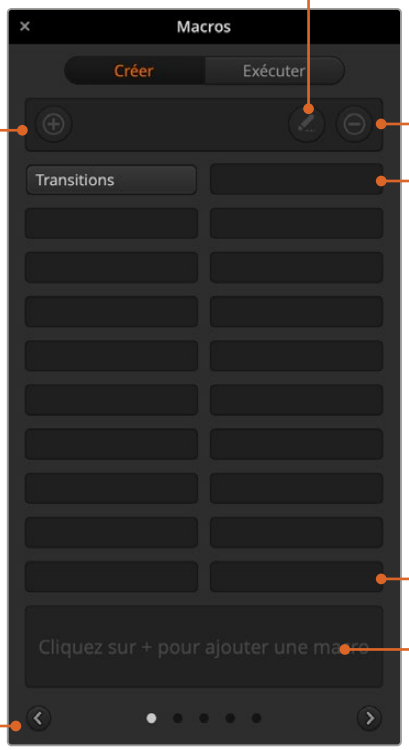
En enregistrant une macro complexe à l'aide de macros simples, vous pouvez également modifier la macro complexe en réenregistrant seulement certaines des macros simples, et les réinsérer ensuite dans la macro complexe.

Pour compiler des macros simples dans une macro complexe :

1. Commencez l'enregistrement de la nouvelle macro, puis en cours d'enregistrement, cliquez sur le bouton **Exécuter** pour ouvrir la page Exécuter.
2. Sélectionnez la fonction **Rappeler et exécuter** pour exécuter automatiquement les macros en appuyant sur un seul bouton, ou désélectionnez la fonction pour charger une macro et l'exécuter manuellement.
3. Exécutez votre suite de macros simples et ajoutez des pauses d'une durée identique entre chacune de ces macros jusqu'à ce que votre macro complexe soit terminée.
4. Arrêtez l'enregistrement. Vous disposez désormais d'une macro complexe qui a été créée à l'aide de macros simples modifiables à tout moment.

Il n'y a pas de limites au nombre d'opérations que vous pouvez effectuer. Il est aisé de créer des transitions complexes et des effets en boucle uniques à l'aide d'incrustateurs, ou de régler les paramètres de la Blackmagic Studio Camera les plus utilisés, les informations graphiques et les effets vidéo numériques. Cela vous permettra de ne pas devoir les régler à chaque fois que vous commencez un nouveau projet. Les macros sont pratiques et vous permettront de gagner beaucoup de temps !

La page Créer de la fenêtre Macros



Bouton de création de la macro :
Cliquez sur ce bouton pour ouvrir la fenêtre de création de la macro. Dans cette fenêtre, vous pouvez saisir le nom de la nouvelle macro, écrire une description dans la section des notes, et cliquer sur enregistrer pour commencer l'enregistrement de la macro.

Boutons flèches et icônes représentant les pages :
Pour accéder à plus de 20 macros ou enregistrer de nouvelles macros, cliquez simplement sur la flèche en bas à droite de la fenêtre Macros pour afficher une nouvelle page. Pour retourner à la page précédente, cliquez sur la flèche gauche. Les icônes page situées entre les flèches en bas de la fenêtre vous permettent de savoir à quelle page vous vous trouvez.

Bouton de modification de la macro :
Sélectionnez la macro que vous souhaitez modifier, puis cliquez sur le bouton de modification pour changer le nom et la description de la macro.

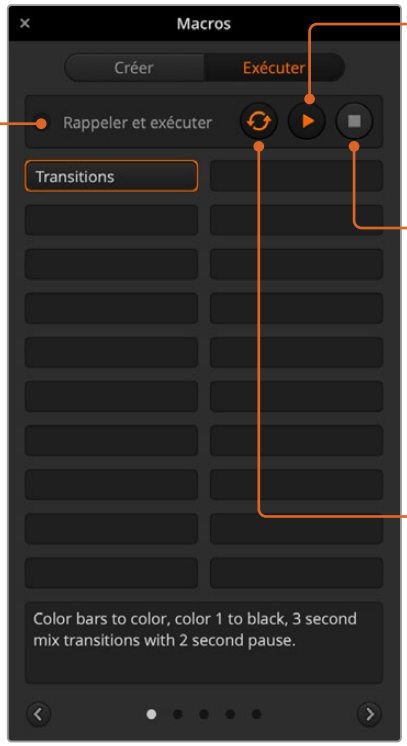
Bouton de suppression de la macro :
Sélectionnez la macro que vous souhaitez supprimer et cliquez sur le bouton de suppression de la macro pour la supprimer.

Boutons macro :
Après avoir enregistré une macro dans l'emplacement pour macro sélectionné, votre macro apparaîtra en tant que bouton macro. 20 boutons macro peuvent être affichés sur chaque page. Si la macro n'a pas été nommée, un chiffre apparaît dans l'emplacement.

Fenêtre État :
Cette fenêtre affiche des messages utiles concernant l'état de l'enregistrement et de l'exécution des macros. Lorsqu'une macro est sélectionnée, elle affiche également les descriptions enregistrées.

La page Exécuter de la fenêtre Macros

Rappeler et exécuter :
Sélectionner cette fonction permet d'exécuter immédiatement la macro en cliquant sur un bouton macro. Désélectionner cette fonction permet de charger une macro en cliquant sur un bouton macro. Exécutez la macro en cliquant sur le bouton lecture.



Lecture :
Lorsque la fonction Rappeler et exécuter est désélectionnée et que vous avez choisi une macro en cliquant sur un bouton macro, cliquez sur l'icône de lecture pour commencer à lire la macro.

Stop :
Ce bouton arrête la lecture de la macro, après l'exécution de l'opération en cours.
Par exemple, si vous appuyez sur ce bouton en cours de transition, le mélangeur effectuera la transition, puis s'arrêtera.

Boucle :
Lorsque ce bouton est sélectionné et que vous exécutez une macro, la macro sera exécutée en boucle jusqu'à ce que vous appuyiez sur le bouton Stop. Lorsque le bouton Boucle est désélectionné, la macro sera exécutée jusqu'à la fin.

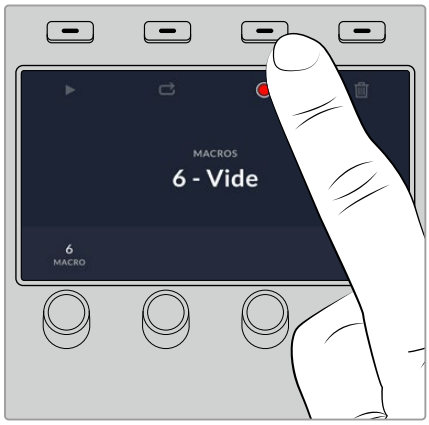
Enregistrer des macros avec l'ATEM Television Studio

Vous pouvez enregistrer et exécuter des macros à l'aide d'un ATEM Television Studio indépendamment de l'ATEM Software Control. Toutes les opérations effectuées sur la page Mélangeur de l'ATEM Software Control peuvent également être effectuées depuis le panneau de votre mélangeur. Si vous devez organiser des graphiques dans la bibliothèque de médias ou ajuster les paramètres des caméras, vous pouvez y accéder tout simplement à partir de l'ATEM Software Control.

Les boutons utilisés pour enregistrer et exécuter les macros sur l'ATEM Television Studio sont situés dans le bloc de boutons du Contrôle système. Les noms des boutons macro sont affichés dans la zone d'affichage des noms de source.

Suivez les instructions ci-dessous pour créer la macro Transitions décrite précédemment dans la section relative à l'enregistrement d'une macro à l'aide de l'ATEM Software Control. Cette fois, vous allez créer une macro dans l'emplacement pour macro numéro 6.

1. Appuyez sur le bouton multifonction **Macro** pour ouvrir le menu à l'écran.
2. Sélectionnez l'emplacement pour macro que vous souhaitez utiliser à l'aide de la molette **Macro** située sous l'écran LCD. Pour cet exemple, sélectionnez l'emplacement **6 - Vide**.
3. Appuyez sur le bouton d'enregistrement en haut de l'écran pour démarrer l'enregistrement. L'icône d'enregistrement en forme de cercle rouge apparaît. Lors de l'enregistrement, cette icône se transforme en carré rouge et une bordure rouge apparaît autour de l'écran LCD.



Appuyez sur le bouton d'enregistrement pour commencer l'enregistrement de votre macro.

Lors de l'enregistrement, une bordure rouge apparaît autour de l'écran

4 Sélectionnez **Color Bars** sur le bus Program à l'aide du bouton Shift. Le bouton clignote pour indiquer qu'il s'agit d'une source révélée par le bouton Shift.

5 Sélectionnez **Couleur 1** sur le bus Preview à l'aide du bouton Shift. Si vous le souhaitez, vous pouvez facilement mapper des boutons tels que Color Bars, Black et Color Generator sur un des 10 premiers boutons du bus Program ou du bus Preview pour y accéder plus rapidement. Veuillez vous référer à la section « Mappage des boutons » de ce manuel pour obtenir de plus amples informations.

6 Appuyez sur le bouton Wipe dans la section de contrôle des transitions pour vous assurer que la macro enregistre la transition Wipe sélectionnée.

7 Dans le menu à l'écran Wipe, réglez la durée sur 2:00 secondes.

8 Appuyez sur le bouton **Auto** de la section Transition Control pour effectuer la transition de la mire de barres couleurs à Couleur 1.

9 Appuyez sur le bouton **Macro** pour retourner sur l'écran de la macro.

10 Pour régler la macro sur un temps de pause de 2 secondes avant d'exécuter la transition suivante, appuyez sur le bouton multifonction **Ajouter une pause**, puis réglez la durée sur 2 secondes en tournant la molette correspondant à **Secondes**. Appuyez sur le bouton multifonction **Confirmer** pour enregistrer la pause.

11 Maintenant, sélectionnez **Black** sur le bus Preview à l'aide du bouton Shift, appuyez sur le bouton **Mix**, puis sur le bouton **Auto**. Votre mélangeur effectuera une transition Mix vers Black.

12 Appuyez sur le bouton **Macro** pour revenir au menu des macros, puis appuyez sur le bouton multifonction d'arrêt pour stopper l'enregistrement.

Vous venez d'enregistrer une macro à l'aide de l'ATEM Television Studio. La macro s'affichera en tant que **Macro 6**, car elle est située à l'emplacement pour macro numéro 6. Vous pouvez nommer votre macro et ajouter une description en cliquant sur le bouton de modification des macros (icône crayon) de l'ATEM Software Control.

Pour exécuter la macro, appuyez sur le bouton Macro afin de régler la rangée de sélection des sources de votre panneau en mode macro. Les boutons s'allument en bleu lorsque le mode macro est sélectionné. Appuyez sur le bouton Macro 6. Il est facile de voir quand une macro est exécutée, car le bouton Macro clignote en vert et une bordure orange apparaît autour du menu à l'écran.

Si la macro fonctionne correctement, vous devriez voir une transition Mix du signal Color Bars à Couleur 1 d'une durée de 2 secondes, puis une pause de 2 secondes et finalement une autre transition Mix de 2 secondes vers Black, le tout en appuyant sur un seul bouton de votre mélangeur ATEM. Si vous voulez mettre une macro en boucle, appuyez sur le bouton multifonction de lecture en boucle. Appuyez sur ce même bouton pour la désactiver.

Il est judicieux de tester fréquemment vos macros en utilisant des paramètres de mélangeur différents pour vérifier que la macro effectue toutes les fonctions souhaitées, qu'il ne manque aucune instruction et que rien d'inattendu ne se produise.

Contrôle de l’HyperDeck

Contrôle de l’HyperDeck

Vous pouvez brancher jusqu’à 10 enregistreurs à disque HyperDeck et les contrôler à l’aide des boutons du Contrôle système du mélangeur ATEM ou en utilisant la palette HyperDecks depuis l’ATEM Software Control. Vous avez donc une fonctionnalité très efficace à votre disposition ! Avec dix HyperDecks connectés à votre mélangeur, vous disposez d’un véritable studio d’enregistrement portatif. Vous êtes non seulement en mesure d’enregistrer des signaux de sortie à partir de votre mélangeur, mais aussi de lire les graphiques et de régler le mélangeur pour lire les clips préenregistrés grâce à un simple bouton.

Les commandes de transport se trouvent dans le menu Contrôle système de l’ATEM Television Studio et dans la palette HyperDecks de l’ATEM Software Control. Vous pouvez ainsi lire la vidéo, naviguer dans les clips, passer aux clips suivants, les mettre en pause et autres. Vous pouvez également enregistrer de la vidéo.

Si vous associez cette fonctionnalité aux macros puissantes disponibles sur l’ATEM, vous disposez d’un choix illimité pour produire vos émissions en direct !

HyperDeck Studio HD Plus

Connecter les HyperDecks

Pour connecter des HyperDecks au mélangeur, il suffit de brancher ces appareils aux entrées SDI du mélangeur. La connexion Ethernet permet à votre mélangeur ATEM de communiquer avec l’enregistreur à disque HyperDeck.

1. Sur la connexion Ethernet, reliez l’enregistreur à disque HyperDeck au même réseau que celui du mélangeur ATEM.
2. Appuyez sur le bouton **REM** situé sur le panneau avant de l’HyperDeck. Ce bouton s’allume pour indiquer que le contrôle à distance est activé. Si vous utilisez un HyperDeck Studio HD Mini, activez le paramètre de contrôle à distance à l’aide du menu de l’écran LCD.
3. Branchez la sortie SDI de l’HyperDeck aux entrées SDI du mélangeur ATEM.
4. Si vous voulez enregistrer la sortie programme de l’ATEM avec l’HyperDeck, branchez une des sorties SDI du mélangeur à l’entrée SDI de l’HyperDeck.
5. Répétez cette étape pour chaque HyperDeck que vous souhaitez connecter.

Une fois l’HyperDeck connecté au mélangeur, utilisez les boutons multifonction du Contrôle système et de l’écran LCD pour configurer et contrôler vos HyperDecks.

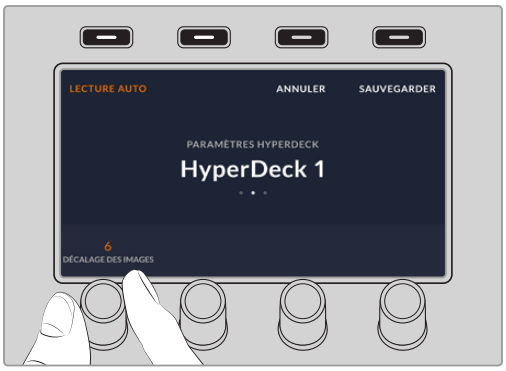
Pour commencer, appuyez sur le bouton **Settings** du Contrôle Système.

Appuyez sur le bouton multifonction de l'écran LCD situé au-dessus du paramètre **HyperDecks** pour accéder au menu **Paramètres HyperDeck**. Sur la première page du menu, vous verrez l'indicateur **HyperDeck** en bas à gauche, ainsi que l'indicateur **Entrée**. Utilisez la molette située sous l'indicateur **HyperDeck** pour passer les HyperDecks disponibles en revue.

Une fois que vous avez sélectionné un HyperDeck, tournez la molette située sous l'indicateur **Entrée** afin de sélectionner l'entrée de l'HyperDeck connecté au mélangeur. Par exemple, si l'HyperDeck 1 est connecté à l'entrée SDI 4 du mélangeur, tournez la molette située sous l'indicateur **Entrée** afin de sélectionner la caméra 4. Appuyez sur la molette **Entrée** pour confirmer la sélection.

Depuis la deuxième page, vous pouvez activer ou désactiver la lecture automatique et régler une valeur pour le décalage des images. Lorsque la fonction Lecture Auto est activée, l'enregistreur à disque HyperDeck lira automatiquement la vidéo lorsqu'il est commuté sur la sortie programme. Par exemple, vous pouvez positionner l'HyperDeck à l'endroit où vous souhaitez que votre source commence, puis lire la source en appuyant sur le bouton représentant son entrée dans le bus Programme. Si vous souhaitez positionner l'HyperDeck sur une image fixe ou déclencher manuellement la lecture vidéo, vous pouvez également désélectionner la fonction **Lecture auto**.

Comme l'HyperDeck doit tamponner quelques images avant de commencer la lecture, le raccord sera retardé d'un nombre d'images prédéfini afin d'obtenir une transition impeccable. Cela ressemble au réglage du preroll sur un magnétoscope. Vous pouvez modifier la durée du décalage en changeant le nombre inscrit dans la case **Décalage des images**. Nous suggérons de régler cette fonction sur cinq images pour obtenir une transition « propre ».



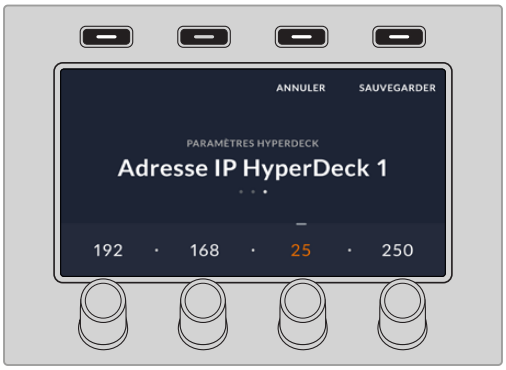
Une fois que vous avez attribué une entrée à un HyperDeck, vous devrez saisir son adresse IP. Cela permet à l'ATEM Television Studio de contrôler l'HyperDeck via Ethernet.

Pour saisir l'adresse IP d'un HyperDeck, allez sur la troisième page de configuration de l'HyperDeck à l'aide des flèches gauche ou droite, ou appuyez sur le numéro 3 du pavé numérique lorsque vous vous trouvez dans le menu de configuration de l'HyperDeck.

Sur cette page, vous verrez l'adresse IP de l'HyperDeck sélectionné actuellement. Chaque numéro d'adresse IP correspond à une molette au-dessous. Pour modifier ces numéros, vous pouvez tourner la molette correspondante, ou appuyer une fois sur la molette et saisir un numéro à l'aide du pavé numérique.

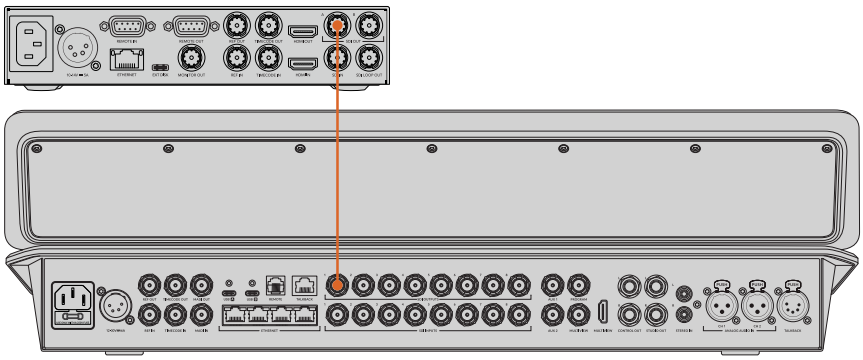
Suivez ce procédé pour chaque numéro de l'adresse IP.

Une fois que vous avez saisi l'adresse IP de votre HyperDeck, appuyez sur le bouton multifonction correspondant à l'indicateur **Sauvegarder** afin de confirmer l'adresse. Pour annuler, appuyez sur **Annuler**.



Pour saisir l'adresse IP des HyperDecks suivants, vous devrez sélectionner l'HyperDeck sur la première page du menu de configuration de l'HyperDeck.

Vous pouvez contrôler les HyperDecks via le mélangeur en utilisant le bouton **Media players**. Pour plus d'informations, consultez la section « Contrôle de l'HyperDeck » de ce manuel.



Branchez la sortie SDI de l'HyperDeck Studio HD Plus à une entrée SDI de l'ATEM Television Studio

Maintenant, indiquez à votre mélangeur ATEM l'adresse IP qui correspond à l'entrée utilisée par chaque HyperDeck. Pour y accéder, ouvrez l'onglet HyperDeck des paramètres de l'ATEM Software Control, ou en utilisant les boutons multifonctions du Contrôle système sur les ATEM Television Studio.

Paramètres de l'HyperDeck

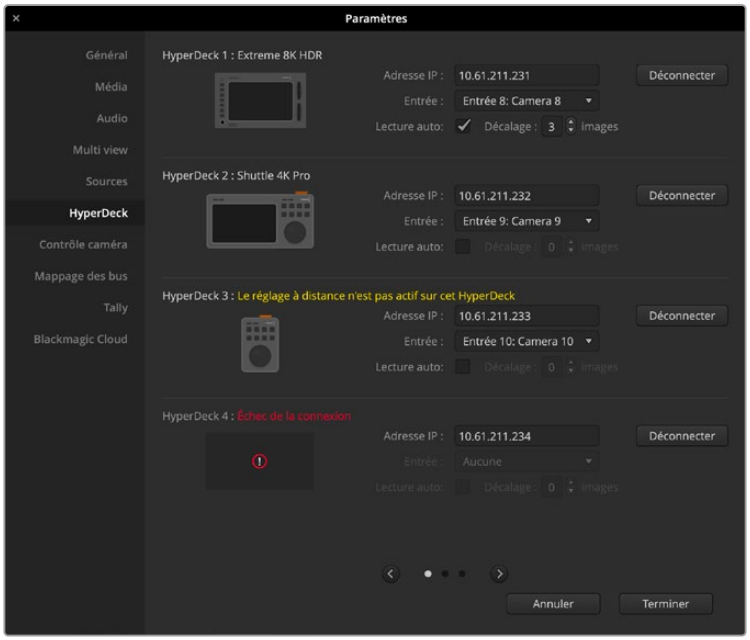
Les paramètres de connexion de l'HyperDeck sont situés sous l'onglet **HyperDeck** dans la section paramètres du mélangeur de l'ATEM Software Control. Vous y trouverez les options de configuration pour dix HyperDecks.

Il suffit de saisir l'adresse IP de votre HyperDeck dans la case **Adresse IP** et de choisir la source à laquelle vous souhaitez le brancher dans le menu **Entrée**. Cliquez sur **Connecter**, votre HyperDeck est prêt à être utilisé !

Les voyants d'état apparaissent au-dessus et au-dessous de chaque icône HyperDeck pour vous indiquer l'état de la connexion. Une coche verte signifie que l'HyperDeck est connecté à distance et prêt à être utilisé.

Si l'HyperDeck est connecté et reconnu, mais que son bouton Remote n'est pas actif, un voyant vous indiquera que le réglage à distance n'est pas actif.

Si votre HyperDeck n'est pas reconnu, un voyant vous indiquant que la connexion a échoué apparaît. Lorsque ce voyant apparaît, vérifiez que le port Ethernet de l'HyperDeck est connecté au réseau et que l'adresse IP a été correctement saisie.



Lecture automatique

Vous pouvez régler l'enregistreur à disque HyperDeck afin qu'il lise automatiquement la vidéo lorsqu'il est connecté à la sortie programme. Par exemple, vous pouvez positionner l'HyperDeck à l'endroit où vous souhaitez que votre source commence, puis lire la source en appuyant sur le bouton représentant son entrée dans le bus Programme.

Comme l'HyperDeck doit tamponner quelques images avant de commencer la lecture, le raccord sera retardé d'un nombre d'images prédéfini afin d'obtenir une transition impeccable. Cela ressemble au réglage du preroll sur un magnétoscope. Vous pouvez modifier la durée du décalage en changeant le nombre inscrit dans la case **Décalage des images**. Nous suggérons de régler cette fonction sur cinq images pour obtenir une transition "propre".

Si vous souhaitez positionner l'HyperDeck sur une image fixe ou déclencher manuellement la lecture vidéo, vous pouvez également désélectionner la fonction **Lecture auto**.

Contrôler des HyperDecks avec le logiciel ATEM

Pour contrôler les HyperDecks connectés au mélangeur, cliquez sur l'onglet **Lecteurs multimédia** sur le panneau de contrôle logiciel et sélectionnez la palette **HyperDecks**.

Choisissez ensuite un des HyperDecks connectés à votre système en cliquant sur un des dix boutons situés sur le haut du panneau. Ils sont nommés selon les libellés saisis dans les paramètres de l'ATEM. Les HyperDecks disponibles sont affichés en blanc, tandis que l'HyperDeck que vous contrôlez est affiché en orange.

Choisissez un des dix HyperDecks en cliquant sur le bouton correspondant dans la palette HyperDecks.

En plus de la couleur du texte, le bouton de sélection de chaque HyperDeck possède également un voyant tally.

Contour vert	Indique que l'HyperDeck est connecté à la sortie prévisualisation.
Contour rouge	Indique que l'HyperDeck est connecté à la sortie programme et donc à l'antenne. Les voyants d'état suivants peuvent également apparaître au-dessus des boutons de sélection de vos HyperDecks.
Prête	L'HyperDeck est réglé sur Remote et un disque a été inséré. Il est prêt à lire ou à enregistrer de la vidéo s'il y a de l'espace disponible.
Enregistrement	L'HyperDeck est en cours d'enregistrement.
Aucun disque	Aucun disque n'est installé dans l'HyperDeck.
Local	L'HyperDeck n'est pas réglé sur **Remote** et ne peut actuellement pas être contrôlé par le mélangeur ATEM.

Lorsque vous sélectionnez un HyperDeck, des informations concernant le clip sélectionné s'affichent, notamment son nom et sa durée ainsi que le temps écoulé et le temps restant. Au-dessous de ces informations, vous trouverez les boutons de contrôle.

	**Enregistrement** Cliquez sur ce bouton pour démarrer l'enregistrement sur l'HyperDeck. Cliquez à nouveau sur ce bouton pour arrêter l'enregistrement.
	**Clip précédent** Déplacement sur le clip précédent dans la liste de médias de l'HyperDeck.
	**Lecture** Cliquez sur ce bouton pour démarrer la lecture. Cliquez à nouveau pour l'arrêter. Si la fonction **Lecture auto** est activée dans les paramètres de l'HyperDeck, la lecture commence automatiquement lorsque l'HyperDeck commute sur la sortie programme.
	**Clip suivant** Déplacement sur le clip suivant dans la liste de médias de l'HyperDeck.
	**Lecture en boucle** Cliquez sur ce bouton pour lire en boucle le clip sélectionné. Cliquez à nouveau sur le même bouton pour une lecture en boucle de tous les clips de la liste de médias de l'HyperDeck.

Pour vous déplacer au sein d'un clip, utilisez le curseur shuttle/jog situé sous les boutons de contrôle de l'HyperDeck. Cette fonction permet un défilement rapide ou une recherche image par image dans le clip sélectionné. Vous pouvez passer d'un mode à l'autre en appuyant sur les boutons situés à côté du curseur shuttle/jog.

Choisissez entre un défilement rapide ou image par image du clip à l'aide des boutons situés à gauche du curseur de transport. Déplacez le curseur vers la gauche ou vers la droite pour avancer ou reculer dans le clip.

La liste de clips située au-dessous des commandes de transport indique tous les clips disponibles sur l'HyperDeck sélectionné. Vous pouvez l'agrandir ou la réduire en appuyant sur la flèche située à droite de la liste.

Lecture

Il est très facile de lire des médias sur l'HyperDeck. Réglez l'HyperDeck sur la sortie prévisualisation et sélectionnez le clip que vous souhaitez visualiser. Utilisez les commandes de transport pour vous positionner à un endroit spécifique du clip. Lorsque vous réglez l'HyperDeck sur la sortie programme, la fonction **Lecture auto** fera automatiquement commencer la lecture à partir de cet endroit.

Si vous souhaitez déclencher manuellement la lecture, par exemple vous positionner sur une image fixe et commencer la lecture, décochez la case **Lecture auto** de l'HyperDeck concerné dans l'onglet **HyperDeck** du menu de paramétrage du logiciel ATEM.

Enregistrement

Pour enregistrer avec un HyperDeck muni d'un disque formaté, appuyez sur le bouton d'enregistrement dans les commandes de transport de l'HyperDeck. L'indicateur de temps restant situé dans la palette de l'HyperDeck vous indique approximativement le temps d'enregistrement restant sur le SSD.

Contrôler les HyperDecks avec l'ATEM Television Studio

Une fois les HyperDecks connectés au mélangeur comme décrit précédemment dans la section « Connecter des HyperDecks », vous pouvez utiliser les boutons du Contrôle système et le menu LED du panneau de contrôle pour configurer et contrôler chaque HyperDeck.

Contrôler les HyperDecks avec l'ATEM Television Studio

Vous trouverez les commandes de l'HyperDeck dans le menu **Lecteurs multimédia** du Contrôle système. Pour accéder à ce menu, appuyez sur le bouton du panneau de contrôle nommé **Lecteurs multimédia** et appuyez sur le bouton multifonction situé au-dessus de l'indicateur **HyperDecks**. Si votre mélangeur possède plus de deux lecteurs multimédia, il se peut que vous deviez aller sur la page suivante du menu pour accéder aux commandes de l'HyperDeck.

Utilisez ensuite les molettes situées sous les indicateurs **HyperDeck**, **Clip**, **Jog** et **Shuttle** pour sélectionner les HyperDecks et les clips, ainsi que pour faire défiler les clips.

Le texte au centre du menu de l'HyperDeck se modifiera pour afficher l'HyperDeck et le clip sélectionnés.

Utilisez les troisième et quatrième pages du menu **Lecteurs multimédia** pour accéder à davantage de commandes HyperDeck, notamment Lecture, Stop, Lecture en boucle, Retour et Avance rapide pour passer d'un clip à l'autre.

CONSEIL Pour lire tous les clips, maintenez le bouton Shift appuyé et pressez le bouton multifonction de lecture.

Sur la troisième page du menu, appuyez sur le bouton d'enregistrement pour enregistrer la sortie de programme du mélangeur sur l'HyperDeck. Utilisez les commandes **Jog** et **Shuttle** pour faire défiler les séquences enregistrées.

Utiliser le tally

Envoyer des signaux tally via le boîtier d'interface GPI and Tally Interface

Votre mélangeur ATEM peut envoyer des signaux tally à des moniteurs et à des caméras pour savoir avec exactitude quelle source est sur le signal de sortie programme, en d'autres termes quelle source est à l'antenne.

Le tally est couramment utilisé pour allumer le voyant rouge situé sur une caméra ou un moniteur afin que les acteurs sachent qu'ils sont à l'antenne. Le tally peut également illuminer une bordure sur un moniteur comme le Blackmagic SmartView 4K. La bordure permet à l'équipe de production de savoir quelle caméra est à l'antenne.

L'interface GPI and Tally Interface de Blackmagic Design est un périphérique Ethernet comportant huit relais mécaniques à fermeture de contact liés à la terre qui peuvent être utilisés pour le tally. Les signaux tally sont envoyés à partir du port Ethernet de votre mélangeur ATEM à une GPI and Tally Interface sur le même réseau que le mélangeur. En suivant les instructions de câblage à l'arrière de la GPI and Tally Interface, un câble épanoui peut être connecté à du matériel vidéo qui prend en charge les signaux tally à fermeture de contact, comme le SmartView Duo et le SmartView HD. Une seule GPI and Tally Interface peut prendre en charge jusqu'à 8 signaux de réception tally. Une seule GPI and Tally Interface est nécessaire pour l'ATEM Television Studio.

GPI and Tally Interface

Les entrées GPI sont des isolateurs optiques qui sont activés par une connexion à la terre avec un maximum de 5V à 14mA.

Les sorties tally sont des relais mécaniques à fermeture de contact liés à la terre avec un maximum de 30V à 1 A.

Modifier les paramètres réseau et tally

L'utilitaire ATEM Setup permet de configurer les paramètres réseau de la GPI and Tally Interface afin qu'elle puisse communiquer avec le mélangeur ATEM. La GPI and Tally Interface doit être connectée via USB pour configurer ses paramètres à l'aide de l'ATEM Setup.

1. Connectez la GPI and Tally Interface au même réseau Ethernet que votre mélangeur ATEM.
2. Connectez la GPI and Tally Interface à un port USB sur votre ordinateur et connectez également l'alimentation fournie.
3. Lancez l'ATEM Setup.
4. Si votre mélangeur ATEM se connecte directement à votre ordinateur sans commutateur réseau Ethernet, choisissez l'option : « Configure address Using a static IP » (Configuration de l'adresse avec un IP fixe). La GPI and Tally Interface est livrée par défaut avec une adresse IP fixe de 192.168.10.2. Nous vous suggérons d'utiliser ce nombre pour plus de simplicité.

   Si vous optez pour une adresse IP fixe différente, vous pouvez la configurer dans la même plage que votre mélangeur ATEM, tant que cette adresse IP est différente de celle utilisée par un autre périphérique de votre réseau. Pour cette raison, nous vous recommandons d'éviter d'utiliser les

adresses IP des produits ATEM réglées par défaut suivantes : 192.168.10.1, 192.168.10.2, 192.168.10.3, 192.168.10.10, 192.168.10.50, 192.168.10.60 et 192.168.10.240.

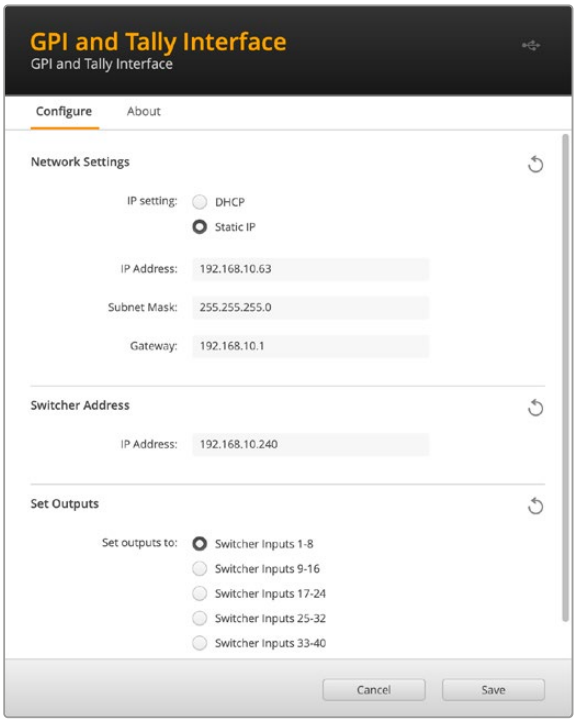
Si votre mélangeur ATEM se connecte via un commutateur réseau Ethernet existant, vous opterez peut-être pour « Configure address Using DHCP » (Configurer l'adresse en utilisant un serveur DHCP) étant donné que ce paramètre récupère automatiquement l'adresse IP, le masque sous-réseau et les informations relatives à la passerelle de votre serveur DHCP.

5 Saisissez l'adresse IP de votre mélangeur ATEM dans le champ intitulé « Switcher Address ». Votre mélangeur ATEM est réglé par défaut sur DHCP. Vous pouvez lui attribuer une adresse IP statique.

6 Le paramètre « Set tally outputs » devrait être réglé sur « Switcher Inputs 1-8 ».

7 Cliquez sur « Apply ». La LED blanche située à droite du port USB devrait s'arrêter de clignoter et rester allumée pour indiquer que l'ATEM a été reconnu. La GPI and Tally Interface est maintenant prête à être utilisée.

8 Fermez l'ATEM Setup et déconnectez le câble USB.



Paramètres réseau et sortie pour la GPI and Tally Interface

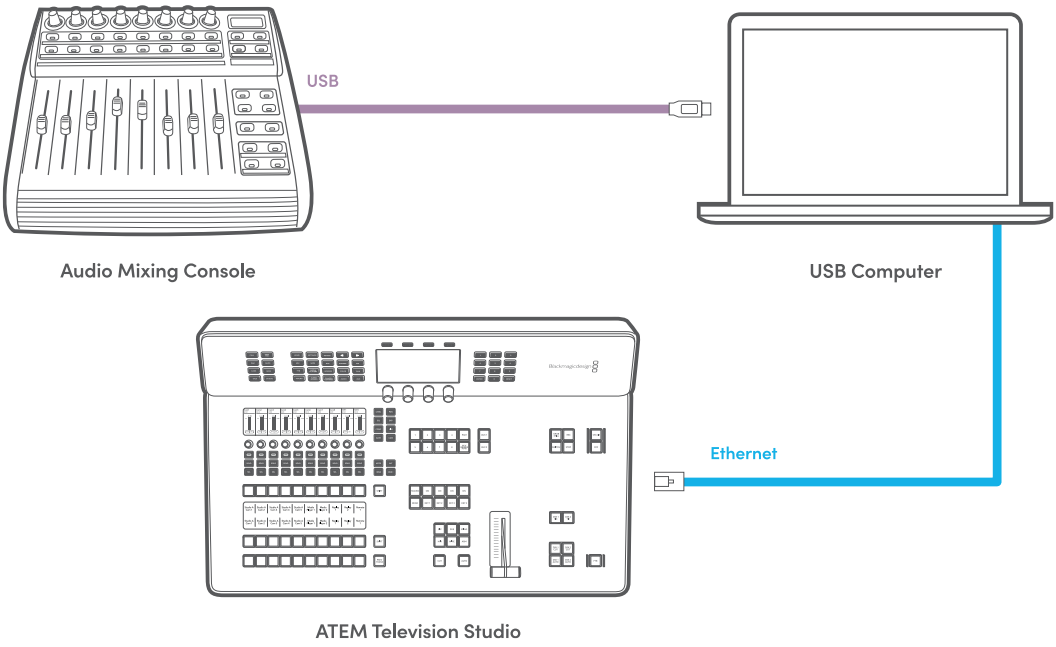
Utiliser une console de mixage audio tierce

Utiliser une console de mixage audio

Dans le monde toujours sous pression de la production télévisée, les réglages effectués avec une simple souris peuvent parfois paraître très lents ! Si vous devez mixer davantage de sources audio simultanément sur le mélangeur ATEM, ce qui suit pourrait vous être utile. Connecter une console de mixage audio à un mélangeur ATEM vous offre la possibilité d'ajuster plusieurs niveaux audio en même temps.

Une surface de contrôle audio peut être connectée à votre Mac ou PC en tant que périphérique MIDI qui communique avec le mélangeur ATEM au moyen de commandes Mackie Control.

Un grand nombre de surfaces de contrôle MIDI tierces sont compatibles avec votre mélangeur ATEM. Il vous est cependant conseillé de vérifier ce point avec le fabricant de votre surface de contrôle, en cas de doute.



Vous pouvez ajuster plusieurs niveaux audio en même temps en connectant une console de mixage audio à l'ordinateur qui exécute l'ATEM Software Control.

Connecter une console de mixage audio

1. Connectez une console de mixage MIDI compatible avec Mac ou PC. La plupart des surfaces de contrôle modernes utilisent l'USB.

2. Vérifiez que votre console de mixage est reconnue par votre ordinateur en tant que périphérique MIDI.

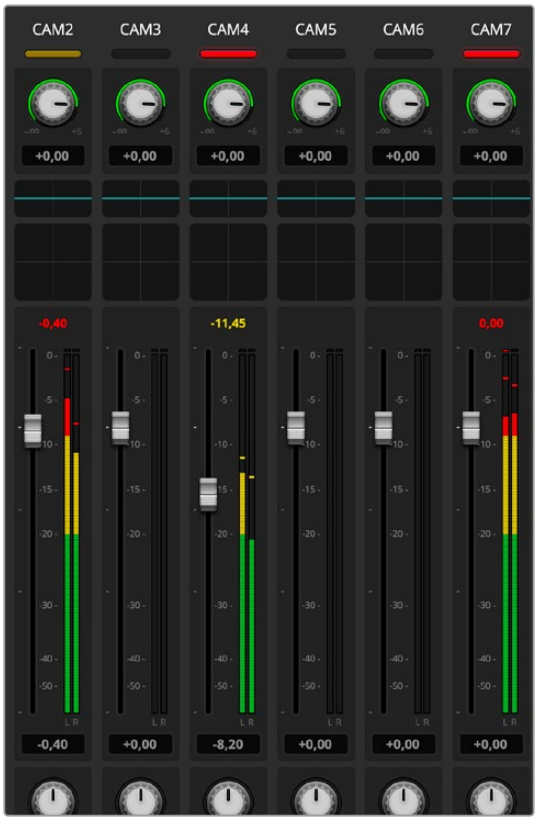
   Pour les ordinateurs Mac, allez sur Applications/Utilities/Audio MIDI Setup et lancez l'application. Allez sur le menu Window (Fenêtre) et choisissez l'option Show MIDI Window (Afficher la fenêtre MIDI). Assurez-vous que la surface de contrôle apparaît en tant que périphérique MIDI dans cette fenêtre.

   Pour les ordinateurs Windows, allez sur Device Manager/Sound, Video and Game Controllers et assurez-vous que la surface de contrôle apparaît sur la liste d'icônes.

3. Le mixeur audio de l'ATEM est conçu pour communiquer avec votre console de mixage audio à l'aide des commandes Mackie Control. La console de mixage audio devra donc prendre en charge le Mackie Control. Vous devrez également vous assurer que votre console de mixage audio est configurée pour utiliser le Mackie Control natif ou une émulation du Mackie Control. Consultez le manuel d'utilisation de votre surface de contrôle pour obtenir de plus amples informations sur la configuration de l'appareil.

   Certaines consoles de mixage offrent plusieurs types d'émulation du Mackie Control. Il convient de choisir celui qui active le plus grand nombre de fonctions sur votre console de mixage. Par exemple, avec le modèle Behringer BCF 2000, choisir l'option "Mackie Control Mapping for Cakewalk Sonar 3 [MCSo]" active les potentiomètres de niveau, les sélecteurs de rangée, le contrôle de la balance, ainsi que les fonctions AFV et ON/MUTE. Cette option active également l'écran LED qui affiche les potentiomètres que vous avez sélectionnés pour votre mixage audio. L'écran LED ne s'activera pas si vous sélectionnez une autre émulation du Mackie Control.

4. Lancez l'ATEM Software Control. Il détecte alors automatiquement la console de mixage branchée au premier port du périphérique MIDI. Cliquez sur l'onglet Audio dans l'ATEM Software Control pour afficher le mixeur audio de l'ATEM. Faites glisser les potentiomètres de gain de bas en haut sur votre mixeur audio et vérifiez que les mouvements du mixeur audio à l'écran correspondent. Si tel est le cas, vous avez configuré avec succès votre console de mixage avec le mélangeur ATEM.



Bouton MUTE

Dans l'interface du mixeur audio de l'ATEM, l'audio est toujours activé ou présent dans le mix, lorsque le bouton ON est sélectionné. Lorsque le bouton ON est désélectionné, l'audio n'est pas présent ou en mode silencieux. Pour correspondre à l'interface du logiciel, vous constaterez que le bouton MUTE de votre surface de contrôle audio est allumé quand l'audio est activé ou présent dans le mix. Le bouton MUTE est éteint lorsque l'audio est absent ou en mode silencieux.

Échelles des décibels

Toutes les consoles de mixage audio sont différentes. Par conséquent, il est possible que l'échelle imprimée sur votre console ne corresponde pas à celle du mixeur audio de l'ATEM. Consultez toujours les niveaux du mixeur audio de l'ATEM pour obtenir l'échelle de décibels appropriée.

Utiliser un DaVinci Resolve Micro Panel

Le correcteur colorimétrique primaire DaVinci Resolve de chaque caméra peut être contrôlé à l'aide d'un DaVinci Resolve Micro Panel. Il vous permet d'effectuer rapidement des ajustements de couleurs précis avec un panneau de contrôle matériel.

Pour installer le panneau :

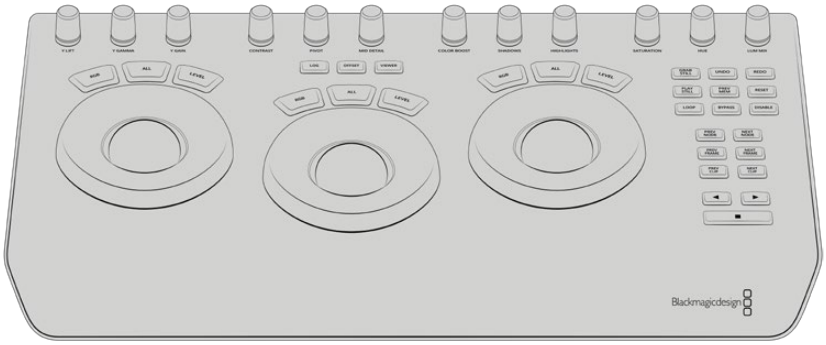
1. Connectez le DaVinci Resolve Micro Panel à votre ordinateur via USB-C et lancez l'ATEM Software Control.
2. Cliquez sur l'onglet **Caméra** et sélectionnez une caméra en cliquant n'importe où dans la fenêtre de contrôle de caméra.
3. Sur le DaVinci Resolve Micro Panel, faites tourner les boules de commande et les molettes pour ajuster les commandes correspondantes du correcteur colorimétrique primaire.

Ajuster la correction colorimétrique

Le DaVinci Resolve Micro Panel est principalement conçu pour fonctionner avec le logiciel DaVinci Resolve. Vous pouvez toutefois l'utiliser pour effectuer des ajustements dans la fenêtre de correction colorimétrique du logiciel ATEM.

Boules de commande

Les trois boules de commande contrôlent les roues colorimétriques Lift, Gamma et Gain dans la fenêtre de correction colorimétrique. L'anneau autour de chaque boule de commande ajuste la roue maîtresse correspondante située sous les roues colorimétriques.



DaVinci Resolve Micro Panel

Molettes de contrôle

Lorsque vous modifiez des paramètres avec le panneau de contrôle matériel, les paramètres correspondants sur le panneau de contrôle logiciel se modifient également. Utilisez les molettes de contrôle suivantes pour effectuer des ajustements :

Y Lift	Permet de modifier le contraste de l'image via un ajustement n'affectant que la luminance du niveau de noir.
Y Gamma	Permet de modifier le contraste de l'image via un ajustement n'affectant que la luminance du gamma.
Y Gain	Permet de modifier le contraste de l'image via un ajustement n'affectant que la luminance des hautes lumières.
Contraste	Tournez la molette dans le sens des aiguilles d'une montre pour augmenter le contraste, et dans le sens inverse pour le réduire.
Highlights	Contrôle l'iris de la caméra sélectionnée. Tournez la molette dans le sens des aiguilles d'une montre pour ouvrir l'iris ou dans le sens inverse pour le fermer.
Saturation	Tournez la molette dans le sens des aiguilles d'une montre pour augmenter la saturation des couleurs, et dans le sens inverse pour la réduire.
Teinte	Ajustez la teinte comme sur une roue chromatique en tournant la molette Hue dans le sens des aiguilles d'une montre ou dans le sens inverse.
Lum Mix	Tournez la molette dans le sens des aiguiles d'une montre ou dans le sens inverse pour définir le mélange entre les correcteurs RGB et YRGB.

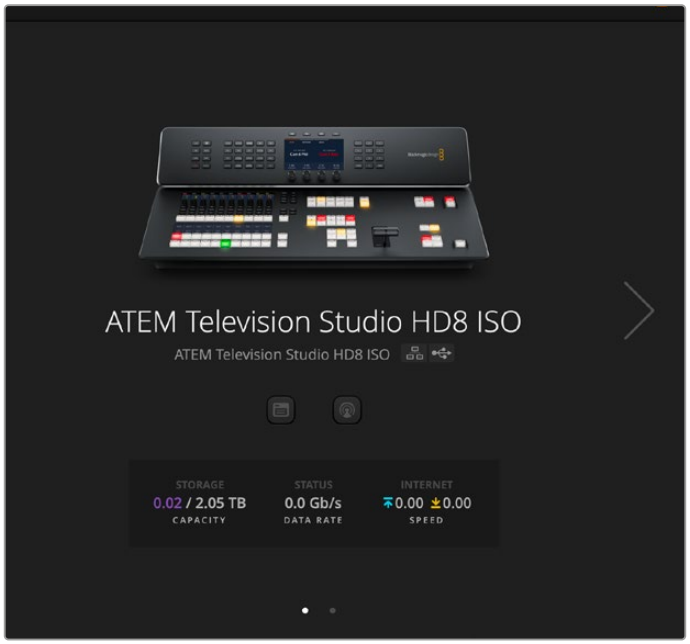
Boutons de contrôle

Flèche gauche	Sélectionne le numéro de caméra précédent.
Flèche droite	Sélectionne le numéro de caméra suivant.

Pour plus d'informations sur la façon dont ces commandes affectent l'image, consultez les explications données précédemment dans cette section.

Utiliser l'ATEM Setup

Lorsque l'ATEM Software Control est installé sur votre ordinateur, l'utilitaire ATEM Setup sera également installé. Cet utilitaire vous permet de mettre à jour votre ATEM Television Studio, de nommer l'appareil, de modifier les paramètres réseau et de régler les paramètres du panneau, notamment les modes de commutation Cut Bus et Programme/Prévisualisation, ainsi que les incrustateurs.



Lorsque vous lancez l'ATEM Setup, l'écran d'accueil apparaît. Si vous avez plus d'un mélangeur ATEM connecté via USB ou sur votre réseau, ils seront tous disponibles en cliquant sur la flèche gauche ou droite.

Si vous avez un stockage cloud interne, les indicateurs en bas de l'écran d'accueil affichent la capacité de stockage totale, la quantité d'espace utilisée, l'état de la connexion réseau, ainsi que le débit de données maximum actuel. Si le nombre représentant l'espace utilisé est violet, vous pouvez lire et écrire sur le stockage. Si le nombre est bleu, l'accès au stockage est réglé sur lecture seule.

Cliquez sur l'icône bleue au-dessus des indicateurs de stockage pour ouvrir la page des réglages. Cliquez sur l'icône à droite pour lancer l'ATEM Software Control.

Onglet Setup (Réglages)

Name (Nom)

Si vous souhaitez renommer votre mélangeur, saisissez un nouveau nom dans la boîte et cliquez sur **Save**.

Software (Logiciel)

Affiche la version du logiciel installé sur votre ATEM Television Studio.

Date and Time (date et heure)

Sélectionnez automatiquement la date et l'heure de l'ATEM Television Studio en cochant la case.

Lorsque vous réglez la date et l'heure automatiquement, votre mélangeur ATEM utilisera le serveur du Network Time Protocol réglé dans le champ NTP. Le serveur NTP par défaut est time.cloudflare.com. Toutefois, vous pouvez également saisir manuellement un autre serveur NTP, puis cliquer sur **Set**.

Si vous saisissez la date et l'heure manuellement, utilisez les champs pour saisir la date, l'heure et le fuseau horaire. Régler la date et l'heure correctement garantit que vos enregistrements disposent des mêmes informations d'horodatage que votre réseau et évite également les conflits pouvant survenir avec certains systèmes de stockage en réseau.

Réseau

Ces paramètres vous permettent de configurer les options réseau, comme le choix de connexion à un réseau via DHCP ou via une adresse statique IP. Pour plus d'informations sur la connexion de votre mélangeur ATEM à un réseau, veuillez consulter la section « Connexion à un réseau ».

Allow Utility Administration (Autoriser l'administration de l'utilitaire)

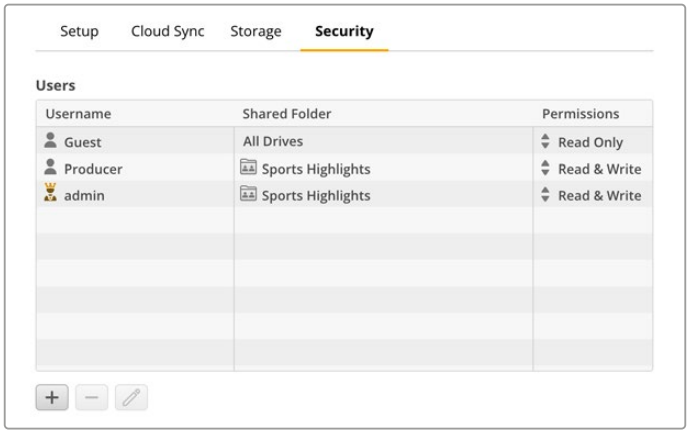
Vous pouvez accéder à l'ATEM Setup lorsque votre mélangeur ATEM est connecté via le réseau ou USB. Pour éviter que des utilisateurs y aient accès via le réseau, sélectionnez uniquement USB.

Connexion prioritaire

Quand Ethernet et un téléphone portable sont connectés à votre ATEM Television Studio, ce paramètre vous permet de choisir la connexion à utiliser pour le streaming. Pour plus d'informations sur le partage des données mobiles, veuillez consulter la section « Partage de connexion via un smartphone ».

Onglet Security (Sécurité)

L'onglet **Security** comporte les réglages d'authentification utilisateur, ainsi que des options pour créer des utilisateurs, allouer les dossiers partagés et assigner les permissions aux dossiers.

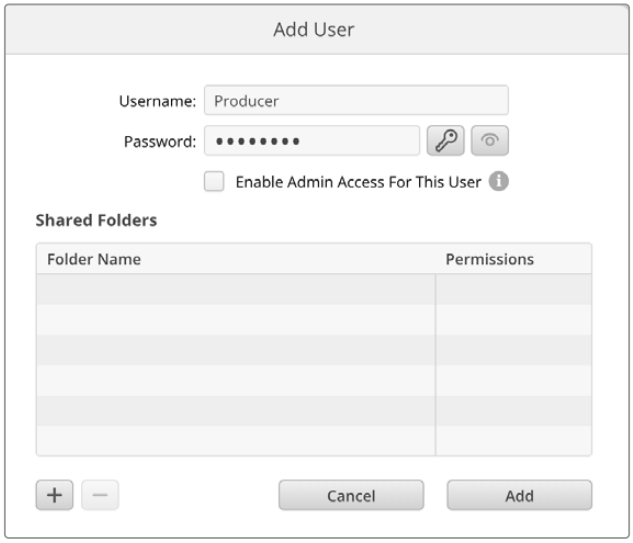


Add users (Ajouter des utilisateurs)

Utilisez ces paramètres pour créer des utilisateurs, allouer des dossiers partagés et régler les permissions des dossiers. Ils s'appliquent lorsque les utilisateurs se connectent via un mot de passe stocké localement. Par exemple, vous pouvez attribuer à un chef de projet des droits de lecture et d'écriture sur un dossier partagé, puis des droits de lecture seule aux utilisateurs qui ont seulement besoin de consulter les fichiers. Tout dossier sur le stockage USB externe de votre mélangeur ATEM ou sur un stockage cloud optionnel peut être partagé.

1 Cliquez sur le bouton + en bas à gauche de l'onglet **Security** pour ouvrir la fenêtre d'ajout d'un utilisateur.

2 Dans la fenêtre **Add user**, entrez un nom d'utilisateur pour le nouvel utilisateur. Si vous créez un utilisateur qui se connectera via SMB avec un mot de passe stocké localement, entrez un mot de passe dans le champ **Password**. Vous pouvez générer automatiquement un mot de passe sécurisé en appuyant sur la clé.



Si vous souhaitez donner au nouvel utilisateur un accès administrateur, cochez la case **Enable admin access for this user**. Cette option permet à l'utilisateur d'accéder à l'ATEM Setup via Ethernet et de modifier les paramètres.

3 Cliquez sur le bouton + pour ouvrir la fenêtre du dossier partagé.

Une liste de tous les dossiers du niveau supérieur du stockage interne de l'ATEM Television Studio s'affiche. Double-cliquez sur un dossier pour afficher les sous-dossiers. Le menu situé en haut de la fenêtre affiche le nom du dossier que vous êtes en train de consulter et vous permet de remonter les niveaux. Sélectionnez le dossier partagé auquel vous souhaitez que le nouvel utilisateur ait accès et appuyez sur **Set**.

4 Le dossier partagé s'affiche dans la liste des dossiers partagés de la fenêtre **Add users**.

Pour attribuer un autre dossier, cliquez sur le bouton + ou pour supprimer l'accès au dossier partagé, cliquez sur le bouton -. Pour fermer la fenêtre **Add user** et revenir à l'onglet **Security**, cliquez sur **Add**, puis sur **Save**.

Le nouvel utilisateur peut désormais se connecter à l'ATEM et accéder à ses dossiers partagés alloués.

Pour accéder aux dossiers partagés sur un Mac :

1 Ouvrez le Finder et cliquez sur **Réseau** dans le menu de la barre latérale.

2 Dans la liste, cliquez sur le mélangeur ATEM.

3 Cliquez sur **Se connecter en tant que**, saisissez votre nom d'utilisateur et votre mot de passe, puis cliquez sur **Se connecter**.

Votre mélangeur ATEM apparaît dans la barre latérale Emplacements. Cliquez sur votre mélangeur pour afficher les dossiers partagés.

Pour accéder aux dossiers partagés sur un ordinateur Windows :

1 Cliquez sur **Réseau** dans le menu de la barre latérale de l'Explorateur de fichiers. Vous verrez votre mélangeur ATEM dans la liste.

2 Double-cliquez sur votre mélangeur ATEM et une fenêtre de sécurité Windows apparaîtra pour vous demander les informations d'identification du réseau.

3 Saisissez votre nom d'utilisateur et votre mot de passe.

4 Cliquez sur **OK**.

Le dossier partagé de votre mélangeur ATEM s'affichera dans la fenêtre Explorer et vous pourrez y accéder comme à tout autre disque réseau.

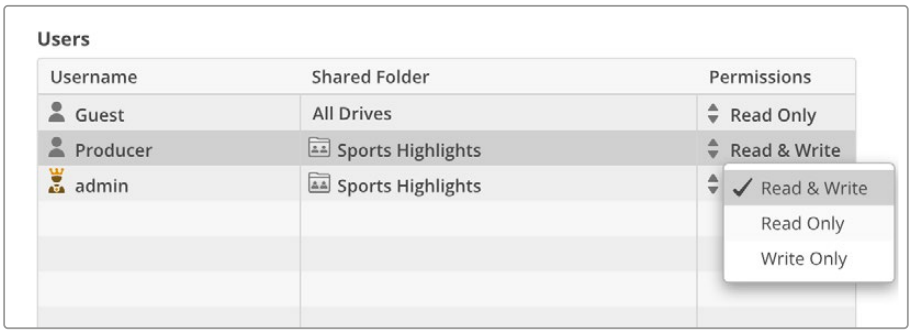
Permissions (Autorisations)

Les autorisations vous permettent de contrôler le niveau d'accès d'un utilisateur à un dossier partagé. Lorsque vous attribuez un dossier à un utilisateur pour la première fois, celui-ci reçoit des autorisations de lecture et d'écriture qui lui permettent d'ajouter, de déplacer, de modifier ou de supprimer le contenu du dossier partagé. Vous pouvez modifier les autorisations du dossier partagé en lecture seule **Read only** ou en écriture seule **Write only**. Lorsque l'autorisation est réglée sur la lecture seule, l'utilisateur peut voir le contenu du dossier, mais ne peut pas ajouter, supprimer ou modifier de fichiers. Avec l'écriture seule, l'utilisateur pourra copier des fichiers dans le dossier, mais ne pourra pas en voir le contenu.

Pour modifier les autorisations :

1 Sélectionnez un utilisateur dans la liste utilisateurs de l'onglet **Security**.

2 Dans la colonne **Permissions**, cliquez sur les autorisations actuelles de l'utilisateur et sélectionnez une option dans la liste.



3 Cliquez sur **Save** pour confirmer votre sélection.

CONSEIL L'utilisateur **Guest** est créé par défaut et dispose automatiquement d'un accès en lecture et en écriture à tous les dossiers partagés sur le stockage de votre ATEM. Vous pouvez modifier les autorisations de l'utilisateur invité dans la section **Permissions** de l'onglet **Security** en **Read & write** (Lecture et écriture), **Write only** (Écriture seule), **Read only** (Lecture seule) ou **No access** (Pas d'accès).

Gestion des utilisateurs

Utilisez les options de gestion des utilisateurs pour modifier les attributions de dossiers, le nom d'utilisateur ou le mot de passe d'un utilisateur, ainsi que pour activer ou désactiver l'accès administrateur.

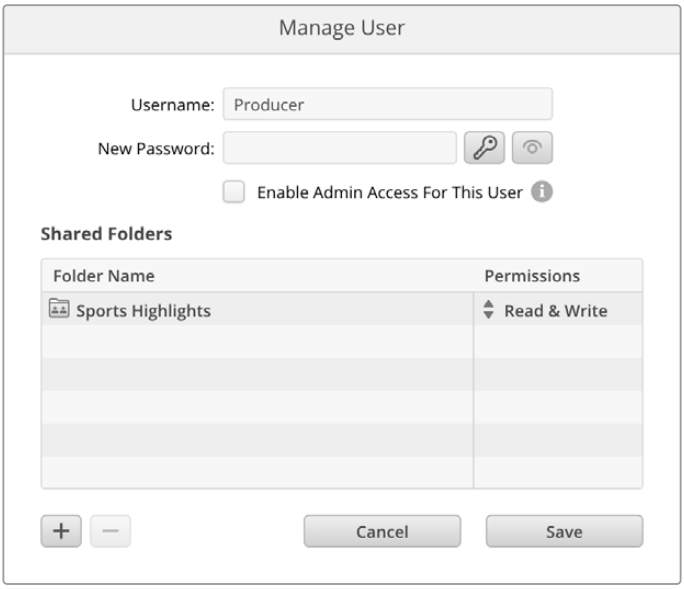
Settings (Réglages)

Pour gérer un utilisateur :

1 Dans l'onglet **Security**, sélectionnez l'utilisateur que vous souhaitez gérer dans la liste des utilisateurs.

2 Cliquez sur l'icône crayon.

3 Dans la fenêtre **Manage user**, mettez à jour les informations de l'utilisateur.



4 Cliquez sur **Save** pour confirmer vos changements.

Supprimer des utilisateurs

Pour supprimer un utilisateur, sélectionnez le nom d'utilisateur que vous souhaitez supprimer dans la liste des utilisateurs de l'onglet **Security** et cliquez sur le bouton -. Pour confirmer votre choix, cliquez sur **Delete**. Si vous supprimez un utilisateur, il perdra accès à tous les dossiers partagés qui lui ont été attribués.

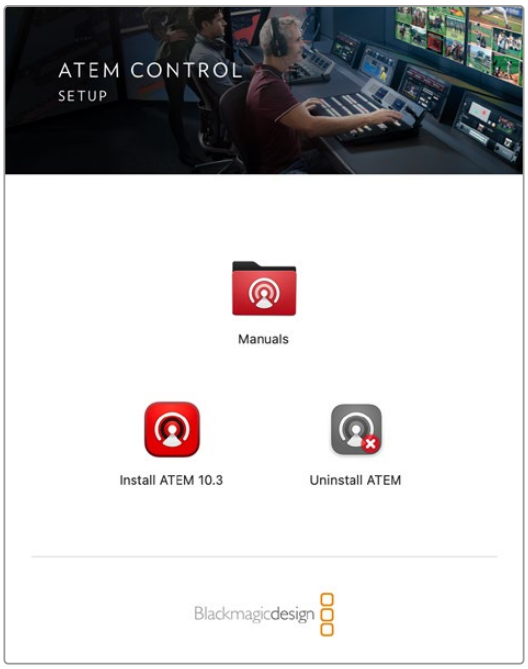
Mettre à jour le logiciel

Mise à jour du logiciel ATEM

De temps en temps Blackmagic Design proposera un nouveau logiciel pour votre mélangeur ATEM et votre panneau de contrôle matériel, offrant de nouvelles fonctions, des corrections de bugs et une plus grande compatibilité avec les logiciels et les appareils vidéo tiers.

Pour mettre à jour votre mélangeur ATEM avec le nouveau logiciel, vous devrez utiliser l'utilitaire Blackmagic ATEM Setup afin de vous connecter au mélangeur et aux panneaux matériels. L'ATEM Setup vérifiera le logiciel interne de votre mélangeur et vous proposera une mise à jour si une version plus récente est installée sur votre ordinateur.

Mettez toujours tout votre matériel à jour en même temps afin que tous les appareils aient la même version du logiciel.



Programme d'installation du logiciel ATEM

Pour effectuer une mise à jour, il suffit de connecter directement votre mélangeur ATEM à un ordinateur via USB.

Si votre mélangeur est connecté à l'ordinateur via Ethernet, vous pouvez également effectuer la mise à jour via la connexion Ethernet.

Premièrement, téléchargez la dernière version du logiciel ATEM et installez-la sur votre Mac ou PC en suivant les instructions décrites précédemment dans la section relative à l'installation du logiciel de ce manuel. Une fois installé, le nouveau logiciel pour votre mélangeur sera inclus dans l'utilitaire ATEM.

Mise à jour du logiciel pour le mélangeur

1. Connectez le mélangeur à votre ordinateur via USB.

   Si votre mélangeur est déjà connecté à l'ordinateur via Ethernet, vous pouvez effectuer la mise à jour via la connexion Ethernet.

   Lors de la mise à jour du logiciel via USB, vérifiez que le mélangeur est le seul appareil ATEM connecté par câble USB à l'ordinateur qui exécute l'utilitaire. Si plus d'un appareil ATEM est connecté, il se peut que le mélangeur ne soit pas reconnu.

2. Lancez l'ATEM Setup.

3. Si le logiciel du mélangeur doit être mis à jour, une fenêtre apparaîtra et vous proposera une mise à jour. Cliquez sur **Update** pour démarrer la mise à jour, cette opération peut prendre quelques minutes. Ne débranchez pas l'alimentation du mélangeur lors de la mise à jour logicielle.

4. Une fois la mise à jour terminée, une fenêtre apparaît et vous demande de redémarrer votre mélangeur. Éteignez votre mélangeur, puis rallumez-le et fermez la boîte de dialogue.

Mise à jour via Ethernet

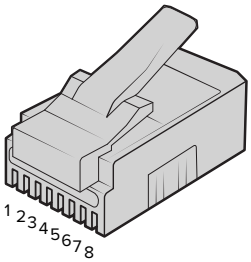
Il est généralement plus rapide et facile de mettre à jour votre mélangeur ATEM via la connexion Ethernet. Cependant, dans les cas mentionnés ci-dessous, cela n'est pas toujours possible. Vous devrez donc effectuer la mise à jour via USB :

- Première mise à jour du logiciel interne.
- Les paramètres réseau de l'ATEM sont configurés pour une utilisation directe. Cependant, si vous connectez votre appareil à un réseau comportant d'autres équipements vidéo, il se peut qu'un conflit d'adresse IP empêche l'ordinateur et le mélangeur de communiquer. Les paramètres réseau peuvent uniquement être réglés via USB.

Câbles adaptateurs pour le réseau d'ordres et le contrôle des caméras

Broches de connexion pour le réseau d'ordres

Le connecteur **Talkback** sur la face arrière de l'ATEM Television Studio permet de router le réseau d'ordres des ingénieurs et le réseau d'ordres de la production. Vous pouvez créer un câble adaptateur avec un connecteur RJ45 en suivant ce schéma de brochage.



Ing TX+	Ing TX-	Prod TX+	Prod RX+	Prod RX-	Prod TX-	Ing RX+	Ing RX-
1	2	3	4	5	6	7	8

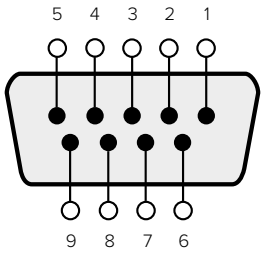
Brochage RJ45 pour le connecteur **Talkback** sur la face arrière de l'ATEM Television Studio.

Broches de connexions du port série pour le contrôle par câble

Broches de connexions RS-422 pour le contrôle par câble

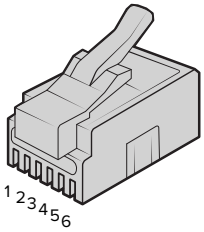
Le RS-422 est une norme de diffusion qui utilise un connecteur DE-9 ou RJ12 standard. Vous pouvez facilement reconnecter ces types de connecteurs pour créer des commandes PTZ personnalisées.

Vous trouverez un schéma de brochage du connecteur DE-9 et RJ12 RS-422 sur cette page.



Récepteur (–)	Récepteur (+)	Émetteur (–)	Émetteur (+)	Masse
8	3	2	7	1, 4, 6, 9

Broches de connexion pour le contrôle PTZ via RS-422.



TX+	TX-	GND	GND	RX-	RX+
1	2	3	4	5	6

Brochage du RJ12 pour le contrôle à distance PTZ sur l'ATEM Television Studio.

Schéma de brochage du connecteur XLR à 5 broches pour casque réseau d'ordres

Vues extérieures	Broches	Signal	E/S	Description
 Connecteur XLR à 5 broches pour casque **Talkback**	1	Intercom MIC (Y)	In -	L'entrée du micro de l'intercom prend en charge les micros dynamiques, symétriques ou asymétriques. La broche 1 correspond au signal micro GND et la broche 2 correspond à l'entrée accueillant les deux types de micro. Avec les micros électret, un adaptateur de polarisation DC externe est requis, permettant ainsi aux casques d'aviation d'être utilisés.
	2	Intercom MIC (X)	In +	
	3	GND	GND	GND
	4	Intercom left	Sortie	
	5	Intercom right	Sortie	

Informations pour les développeurs

Blackmagic SDI Camera Control Protocol

Version 1.3

If you are a software developer you can use the SDI Camera Control Protocol to construct devices that integrate with our products. Here at Blackmagic Design our approach is to open up our protocols and we eagerly look forward to seeing what you come up with!

Overview

The Blackmagic SDI Camera Control Protocol is used by ATEM switchers, Blackmagic 3G-SDI Shield for Arduino and the Blackmagic Camera Control app to provide Camera Control functionality with supported Blackmagic Design cameras. Please refer to the 'Understanding Studio Camera Control' chapter section of this manual, or the ATEM Switchers Manual and SDK manual for more information. These can be downloaded at www.blackmagicdesign.com/support.

This document describes an extensible protocol for sending a uni directional stream of small control messages embedded in the non-active picture region of a digital video stream. The video stream containing the protocol stream may be broadcast to a number of devices. Device addressing is used to allow the sender to specify which device each message is directed to.

Assumptions

Alignment and padding constraints are explicitly described in the protocol document. Bit fields are packed from LSB first. Message groups, individual messages and command headers are defined as, and can be assumed to be, 32 bit aligned.

Blanking Encoding

A message group is encoded into a SMPTE 291M packet with DID/SDID x51/x53 in the active region of VANC line 16.

Message Grouping

Up to 32 messages may be concatenated and transmitted in one blanking packet up to a maximum of 255 bytes payload. Under most circumstances, this should allow all messages to be sent with a maximum of one frame latency.

If the transmitting device queues more bytes of message packets than can be sent in a single frame, it should use heuristics to determine which packets to prioritize and send immediately. Lower priority messages can be delayed to later frames, or dropped entirely as appropriate.

Abstract Message Packet Format

Every message packet consists of a three byte header followed by an optional variable length data block. The maximum packet size is 64 bytes.

Destination device (uint8)	Device addresses are represented as an 8 bit unsigned integer. Individual devices are numbered 0 through 254 with the value 255 reserved to indicate a broadcast message to all devices.
Command length (uint8)	The command length is an 8 bit unsigned integer which specifies the length of the included command data. The length does NOT include the length of the header or any trailing padding bytes.

Command id (uint8)	The command id is an 8 bit unsigned integer which indicates the message type being sent. Receiving devices should ignore any commands that they do not understand. Commands 0 through 127 are reserved for commands that apply to multiple types of devices. Commands 128 through 255 are device specific.
Reserved (uint8)	This byte is reserved for alignment and expansion purposes. It should be set to zero.
Command data (uint8[])	The command data may contain between 0 and 60 bytes of data. The format of the data section is defined by the command itself.
Padding (uint8[])	Messages must be padded up to a 32 bit boundary with 0x0 bytes. Any padding bytes are NOT included in the command length.

Receiving devices should use the destination device address and or the command identifier to determine which messages to process. The receiver should use the command length to skip irrelevant or unknown commands and should be careful to skip the implicit padding as well.

Defined Commands

Command 0 : change configuration

Category (uint8)	The category number specifies one of up to 256 configuration categories available on the device.
Parameter (uint8)	The parameter number specifies one of 256 potential configuration parameters available on the device. Parameters 0 through 127 are device specific parameters. Parameters 128 though 255 are reserved for parameters that apply to multiple types of devices.
Data type (uint8)	The data type specifies the type of the remaining data. The packet length is used to determine the number of elements in the message. Each message must contain an integral number of data elements.

Currently defined values are:

0: void / boolean	A void value is represented as a boolean array of length zero. The data field is a 8 bit value with 0 meaning false and all other values meaning true.
1: signed byte	Data elements are signed bytes
2: signed 16 bit integer	Data elements are signed 16 bit values
3: signed 32 bit integer	Data elements are signed 32 bit values
4: signed 64 bit integer	Data elements are signed 64 bit values
5: UTF-8 string	Data elements represent a UTF-8 string with no terminating character.

Data types 6 through 127 are reserved.

128: signed 5.11 fixed point	Data elements are signed 16 bit integers representing a real number with 5 bits for the integer component and 11 bits for the fractional component. The fixed point representation is equal to the real value multiplied by 2^11. The representable range is from -16.0 to 15.9995 (15 + 2047/2048).

Data types 129 through 255 are available for device specific purposes.

Operation type (uint8)	The operation type specifies what action to perform on the specified parameter. Currently defined values are:
0: assign value	The supplied values are assigned to the specified parameter. Each element will be clamped according to its valid range. A void parameter may only be 'assigned' an empty list of boolean type. This operation will trigger the action associated with that parameter. A boolean value may be assigned the value zero for false, and any other value for true.
1: offset / toggle value	Each value specifies signed offsets of the same type to be added to the current parameter values. The resulting parameter value will be clamped according to their valid range. It is not valid to apply an offset to a void value. Applying any offset other than zero to a boolean value will invert that value.

Operation types 2 through 127 are reserved.

Operation types 128 through 255 are available for device specific purposes.

Data (void)	The data field is 0 or more bytes as determined by the data type and number of elements.

The category, parameter, data type and operation type partition a 24 bit operation space.

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Lens	0.0	Focus	fixed16	–	0	1	0.0 = near, 1.0 = far
	0.1	Instantaneous autofocus	void	–	–	–	trigger instantaneous autofocus
	0.2	Aperture (f-stop)	fixed16	–	-1	16	Aperture Value (where fnumber = sqrt(2^AV))
	0.3	Aperture (normalised)	fixed16	–	0	1	0.0 = smallest, 1.0 = largest
	0.4	Aperture (ordinal)	int16	–	0	n	Steps through available aperture values from minimum (0) to maximum (n)

Blackmagic Embedded Tally Control Protocol

Version 1.0 (30/04/14)

This section is for third party developers or users who may wish to add support for the Blackmagic Embedded Tally Control Protocol to their products or system. It describes the protocol for sending tally information embedded in the non-active picture region of a digital video stream.

Data Flow

A master device such as a broadcast switcher embeds tally information into its program feed which is broadcast to a number of slave devices such as cameras or camera controllers. The output from the slave devices is typically fed back to the master device, but may also be sent to a video monitor.

The primary flow of tally information is from the master device to the slaves. Each slave device may use its device id to extract and display the relevant tally information.

Slave devices pass through the tally packet on their output and update the monitor tally status, so that monitor devices connected to that individual output may display tally status without knowledge of the device id they are monitoring.

Assumptions

Any data alignment / padding is explicit in the protocol. Bit fields are packed from LSB first.

Blanking Encoding

One tally control packet may be sent per video frame. Packets are encoded as a SMPTE 291M packet with DID/SDID x51/x52 in the active region of VANC line 15. A tally control packet may contain up to 256 bytes of tally information.

Packet Format

Each tally status consists of 4 bits of information:

uint4

bit 0:	program tally status (0=off, 1=on)
bit 1:	preview tally status (0=off, 1=on)
bit 2-3:	reserved (0x0)

The first byte of the tally packet contains the monitor device tally status and a version number.

Subsequent bytes of the tally packet contain tally status for pairs of slave devices. The master device sends tally status for the number of devices configured/supported, up to a maximum of 510.

struct tally

uint8

bit 0: monitor device program tally status (0=off, 1=on)

bit 1: monitor device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4-7: protocol version (0b0000)

uint8[0]

bit 0: slave device 1 program tally status (0=off, 1=on)

bit 1: slave device 1 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 2 program tally status (0=off, 1=on)

bit 5: slave device 2 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

uint8[1]

bit 0: slave device 3 program tally status (0=off, 1=on)

bit 1: slave device 3 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 4 program tally status (0=off, 1=on)

bit 5: slave device 4 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

Aide

Obtenir de l'aide

Le moyen le plus rapide d'obtenir de l'aide est d'accéder aux pages d'assistance en ligne de Blackmagic Design et de consulter les dernières informations concernant votre mélangeur ATEM.

Pages d'assistance en ligne de Blackmagic Design

Les dernières versions du manuel, du logiciel et des notes d'assistance peuvent être consultées sur la page d'assistance technique de Blackmagic Design : www.blackmagicdesign.com/fr/support.

Contacter le service d'assistance de Blackmagic Design

Si vous ne parvenez pas à trouver l'aide dont vous avez besoin dans nos pages d'aide, veuillez utiliser l'option « Envoyer un email », accessible sur la page d'assistance pour envoyer une demande d'assistance par email. Vous pouvez également cliquer sur le bouton « Trouver un support technique » situé sur la page d'assistance pour contacter le centre d'assistance technique Blackmagic Design le plus proche de chez vous.

Vérification du logiciel actuel

Pour vérifier quelle version du logiciel ATEM est installée sur votre ordinateur, ouvrez la fenêtre intitulée About ATEM Software Control.

- Sur Mac, ouvrez l'ATEM Software Control à partir du dossier Applications. Sélectionnez About ATEM Software Control dans le menu d'application pour connaître le numéro de version.
- Sur Windows, ouvrez l'ATEM Software Control dans votre menu de Démarrage. Cliquez sur le menu Aide et sélectionnez About pour savoir quelle version est installée.

Comment obtenir les dernières mises à jour

Après avoir vérifié la version du logiciel ATEM installée sur votre ordinateur, veuillez visiter le centre d'assistance Blackmagic Design à l'adresse suivante www.blackmagicdesign.com/fr/support pour vérifier les dernières mises à jour. Même s'il est généralement conseillé d'exécuter les dernières mises à jour, il est prudent d'éviter d'effectuer une mise à jour logicielle au milieu d'un projet important.

Avis règlementaires

Élimination des déchets d'équipements électriques et électroniques au sein de l'Union européenne.

Le symbole imprimé sur ce produit indique qu'il ne doit pas être jeté avec les autres déchets. Cet appareil doit être déposé dans un point de collecte agréé pour être recyclé. Le tri, l'élimination et le recyclage séparés de vos équipements usagés permettent de préserver les ressources naturelles et d'assurer le recyclage de ces équipements dans le respect de l'homme et de l'environnement. Pour plus d'informations quant aux lieux d'éliminations des déchets d'équipements électriques, vous pouvez contacter votre mairie ou le service local de traitement des ordures ménagères.

Cet équipement a été testé et déclaré conforme aux limites imposées aux appareils numériques de classe A, en vertu du chapitre 15 des règles de la FCC. Ces limites ont pour objectif d'assurer une protection suffisante contre les interférences nuisibles lorsque l'équipement est utilisé dans un environnement commercial. Cet appareil génère, utilise et émet de l'énergie de fréquences radio et peut, en cas d'installation ou d'utilisation non conforme aux instructions, engendrer des interférences nuisibles au niveau des communications radio. L'utilisation de cet équipement en zone résidentielle est susceptible de provoquer des interférences nuisibles, auquel cas il sera demandé à l'utilisateur de corriger ces interférences à ses frais.

L'utilisation de cet appareil est soumise aux deux conditions suivantes :

1. Cet appareil ne doit pas causer d'interférences nuisibles.
2. Cet appareil doit accepter toute interférence reçue, y compris les interférences pouvant entraîner un dysfonctionnement.

Déclaration de ISDE Canada

Cet appareil est conforme aux normes canadiennes relatives aux appareils numériques de Classe A.

Toute modification ou utilisation de ce produit en dehors de son utilisation prévue peut annuler la conformité avec ces normes.

Les connexions aux interfaces HDMI doivent être effectuées avec des câbles HDMI blindés d'excellente qualité.

Cet équipement a été testé pour être en conformité avec une utilisation prévue dans un environnement commercial. Si cet équipement est utilisé dans un environnement domestique, il peut provoquer des interférences radio.

Informations de sécurité

Pour une protection contre les décharges électriques, cet appareil doit être connecté à une prise secteur équipée d'un conducteur de protection. En cas de doute, veuillez contacter un électricien qualifié.

Afin de réduire le risque de décharge électrique, ne pas éclabousser ou renverser de liquide sur cet appareil.

Vérifiez que toute source d'alimentation DC connectée aux appareils est compatible avec la tension de l'entrée et les caractéristiques marquées sur le connecteur DC IN.

Ce produit peut être utilisé dans un climat tropical lorsque la température ambiante n'excède pas 40°C.

Veillez à ce que l'espace autour du produit soit suffisant afin de ne pas compromettre la ventilation.

Les pièces de cet appareil ne sont pas réparables par l'opérateur. Toute opération d'entretien doit être effectuée par un centre de service Blackmagic Design.

Cet appareil doit être utilisé à une altitude inférieure à 2000 mètres.

Déclaration de l'État de Californie

Ce produit est susceptible de vous exposer à des produits chimiques, dont des traces de polybromobiphényle dans les parties en plastique, reconnu par l'État de Californie comme étant responsable de cancers, d'anomalies congénitales ou d'autres effets nocifs sur la reproduction.

Pour de plus amples informations, veuillez vous rendre sur www.P65Warnings.ca.gov.

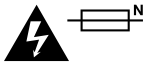
Avertissement destiné aux techniciens agréés

Assurez-vous que le courant des deux prises est bien coupé avant toute opération d'entretien.

Attention - Système de fusibles bipolaire/neutre



La source d'alimentation de cet appareil contient un fusible dans les conducteurs de ligne et neutre. Elle est compatible avec le système de distribution électrique/réseau de distribution d'électricité en Norvège.

Garantie

Garantie limitée à 12 mois

Par la présente, Blackmagic Design garantit que ce produit sera exempt de défauts matériels et de fabrication pendant une durée d'un an à compter de la date d'achat. Si un produit s'avère défectueux pendant la période de garantie, Blackmagic Design peut, à sa seule discrétion, réparer le produit défectueux sans frais pour les pièces et la main-d'œuvre, ou le remplacer.

Pour se prévaloir du service offert en vertu de la présente garantie, il vous incombe d'informer Blackmagic Design de l'existence du défaut avant expiration de la période de garantie, et de prendre les mesures nécessaires pour l'exécution des dispositions de ce service. Le consommateur a la responsabilité de s'occuper de l'emballage et de l'expédition du produit défectueux au centre de service nommément désigné par Blackmagic Design, en frais de port prépayé. Il incombe au Consommateur de payer tous les frais de transport, d'assurance, droits de douane et taxes et toutes autres charges relatives aux produits qui nous auront été retournés et ce, quelle que soit la raison.

La présente garantie ne saurait en aucun cas s'appliquer à des défauts, pannes ou dommages causés par une utilisation inappropriée ou un entretien inadéquat ou incorrect. Blackmagic Design n'a en aucun cas l'obligation de fournir un service en vertu de la présente garantie : a) pour réparer les dommages résultant de tentatives de réparations, d'installations ou tous services effectués par du personnel non qualifié par Blackmagic Design, b) pour réparer tout dommage résultant d'une utilisation inadéquate ou d'une connexion à du matériel incompatible, c) pour réparer tout dommage ou dysfonctionnement causé par l'utilisation de pièces ou de fournitures n'appartenant pas à la marque de Blackmagic Design, d) pour examiner un produit qui a été modifié ou intégré à d'autres produits quand l'impact d'une telle modification ou intégration augmente les délais ou la difficulté d'examiner ce produit.

CETTE GARANTIE REMPLACE TOUTE GARANTIE EXPLICITE OU TACITE. BLACKMAGIC DESIGN ET SES REVENDEURS DÉCLINENT EXPRESSÉMENT TOUTE GARANTIE IMPLICITE DE COMMERCIALISATION OU D'ADAPTATION QUEL QU'EN SOIT LE BUT. LA RESPONSABILITÉ DE BLACKMAGIC DESIGN POUR RÉPARER OU REMPLACER UN PRODUIT S'AVÉRANT DÉFECTUEUX CONSTITUE LA TOTALITÉ ET LE SEUL RECOURS EXCLUSIF PRÉVU ET FOURNI AU CONSOMMATEUR POUR TOUT DOMMAGE INDIRECT, SPÉCIFIQUE, ACCIDENTEL OU CONSÉCUTIF, PEU IMPORTE QUE BLACKMAGIC DESIGN OU SES REVENDEURS AIENT ÉTÉ INFORMÉS OU SE SOIENT RENDU COMPTE AU PRÉALABLE DE L'ÉVENTUALITÉ DE CES DOMMAGES. BLACKMAGIC DESIGN NE PEUT ÊTRE TENU POUR RESPONSABLE DE TOUTE UTILISATION ILLICITE DU MATÉRIEL PAR LE CONSOMMATEUR. BLACKMAGIC DESIGN N'EST PAS RESPONSABLE DES DOMMAGES RÉSULTANT DE L'UTILISATION DE CE PRODUIT. LE CONSOMMATEUR UTILISE CE PRODUIT À SES SEULS RISQUES.

ATEM Television Studio Mischer

ATEM Television Studio HD8
ATEM Television Studio HD8 ISO
ATEM Television Studio 4K8

Willkommen!

Danke, dass Sie für Ihre Liveproduktionsarbeit einen ATEM Television Studio Mischer gewählt haben.

Wenn Ihnen die Arbeit mit Liveproduktionsmischern neu ist, steigen Sie gerade in den spannendsten Bereich der Fernsehbranche ein. Nichts ist mit den Adrenalinstößen vergleichbar, die man bei der Echtzeit-Videobearbeitung von Events erlebt, die sich live vor den eigenen Augen abspielen. Da wird man leicht süchtig. Das ist Fernseharbeit, wie sie sich gehört!

Früher war die Liveproduktion in Broadcastqualität viel zu kostspielig und für die meisten Leute unerschwinglich. Bezahlbaren Mischern mangelte es jedoch an broadcasttauglichen Leistungsmerkmalen und Qualität. Mit ATEM Television Studio Mischern ist das anders, weil Sie damit die großartigsten Liveproduktionen gestalten können. Wir wünschen Ihnen langfristigen Nutzen an Ihrem Mischer und viel Freude an Ihren Liveproduktionen.

Diese Bedienungsanleitung enthält alle für die Installation Ihres ATEM Television Studio Mischers nötigen Informationen.

Bitte sehen Sie auf der Support-Seite unserer Website unter www.blackmagicdesign.com/de nach der aktuellsten Softwareversion für Ihren ATEM Mischer. Holen Sie sich die aktuellsten Features, indem Sie den ATEM Mischer und das ATEM Hardware-Bedienpult zur Aktualisierung der Software einfach via USB an Ihren Computer anschließen. Bitte registrieren Sie beim Herunterladen von Software Ihre Kontaktdaten, damit wir Sie über neue Versionen informieren können. Wir arbeiten ständig an neuen Features und Verbesserungen und würden uns über Ihr Feedback freuen.

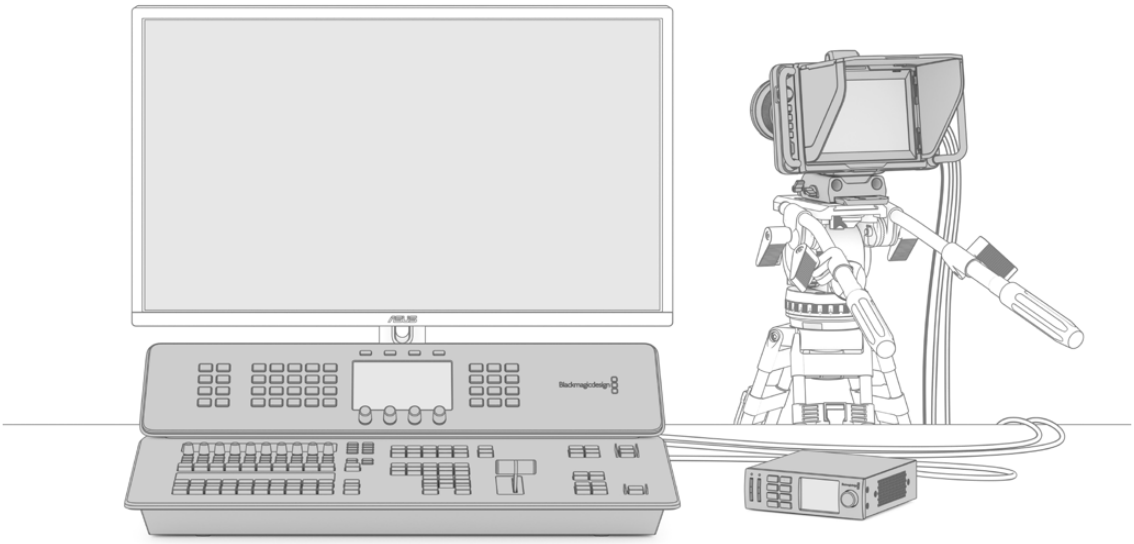
Vorgestellt: ATEM Television Studio

ATEM Television Studio Mischer sind digitale Produktionsmischer in professioneller Broadcastqualität. Sie dienen zum Umschalten und zur kreativen Verarbeitung vielfältiger Videoquellen und werden in der Live-Videoproduktion und im Rundfunk eingesetzt. Das Mischerdesign basiert auf dem gebräuchlichen und vertrauten Misch/Effekte-Prinzip (M/E). Seine Optionen für die Software- und Hardwaresteuerung ermöglichen einen schnellen, intuitiven und unkomplizierten Arbeitsfluss zum Mischen auf Programm- und Vorschaubussen. Auch wer an ältere Mischer mit A/B-Stufen gewöhnt ist, wird schnell mit ATEM Mischern klar kommen, da auch diese direktes A/B-Mischen unterstützen.

Für den Einstieg brauchen Sie lediglich Ihren ATEM Mischer, da er über ein integriertes Bedienpanel verfügt. Sie können Ihre Liveproduktion also bloß mit dem ATEM mischen. Wenn Sie in Sachen Bedienung noch flexibler sein wollen, verwenden Sie ATEM Software Control oder schließen für eine breiter aufgestellte Lösung ein oder mehrere Hardware-Bedienpanels an.



Ihr ATEM Television Studio Mischer lässt sich einfach einrichten: Man verbindet den Multiview-Ausgang mit einem Monitor, schließt eine Kamera an und verbindet den Programmausgang dann mit einem Rekorder

Was ist ein M/E-Mischer?

Wer früher mit niedrigpreisigen Mischern gearbeitet hat, weiß, dass nicht alle über den als M/E bezeichneten Mix- und Effekt-Betriebsmodus verfügten. Wer bereits mit M/E-Mischern vertraut ist, überspringt die nächsten Schritte vielleicht lieber und steigt gleich in die Arbeit mit dem neuen ATEM Mischer ein.

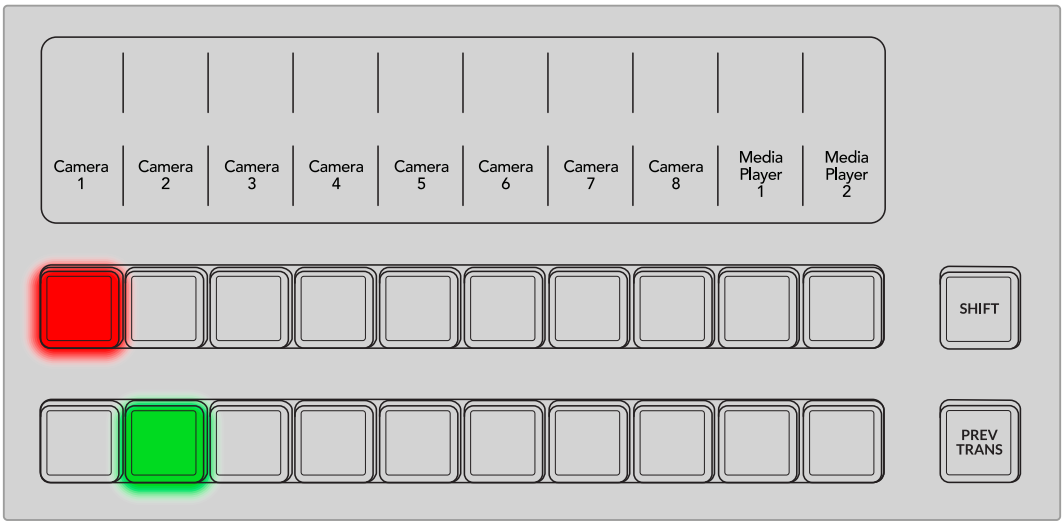
Wem der Umgang mit Mischern völlig neu ist, mag den ATEM mit all seinen Tasten und Reglern etwas einschüchternd finden. Alles ist jedoch völlig logisch angeordnet und sehr benutzerfreundlich.

Der ATEM ist ein echter Broadcastmischer aus dem Topsegment und arbeitet mit den in der Rundfunkbranche üblichen M/E-Workflows. Sobald Sie mit seiner Funktionsweise vertraut sind, finden Sie sich auch mit fast jedem anderen im heutigen Rundfunkbetrieb eingesetzten Mischer zurecht.

Der Betrieb im M/E-Stil gilt im Rundfunk inzwischen als Standard. Er wurde über Jahrzehnte entwickelt, um Patzer beim Mischen von Live-Veranstaltungen zu verhindern. Weil aktuelle Vorgänge auf einen Blick nachvollziehbar sind, verringert sich auch das Fehlerpotenzial. Im M/E-Betriebsstil können Sie Quellen prüfen und Effekte ausprobieren, ehe Sie sie auf Sendung schalten. Da die Tasten bzw. Schaltflächen für jeden Keyer und jeden Übergang sichtbar sind, wissen Sie auf Anhieb, was vor sich geht und was als Nächstes passieren wird.

Am besten lernen Sie mit Ihrem ATEM Mischer umzugehen, indem Sie ihn unter Bezugnahme auf diese Bedienungsanleitung spielerisch entdecken. Oder vielleicht überspringen Sie lieber einige Schritte und nehmen Ihren Mischer in Betrieb, ehe Sie diesen Abschnitt komplett durchlesen.

Los geht's mit den offensichtlichsten Teilen des M/E-basierten Bedienpanels: dem Blendenhebel und den Quelltasten der Programm- und Vorschaureihen bzw. deren Entsprechungen in der Bediensoftware.



Mit den Tasten in den Reihen Programm und Vorschau können Sie eine Quelle sichten, bevor Sie sie auf Sendung schalten

Es sind verschiedene Übergangsarten verfügbar. Ihre Auswahl erfolgt auf dem Bedienpanel mit den Systemsteuerungstasten links neben dem LCD oder durch Drücken der jeweiligen Übergangstasten. Sie haben eine Vielzahl an Wipe-Mustern und digitalen Videoeffekten, sogenannten DVE, zur Wahl. Die Übergangsrate und andere Übergangseinstellungen lassen sich im LCD-Menü anpassen.

In Bezug auf M/E-Mischer wie dem ATEM ist ebenfalls wissenswert, dass das Video in den Programm- und Vorschaureihen technisch als Hintergrundvideo bezeichnet wird. Das ist so, weil Upstream- bzw. Effekt-Keyer und Downstream-Keyer über diese Quelle gelegt werden. So können Sie Grafiken auf die Keyer laden und sie mit dem Vorschauvideo ansehen. Wenn die Keys aktiviert sind, sieht man das Overlay über das Programmvideo gelegt. Damit lassen sich sehr effektiv mehrere Ebenen anlegen.

Ein weiterer großer Vorteil des Betriebs im ATEM M/E-Stil liegt darin, dass Sie Keys an einen Übergang binden können. Demnach lassen sich beim Ausführen eines Mix-Übergangs auch mehrere Keys zugleich ein- und ausblenden. Das erlaubt Ihnen, eine Komposition zu erstellen und das Ganze gleichzeitig on air zu bringen. Hierfür dienen die Tasten im Block für den nächsten Übergang. Sie können für normale Übergänge auch einen Hintergrund oder einen oder mehrere Keyer auswählen, um diese auf Sendung zu schalten.

Auf dem Bedienpanel von ATEM Television Studio Mischern können Sie mehrere Tasten drücken, um mehrere Keys gleichzeitig mit dem Hintergrund zu verknüpfen. Mit dedizierten TIE-Tasten für Downstream-Keys lassen sich auch Downstream-Keyer an den Übergang knüpfen. Da Downstream-Keyer ebenfalls über dedizierte CUT- und MIX-Tasten verfügen, sind sie extrem flexibel. Downstream-Keys werden immer über alles andere gelegt, einschließlich des Übergangs. Also ein idealer Ort, um per Key-Füllsignal Info-Grafiken und Logos einzubringen.

Für das Ende Ihrer Liveproduktion ist es zudem praktisch, mit der Abblende (FTB bzw. Fade to Black) eine dedizierte Steuerung für einen Übergang nach Schwarz zu haben. Die Fade-to-Black-Steuerung befindet sich unten rechts auf dem Bedienpanel Ihres Mischers. Sie blendet alles nach Schwarz aus und hilft zu vermeiden, dass versehentlich eine Ebene ausgelassen wird. Die Abblende liegt am äußersten Ende der Bearbeitungskette und ermöglicht so ein sauberes Ausblenden aller Quellen.

Der letzte Teil eines Mischers im M/E-Stil ist der Auswahlbus. Dieser liegt über der Programmreihe und ermöglicht die Auswahl von Quellen zur Verarbeitung von Effekten und zu anderen Zwecken. Die darüber angeordnete Beschriftung verdeutlicht, was geschaltet wird. Im Auswahlbus werden üblicherweise Key-Eingaben gewählt. Er dient aber auch zum Ausführen von Makros direkt vom Bedienpanel.

Wie diese Kurzübersicht verdeutlicht, ermöglicht der Betrieb im M/E-Stil eine souveräne Liveproduktion, da aktuelle Abläufe und der Mischerstatus in jeder Produktionsphase klar überschaubar sind. Wer mit dem Betrieb im M/E-Stil vertraut ist, kann mit minimalem Umlernen zwischen verschiedenen Produktionsmischer-Modellen wechseln, da alle auf die gleiche Weise arbeiten.

Was ist ein A/B-Direkt-Mischer?

Wer schon lange mit Videomischern arbeitet, ist wahrscheinlich mit dem älteren A/B-Direkt-Mischerstil vertraut.

A/B-Direkt-Mischer verfügen über einen A-Bus und einen B-Bus. Einer der Busse ist der Programmbus, der die aktuelle Programmausgabe mit einer roten Taste anzeigt. Der andere ist der Vorschaubus, der das Vorschauvideo mit einer grün erleuchteten Taste anzeigt. Durch Umlegen des Blendenhebels nach oben oder unten wechseln die Busse. Dabei folgt die rote Programmtaste der Griffposition des Blendenhebels. In dieser Hinsicht ist die Arbeit mit A/B-Direkt-Mischern einfach, weil die Tasten in der gleichen Position erleuchtet bleiben und nur zwischen Grün und Rot wechseln.

Etwas unübersichtlicher sind A/B-Direkt-Mischer allerdings, wenn Übergänge nicht per Blendensteuerung ausgeführt werden. Wenn Sie Ihre Vorschauquelle mit der Taste CUT oder AUTO auf Sendung bringen oder mehrere Software-Bedienpanel an Ihren Mischer angeschlossen sind, verbleibt der Blendenhebel auf dem zuletzt benutzten Bedienpanel in unveränderter Position. Die rote Programmausgabe folgt immer der Griffposition des Blendenhebels. Da Sie ihn nicht bewegt haben, muss die rote Programmleuchte nun auf eine andere Taste in der gleichen Reihe wechseln und das grüne Vorschaulicht muss auch auf eine andere Taste in seiner Reihe wechseln.

Es kann verwirrend sein, wenn der Blendenhebel manchmal zur Ausführung von Übergängen eingesetzt wird und manchmal nicht, da dann die Reihen mit Ihren Vorschau- und Programmtasten mal wechseln und mal bleiben, wo sie sind. Das kann Fehler verursachen.

Aus diesem Grund ist modernes Mischen im M/E-Stil vorzuziehen, da Sie in dieser Variante Ihre grüne Vorschautaste immer in der Vorschau-Tastenreihe und die rote Programmtaste in der Programm-Tastenreihe vorfinden. Da der Ablauf immer gleich ist, gibt es beim Mischen im M/E-Stil keine unangenehmen Überraschungen.

So funktioniert ein ATEM Mischer

ATEM Television Studio Mischer besorgen die gesamte Videoverarbeitung und verfügen über sämtliche Videoeingänge und -ausgänge sowie Netzstromanschlüsse.

Über das in den Mischer integrierte Bedienpanel mit Tasten und Reglern können Sie direkt vom Mischer aus umschalten. Alternativ verbinden Sie einen mit ATEM Software Control bespielten Computer per Ethernet und verfügen dann auf dem Software-Bedienpanel über die gleichen Bedienelemente. Durch den parallelen Einsatz von Software-Bedienpanel und integriertem Bedienpanel können mehrere Operatoren Ihre Produktion mischen. Beispiel: Sie mischen die Kameras auf dem integrierten Bedienpanel, während weitere Operatoren die Kamera- und Audiopegel über das Software-Bedienpanel steuern. Es gibt unzählige Möglichkeiten.

ATEM Television Studio Mischer unterstützen HD-Video bis zu 1080p/60 über 3G-SDI. ATEM Television Studio 4K8 Mischer unterstützen überdies 4K-Video bis zu 2160p/60. Jeder Mischereingang ist mit einem Normwandler und einem Resynchronisierer ausgestattet. So können Sie Quellen mit unterschiedlichen Videoformaten anschließen, die dann automatisch in das vorgegebene Ausgabeformat des Mischers gewandelt werden.

Alle Mischermodelle verfügen über erweiterte Chromakeyer, einen Fairlight Audiomixer und Bedienelemente für die Kamerasteuerung. Überdies kann man bei diesen Modellen Standbilder im

Media Pool speichern und vieles mehr. Wenn Ihr Mischer in ein Netzwerk eingebunden ist, können Sie Streaming-Eingaben auswählen oder direkt auf Netzwerkspeicher aufzeichnen.

ATEM Television Studio Mischer verfügen über Auxiliary-Ausgänge, die für interne und externe Videoquellen verwendet werden können. Beispielsweise für Programm-Feeds, wenn Sie weitere Programmausgänge benötigen, oder für Clean-Feeds ohne Downstream-Keying oder sogar spezifische Videoeingaben. ATEM Television Studio HD8 Mischer haben zwei Auxiliary-Ausgänge. Der ATEM Television Studio 4K8 Mischer hat zehn Auxiliary-Ausgänge. An die zusätzlichen Auxiliary-Ausgänge beim ATEM Television Studio 4K8 Modell können Sie externe HyperDeck Diskrekorder anschließen und alle Videoeingaben zur späteren Bearbeitung aufzeichnen. Man bezeichnet die Aufzeichnung von getrennten Videoeingaben als ISO-Aufzeichnung.

ATEM Television Studio HD8 ISO

ATEM Television Studio HD8

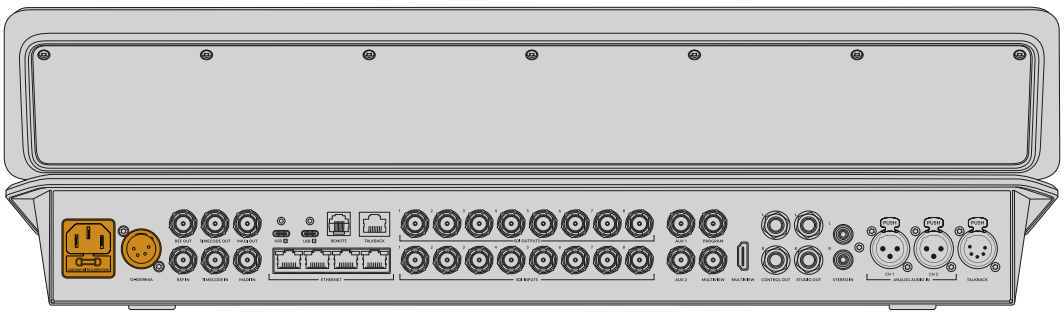
ATEM Television Studio 4K8

Erste Schritte

So einfach geht die Inbetriebnahme Ihres ATEM Television Studio Mischers: Stromkabel einstecken, SDI-Videoquellen anschließen und über das integrierte Bedienpanel Ihre Signaleingaben prüfen.

Strom anschließen

Versorgen Sie Ihren ATEM Television Studio mit Strom, indem Sie die Strombuchse hinten am Mischer über ein IEC-Standardkabel an den Netzstrom anschließen. ATEM Television Studio Mischer verfügen außerdem über eine DC-Buchse zum Anschließen eines externen 12V-Netzteils. Sobald die Stromversorgung steht, leuchten die Bedienpanel-LCDs und Kameratasten auf.



Versorgen Sie Ihren ATEM Television Studio über die IEC- oder DC-Buchsen mit Strom

Anschließen von Monitoren für Multiview

Verbinden Sie zum Prüfen der Videoeingaben über die Multiview-Ausgabe einen Bildschirm mit dem SDI- oder HDMI-Multiview-Eingang.

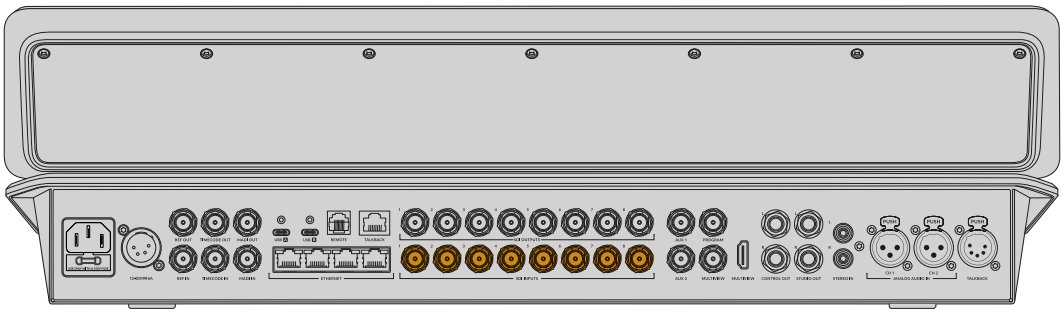
Auf dem angeschlossenen Bildschirm sollten nun 8 kleine und 2 große Videofenster zu sehen sein. Jedes Videofenster stellt eine separate Ansicht dar. Jede weitere Videoquelle, die Sie anschließen, erscheint in der zugehörigen Ansicht. Das Multiview-Layout mit bis zu 16 Ansichten können Sie in ATEM Software Control individuell einrichten. Näheres finden Sie im Abschnitt „Verwenden von Multiview“ weiter hinten im Handbuch.

Wenn die Multiview-Ansicht zu sehen ist, wird Ihr ATEM Mischer mit Strom versorgt und Sie können mit dem Anschließen von Quellen beginnen.

Um die Multiview-Ausgabe zu sichten, verbinden Sie Ihren ATEM Television Studio mit einem Monitor

Anschließen von Videoquellen

Verbinden Sie Ihre SDI-Kameras und sonstige Quellen mit den SDI-Eingängen des ATEM Television Studio Mischers. Die mit Normwandlern und Frame-Synchronisatoren ausgestatteten SDI-Anschlüsse wandeln alle Quellsignale in das auf Ihrem Mischer eingestellte Videoformat.



SDI-Eingänge am ATEM Television Studio Mischer

An ATEM Television Studio HD8 ISO Mischer können Sie auch Streaming-Quellen, bspw. Blackmagic Studio Camera 6K Pro Kameras, über die Ethernet-Ports anschließen. Näheres zur Auswahl von Quellen über die Ethernet-Verbindung finden Sie im Abschnitt „Zusätzliche Funktionen von ISO-Modellen“ weiter hinten in dieser Bedienungsanleitung.

Anschließen von Audiogeräten

ATEM Television Studio Mischer verfügen über einen internen Audiomixer. Dies ermöglicht den Einsatz eingebetteter SDI-Audiosignale von Ihren Kameras und von externem Audio, das über die XLR- und RCA-Eingänge sowie die MADI-BNC-Eingänge eingeht. Die zusätzlichen Audioeingänge sind für Audioquellen wie Kameramikrofone und voraufgezeichnete Audioinhalte einsetzbar.

Audio-Eingänge am ATEM Television Studio

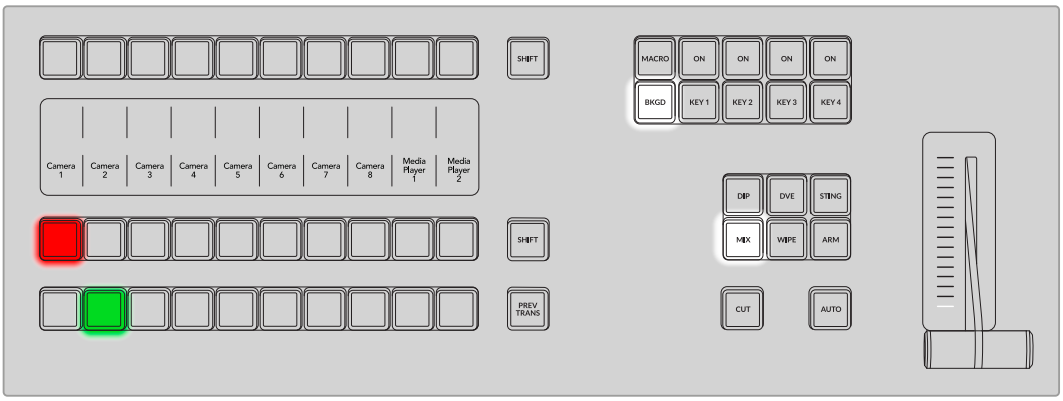
Nach Anschließen Ihrer Audioquelle können Sie das Signal der einzelnen Kanäle anhand der Pegel des Audiomixers auf dem Bedienpanel prüfen.

Prüfen Sie die Tonpegel über die Pegelmeter des Fairlight Audiomixers

Näheres erfahren Sie im Abschnitt „Audiomixer“ in dieser Bedienungsanleitung.

Ausführen eines Übergangs

Los geht’s mit den offensichtlichsten Teilen des M/E-basierten Bedienpanels: dem Blendenhebel und den Quelltasten der Programm- und Vorschaureihen bzw. deren Entsprechungen in der Bediensoftware.

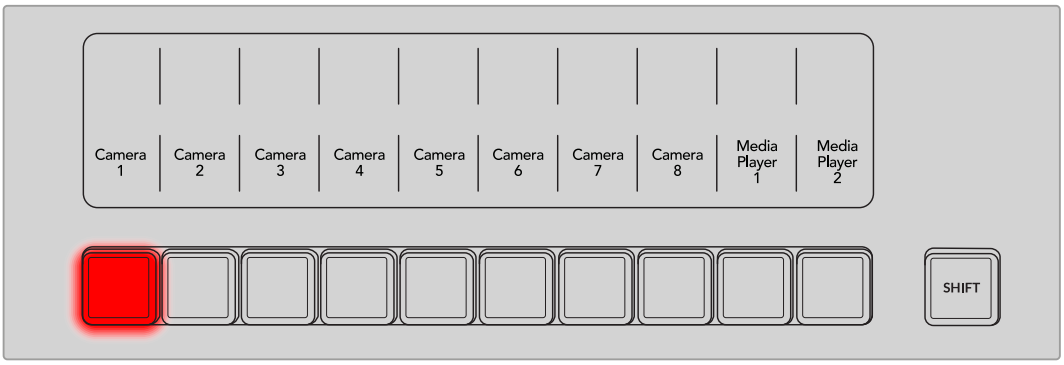


Als ersten Schritt zur Überprüfung Ihres Setups könnten Sie probieren, einen Übergang auszuführen.

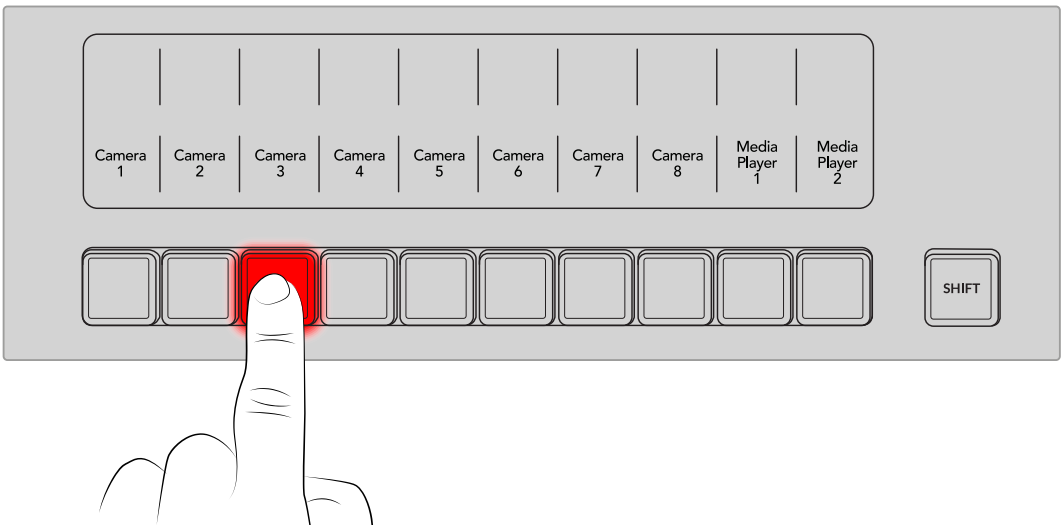
Für den Betrieb Ihres ATEM Television Studio Mischers sind zwei Mischermodi verfügbar. Der Standardbetriebsmodus „Programmvorschau“ lässt Sie eine Quelle als Vorschau sichten, bevor Sie sie auf Sendung schalten. Die Quellauswahltasten des Programmbusses in der oberen Tastenreihe dienen zum sofortigen Umschalten von Quellen auf den Programmausgang. Vorsicht bei der Auswahl von Quellen in dieser Reihe, da sie augenblicklich auf Sendung gehen.

So führen Sie einen Hartschnitt von Eingang 1 auf Eingang 3 über die Programmreihe aus:

1 Eingangstaste 1 leuchtet rot, was besagt, dass Eingang 1 aktuell auf Sendung ist.



2 Drücken Sie in der Programmreihe die Taste für Eingang 3.



Von Eingang 1 wird jetzt unmittelbar auf Eingang 3 umgeschaltet. Da Eingangstaste 3 nun rot leuchtet, wissen Sie, dass jetzt Eingang 3 auf Sendung ist. Man bezeichnet diesen Vorgang als Hartschnitt, weil man direkt von einer Quelle zu einer anderen schneidet.

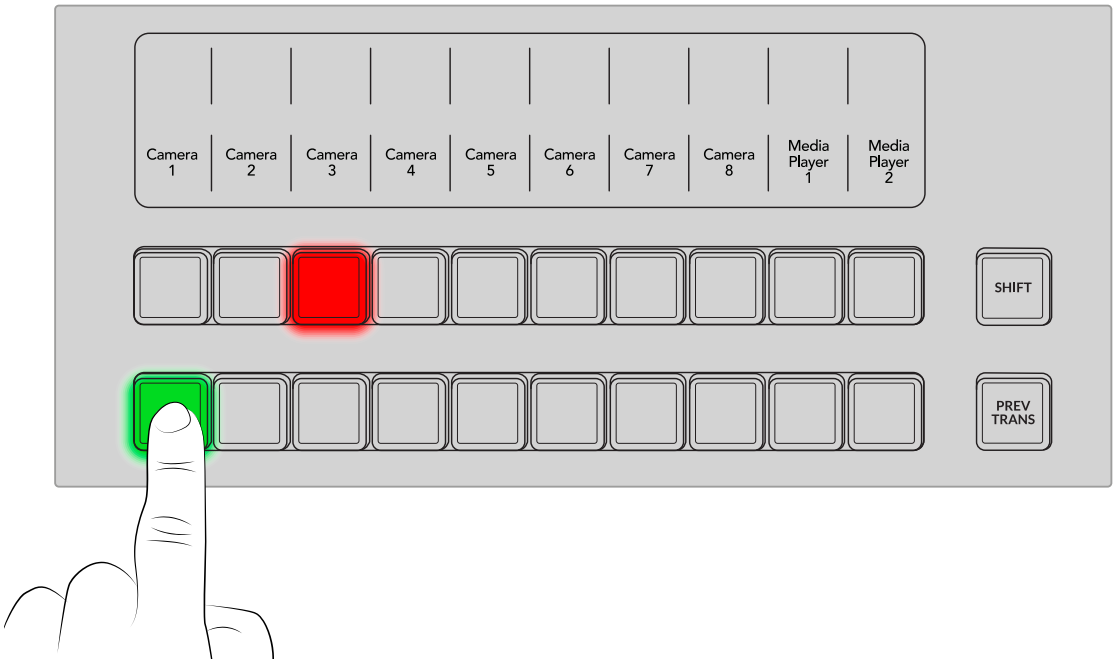
Risikofreier und kontrollierter mischt man Übergänge, indem man sie zunächst in der Vorschau-Tastenreihe auswählt und dann per Hartschnitt oder mit einer Blende live schaltet.

So holen Sie viel Leistung aus Ihrem Mischer, weil Sie die Quelle in der Vorschaureihe vorgeben, sie in der Videoausgabevorschau ansehen und so bestätigen können, dass die Quelle stimmt, bevor Sie den gewünschten Übergang auswählen. Da jeder Schritt des Vorgangs sichtbar ist, sind Fehler unwahrscheinlicher. Nur der Betrieb im M/E-Stil lässt Sie den Überblick über gegenwärtige Vorgänge behalten.

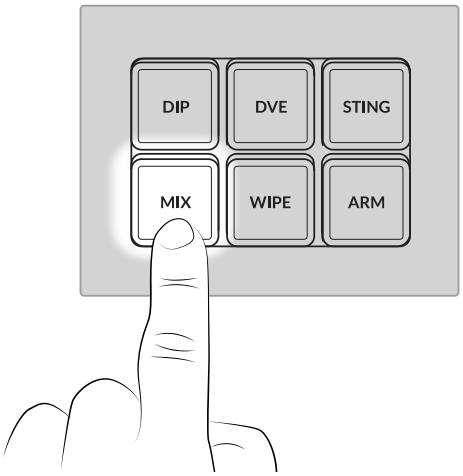
Die untere Tastenreihe dient zur Auswahl der Quellen für den Vorschaubus. Hier werden Sie vorrangig Zeit mit der Auswahl von Quellen verbringen, die als nächstes auf Sendung gehen. Eine ausgewählte Quelle wird auf den Programmausgang gelegt, sobald der nächste Übergang erfolgt. Der nächste Übergang lässt sich durch Drücken der CUT- oder AUTO-Taste oder durch Auf- und Abbewegen des Blendenhebels auslösen. Zur Auswahl stehen die Übergangsarten Mix, Dip, Wipe, DVE und, je nach Ihrer Vorgabe im Bereich Übergangssteuerung, weitere Übergänge.

Im nachstehenden Beispiel wird eine Mischblende als Übergang von Quelle 3 zurück zu Quelle 1 verwendet.

1 Wählen Sie die nächste Quelle, indem Sie Taste 1 in der Vorschau-Tastenreihe drücken. Die nun grün leuchtende Taste besagt, dass sie auf dem Vorschaubus ausgewählt ist.

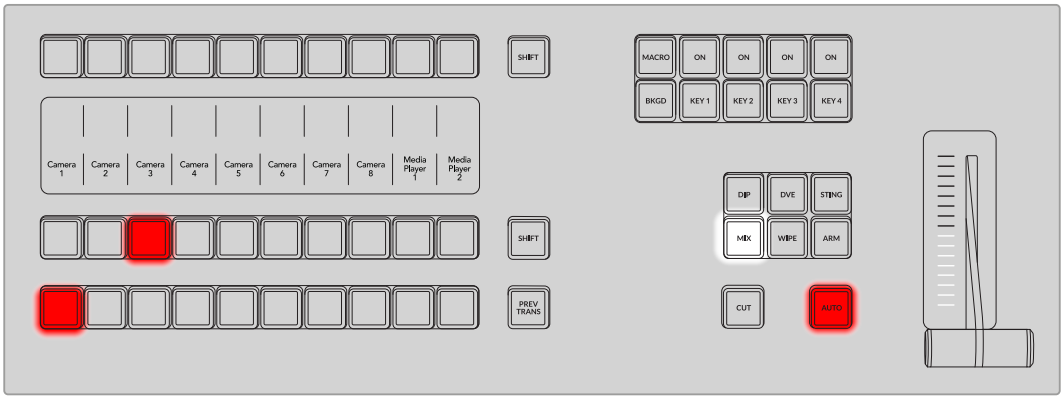


2 Drücken Sie die MIX-Übergangstaste.

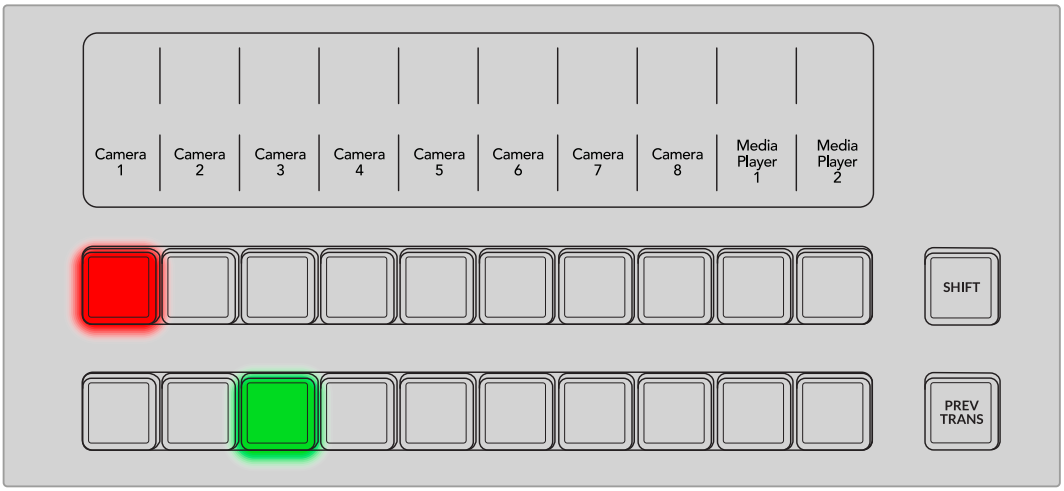


3 Drücken Sie dann die AUTO-Taste, um den Übergang auszuführen.

Im Laufe des Übergangs leuchten die Eingangstasten sowohl in den Programm- als auch den Vorschaureihen rot. Dies besagt, dass beide auf Sendung sind. Auch die Blendenhebel-Anzeige leuchtet auf.



Sie werden sehen, wie nach einem abgeschlossenen Übergang die in den Vorschau- und Programmreihen gewählten Quellen ihre Plätze wechseln. Das geschieht, weil Ihre in der Vorschaureihe festgelegte Quelle nun die neue On-air-Quelle ist. Sie wird in der Programmreihe aktiviert, sobald der vorherige Übergang abgeschlossen ist. Die Programmreihe zeigt immer das an, was gerade gesendet wird.



Einrichten Ihres Netzwerks

Ihr ATEM Mischer ist werksseitig so voreingestellt, dass sich Hardware-Bedienpulte direkt über ein Ethernet-Kabel anschließen lassen. Ihr ATEM unterstützt jedoch auch vollumfängliche Ethernet-IP-Protokolle, sodass Sie Ihren ATEM Television Studio und externe ATEM Hardware-Bedienpulte in Ihr Netzwerk einbinden oder diese via Internet von überall auf der Welt einbinden können. Die Einbindung in ein Netzwerk bedeutet enorme Flexibilität bei der Steuerung Ihres Mischers. Beispiel: Sie können ein ATEM Camera Control Panel in dasselbe Netzwerk wie Ihren Mischer einbinden. Dann kann ein Bediener die Inhalte mischen und ein anderer die Kameras einstellen. Darüber hinaus können Sie sich das Software-Bedienpanel auf Ihren Computer laden, über das ein dritter Bediener den Ton handhaben oder Medien verwalten kann.

ATEM Television Studio Mischer sind standardmäßig auf DHCP eingestellt, damit der Mischer seine Netzwerkdaten automatisch erhält. Sie können jedoch eine statische IP-Adresse manuell einrichten.

1. Wenn Sie nicht auf der Startseite sind, drücken Sie die HOME-Taste, um ins Hauptmenü zurückzukehren.
2. Drücken Sie die Multifunktionstaste NETZWERK über dem LCD und navigieren Sie mit der Rechtspfeiltaste zur Option „IP-Adresse“. Wenn Ihr Mischer das Netzwerk erkennt, erscheint die zugewiesene IP-Adresse unten am Bildschirmrand.
3. Um eine IP-Adresse manuell einzugeben, drücken Sie die Multifunktionstaste „DHCP EIN“ über dem LCD, um DHCP auszuschalten. Geben Sie Ihre IP-Adresse manuell mit den entsprechenden Reglern unter dem LCD ein. Bei Verwendung einer statischen IP muss der Mischer dieselbe IP-Subnetzadresse wie mit ihm verbundene Geräte, bspw. einem HyperDeck, haben. Das bedeutet in der Regel, dass die ersten drei Felder der IP-Adressen identisch sein müssen.

4. Nach Eingeben der Adresse drücken Sie die Multifunktionstaste „Aktualisieren“.

Sobald Ihr Mischer in Ihr Netzwerk eingebunden ist, können Sie Ihre Streaming-Plattform über ATEM Software Control vorgeben und Ihren Stream mit der „ON AIR“-Schaltfläche bzw. -Taste starten.

Näheres zur Auswahl Ihrer Streaming-Plattform finden Sie im Abschnitt „Ausgabe-Registerkarte“ weiter hinten in dieser Bedienungsanleitung.

Für den Einstieg war das schon alles. Sie finden weitere Anweisungen zu allen Funktionen und Bedienelementen Ihres ATEM Television Studio Mischers in dieser Bedienungsanleitung.

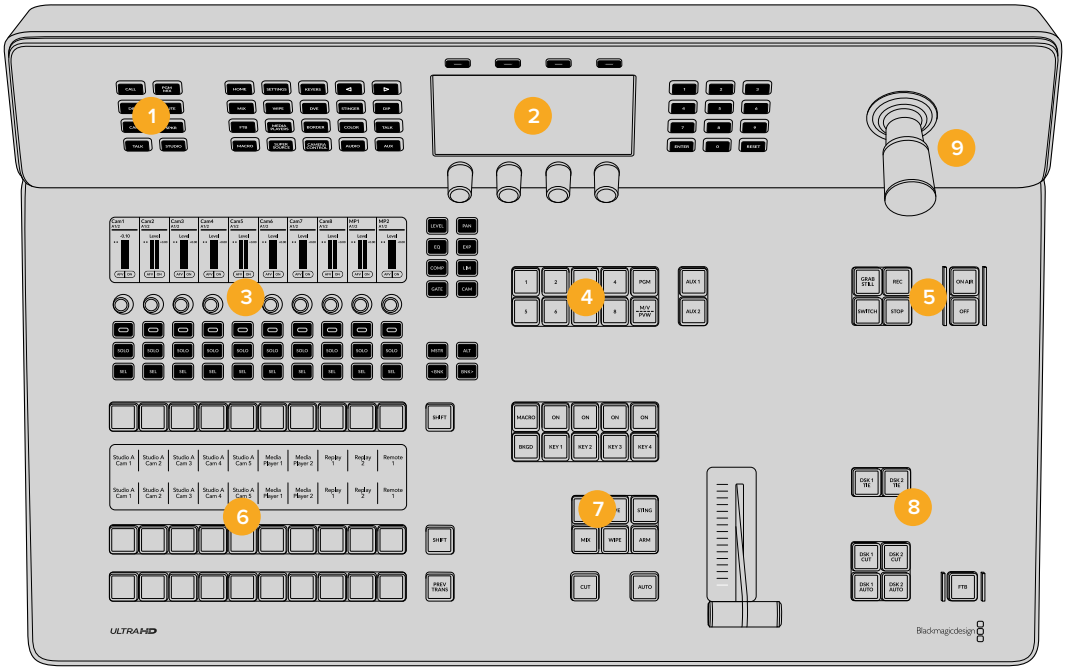
Arbeiten mit einem ATEM Television Studio

Das erweiterte, integrierte Bedienpanel Ihres ATEM Television Studio Mischers bietet u. a. Tastenreihen für Programm und Vorschau, ein Misch/Effekte-Panel, Talkback-Bedienelemente, einen Fairlight Audiomixer, Tasten für die Kamerasteuerung, ein Menü-LCD und einen Blendenhebel für die präzise Steuerung von Übergängen.

Bei paralleler Benutzung des integrierten Hardware-Bedienpanels und des mitgelieferten Software-Bedienpanels ATEM Software Control wird jede auf einem der Panels vorgenommene Änderung auf dem anderen reflektiert. Dies ermöglicht ihren gleichzeitigen Gebrauch. Alternativ können Sie überdies zusätzliche Hardware-Bedienpulte anschließen. Beispielsweise ein ATEM Camera Control Panel, um einen weiteren Operator mit der Kamerasteuerung zu betrauen.

Das Bedienpanel im Überblick

In diesem Abschnitt werden die wichtigsten Funktionsmerkmale des Bedienpanels vorgestellt. Diese umfassen das Hauptmenü zur Systemsteuerung, das LCD-Menü, Programm- und Vorschautasten, Übergangstasten, Keyertasten, Fairlight Audio-Steuerelemente u. a.



ATEM Television Studio 4K8

1 Talkback- und Call-Tasten

2 Systemsteuerung

3 Audiomixer

4 Aux-Auswahl-Tasten

5 Streaming- und Aufnahmetasten

6 Programm, Vorschau und Quellauswahl

7 DVE-Übergänge

8 Downstream-Keyer und Blende nach Schwarz

9 Joystick an ATEM Television Studio 4K8 Mischern

Systemsteuerung

Im oberen Bereich des Bedienpanels befindet sich das LCD mit den zugehörigen Tasten. Flankiert wird es von den Tasten der Systemsteuerung, die als Steuerzentrale des Mischers fungiert. Von dort haben Sie Zugriff auf das Menü, um wichtige Einstellungen zu ändern und um Ihren Mischer insgesamt zu konfigurieren.

Systemsteuerung

Navigieren im LCD-Menü

Wenn Sie eine der Systemsteuerungstasten drücken, zum Beispiel die HOME-Taste, erscheinen auf dem LCD die relevanten Bedienelemente und Einstellungen. Nehmen Sie Änderungen anhand der Multifunktionstasten oberhalb und den Multifunktionsreglern unterhalb des LCDs vor.

Die einzelnen LCD-Menüs bestehen aus einer oder mehr Seiten mit Einstellungen. Die Punkte unter dem Menünamen symbolisieren jeweils eine Seite. Die Navigation zwischen den Einstellungsseiten erfolgt mit den Rechts- und Linkspfeilen oder dem numerischen Tastenblock rechts vom LCD.

So wählen Sie bspw. einen der Mischermodi „Programmvorschau“ oder „A/B DIREKT“:

1 Drücken Sie die SETTINGS-Taste. Nach Aktivieren dieser Taste leuchten sowohl die Links- und Rechtstasten als auch die Zifferntasten auf.

Zum schnellen Zugriff auf einzelne Menüseiten leuchten die Zahlentasten rechts vom LCD auf

2 Drücken Sie mehrmals die Rechtspfeiltaste bis die Option „Mischermodus“ erscheint. Oder drücken Sie die Zifferntaste 6, um unmittelbar auf das Menü „Mischermodus“ zuzugreifen.

Navigieren Sie die Menüs über den numerischen Tastenblock

3 Wählen Sie aus den Multifunktionsoptionen oben am LCD die Option PGM/PVW für Programmvorschau oder A/B DIREKT.

Geben Sie den Mischermodus mit den Multifunktionstasten oberhalb des LCDs vor

4 Drücken Sie die HOME-Taste, um das LCD-Menü zu schließen.

Über den numerischen Tastenblock lassen sich Werte auch direkt eingeben. Beispiel: Um die Dauer von automatischen Übergängen auf der Startseite zu ändern, drücken Sie den „AUTO-RATE“-Regler. Nun leuchtet auf dem LCD der Button TASTATUR.

Geben Sie die neue Dauer ein und drücken Sie die ENTER-Taste.

Bestätigen Sie Änderungen durch Drücken der ENTER-Taste

Ändern von Einstellungen

Die Startseite ist das erste Menü, das auf dem LCD erscheint. Es enthält die Netzwerkeinstellungen und Benutzerprofile. Sie können jederzeit zur Startseite zurückkehren, indem Sie einfach die HOME-Taste drücken.

Drücken Sie die Multifunktionstaste über dem LCD-Menü TASTENBELEGUNG, um dieses Menü zu öffnen

Startseite

Im Startmenü erscheinen die aktuellen Eingaben und Übergangsraten sowie Untermenüs für Netzwerkeinstellungen und Informationen zur Softwareversion. Dort speichert man auch Profile.

Startseite	Der Hauptbildschirm des LCDs.
Netzwerk	Hier geben Sie für Ihren Mischer „DHCP“ vor. Alternativ verwenden Sie eine manuelle Adresse.
Info	Zeigt die aktuelle Softwareversion an.
Profile	Hier speichern Sie all Ihre bevorzugten Paneleinstellungen und Makros, um sie für Ihre nächste Sitzung an diesem Panel erneut zu laden. Ideal, wenn der Mischer von mehreren Leuten benutzt wird!

Einstellungen

Durch Drücken der SETTINGS-Taste rufen Sie Menüs wie EINSTELLUNGEN, HYPERDECKS und TASTENBELEGUNG auf, die Sie mit den Multifunktionstasten oberhalb des LCDs auswählen.

Ändern von Einstellungen

Benutzen Sie die Regler, Multifunktionstasten und den numerischen Tastenblock, um die Optionen im Menü EINSTELLUNGEN zu ändern.

Einstellen der Videonorm des Mischers	Über die Einstellung „Video“ bestimmen Sie die Videonorm für den Betrieb Ihres ATEM Mischers. Bei jeder Änderung der Videonorm werden sämtliche im Media Pool befindlichen Frames gelöscht.
Einstellen der Videonorm für Multiview	Bei einer für Ihre Produktion auf 1080p/25 oder höher eingestellten Videonorm, können Sie für die Multiview-Ausgabe eine niedrigere Framerate vorgeben. Auf diese Weise richten Sie die Downkonvertierung der Multiview-Ausgaben ein und erweitern die Monitorkompatibilität.
Einstellen der Helligkeit	Die Helligkeit von Tasten, Kennungen und Displays können Sie sich mit den Reglern für „Helligkeit“ nach Bedarf einrichten. Beim Arbeiten in dunklen Umgebungen kann das hilfreich sein.

Mischer-Timecode	Sobald der Mischer mit Strom versorgt wird, erstellt er automatisch Uhrzeit-Timecode. Man kann den Zähler aber auch manuell auf Null zurückzustellen oder einen neuen Wert für den Timecode-Start eingeben.
Mischermodus	Bei der Inbetriebnahme ist Ihr neuer ATEM Mischer auf den Betriebsmodus „Programm/Vorschau“, den gebräuchlichen Standard eines M/E-Mischers, eingestellt. Um im klassischen Stil des A/B-Mischens zu arbeiten, können Sie diese Voreinstellung auf „A/B Direkt“ ändern.
Abblende	Die FTB-Taste am ATEM Television Studio 4K8 lässt sich über das Systemsteuerungsmenü mit den LCD-Multifunktionstasten aktivieren und deaktivieren.
Einstellungen für den seriellen Port	ATEM Television Studio Mischer haben hinten einen RJ12-Remote-Port für die Steuerung über RS-422. Wie dieser Port genutzt wird, geben Sie im Menü „Serieller Port“ vor.
Einstellungen für die Kamer-asteuerung	Bei ATEM Television Studio 4K8 Modellen können Sie die Neigerichtung des Joysticks durch Auswahl von „Umgekehrt“ oder „Normal“ vorgeben. Wählen Sie den SDI-Ausgang zur Überwachung der Kamerasteuerung mit dem Multifunktionsregler MONITORING aus.
Sprachauswahl	ATEM Television Studio Mischer lassen sich neben Englisch und Deutsch auch auf Französisch, Italienisch, Japanisch, Koreanisch, Polnisch, Portugiesisch, Russisch, Spanisch, Türkisch, Ukrainisch und vereinfachtes Chinesisch einstellen.
Medium formatieren	Auf der letzten Seite der Menüeinstellungen können Sie den internen Speicher formatieren. Bei Mischern ohne optionalen Speicher ist diese Einstellung nicht verfügbar. Näheres erfahren Sie im Abschnitt „Datenträger“ in dieser Bedienungsanleitung.
Start-Status	Wenn Sie auf Ihrem ATEM Television Studio Mischer dieselben Einstellungen für alle Ihre Produktionen verwenden, können Sie diese als standardmäßigen Start-Status speichern. Ist ein Status gespeichert, werden bei jedem Hochfahren Ihres Mischers all Ihre Presets und Einstellungen geladen. Löschen lassen sich diese Einstellungen mit der Option „Start-Status verwerfen“.

HyperDeck Einstellungen

Sie können bis zu zehn HyperDeck Rekorder anschließen und über die Systemsteuerung des Mischers steuern. Richten Sie angeschlossene HyperDeck Rekorder über die Einstellungen „Eingänge“, „Auto-Play aktivieren“ und „Frame-Offset“ ein und konfigurieren Sie die IP-Adressen. Näheres zur Einrichtung von HyperDecks finden Sie im Abschnitt „HyperDeck Steuerung“ weiter hinten im Handbuch.

Tastenbelegung

Greifen Sie auf die Einstellungen für die Tastenbelegung zu, indem Sie durch Drücken der SETTINGS-Taste das LCD-Menü mit den allgemeinen Mischereinstellungen öffnen und dann die Multifunktionstaste TASTENBELEGUNG drücken.

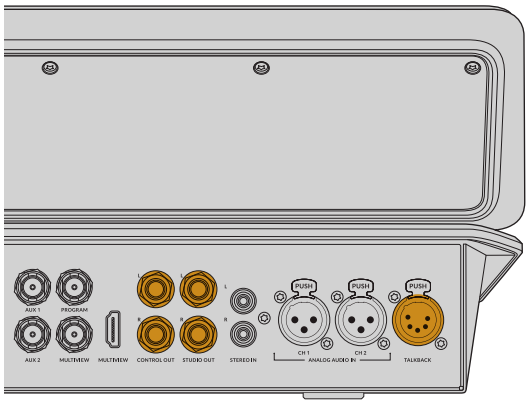
Benutzen Sie die Regler unter den einzelnen LCD-Einstellungen, um die zu belegende Taste auszuwählen und um den Eingang vorzugeben, den sie nun reflektieren soll. Um bestimmte Quellen hervorzuheben, können Sie auch die auf dem Bedienpanel angezeigten Farben der Tasten und Labels ändern. Bspw. möchten Sie ggf. Ihre Wiedergabequellen durch eine andere Farbe kenntlich machen, sodass sie auf dem Panel sofort identifizierbar sind. Eine Taste bleibt sowohl in der Vorschau- als auch in der Programmtastenzeile solange erleuchtet, bis die Quelle auf den Vorschau- oder Programmausgang geschaltet wird. Dann wechselt die Tastenfarbe von Grün nach Rot bzw. umgekehrt.

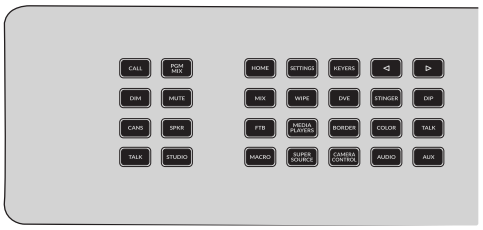
Sobald Sie eine Einstellung geändert haben, greift die Änderung sofort. Sie brauchen sich nicht ums Speichern zu kümmern. Drücken Sie zweimal die HOME-Taste, um zur Startseite zurückzukehren.

Um die Helligkeit der Tasten zu ändern, öffnen Sie das LCD-Menü mit den allgemeinen Mischereinstellungen durch Drücken der Multifunktionstaste EINSTELLUNGEN. Navigieren Sie dann mit den Pfeiltasten zur vierten Seite des Menüs oder drücken Sie auf dem numerischen Zahlenblock die Taste 4. Drehen Sie den entsprechenden Multifunktionsregler, um die Helligkeit der Kennungen und Tasten bedarfsgemäß einzustellen. Wenn Sie die Tasteneinstellungen fertig konfiguriert haben, drücken Sie die HOME-Taste, um zur Startseite zurückzukehren. Näheres finden Sie im Abschnitt „Helligkeitseinstellungen“ weiter hinten im Handbuch.

Talkback- und Call-Tasten

Über die TALK-Taste und die CALL-Taste oben links auf dem Panel greifen Sie ohne zusätzliche Hardware direkt auf die Sprechverbindungs-Funktionen zu. Verbinden Sie ein Intercom-Headset mit Mikrofon mit dem 5-poligen XLR-Anschluss hinten am Mischer.





Die CALL-Taste

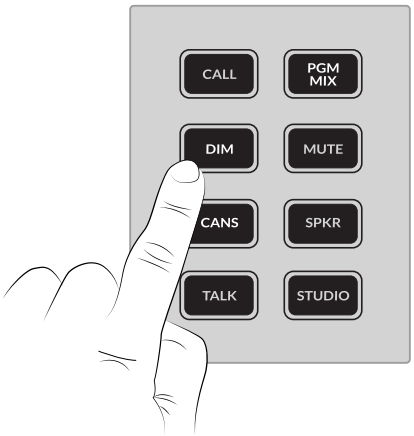
Solange Sie die CALL-Taste gedrückt halten, blinkt das Tally an allen verbundenen Kameras. Auf diese Weise kann man bequem mit dem Kameraoperator Kontakt aufnehmen oder mehrere Kameraleute informieren, dass man im Begriff ist live zu gehen.

PROGRAMM-MIX

Drücken Sie die die Taste PGM MIX, um die Programmmischung zu hören. Bei aktivierter CANS- oder PGM MIX-Taste kann man den Programmmix über die TALKBACK-XLR-Anschlüsse und über an die „CONTROL OUT“-Buchsen angeschlossene Lautsprecher hören.

DIM

Diese Taste dient zum zeitweiligen Reduzieren (RED. in der Software) der Lautstärke des Programmmixes ohne Anpassen des Faders. Um zur ursprünglich vorgegebenen Lautstärke zurückzukehren, drücken Sie die DIM-Taste erneut.



MUTE

Drücken Sie die MUTE-Taste, um die Ausgabe der Programmmischung ohne Anpassen des Faders zeitweilig stummzuschalten.

CANS

Bei Einsatz eines Headsets, das an die 5-polige TALKBACK-XLR-Buchse hinten am Mischer angeschlossen ist, drücken Sie die CANS-Taste, um den Ton über diese Verbindung zu aktivieren. Wenn der Ton aktiviert ist, drücken Sie auf PGM MIX, um die Programmmischung zu hören.

SPKR (Speaker)

Drücken der SPKR-Taste (Lautsprecher) aktiviert den Ton über die „CONTROL OUT“-Buchse hinten am Mischer.

TALK

Bei Gebrauch eines Intercom-Headsets können Sie die Mikrofonausgabe durch Drücken der TALK-Taste aktivieren. Ton über TALK ist nur dann in der Studioausgabe zu hören, wenn die STUDIO-Taste gedrückt gehalten wird oder durch zweimaliges Drücken durchgehend eingeschaltet ist.

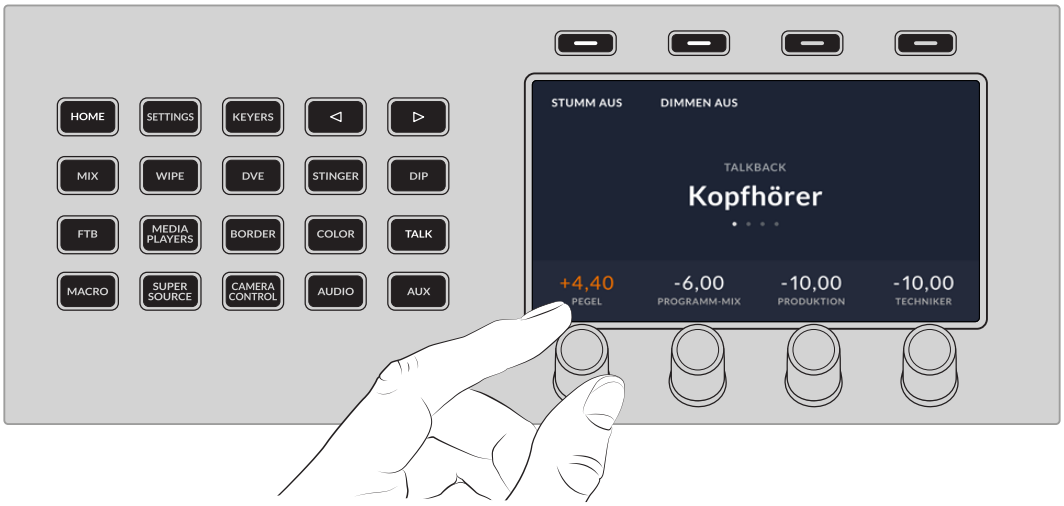
Nach zweimaligem Drücken der TALK-Taste bleibt das Mikrofon eingeschaltet und die Taste leuchtet rot, bis sie erneut zweimal gedrückt wird. Sind die STUDIO-Taste und die SPRK-Tasten beide aktiviert, bleibt das Mikrofon für alle Talkback-Kanäle eingeschaltet.

STUDIO

Die STUDIO-Taste aktiviert die Tonausgabe über die mit STUDIO OUT beschrifteten Buchse hinten am Mischer. Dort könnte ein Lautsprecher im Studio angeschlossen sein, über den Mitwirkende den Ton mithören können. Halten Sie, um zu sprechen, bei aktivierter TALK-Taste die STUDIO-Taste zeitweilig gedrückt oder drücken Sie sie zweimal.

Die Lautstärke der Kopfhörer-, Steuerung- und Studio-Ausgaben justiert man über die AUDIO- und TALK-Tasten in der Systemsteuerung.

1. Drücken Sie die TALK-Taste. Über die Kopfhörereinstellungen lässt sich der Audiomix für die 5-polige XLR-Kopfhörerbuchse hinten am Mischer anpassen. Für die Einstellungen gibt es zwei Seiten.
2. Passen Sie die Lautstärke durch Drehen des jeweiligen Multifunktionsreglers an.

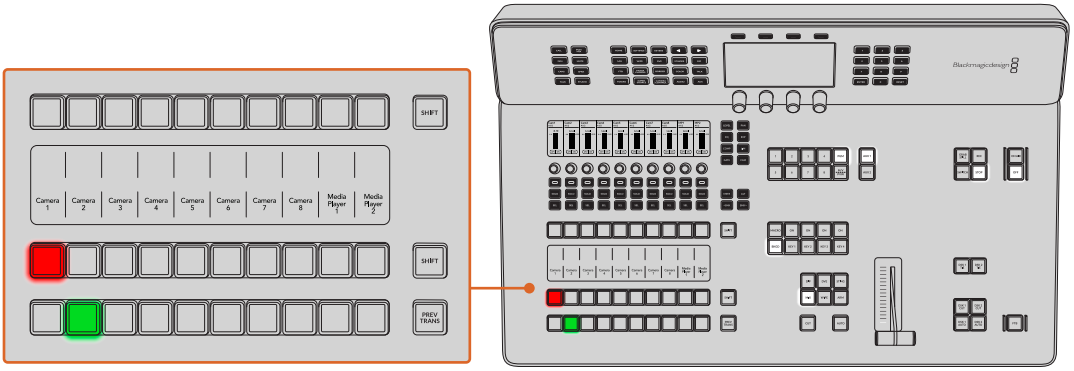


3 Passen Sie die Lautstärke für „Steuerung Ausgabe“ und „Studio Ausgabe“ mit den Einstellungen auf der dritten und vierten Seite an.

Einstellungen	
PEGEL	Passt die Ausgabelautstärke für Kopfhörer, Studio oder Steuerung insgesamt an.
PROGRAMM-MIX	Gibt die Lautstärke des Programmtons vor.
PRODUKTION	Steigert oder senkt die Produktions-Gegensprechlautstärke der einzelnen Ausgaben.
TECHNIKER	Steigert oder senkt die Techniker-Gegensprechlautstärke der einzelnen Ausgaben.
MITHÖRTON Nur für Kopfhörer	Mit der nur für Kopfhörer verfügbaren Einstellung „Mithörton“ können Sie Ihre Stimme vom Headsetmikrofon in die Monitoring-Ausgabe mischen. Das ist praktisch, wenn Sie ein geräuschreduzierendes Headset einsetzen.
MIC-GAIN Nur für Kopfhörer	Bei manchen Talkback-Headsets ist die Mikrofonlautstärke niedrig und ggf. schwer zu hören. Passen Sie die Einstellung MIC-GAIN an, um die Mikrofonlautstärke zu steigern oder zu senken.

Misch/Effekte (M/E)

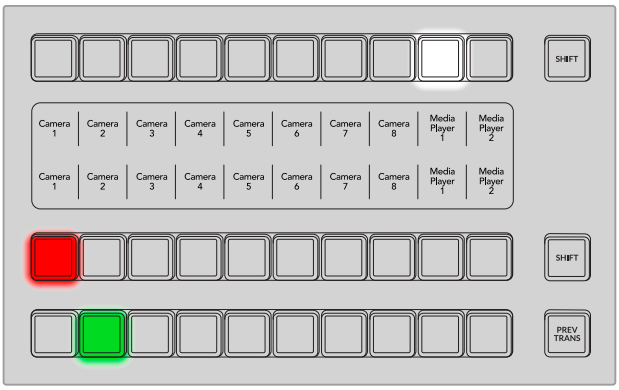
Zusammen dienen die Programm- und Vorschaubusse sowie das Quellnamen-Display dazu, Quellen auf die Programm- und Vorschauausgänge zu schalten.



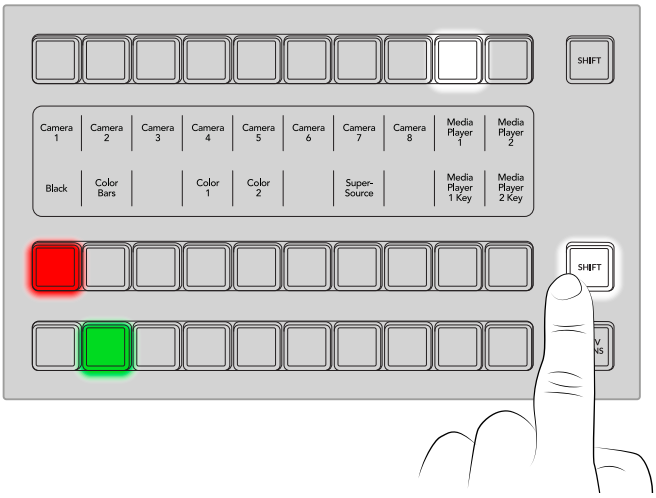
Quellnamen-Displays

Im Quellnamen-Display werden die externen Eingänge bzw. internen Quellen des Mischers anhand von Kennungen dargestellt. Die Bearbeitung der Labels für die externen Eingänge erfolgt im „Einstellungen“-Fenster des Software-Bedienpanels. Die Kennungen der internen Quellen sind festgelegt und lassen sich nicht ändern.

Die Displays zeigen die Kennungen für die einzelnen Tastenreihen in den Quellauswahl-, Programm- und Vorschaureihen an.



Durch Drücken der SHIFT-Taste schaltet das Quellnamen-Display um. Es zeigt dann zusätzliche geshiftete Quellen an, was die Auswahl von bis zu 20 verschiedenen Quellen ermöglicht.



Gleichzeitiges Drücken beider SHIFT-Tasten neben den Quellauswahl- und Programm-Tastenreihen bewirkt, dass im Quellnamen-Display nun die geschützten Quellen angezeigt werden. Diese stehen in der Quellauswahl-Tastenreihe jetzt für Keyer und zur Signalverteilung an die Aux-Ausgänge bereit. Geschützte Quellen sind Programm, Vorschau, Clean Feed 1 und Clean Feed 2.

Programm-Bus

Mit dem Programm-Bus lassen sich Hintergrundquellen unmittelbar auf den Programmausgang schalten. Die jeweils auf Sendung befindliche Quelle ist an einer rot erleuchteten Taste erkennbar. Eine rot blinkende Taste zeigt an, dass eine geshiftete Quelle auf Sendung ist. Durch Drücken der SHIFT-Taste wird die geshiftete Quelle angezeigt.

Vorschau-Bus

Der Vorschau-Bus dient zur Auswahl einer am Vorschauausgang anliegenden Quelle. Beim nächsten Übergang wird die ausgewählte Quelle an den Programmausgang gelegt. Die ausgewählte Vorschauquelle ist an einer grün erleuchteten Taste erkennbar. Eine grün blinkende Taste bedeutet, dass eine geshiftete Quelle auf Vorschau ist. Durch Drücken der SHIFT-Taste wird die geshiftete Quelle angezeigt.

Shift

Die SHIFT-Taste bewirkt eine globale Umschaltung und dient zur Umschaltung der Programm-, Vorschau- und Auswahlbusse mitsamt ihrer Kennungen. Sie dient außerdem zum Wechseln zwischen Übergangsarten und anderen Menüfunktionen.

Das doppelte Drücken von Tasten in den Vorschau- und Auswahlbussen sowie der Übergangsart-Tasten bewirkt dasselbe wie ihre Aktivierung mit der SHIFT-Taste, geht ggf. jedoch schneller als die Auswahl mit den SHIFT-Tasten. Für den Programm-Bus ist die Bedienung per zweimaligem Drücken der Taste nicht möglich, da dies zur Folge hätte, dass am Programmausgang für einen Augenblick die falsche Quelle ausgegeben wird.

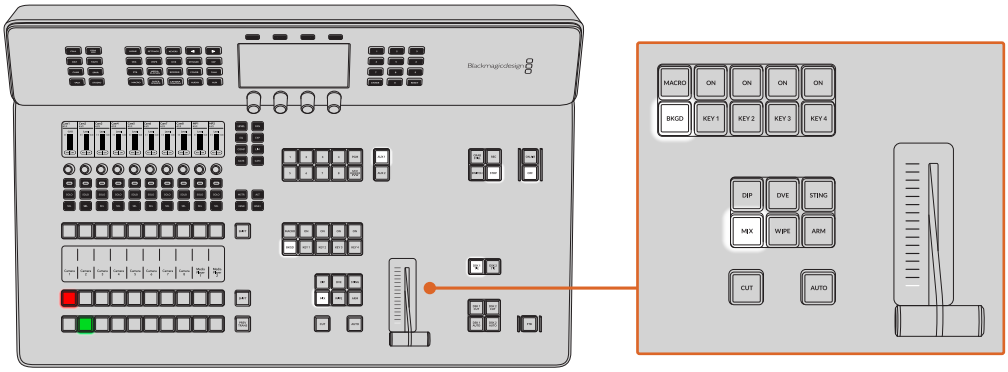
Quellauswahl-Bus

Der Quellauswahl-Bus arbeitet im Einklang mit dem Quellnamen-Display und dient zur Zuweisung von Quellen an Auxiliary-Ausgänge und Keyer. Ist die MACRO-Taste aktiviert, dient diese Tastenzeile überdies zum Laden und Ausführen von Makros, die an den entsprechenden Plätzen aufgezeichnet sind. Bei aktivierter MACRO-Taste leuchten alle Tasten blau.

Die Zielanzeige und der Auswahlbus zeigen Ihnen die Signalverteilung der Quellen auf Keyer und Auxiliary-Ausgänge an. Die aktuell ausgewählte Quelle ist an einer leuchteten Taste zu erkennen. Eine blinkende Taste zeigt eine geshiftete Quelle an. Eine grün erleuchtete Taste macht eine geschützte Quelle kenntlich.

Geschützte Quellen sind Programm, Vorschau, Clean Feed 1 und Clean Feed 2.

Übergangssteuerung und Upstream-Keyer



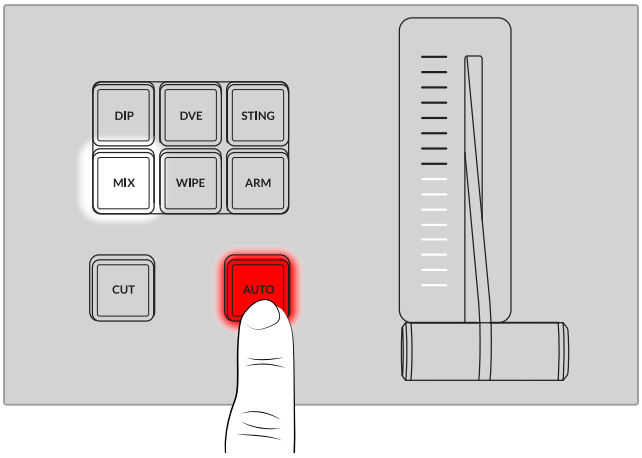
CUT

Die CUT-Taste führt einen sofortigen Übergang der Programm- und Vorschauausgaben per Hartschnitt aus. Dabei wird die ausgewählte Übergangsart außer Kraft gesetzt.

AUTO

Die AUTO-Taste führt den ausgewählten Übergang innerhalb der auf der LCD-Startseite unter AUTO-RATE eingestellten Zeitspanne automatisch aus. Die Übergangsrate für die einzelnen Übergangsarten wird über das LCD-Menü eingestellt und bei Aktivierung der entsprechenden Übergangsart-Taste angezeigt.

Die AUTO-Taste leuchtet für die Dauer des Übergangs rot. Die sequentiell aufleuchtenden LEDs des Blendenhebel-Indikators signalisieren den Verlauf des Übergangs. Bei aktivem Software-Bedienpanel aktualisiert sich dabei auch die Position des virtuellen Blendenhebels und gibt so visuellen Aufschluss über den Verlauf des Übergangs.



Blendenhebel und Blendenhebel-Indikator

Der Blendenhebel dient als Alternative zur AUTO-Taste und erlaubt dem Bediener die manuelle Steuerung von Übergängen. Der neben dem Blendenhebel angeordnete Blendenhebel-Indikator zeigt den Verlauf des Übergangs visuell an.

Die AUTO-Taste leuchtet für die Dauer des Übergangs rot und der Blendenhebel-Indikator aktualisiert sich im Verlauf des Übergangs. Bei aktivem Software-Bedienpanel aktualisiert sich dabei gleichzeitig die Position des virtuellen Blendenhebels.

Übergangsart-Tasten

Mit den Übergangsart-Tasten kann der Bediener eine von fünf Übergangsarten auswählen: Mix, Wipe, Dip, DVE und Stinger (mit STING markiert). Die Auswahl der Übergangsart erfolgt durch Drücken der entsprechend gekennzeichneten Übergangsart-Taste. Die Taste leuchtet bei Aktivierung auf.

Nach Auswahl einer Übergangsart wird auf dem LCD-Menü die Übergangsrate angezeigt. Überdies gewährt das Menü unmittelbaren Zugriff auf die artspezifischen Einstellungen des Übergangs. Benutzen Sie die Multifunktionstasten und -regler, um durch die Einstellungen zu navigieren und Änderungen vorzunehmen.

Die mit ARM gekennzeichnete Taste ist aktuell funktionslos und zur Aktivierung durch ein künftiges Update vorgesehen.

ARM

Die ARM-Taste aktiviert die automatische Wiedergabe von einem angeschlossenen HyperDeck, der unmittelbar nach einem Übergang auf dem Vorschau-Bus ausgewählt wurde. Ähnlich wie bei der Auto-Roll-Funktion beginnt der auf dem Vorschau-Bus ausgewählte HyperDeck mit der Wiedergabe, sobald Sie zum Auslösen des Übergangs die CUT- oder AUTO-Tasten drücken. Um die ARM-Funktion zu nutzen, drücken Sie die entsprechende ARM-Taste; die Wiedergabe läuft dann nur beim nächsten Übergang automatisch für den ausgewählten HyperDeck-Eingang. Um ARM im aktivierten Zustand zu belassen, drücken Sie die ARM-Taste zweimal; sie leuchtet dann grün, um anzuzeigen, dass sie aktiviert ist.

Es ist zu beachten, dass jegliche über den HyperDeck eingestellte Vorlaufzeit ignoriert wird, wenn ARM aktiviert ist.

PREV TRANS

Die Taste PREV TRANS aktiviert den Übergangsvorschaumodus. Er erlaubt dem Bediener, einen Übergang zu prüfen, indem er ihn mit dem Blendenhebel probeweise als Vorschauausgabe ausführt. Sobald Sie diese Taste gedrückt und so die Übergangsvorschau aktiviert haben, können Sie Ihren Übergang beliebig oft in der Vorschau ansehen. So können Sie einen Übergang testen, bevor Sie ihn auf Sendung bringen und ggf. modifizieren. Sie können sogar Stinger-Übergänge als Vorschau betrachten! Wenn Sie mit dem Übergang in der Vorschau zufrieden sind, deaktivieren Sie die Taste durch erneutes Drücken. Nun sind Sie bereit, Ihren Übergang auf Sendung zu schalten.

Nächster Übergang

Die Tasten BKGD (Hintergrund), KEY 1, KEY 2, KEY 3, KEY 4 dienen zur Auswahl von Elementen, die mit dem nächsten Übergang in den On-air- oder Off-air-Betrieb übergehen. Durch gleichzeitiges Drücken mehrerer Tasten können beliebig kombinierte Hintergründe und Keys ausgewählt werden. Durch zweimaliges Drücken der BKGD-Taste werden alle aktuell auf Sendung befindlichen Upstream-Keyer des nächsten Übergangs gewählt und auf die Tasten für den nächsten Übergang kopiert.

Das Drücken einer der Tasten in der Zeile für den nächsten Übergang hebt die Auswahl aller übrigen auf. Bei der Auswahl von Elementen für den nächsten Übergang sollte der Mischerbediener die Vorschauausgabe ansehen. Diese gibt akkurat wieder, wie die Programmausgabe nach erfolgtem Übergang aussehen wird. Ist nur die BKGD-Taste aktiviert, erfolgt der Übergang von der aktuellen Quelle im Programmbus auf die im Vorschaubus ausgewählte Quelle.

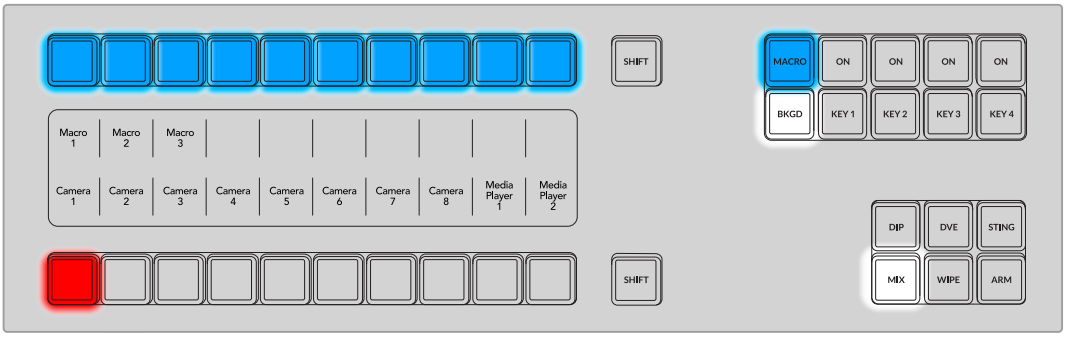
ON AIR

Die mit „ON“ markierten On-air-Indikatortasten über den einzelnen Keyern zeigen die aktuell auf Sendung befindlichen Upstream-Keyer an. Sie dienen ebenfalls dazu, einen Key per Hartschnitt sofort auf Sendung zu schalten oder ihn wegzuschalten.

MACRO

Die MACRO-Taste aktiviert die Makrofunktion und bewirkt, dass die Tasten in der Quellauswahlreihe nun als Makrotasten für die jeweiligen Makroplätze fungieren.

Die Quellauswahlreihe weist zehn Makrotasten auf. Wenn Sie mehr als zehn Makros an den Makroplätzen gespeichert haben, können Sie darauf über die Makroeinstellungen im LCD-Menü zugreifen und die Makrogruppe mit dem Drehregler ändern.

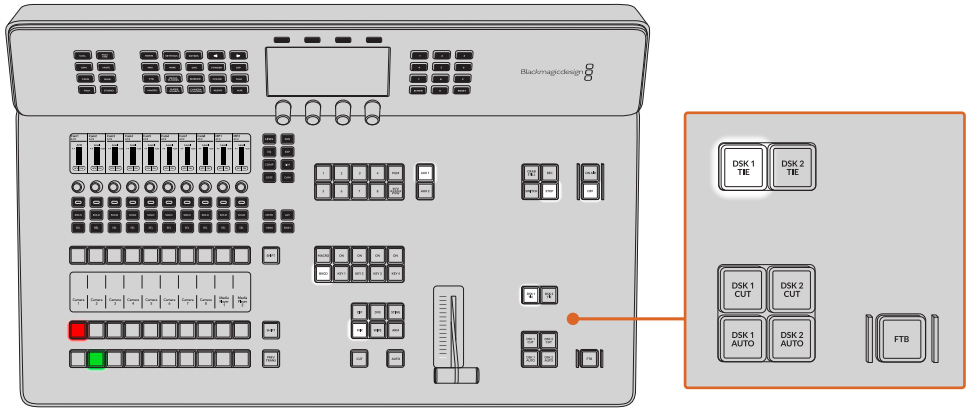


Näheres zum Aufzeichnen und Ausführen von Makros mit einem ATEM Television Studio siehe Abschnitt „Mit Makros arbeiten“ weiter hinten in dieser Bedienungsanleitung.

Downstream-Keyer (DSK)

Downstream-Keyer Tie (DSK TIE)

Die Taste DSK TIE aktiviert den DSK auf dem Vorschauausgang zusammen mit den nächsten Übergangseffekten und verknüpft ihn mit der primären Übergangssteuerung. Der DSK kann dann beim nächsten Übergang auf Sendung gebracht werden.



Da der Downstream-Keyer nun mit dem primären Übergang verknüpft ist, erfolgt der Übergang in der mit der „AUTO-RATE“-Einstellung im STARTSEITE-Menü vorgegebenen Zeitspanne. Ein verknüpfter DSK wirkt sich nicht auf die Signalverteilung zum Clean Feed 1 aus.

Downstream-Keyer Cut (DSK CUT)

Die Taste DSK CUT schaltet den DSK per Hartschnitt on air oder off air. Sie signalisiert ebenfalls, ob der DSK aktuell auf Sendung ist oder nicht. Die Taste leuchtet, wenn der DSK aktuell auf Sendung ist.

Downstream-Keyer Auto (DSK AUTO)

Die Taste DSK AUTO mischt den DSK im durch die Einstellung der DSK-Rate im LCD-Menü spezifizierten Zeitraum automatisch on air oder off air.

Abblende

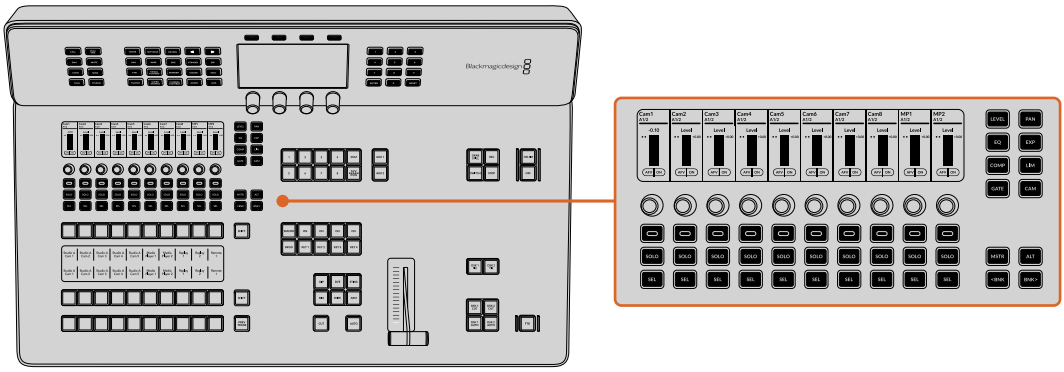
Die FTB-Taste blendet die Programmausgabe nach Schwarz ab. Dies erfolgt innerhalb des im LCD-Menü mit der FTB-Rate spezifizierten Zeitraums. Nach erfolgter Abblende der Programmausgabe blinkt die FTB-Taste rot, bis sie erneut gedrückt wird. Dies bewirkt die Aufblende der Programmausgabe von Schwarz im gleichen Zeitraum. Eine Vorschau ist für die Blende nach Schwarz nicht möglich.

Ihr Mischer kann so eingestellt werden, dass der Ton zusammen mit Ihrer FTB ausgeblendet wird. Navigieren Sie hierfür auf dem LCD-Menü zu FTB und aktivieren Sie Audio-Follow-Video mit „AFV EIN“. So blendet der Mischer den Ton in der gleichen Dauer wie die FTB aus. Soll der Ton während und nach der FTB weiterlaufen, geben Sie „AFV AUS“ vor.

Audiomixer

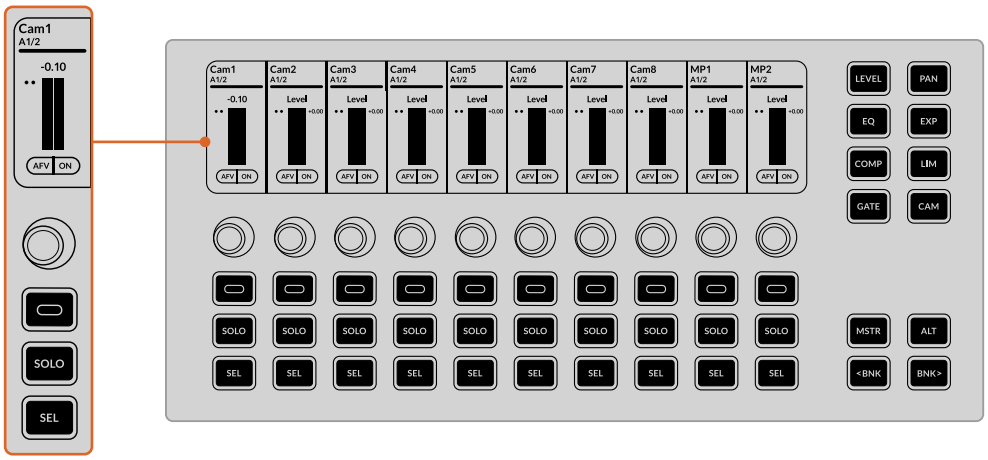
Die erweiterten Audio-Steuerelemente von ATEM Television Studio Mischern dienen zum Gestalten und Verfeinern der Tonqualität einzelner Eingaben und der Master-Ausgabe. Verfügbar sind bspw. Eingabepegel-Steuerelemente, ein parametrischer 6-Band-Equalizer und wirkungsvolle Dynamikeinstellungen. Dieser Abschnitt der Bedienungsanleitung stellt die verschiedenen Audiosteuerelemente vor, mithilfe derer Sie den Tonmix Ihrer Liveproduktionen gestalten und verfeinern können. Die zur Tonanpassung verwendeten Regler und Tasten dienen auch zur Kamerasteuerung und zur Verfeinerung von über den Mischer ausgegebenem Ton.

Der Audiomixer bietet vielerlei physische Bedienelemente, mit denen Sie Ihre Liveproduktion mischen und prüfen können. Manche Tasten dienen einem bestimmten Zweck, bei anderen handelt es sich um Multifunktionstasten. Darum sollte man sich zunächst mit den verschiedenen Bedienelementtypen vertraut machen, bevor man in die Details einzelner Tasten oder Regler eintaucht.



Kanalzüge

Den meisten Platz nehmen auf der Bedienoberfläche des Audiomixers die Kanalzüge ein. Im standardmäßigen Betriebsmodus bietet die Konsole 10 Kanalzüge mit je einer Ein/Aus-, SOLO- und SEL-Taste, einem Drehregler für Justagen sowie einem LCD, das die Kanalinformationen anzeigt. Alle an den Kanalzug-Bedienelementen vorgenommenen Änderungen werden in ATEM Software Control im Audio-Arbeitsraum gespiegelt.



LCD

Beim erstmaligen Einschalten Ihres ATEM Television Studio Mischers erscheinen auf dem LCD über jedem der Kanalzüge der Eingabename und ein Pegelmeter. Je nach dem Modus, der mit den Tasten rechts der Kanalzüge gewählt wurde, zeigen die einzelnen LCDs aber jeweils andere Informationen an. Wurde bspw. der Modus PAN gewählt, erscheinen dort die Audiopegelmeter für zehn Eingaben. Ist für einen oder mehrere Eingänge „Audio in separate Monokanäle trennen“ gewählt, erhält jede Monoeingabe ihren eigenen Kanalzug.

Die LCD-Anzeige aktualisiert sich dynamisch, sobald mit den Tasten rechts vom LCD andere Modi vorgegeben werden. Beispiel: Wird die EQ-Taste gedrückt, wechselt die LCD-Anzeige und zeigt u. .a. die Filter „Niedrige Mitten“ und „Hoch“ an. Die Tasten und Regler steuern nun spezifische EQ-Parameter, die die auf den Ton angewendeten EQ-Steuerelemente widerspiegeln.

Drehregler

Für schnelle Änderungen an bestimmten Parametern geben Ihnen diese vielseitigen, auch als Encoder bezeichneten Drehregler eine hochpräzise Kontrolle. Um die Lautstärke einer Eingabe zu steigern, drücken Sie die LEVEL-Taste und drehen Sie den Regler nach rechts.

Einschalt-Multifunktionstaste

Mit dieser Multifunktionstaste wählt man den Button, der auf dem LCD gezeigt wird. Ist zum Beispiel PEGEL gewählt, schaltet die Multifunktionstaste zwischen dem Audioverhalten „Audio folgt Video“, ein und aus. Wenn PEGEL oder PAN aktiviert ist, leuchtet der Button rot, um zu signalisieren, dass der Eingang auf Sendung ist.

SOLO-Taste

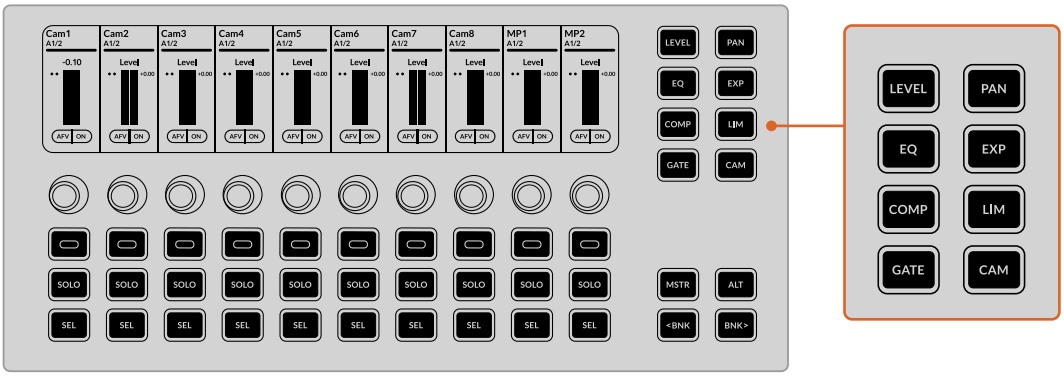
Drücken Sie auf SOLO, um nur diesen einen Kanal zu hören. Das kann beim Verfeinern von Justagen am Ton hilfreich sein. Ist SOLO aktiviert, erscheint auf dem LCD ein Kopfhörersymbol für den gewählten Kanal.

SEL-Taste

Mit der SEL-Taste lässt sich ein Kanal aktivieren oder deaktivieren.

Modus-Tasten

Verwenden Sie die Modus-Tasten, um den Kanalzügen die entsprechenden Einstellungen zuzuweisen.



Drücken Sie zweimal auf die EQ-Taste, um die Hoch- und Tiefpass-Steuerelemente einzublenden

Für manche Einstellungen gibt es mehr als eine Seite mit Bedienelementen. Dies wird am ersten Kanalzug angezeigt. Um die zusätzlichen Bedienelemente einzublenden, drücken Sie die Modus-Taste ein zweites Mal. Beispiel: Drücken Sie zweimal die EQ-Taste, um auf die Hoch- und Tiefpassfilter zuzugreifen.

Modi

Die über das Bedienpanel des Mischers für die Arbeit mit dem Audiomixer verfügbaren Audiomodi sind ein Abbild der auch in ATEM Software Control verfügbaren Einstellungen. Demnach können Sie über die Einstellung „Kamerasteuerung“ von Ihrem ATEM Mischer aus auch Blackmagic Kameras wie die Blackmagic Studio Camera 6K Pro und die URSA Broadcast G2 steuern.

Pegel	Passen Sie den Pegel für die Tonausgabe für die einzelnen Kanäle mit den entsprechenden Reglern an. Für jeden Kanalzug gibt es eine Multifunktionstaste zum Wechseln der Audiomodi „Audio folgt Video“, ein und aus. Wenn ALT aktiviert ist, können Sie die Verstärkung für die einzelnen Kanäle anpassen. Durch Anpassen von Gain nach oben oder unten wird die Lautstärke der gewählten Eingabe gesenkt bzw. gesteigert.
Equalizer	Der EQ-Steuerelementesatz umfasst zwei Seiten. Drücken Sie die EQ-Taste, um die erste Seite mit den Steuerelementen zu öffnen. Die Belegung der Regler und SEL-Tasten verläuft von links nach rechts. Um zur zweiten Seite zu gehen, drücken Sie die EQ-Taste erneut. Der Satz mit den EQ-Steuerelementen konzentriert sich auf Hochpass- und Tiefpassfilter der Bänder 1 und 6. Mit den jeweiligen Multifunktionstasten schaltet man die Filter ein oder aus oder wählt eine Form. Um zur ersten Seite zurückzugehen, drücken Sie erneut auf EQ. Wiederholen Sie die nötigen Schritte, um zwischen Seite 1 und 2 zu wechseln. Der Satz mit den EQ-Steuerelementen spiegelt alle im Audio-Arbeitsraum von ATEM Software Control verfügbaren Parameter-Steuerelemente wider.
Kompressor	Der Satz mit den Kompressor-Steuerelementen umfasst alle im „Dynamik“-Fenster verfügbaren Kompressor-Parameter. Wie bei allen anderen Steuerelementsätzen, befindet sich der einer Multifunktionstaste zugewiesene Ein/Ausschalter an der Position von Kanal 1.
Gate	Der Satz mit den Gate-Steuerelementen spiegelt alle im Audio-Arbeitsraum von ATEM Software Control verfügbaren Gate-Parameter-Bedienelemente wider. Wählen Sie die zu bearbeitende Spur mit der SEL-Taste. Ein Gate funktioniert wie ein extrem eingestellter Expander, der die Pegelstärke senkt oder sogar in einen bestimmten Bereich fallende Teile eines Signals stummschaltet. Dies reduziert oder eliminiert Störgeräusche in den leisen Abschnitten einer Aufzeichnung.
Pan	Jeder Audiokanal verfügt einen einfachen Panoramaregler, mit dem Sie die Klangverteilung für diese Eingabe vornehmen können. Pannen Sie einen Kanal nach links oder rechts, indem Sie den jeweiligen Kanalregler drehen. Die mit den einzelnen Reglern vorgenommenen Anpassungen berühren den an der leuchteten SEL-Taste erkenntlichen Kanal.
Expander	Der Satz mit den EXP-Steuerelementen spiegelt alle im Audio-Arbeitsraum von ATEM Software Control verfügbaren Expander-Parameter-Steuerelemente wider. Wählen Sie die zu bearbeitende Spur mit der SEL-Taste. Die folgenden sieben Kanalzüge umfassen Regler für die Expander-Parameter, die in derselben Reihenfolge wie im „Dynamik“-Fenster erscheinen.
Limiter	Wie die anderen Dynamik-Steuerelementsätze, umfasst der Limiter-Satz alle Limiter-Parameter-Steuerelemente. Sie sind den Reglern in der gleichen Reihenfolge wie im „Dynamik“-Fenster zugewiesen.
Kamera-steuerung	Über die Funktion zur Kamerasteuerung des Audiomixers können Sie Blackmagic Kameras mit denselben Reglern und Tasten Ihres Mischers bedienen. Drücken Sie die CAM-Taste, um die Einstellungen aufzurufen. Die Einstellungen für die Kamerasteuerung sind auf drei Menüseiten verteilt, durch die Sie durch erneutes Drücken auf CAM navigieren. In der Systemsteuerung können Sie die Einstellungen für die Kamerasteuerung auch mit dem „Kamerasteuerung“-Button anpassen. Näheres zur Kamerasteuerung finden Sie im Abschnitt „Arbeiten mit der Kamerasteuerung“ weiter hinten in dieser Bedienungsanleitung.

Kanal- und Hilfstasten

Die Kanal- und Hilfstasten befinden sich unterhalb der Modus-Tasten.

MSTR (Master)

Mit der MSTR-Taste ruft man die Steuerelemente für die Audioausgänge an der Rückseite des Mischers auf, einschließlich der Ausgaben für Kopfhörer, Steuerung und Studio. Überdies justiert man mit dieser Taste die Lautstärke für die Masterausgabe.

ALT

Die ALT-Taste ruft alternative Parameter oder Funktionen auf. Beispiel: Wenn Sie die Lautstärke-Steuerelemente justieren, blenden Sie durch Drücken auf ALT die Verstärkungsregler ein.

Drücken der ALT-Taste ruft die Verstärkungsregler auf

BNK (Reihe)

Mit den BNK-Tasten (Bank) blendet man die nächste Reihe mit Eingabequellen auf dem LCD ein. BNK> reiht Kanalzüge in Zehnergruppen nach rechts verlaufend auf. <BNK reiht den vorherigen Satz mit 10 Kanälen auf.

Workflow-Anleitung zu den Audiosteuerelementen

Dieser Abschnitt stellt einen elementaren Workflow vor. Er ist als Starthilfe beim Verfeinern und Aufbereiten Ihrer Tonmischung mit dem Audiomixer gedacht.

1. Als ersten Schritt zur Optimierung Ihres Mixes normalisiert man in der Regel sämtliche Eingaben, um diese mit maximaler Pegelstärke in den Mix einzubringen, ohne sie zu übersteuern. Normalerweise geschieht das, indem man den Pegel der Eingabeverstärkung für jeden Eingang anhebt oder senkt, bis die Signalspitzen auf der Pegelanzeige des Kanalzugs etwas unter 0 dB liegen.
2. Um eine der Mono-Eingaben in zwei separate Kanäle für eine Stereoausgabe zu trennen, navigieren Sie von den allgemeinen Mischereinstellungen zum „Audio“-Tab. Aktivieren Sie die Kontrollkästchen für alle Eingaben, die Sie in Stereo ändern wollen. Klicken Sie zur Bestätigung auf „Fertig“.

TIPP Um eingehende Mono-Signale in zwei separate Kanäle zu splitten, tun Sie das am besten, bevor Sie die Signaleingabe, wie in Schritt 1 beschrieben, normalisieren. So können Sie beide Kanäle getrennt normalisieren.

3. Um die Entzerrung für die einzelnen Eingaben zu ändern, drücken Sie die EQ-Taste.

4 Nachdem sie EQ vorgegeben haben, öffnen Sie die Dynamik-Steuerelemente mit den EXP- und GATE-Tasten. Nehmen Sie die zur generellen Verbesserung und Verfeinerung des Eingabetons erforderlichen Änderungen an der Dynamik vor.

5 Jetzt wo EQ und Dynamik für alle Eingaben vorgegeben sind, öffnen Sie die EQ-Steuerelemente für die Masterausgabe und verfeinern Sie den finalen Audiomix.

6 Öffnen Sie anschließend die Dynamik-Steuerelemente der Masterausgabe und nehmen Sie ggf. erforderliche Änderungen zur Verbesserung der finalen Ausgabe vor.

Nachdem alle Audiomixer-Steuerelemente eingestellt sind, können Sie die Pegel des Audiomixers für Ihren Livemix durch Anheben oder Absenken optimieren und bei Bedarf im Produktionsverlauf anpassen. Alternativ gehen Sie wieder zu beliebigen Einstellungen zurück und nehmen, wo erforderlich, weitere Anpassungen vor. Die besten Ergebnisse erzielt man jedoch, indem man in der oben beschriebenen Reihenfolge vorgeht. Es ist bspw. wichtig, zunächst die EQ-Steuerelemente einzustellen, bevor die Dynamik geändert wird, da entlang der mischerinternen Verarbeitungskette die Dynamikvorgaben erst nach der Entzerrung auf den Ton angewendet werden.

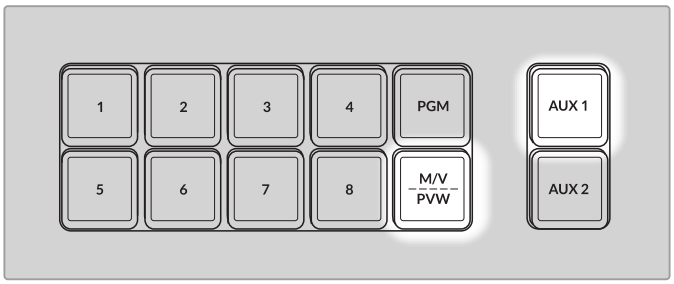
Am allerwichtigsten ist es jedoch, alle Effekte gut durchdacht einzusetzen, damit der Ton ebenso spannend wie natürlich klingt.

Näheres zum Anpassen der Fairlight Steuerelemente finden Sie im Abschnitt „Erweiterte Steuerelemente für Fairlight“ weiter hinten in der Bedienungsanleitung.

HINWEIS Man beachte, dass der Audiomixer automatisch deaktiviert wird, wenn die USB-Verbindung auf „USB-Digitalaudio“ eingestellt ist und der Mischer von einem USB-Audiomixer wie beispielsweise Fairlight Live ein Audiosignal erkennt.

Auswahl-Tasten

ATEM Television Studio Mischer sind an der Rückseite mit Aux-Ausgängen ausgestattet, denen die Signale diverser Eingaben und interner Quellen zugeführt werden können. Die Aux-Ausgänge sind mit den Ausgängen von Kreuzschienen vergleichbar. Man kann darüber sämtliche Videoeingaben, Farbgeneratoren, Media Player, Programme, Vorschauen und sogar Farbbalken ausgeben. Zehn spezielle Tasten am Bedienpanel bieten Abkürzungen zur Auswahl einer der acht Eingänge, des Programms und zum Wechseln zwischen Multiview und Vorschau.



Die M/V-Taste leuchtet bei aktiviertem Multiview weiß und bei aktivierter Vorschau grün

Weitere interne Quellen wie Media Player und Farbbalken können über das „Auxiliary“-Menü der Systemsteuerung für alle verfügbaren Ausgaben gewählt werden. Wenn Sie einen Clean-Feed benötigen, der vor allen Downstream-Keyern erstellt wird, können Sie auch das für die Ausgabe vorgeben. So erhalten Sie einen von Logos oder Infografiken freien Programm-Feed, der als Broadcastmaster zur späteren Postproduktion oder Übertragung bereitsteht.

So weisen Sie Aux 1 einen Clean-Feed zu:

1. Drücken Sie die AUX-Taste im Systemsteuerblock.
2. Drehen Sie den Regler unter „AUSGABE 1“, bis die Option „Clean-Feed“ erscheint.

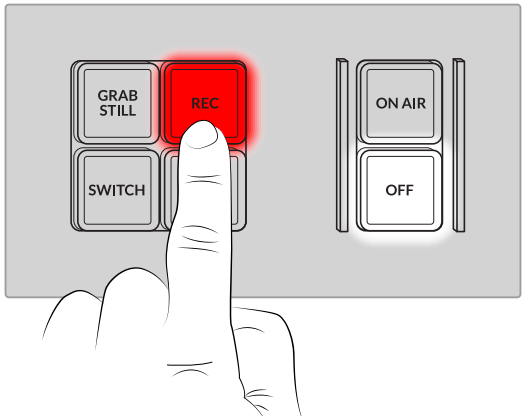
Signalverteilung der drei Auxiliary-Ausgänge am ATEM Television Studio HD8

Bei jedem Wechsel einer am Aux-Ausgang anliegenden Quelle führt der Mischer einen sauberen Schnitt aus. Konkret: Mit dem Mischer können Sie sauber und fehlerfrei zwischen Quellen auf dem Aux-Ausgang umschalten.

Die Signalverteilung über die extrem leistungsfähigen Aux-Ausgänge lässt sich auch mit einem Software-Bedienpanel vornehmen. Das „Ausgänge“-Menü am oberen Rand des Software-Bedienpanels ist unabhängig vom aktuell aktivierten Fenster ständig verfügbar. Näheres zum Einrichten von Ausgängen in ATEM Software Control finden Sie im Abschnitt „Auxiliary-Ausgänge“ weiter hinten in dieser Bedienungsanleitung.

Streaming- und Aufnahmetasten

Mit ATEM Television Studio Mischern können Sie Ihre Produktion mittels spezieller Tasten auf dem Bedienpanel streamen und aufzeichnen.



Mit speziellen Tasten auf dem Bedienpanel können Sie Ihre Produktion streamen und aufzeichnen

GRAB STILL	Um ein Standbild aus Ihrer Sendung zu erfassen, drücken Sie einfach auf die „GRAB STILL“-Taste. Sie ersetzt den Standbildspeicher, da Sie erfasste Bilddateien direkt in den Media Pool speichern können. Von dort laden Sie Standbilder zur Verwendung in Ihrer Sendung unmittelbar in den Media Player, oder Sie speichern den ganzen Media Pool auf Ihren Computer.
REC	Mit dieser Taste zeichnen Sie Ihren Stream per USB-C auf einen externen Speicher auf oder bei Einsatz des ISO-Modells auf dessen optionalen internen Speicher. Starten Sie die Aufzeichnung der Produktion durch Drücken der REC-Taste und beenden Sie sie mit der STOP-Taste.
STOP	
SWITCH	Bei Gebrauch von zwei via USB angeschlossenen externen Laufwerken wechseln Sie mit der SWITCH-Taste zum Laufwerk, auf das aktuell aufgezeichnet werden soll.
ON AIR	Über die interne Streaming-Engine des Mischers können Sie direkt und ohne zusätzliche Software streamen. Wenn Sie Ihren Mischer in ein Netzwerk eingebunden und Ihren Streaming-Dienst in ATEM Software Control vorgegeben haben, können Sie durch Drücken der „ON AIR“-Taste sofort streamen. Näheres zum Einrichten der Streaming-Einstellungen erfahren Sie im Abschnitt „Streamen von Video“ in dieser Bedienungsanleitung.
OFF	

Um zu streamen, müssen Sie Ihren Mischer zuerst in Ihr Netzwerk einbinden. Zusätzlich zum Streamen an Plattformen wie Blackmagic Cloud, YouTube und Twitch kann Ihr in ein Netzwerk eingebundener ATEM Television Studio HD8 ISO Mischer auch an ATEM Hardware-Bedienpanels wie das ATEM Camera Control Panel und per Internet an andere Remote-Quellen streamen.

Wenn die Videonorm auf ein Halbbild-Format wie 1080i/60 eingestellt ist, können Sie streamen oder aufzeichnen. Gleichzeitig geht das jedoch nicht.

Wie Sie sich einen Streamschlüssel beschaffen, erfahren Sie im Abschnitt „Streamen von Video“ in dieser Bedienungsanleitung.

Datenträger

Mit ATEM Television Studio Mischern können Sie Ihr Programm über die beiden USB-C-Ports an der Rückseite auf externe Festplatten oder Laufwerke aufzeichnen. Alternativ lassen sich Multiport-USB-C-Hubs oder die MultiDock 10G einsetzen, über die Sie für noch mehr Speicherkapazität eine oder mehrere SSDs anschließen können.

Bei ATEM Mischern mit einem optionalen internen Speicher können Sie auch auf dem Mischer selbst aufzeichnen. Dieser Abschnitt erklärt, wie Sie externe und interne Datenträger vorbereiten.

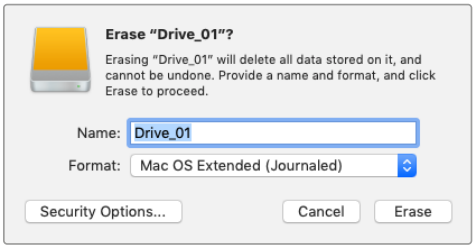
Vorbereiten von Datenträgern auf einem Computer

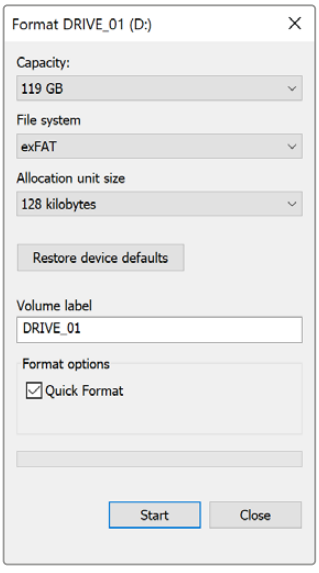
Externe Festplatten können über Mac oder Windows Computer formatiert werden. HFS+ wird auch als „Mac OS X Extended“ bezeichnet und ist das empfohlene Format, da es „Journaling“ unterstützt. Auf Datenträgern mit Journaling gespeicherte Daten lassen sich im seltenen Fall einer Beschädigung Ihres Datenträgers mit höherer Wahrscheinlichkeit wiederherstellen. HFS+ wird nativ von Mac unterstützt. exFAT wird von Mac und Windows nativ unterstützt und macht den Kauf zusätzlicher Software überflüssig. Journaling unterstützt es jedoch nicht. ExFAT empfiehlt sich, wenn Sie sowohl von Mac- als auch Windows-Computern Lese- und Schreibzugriff auf das Laufwerk brauchen.

Datenträger auf einem Mac-Computer formatieren

Mithilfe des auf Mac enthaltenen Festplatten-Dienstprogramms kann Ihr Laufwerk in HFS+ oder exFAT formatiert werden. Fertigen Sie unbedingt Sicherungskopien von allen wichtigen Daten auf Ihrem Datenträger an, da beim Formatieren alle Inhalte gelöscht werden.

1. Verbinden Sie Ihren Datenträger über eine externe Dockingstation oder einen Kabeladapter mit Ihrem Computer und ignorieren Sie jegliche Meldungen, die den Gebrauch Ihres Datenträgers für Time Machine Backups anbieten.
2. Gehen Sie auf Ihrem Computer zu „Programme“ > „Dienstprogramme“ und starten Sie das Datenträger-Dienstprogramm.
3. Klicken Sie auf das Laufwerksymbol Ihres Datenträgers und dann auf „Löschen“.
4. Geben Sie als Format „Mac OS Extended (Journaled)“ oder „exFAT“ vor.
5. Geben Sie einen Namen für das neue Volumen ein und klicken Sie auf „Löschen“. Ihr Datenträger ist im Nu formatiert und einsatzbereit.





Verwenden Sie in Windows das Dialogfeld „Formatieren“, um Ihren externen Datenträger in exFAT zu formatieren

Datenträger auf einem Windows-Computer formatieren

Auf einem Windows-PC erfolgt die Formatierung eines Datenträgers in exFAT über das „Formatieren“-Fenster. Fertigen Sie unbedingt Sicherungskopien von allen wichtigen Daten auf Ihrem Datenträger an, da beim Formatieren alle Inhalte gelöscht werden.

1. Verbinden Sie Ihren Datenträger über eine externe Dockingstation oder einem Kabeladapter mit Ihrem Computer.
2. Öffnen Sie das Startmenü oder den Startbildschirm und wählen Sie „Dieser PC“. Führen Sie einen Rechtsklick auf Ihrem Laufwerk aus.
3. Wählen Sie im Kontextmenü „Formatieren“.
4. Stellen Sie das Dateisystem auf „exFAT“ und die Größe der Zuordnungseinheiten auf „128 Kilobytes“ ein.
5. Geben Sie eine Volumenkennung ein, wählen Sie „Schnellformatierung“ und klicken Sie auf „Start“.
6. Ihr Datenträger wird schnell formatiert und ist anschließend einsatzbereit.

Vorbereiten von Datenträgern mit einem ATEM Television Studio

Interne Datenträger können über die Systemsteuerung auf dem Bedienpanel oder über das ATEM Setup Dienstprogramm formatiert werden. Zudem können externe Datenträger auf dem Bedienpanel Ihres Mischers als Mac OS Extended oder exFAT formatiert werden.

Formatieren von Datenträgern über die ATEM Television Studio Systemsteuerung

Drücken Sie zum Öffnen des Formatiermenüs die SETTINGS-Taste und navigieren Sie mit den Pfeiltasten zum FORMATIEREN-Bildschirm.

Im Menü „Medien formatieren“ können Sie zwischen der Formatierung von internen und über USB angeschlossenen externen Datenträgern wählen.

1. Navigieren Sie zur Formatierung interner Speicher mit dem „Medien“-Drehregler zur Option „Intern“.

   Zum Formatieren externer Datenträger navigieren Sie mit dem „Medien“-Drehregler zum ausgewählten Datenträger und mit dem „Formatieren“-Drehregler zu den Optionen „Mac OS Extended“ oder „exFAT“.

2. Drücken Sie die FORMATIEREN-Multifunktionstaste über dem LCD.

3. Folgen Sie den Anweisungen auf dem Bildschirm. Halten Sie die FORMATIEREN-Multifunktionstaste 3 Sekunden lang gedrückt, bis ein Häkchen im Zähler-Icon erscheint. Nun beginnt die Formatierung.

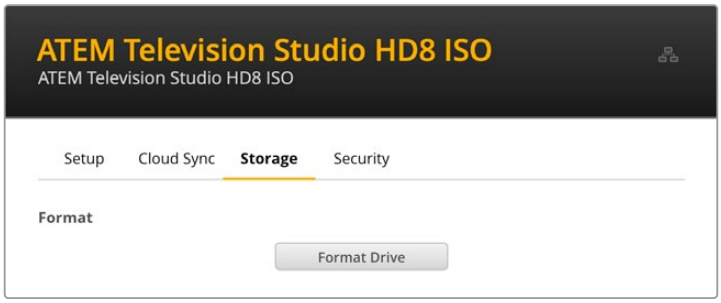
4. Nach abgeschlossener Formatierung ist der interne Speicher einsatzbereit. Drücken Sie die OK-Multifunktionstaste über dem LCD, um zum Formatiermenü zurückzukehren.

Formatieren des internen Speichers mit ATEM Setup

Alternativ formatieren Sie Ihren Datenträger mit dem ATEM Setup Dienstprogramm, das mit Ihrer ATEM Mischersoftware installiert wurde. Zum Formatieren des Datenträgers muss der Mischer via USB mit einem Computer verbunden sein.

1. Öffnen Sie das ATEM Setup Dienstprogramm. Auf Macs befindet sich ATEM Setup unter „Programme“ im Ordner Blackmagic ATEM Switchers. Auf Windows-Computern greift man auf ATEM Setup über „Start“ > „Programme“ > „Blackmagic Design“ zu.

2. Klicken Sie im geöffneten Dienstprogramm auf „Storage“ und dann auf „Format Drive“.



3 Die nun eingeblendete Warnung informiert Sie, dass bei der Formatierung alle Dateien auf dem Datenträger gelöscht werden. Die Warnung erscheint nur, wenn Sie den Datenträger zum ersten Mal formatieren. Klicken Sie auf „Ja“, um fortzufahren.

4 Nun fordert Sie ein zweites Warnfenster auf, die Formatierung zu bestätigen. Das soll dafür sorgen, dass Nutzer nicht versehentlich auf dem Speicher befindliche Daten löschen. Klicken Sie auf „Löschen“.

5 Während der Formatierung erscheint eine Fortschrittanzeige. Der interne Speicher ist einsatzbereit, sobald sie abgeschlossen ist.

Zugreifen auf Datenträger

Wenn Sie auf externe Datenträger aufzeichnen, ist es einfach, auf Videoclips und DaVinci Resolve Projekte zuzugreifen. Trennen Sie den Datenträger hierfür von der Rückseite des Mischers und schließen Sie ihn an Ihren Computer an. Alternativ greifen Sie auf die Dateien über Ihr Netzwerk zu.

So greifen Sie von einem Mac-Computer auf die Daten zu:

1 Öffnen Sie den Finder und klicken Sie im Seitenleistenmenü auf „Netzwerk“.

2 Doppelklicken Sie in der Liste auf den Namen Ihres ATEM Television Studio Mischers.

3 Doppelklicken Sie nun auf „Internal Storage“.

Ihr ATEM Television Studio Mischer erscheint nun in der Speicherortseitenleiste. So greifen Sie von einem Windows-Computer auf die Daten zu:

1 Klicken Sie im Datei-Explorer Seitenleistenmenü auf „Netzwerk“. Ihr ATEM Television Studio wird nun in der Liste aufgeführt.

2 Doppelklicken Sie auf den Eintrag „ATEM Television Studio“. Ein Windows-Sicherheitsdialogfenster öffnet sich und fordert Sie auf, Ihre Zugangsdaten einzugeben.

3 Geben Sie Ihren Benutzernamen und Ihr Passwort ein.

HINWEIS Für Windows 11 werden für Verbindungen mit dem Netzwerkspeicher ohne Benutzernamen und Passwort keine „Gast“-Konten mehr unterstützt. Bevor Sie über ein Netzwerk auf den Speicher des ATEM Mischers zugreifen können, müssen Sie in ATEM Setup einen neuen Benutzer und ein Passwort anlegen. Informationen zum Erstellen und Verwalten von Benutzern finden Sie unter „Security“ im Abschnitt „ATEM Setup“ dieser Bedienungsanleitung.

4 Klicken Sie auf „OK“.

Ihr Mischer erscheint nun im Datei-Explorer-Fenster. Nun können Sie darauf wie auf jedes andere Laufwerk im Netzwerk zugreifen.

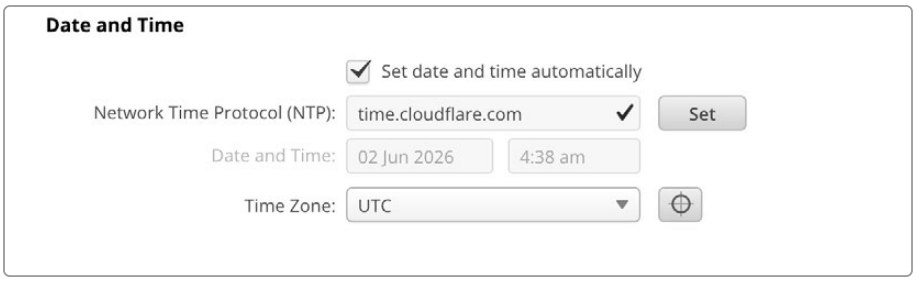
Alternativ greifen Sie über das Setup-Dienstprogramm auf Ihren Speicher zu. Klicken Sie auf einem Mac-Computer auf die Schaltfläche „Im Finder anzeigen“. Klicken Sie auf einem Windows-Computer auf die Schaltfläche „Im Datei-Explorer anzeigen“.

Cloud Sync

Eine weitere Methode für den Zugriff auf Ihre Medien ist Cloud Sync. Damit synchronisieren Sie den internen Speicher oder externe Datenträger von ATEM Television Studio Mischern mit Dropbox.

Einstellen von Datum und Uhrzeit

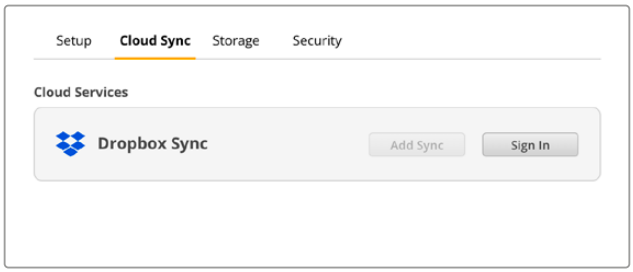
Zum Synchronisieren des internen Speichers Ihres ATEM Mischers erfordern Cloud-Dienste wie Dropbox die korrekte Einstellung von Datum und Uhrzeit. Standardmäßig verwendet Ihr ATEM Television Studio den Cloudflare NTP-Server, um Datum und Uhrzeit automatisch vorzugeben.



Um Ihr Online-Konto mit dem Speicher des ATEM Television Studio Mischers zu synchronisieren, müssen Sie sich lediglich in den „Cloud Sync“-Einstellungen mit Ihrem Online-Konto anmelden und den Zielordner sowie die Synchronisierungsrichtung vorgeben.

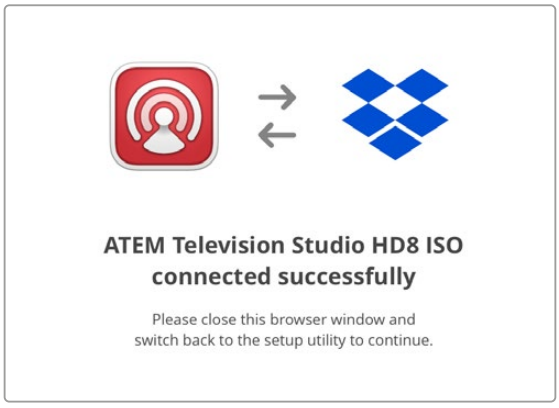
Anmelden in Dropbox

1. Klicken Sie auf den „Sign In“-Button, um sich mit Ihrem Konto bei Dropbox anzumelden. Das Anmeldefenster öffnet sich.
2. Melden Sie sich bei Dropbox an.



Klicken Sie auf den „Allow“-Button, um die Berechtigung zu erteilen, über den Blackmagic Cloud Store Content zu bearbeiten und zu sichten.

Eine Bestätigungsmeldung zeigt an, dass Sie sich erfolgreich verbunden haben. Sollte die Verbindung fehlschlagen, vergewissern Sie sich, dass Ihr Computer mit dem Internet verbunden ist.

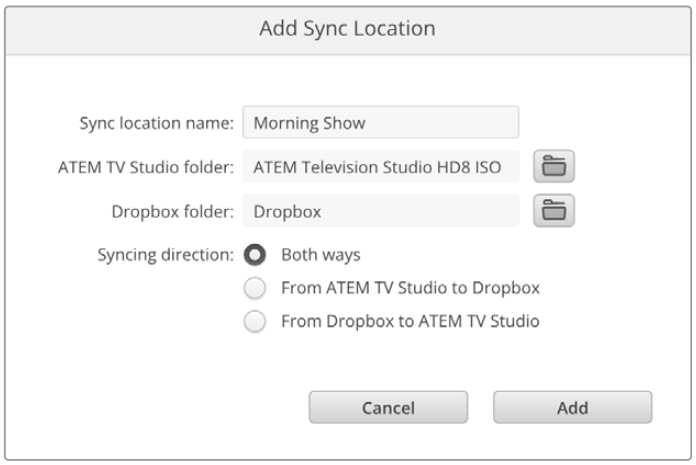


3. Klicken Sie zum Schließen auf „Close“.

Vorgeben von Sync-Ordner und -Richtung

1 Jetzt sehen Sie, dass der „Add Sync“-Button aktiv ist. Klicken Sie auf diesen Button und das Fenster „Add Sync Location“ öffnet sich.

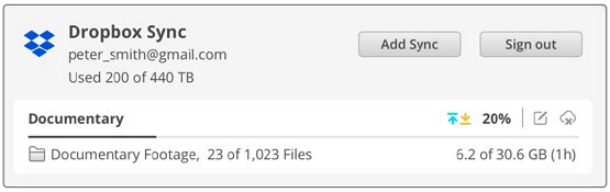
2 Benennen Sie den Sync-Speicherort und klicken Sie auf die Ordner-Symbole, um Ihre gewünschten Sync-Ordner zu wählen. Die Namen sollten einander entsprechen.



3 Wählen Sie die Synchronisierungsrichtung. Beispiel: Möchten Sie Dateien von Ihrem Mischer mit Dropbox synchronisieren, nicht aber von Dropbox mit Ihrem Mischer, wählen Sie „From ATEM TV Studio to Dropbox“.

4 Klicken Sie zum Hinzufügen auf „Add“.

Ihr Cloud-Dienst ist jetzt mit Ihrem ATEM Television Studio Mischer synchronisiert.



Statusanzeigen liefern Informationen zum Synchronisierungsvorgang

Die Sync-Pfeile zeigen die Synchronisierungsrichtung an. Ein blauer Pfeil zeigt an, dass Daten von Ihrem Mischer gesendet werden, und ein gelber Pfeil, dass Daten empfangen werden. Werden Daten gleichzeitig gesendet und empfangen, werden ein blauer und ein gelber Pfeil angezeigt. Ein grauer Pfeil zeigt an, dass in diese Richtung keine Daten synchronisiert werden.

Die Prozentzahl rechts neben den Sync-Pfeilen zeigt den aktuellen Status des Synchronisierungsvorgangs an.

Um die Namen oder den Speicherort des Sync-Ordners zu ändern, klicken Sie auf das Bearbeiten-Icon.

Klicken Sie auf dieses Symbol, um den Sync-Speicherort zu löschen. Klicken Sie im Bestätigungsfenster auf „Continue“, um fortzufahren, oder auf „Cancel“, um den Löschvorgang abzubrechen.

Wenn Sie einen Blackmagic Cloud Store oder Blackmagic Cloud Pod haben, können Sie diese Synchronisierungen über das Blackmagic Cloud Setup Dienstprogramm auf Ihren eigenen Datenträgern sichern und sich so beim Aufzeichnen Livekopien anlegen.

Verwenden von Multiview

Mit der wirkmächtigen Multiview-Funktion Ihres ATEM Mischers können Sie auf einem einzelnen Bildschirm alle Signaleingaben mitsamt Programm- und Vorschauausgaben in einer Mehrfachansicht kontrollieren. Multiview zeigt auch den Media Player, Streaming-Status, Aufzeichnungsstatus des Datenträgers, Audiopegel und Indikatoren zu den Fairlight EQ- und Dynamiktools an.

Die Feature vermittelt einen detaillierten Überblick und Sie wissen jederzeit, was mit Ihrer Sendung passiert.

Multiview ist eine wirkmächtige Feature für das gleichzeitige Monitoring all Ihrer Quellen und Ausgaben

Es folgt eine Beschreibung der einzelnen Multiview-Fenster.

Vorschau-Ansicht

Über das Vorschau-Fenster können Sie die aktuell auf den Vorschau-Ausgang geschaltete Quelle kontrollieren. Es ist eine praktische Ansicht zum probeweisen Umschalten von Quellen, Sichten von Übergängen als Vorschau und fürs Einrichten von Keys, bevor man sie auf den Programmausgang schaltet. Um die Vorschau-Ansicht zu verwenden, versetzen Sie den Mischer in den Programm/Vorschau-Betriebsmodus. Die Einzelheiten werden in späteren Kapiteln näher erörtert.

Programm-Ansicht

Im Programm-Fenster erscheint das aktuell auf den Programmausgang geschaltete Signal. Diese Ansicht zeigt Ihnen genau das an, was Sie aktuell übertragen.

Eingabe-Ansichten

Die Eingabe-Ansichten zeigen alle aktuell an die 8 Eingänge angeschlossenen Quellen an. Da Ihnen Multiview die Signale aller Eingänge anzeigt, können Sie mit Blick auf die Bilder aller Kameras schnelle Entscheidungen treffen. An die Eingänge des Mischers können statt Kameras ebenso gut Videoausgaben von Computern oder HyperDeck Diskrekordern angeschlossen werden. Auch deren Material können Sie in den Eingabe-Ansichten kontrollieren.

Wird eine Signaleingabe auf den Vorschau- bzw. den Programm-Ausgang geschaltet, erhält das zu diesem Eingang gehörige Fenster eine grüne bzw. rote Tally-Umrandung. Grün steht für die Vorschauausgabe und Rot für die Programmausgabe bzw. den On-air-Status.

Media-Player-Ansicht

In diesem Fenster erscheint die aktuell in den Media Player geladene Grafik. Um eine Grafik zu laden, gehen Sie in ATEM Software Control einfach zum Media Pool und ziehen Sie von dort ein Standbild in den Media Player. Näheres zur Verwendung von Media Player und Media Pool finden Sie im Abschnitt „ATEM Media Pool“.

Streaming-Ansicht

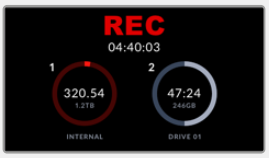
Diese Ansicht zeigt den On-air-Status Ihres Streams einschließlich der Übertragungsrate und den Cache-Status an. Dort wird unten auch die Streaming-Plattform angezeigt, an die Sie aktuell übertragen.

- **„ON AIR“-Indikator** Vor Aufzeichnungsbeginn steht der „ON AIR“-Statusindikator auf AUS. Dies signalisiert, dass Ihr Mischer sich im Standby-Modus befindet und sendebereit ist. Ab Beginn des Streamens leuchtet der „ON AIR“-Statusindikator so lange rot, bis der Stream gestoppt wird.

  Wird der laufende Stream unterbrochen, beginnt der „ON AIR“-Indikator zu blinken. Das könnte bspw. bei einer zu langsamen Internetverbindung und einem erschöpften Cache geschehen.

- **Übertragungsdatenrate** Die Datendurchsatzrate wird in Megabits pro Sekunde angegeben. Um mit Ihrem ATEM Television Studio Mischer 1080p/60-Video ohne Frameverluste aufzuzeichnen, ist eine Datendurchsatzrate von ca. 5–7 Mbit erforderlich.

- **Cache-Status** Der Cache-Status zeigt die Kapazität des in Ihren ATEM Mischer verbauten Puffers an. Der Cache ist ein kleiner interner Speicher, der unaufhörlich aufzeichnet und die Programmausgabe wiedergibt. Wenn die Übertragungsdatenrate unter ein für Video benötigtes Level sinkt, fungiert der Cache als Sicherheitspuffer. Schwankende Internetverbindungen sind vorrangig durch die Netzwerkauslastung oder Funksignalstärke bedingt. Sobald die Übertragungsdatenrate abnimmt, puffert der Cache mehr Daten. Sinkt die Datenübertragungsrate unter die für den Videostream benötigte Geschwindigkeit, gleicht der Cache das durch Zwischenspeichern der Videobilder aus. Sobald der Cache zu 100 % ausgelastet ist, leidet die Streamqualität. Vermeiden Sie es deshalb tunlichst, den Cache ganz voll werden zu lassen. Die Verbindungsgeschwindigkeit können Sie beim Einrichten Ihres Streams testen. Achten Sie im Verlauf des Sendetests auf die Cache-Anzeige im Multiviewer. Wenn sich der Cache häufig der 100-Prozentmarke nähert, geben Sie in den „Livestream“-Einstellungen eine geringere Qualitätsstufe vor.
- **Tethering-Status** Das Handy-Icon wird angezeigt, wenn der ATEM Mischer über Smartphone-Tethering mit dem Internet verbunden ist. Wenn Sie auf Sendung sind, leuchtet das Icon rot.



Aufzeichnungs-Ansicht

Bei der Aufzeichnung auf externe Datenträger über den USB-C-Anschluss zeigt dieses Fenster den aktuellen Aufzeichnungsstatus an.

- **Aufzeichnungs-Indikator** Vor der Aufzeichnung, oder wenn keine Datenträger angeschlossen sind, zeigt der Indikator STOP an. Angeschlossene Datenträger werden unterhalb des Indikators als Icons angezeigt.

  Während auf einen Datenträger aufgezeichnet wird, zeigt der Indikator REC an und leuchtet knallrot.

- **Dauer-Zähler** Dieser Zähler befindet sich unterhalb des Aufzeichnungsindikators. Der Zähler startet, sobald die REC-Taste am Mischer gedrückt wird.
- **Aufzeichnungsstatus-Indikatoren** Diese Indikatoren geben Details zu den Datenträgern und deren Aufzeichnungsstatus an. Beim Einsatz von zwei Datenträgern erscheinen hier die Laufwerksnamen mitsamt dem verfügbaren Speicherplatz und der verbleibenden Aufzeichnungszeit. Bei laufender Aufzeichnung auf einen Datenträger leuchtet das Icon rot und zeigt links den verbleibenden Speicherplatz an.

  Datenträger werden nach Kapazität priorisiert. Sind bspw. vier SSDs über eine Blackmagic MultiDock 10G verbunden, wird der Datenträger mit dem meisten verbleibenden Speicherplatz mit 1 gekennzeichnet. Laufwerk 2 kennzeichnet die SSD mit der nächsthöheren verbleibenden Kapazität. Wenn Laufwerk 1 und 2 voll sind, tritt Laufwerk 3 an die Stelle des Laufwerk-Indikators 1 und Laufwerk 2 an die von Indikator 4. Anhand der unter den Icons angezeigten Laufwerknamen sehen Sie immer, welche Datenträger welchen Laufwerknummern zugeordnet sind.

Audio-Ansicht

Während Ihrer Übertragung können Sie die Audiopegel der einzelnen Quellen und die Pegel der Programmausgabe anhand der Audio-Ansicht kontrollieren.

- **Audiopegelmeter** Alle Eingänge und der Programmausgang verfügen jeweils über ein Audiopegelmeter. Alle lassen sich gleichzeitig überwachen. Bei höheren Audiopegeln als -10 dB leuchtet das Meter rot und warnt, dass die maximale Pegelstärke von 0 dB nahezu erreicht ist. Über 0 dB liegende Audiopegel werden abgeschnitten. Clipping bedeutet, dass der Ton verzerrt ist und der Pegel gesenkt werden muss. Tun Sie das mit den Tonaussteuerungstasten am Mischer oder mit dem Audiomixer in ATEM Software Control. Näheres zu ATEM Software Control finden Sie im nächsten Abschnitt der Bedienungsanleitung.

  Audiopegelmeter sind ein wichtiges Werkzeug zum Aussteuern Ihrer Pegel. So können Sie immer für einen großartigen Sound sorgen.

- **Fairlight Icons** Diese Icons zeigen den Aktivierungsstatus von EQ und Dynamiktools im „Audio“-Arbeitsraum von ATEM Software Control an.

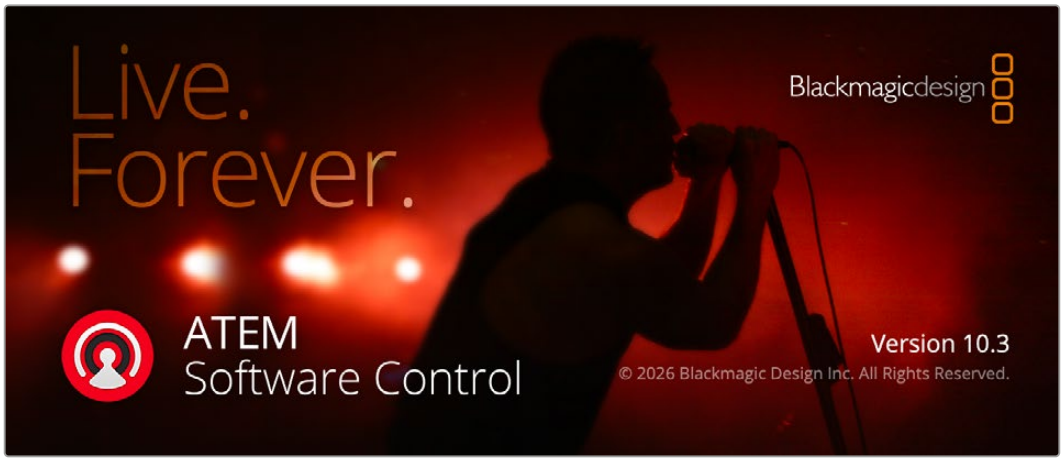
EQ DY	Farbig leuchtende Fairlight Icons besagen, dass EQ oder Dynamiktools aktiv sind und der Eingang auf Sendung ist.
EQ DY	Farbige, aber abgedunkelte Icons besagen, dass die Tools aktiviert sind, der Eingang aber nicht auf Sendung ist.
EQ DY	Sind die Icons abgedunkelt und farblos, sind die Tools im Audio-Arbeitsraum deaktiviert oder werden umgangen.

Multiview ist ein ausgezeichnetes Tool, um jederzeit jede Einzelheit im Auge zu behalten. Zum Beispiel können Sie damit umgesetzte Ideen im Vorschaufenster betrachten, bevor Sie diese auf den Programmausgang schalten. Mithilfe der Mehrfachansicht können Sie jede SDI-Quelle kontrollieren und testweise zwischen ihnen umschalten, einen Chromakey einrichten oder sogar einen Übergang als Vorschau sichten, bevor Sie ihn auf den Programmausgang schalten.

ATEM Software Control

Über das mit Ihrem ATEM Mischer gelieferte Software-Bedienpanel ATEM Software Control steuern Sie Ihren Mischer ähnlich wie mit einem kompletten Hardware-Bedienpult. Anstelle von Menütasten verfügt die Bedienoberfläche der Software auf der rechten Seite über Menüpaletten, die alle Bearbeitungsfunktionen Ihres Produktionsmischers anzeigen. So können Sie den Mischer von einem anderen Standort aus steuern, bspw. wenn sich der Bediener und der rackmontierte Mischer nicht im selben Raum befinden.

Um ATEM Software Control zu verwenden, muss die Software zunächst auf einem Computer installiert werden.

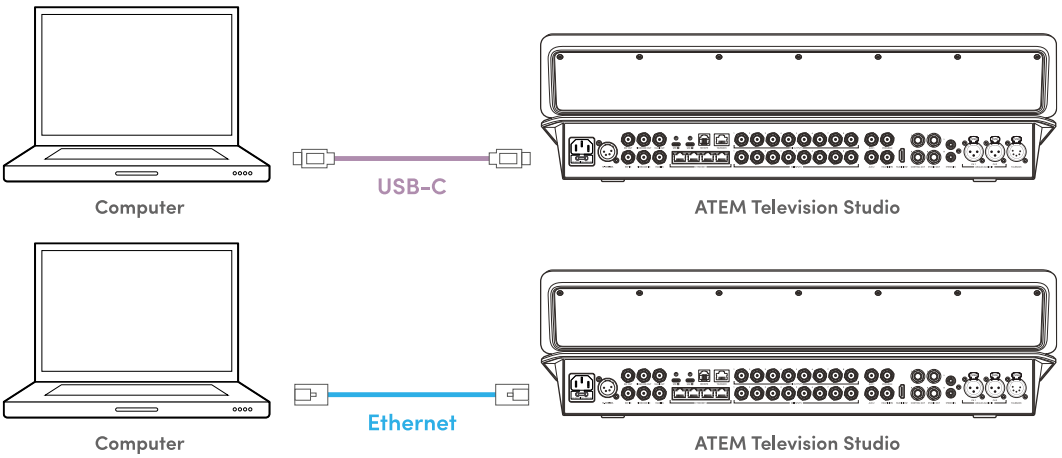


So installieren Sie ATEM Software Control:

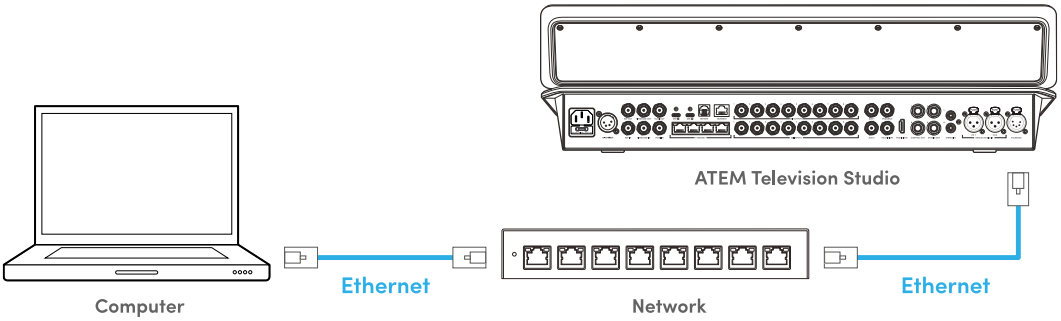
1. Navigieren Sie mit einem Webbrowser zu www.blackmagicdesign.com/de/support/ und laden Sie sich die aktuellsten ATEM Mischer Treiber herunter.
2. Klicken Sie nach erfolgtem Download der Datei zweimal auf das „Install ATEM“-Symbol, um das Installationsprogramm zu starten. Folgen Sie den Anweisungen bis zum Schluss und klicken Sie dann auf „Install“, um die Software zu installieren.
3. Navigieren Sie nach erfolgter Installation in Ihrem Programm- bzw. Anwendungsordner zum Ordner „Blackmagic ATEM Switchers“ und doppelklicken Sie auf „ATEM Software Control“.

Verbinden Sie nach beendeter Softwareinstallation Ihren Mischer mit dem Computer. Die Geräte können direkt per Ethernet oder USB verbunden werden.

Direkte Verbindung



Verbindung über einen Netzwerk-Switch



Vergewissern Sie sich als letzten Schritt, dass Ihr Computer angeschlossen ist und in Ihrem Netzwerk funktioniert. Wenn Sie nun die ATEM Software Control Anwendung öffnen, werden Sie zur Auswahl eines Mischers aufgefordert. Im Netzwerk sichtbare Mischer erscheinen nun auf einer Liste. Wählen Sie einen aus oder geben Sie eine IP-Adresse manuell ein. Verwenden Sie die soeben für den Mischer eingegebene IP-Adresse, damit ATEM Software Control den Mischer finden und mit ihm kommunizieren kann.

Das Software-Bedienpanel für Mischer

Das Software-Bedienpanel weist vier zentrale Steuerungsfenster auf: „Mischer“, „Medien“ „Audio“ und „Kamera“. Die Auswahl eines Arbeitsraums erfolgt per Klick auf die am unteren Rand der Bedienoberfläche am Symbol erkenntliche Registerkarte oder per Druck der SHIFT-(Umschalt-)Taste und der Links/Rechts-Pfeil-Hotkeys. Das Fenster für allgemeine Einstellungen öffnet man durch Auswahl des Zahnradsymbols unten links auf der Benutzeroberfläche. Die Arbeitsräume „Mischer“, „Medien“, „Audio“ und „Kamera“ enthalten spezielle Einstellungen für den Mischer, die sich nur über das Software-Bedienpanel vornehmen lassen.

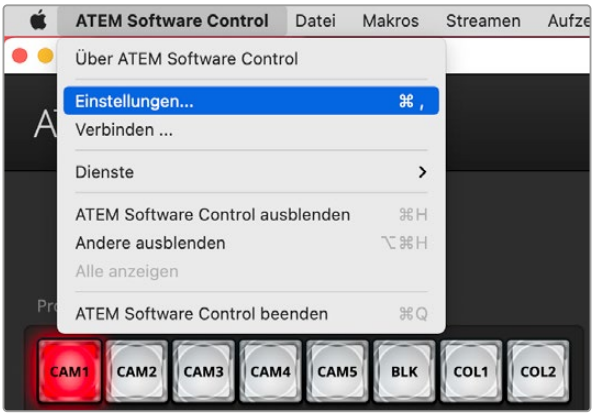
Mischer-Arbeitsraum

Beim Neustart der Software ist die Hauptsteueroberfläche des Mischers, der Arbeitsraum „Mischer“, ausgewählt. Das Software-Bedienpanel ist nur betriebsfähig, wenn es mit einem Mischer verbunden ist.

ATEM Software Control Bedienfenster

Einstellungen

Die Einstellungen sind in die Kategorien „Allgemein“ und „Mapping“ unterteilt. Unter „Allgemein“ finden Sie Einstellungen für die Übergangssteuerung, Sprachauswahl und zum Ein- und Ausschalten der MIDI-Steuerung. Unter „Mapping“ können Sie in den Vorschau- und Programmreihen einzelnen Schaltflächen Eingänge zuordnen. Öffnen Sie die Menüleiste am oberen Bildschirmrand, wählen Sie „ATEM Software Control“ und öffnen Sie „Einstellungen“.



Öffnen Sie „Einstellungen“ im Menü von ATEM Software Control

Allgemeine Einstellungen

Bei der Inbetriebnahme ist Ihr neuer ATEM Mischer auf den Betriebsmodus „Programm/Vorschau“, den gebräuchlichen Standard eines M/E-Mischers, eingestellt. Um im klassischen Stil des A/B-Mischens zu arbeiten, können Sie diese Voreinstellung auf „A/B Direkt“ ändern.

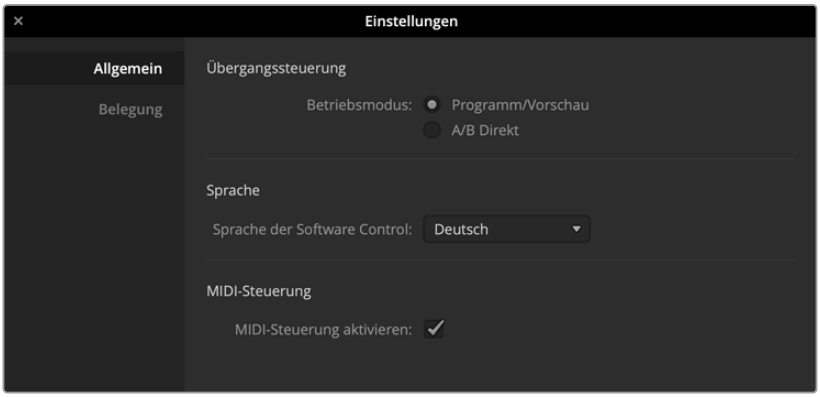
ATEM Software Control lässt sich neben Englisch und Deutsch auch auf Französisch, Italienisch, Japanisch, Koreanisch, Polnisch, Portugiesisch, Russisch, Spanisch, Türkisch, Ukrainisch und vereinfachtes Chinesisch einstellen.

Beim erstmaligen Betrieb von ATEM Software Control nach Installation fordert Sie das Dialogfenster „Einstellungen“ zur Vorgabe der Sprache für die Software auf. Diese Sprachauswahl können Sie aber jederzeit ändern.

Wählen Sie im „Sprache“-Menü die gewünschte Sprache. Nun öffnet sich ein Warnfenster und fordert Sie auf, den Vorgang zu bestätigen. Klicken Sie auf „Ändern“.

ATEM Software Control schließt sich und startet erneut in Ihrer vorgegebenen Sprache.

Um Ihren ATEM Mischer mit einem MIDI-Steuergerät einzusetzen, aktivieren Sie das MIDI-Kontrollkästchen durch Setzen eines Häkchens.

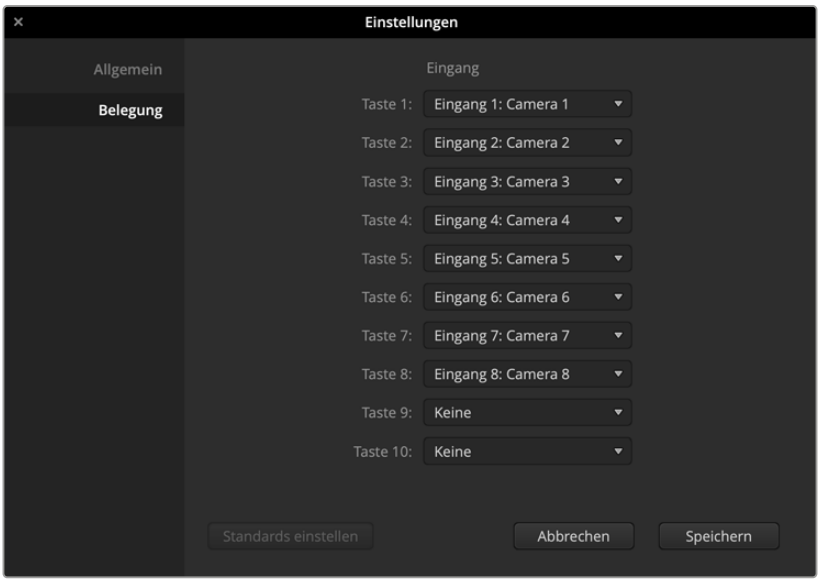


Geben Sie hier Ihre allgemeinen Einstellungen vor

Tastenbelegung

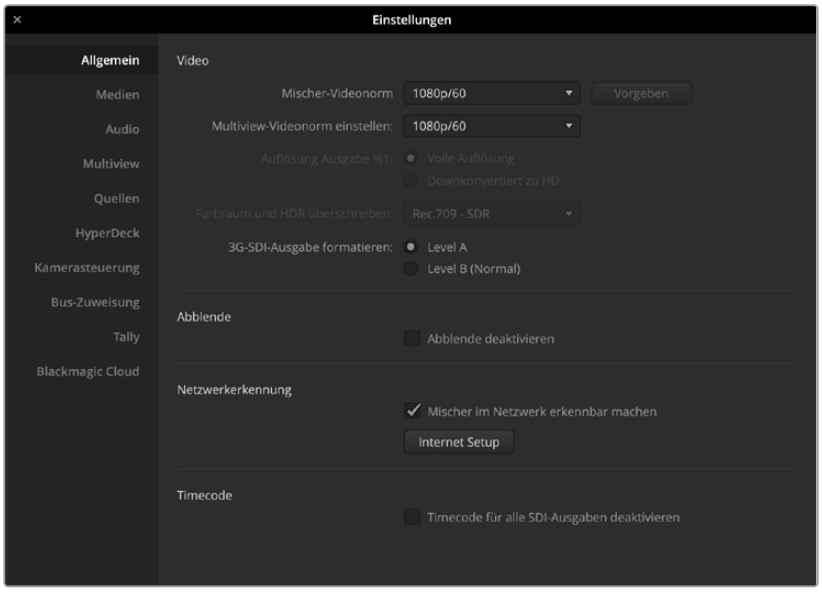
Über die Mapping-Einstellungen können Sie Eingänge einzelnen Schaltflächen in den Vorschau- und Programmreihen zuordnen.

ATEM Software-Bedienpanels und Hardware-Bedienpulte unterstützen das sogenannte Button Mapping. So lassen sich Ihre wichtigsten Quellen, insbesondere Kameras, den griffbereitesten Schaltflächen bzw. Tasten in den Programm- und Vorschaureihen zuordnen. Gelegentlich benutzte Quellen lassen sich weniger greifbaren Buttons zuordnen. Die Buttons lassen sich für jedes der Bedienelemente unabhängig einrichten, d. h. die für das Software-Bedienpanel eingerichtete Schaltflächenbelegung wirkt sich nicht auf die Tastenbelegung von Hardware-Bedienpulten aus.



Ändern der Mischereinstellungen

Ein Klick auf das Zahnrad unten links öffnet das Fenster mit den Mischereinstellungen. Dort können Sie unter „Allgemein“ allgemeine Einstellungen für den Mischer sowie die Einstellungen für „Audio“, „Multiview“, „Quellen“, „HyperDeck“ und „Kamerasteuerung“ ändern. Diese Einstellungen sind in Registerkarten angeordnet.



Allgemeine Einstellungen des ATEM Television Studio HD8 ISO

Allgemeine Einstellungen

Auf der Registerkarte „Allgemein“ finden Sie die Einstellungen für Videonorm und Media Pool. Hier wählen Sie auch die Monitoring-Ausgabe für die Kamerasteuerung aus.

Video

Einstellen der Videonorm des Mischers

Über die Einstellung „Video“ bestimmen Sie die Videonorm für den Betrieb Ihres ATEM Mischers. Die entsprechende Videonorm lässt sich für die Region vorgeben, in der Sie Ihr Programm übertragen, bspw. 1080i/59,94 oder 720p/59,94 für NTSC-Länder. In PAL-Ländern können Sie Ihre Videonorm auf Formate wie 1080i/50 oder 720p/50 einstellen. Die zu verwendende Videonorm können Sie auf den Kameras nachschauen und den Mischer ebenfalls auf diese Norm einstellen.

Einstellen der Videonorm

ATEM Television Studio Mischer unterstützen folgende Videonormen:

HD-Videonormen	720p/50; 720p/59,94; 720p/60 1080p/23,98; 1080p/24; 1080p/25; 1080p/29,97; 1080p/30; 1080p/50; 1080p/59,94; 1080p/60 1080i/50; 1080i/59,94; 1080i/60

ATEM Television Studio 4K8 Mischer unterstützen zusätzlich folgende Videonormen:

Ultra-HD-Videonormen	2160p/23,98; 2160p/24; 2160p/25; 2160p/29,97; 2160p/30; 2160p/50; 2160p/59,94; 2160p/60

Wählen Sie die gewünschte Norm unter „Videonorm einstellen“ im „Video“-Menü und klicken Sie dann auf „Bestätigen“. Bei jeder Änderung der Videonorm werden sämtliche im Media Pool befindlichen Frames gelöscht.

Einstellen der Videonorm für Multiview

Bei einer für Ihre Produktion auf 1080p/25 oder höher eingestellten Videonorm, können Sie für die Multiview-Ausgabe eine niedrigere Framerate vorgeben. Auf diese Weise richten Sie die Downkonvertierung der Multiview-Ausgaben ein und erweitern die Monitorkompatibilität. Ist Ihre Videonorm bspw. auf 1080p/60 eingestellt, können Sie die Multiview-Ausgabe auf 1080i/60 einstellen.

Einstellen des Levels für die 3G-SDI-Ausgabe

Bei Ausgabe von 1080p/50 oder höherem HD-Video an Equipment mit 3G-SDI-Eingängen muss ggf. zwischen den Ausgabenormen für Level A und Level B 3G-SDI gewechselt werden. Dies gewährleistet die Kompatibilität mit Geräten, die nur Level A oder Level B 3G-SDI-Video akzeptieren. Standardmäßig ist Level B vorgegeben, da es mit den meisten Geräten funktioniert. Sie können aber per Klick auf das Level-A-Optionsfeld auf Level A wechseln.

Abblende

Um die FTB-Taste auf dem Bedienpanel des Mischers und in ATEM Software Control zu deaktivieren, klicken Sie auf das Kontrollkästchen „Abblende deaktivieren“.

Downstream-Keyer

Sie können die Tally-Funktion der Kamera außer Kraft setzen, wenn der Downstream-Keyer auf 100 % Deckkraft eingestellt ist, bspw. bei Sport-Replays mit einem DaVinci Resolve Replay Editor. Dies signalisiert dem Kameramann, dass nicht live gesendet wird, während das Replay läuft. Ist der Downstream-Keyer nicht vollständig opak, bleibt das Tally weiterhin sichtbar.

Netzwerkerkennung

ATEM Television Studio HD8 ISO Mischer sind standardmäßig in Ihrem lokalen Netzwerk sichtbar. Mit einer Blackmagic Studio Camera 6K Pro oder URSA Broadcast G2 Kamera können Sie auch direkt an den Mischer streamen. Um diese Funktion auszuschalten, deaktivieren Sie die Option „Mischer im Netzwerk sichtbar machen“.

Medien-Einstellungen

Media Pool

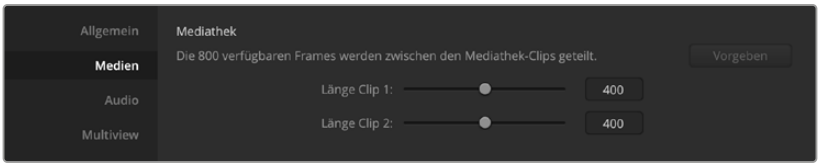
Anpassen der Länge von Clips im Media Pool

Alle ATEM Mischermodelle verfügen über einen Speicher für Grafiken, den sogenannten Media Pool. Dieser Speicher fasst Bilder mit einem Alphakanal sowie Videoclips, die einem Media Player zum Einsatz in der Produktion zugewiesen werden können.

ATEM Mischermodell	Standgrafiken	Video Clips	Videoformat	Cliplänge
ATEM Television Studio HD8	20	2	720p	400 Frames
			1080p	200 Frames
ATEM Television Studio HD8 ISO	20	2	720p	400 Frames
			1080p	200 Frames
ATEM Television Studio 4K8	20	2	720p	1600 Frames
			1080p	800 Frames
			2160p	200 Frames

Kapazitäten des Media Pools

Standardmäßig ist allen Clips gleich viel verfügbare Speicherkapazität zugeordnet. Diese bestimmt die maximale Anzahl der Frames. Um einen Clip mit mehr Frames zu speichern, passen Sie den Speicher an, indem Sie die Aufteilung der Frames ändern. Dabei reduziert eine Erhöhung der für einen Clip verfügbaren Frame-Speicherkapazität die des anderen.



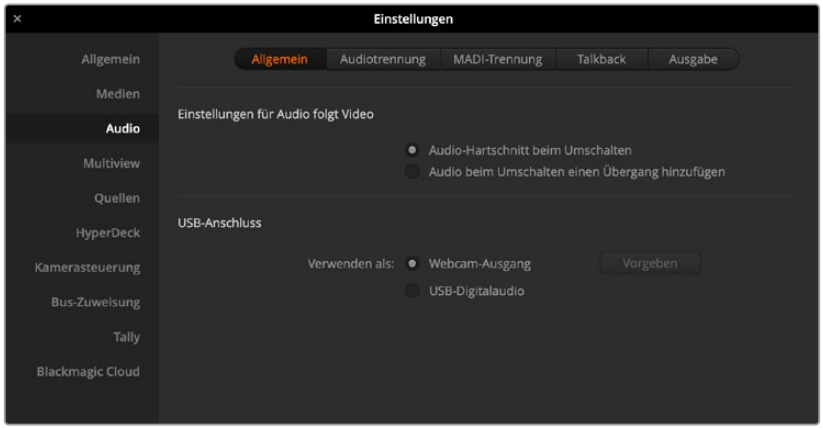
Umverteilen der Media Pool Kapazität

Audio-Einstellungen

Der „Audio“-Tab enthält alle Toneinstellungen. Sie sind in fünf Kategorien gruppiert: „Audiotrennung“, „MADI-Trennung“, „Talkback“, „Ausgabe“ oder „n-1“.

Allgemein

Verwenden Sie unter Audio den „Allgemein“-Tab, um die „Audio folgt Video“-Einstellungen einzurichten.



Einstellungen für Audio folgt Video

Für AFV können Sie das Audioverhalten bei Übergängen über die Optionsfelder einstellen. Um den Ton beim Wechsel von Eingängen zu überblenden, aktivieren Sie zum Hinzufügen eines Übergangs das Optionsfeld. Das Audio wird nur an den Programmausgang gelegt, wenn der Eingang auf Sendung ist.

USB-Anschluss

Der USB-Anschluss an der Rückseite der Television Studio Mischer dient zum Installieren von Software-Updates sowie als Webcam-Ausgang. Sie können diesen USB-Port auch so konfigurieren, dass er bei Verwendung von Fairlight Live als USB-Digitalaudio-Schnittstelle fungiert. Fairlight Live ist ein leistungsstarker, softwarebasierter Live-Audiomixer, der die Verwaltung von Hunderten von Kanälen unterstützt. Er unterstützt Standardformate von Stereo bis Surround Sound und eignet sich ebenso für ambisonische und immersive Audioworkflows.

Um Fairlight Live zu verwenden, aktivieren Sie die Einstellung „USB-Digitalaudio“ and klicken auf „Vorgeben“.

Ist die USB-Verbindung auf „USB Digital Audio“ eingestellt, werden die Audiomixer-Bedienelemente in ATEM Software Control und am Mischer automatisch deaktiviert, sobald der Mischer Audio-Signale vom USB-Audiomixer erkennt.

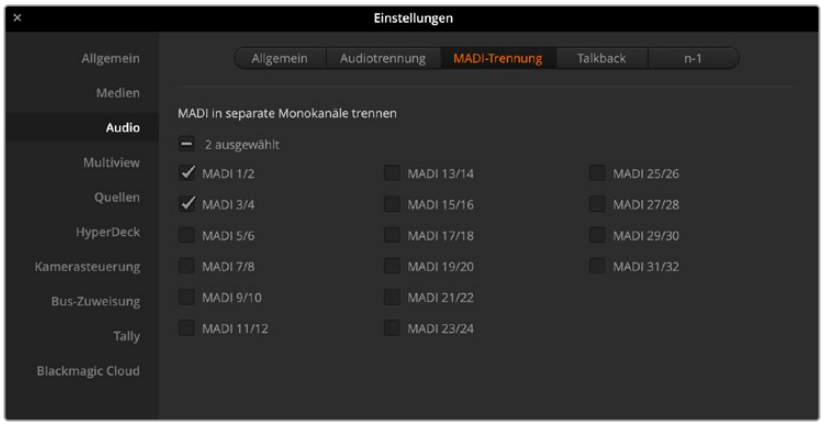
Bei Verwendung einer „ATEM Show“-Vorlage in Fairlight Live geschieht dies unmittelbar nach Show-Beginn. Bei einer benutzerdefinierten Show-Vorlage oder einer anderen USB-Audiomixer-Schnittstelle geschieht dies, nachdem Sie den Audioausgang zurück an den Mischer geroutet haben.

Bei Fairlight Live wird die Ausgangssignalverteilung im Patching-Matrix-Fenster konfiguriert.

Audiotrennung

ATEM Television Studio Mischer können ein eingehendes Stereosignal in zwei separate Monokanäle trennen. Praktisch ist das beim Mischen einer Mono-Eingabe in die beiden Kanäle der Stereo-Masterausgabe. Alternativ lässt sich der gesamte Ton in separate Kanäle trennen oder dies für beliebige Eingabe einzeln vornehmen.

Es lassen sich auch MADI-Kanäle in separate Monokanäle trennen.

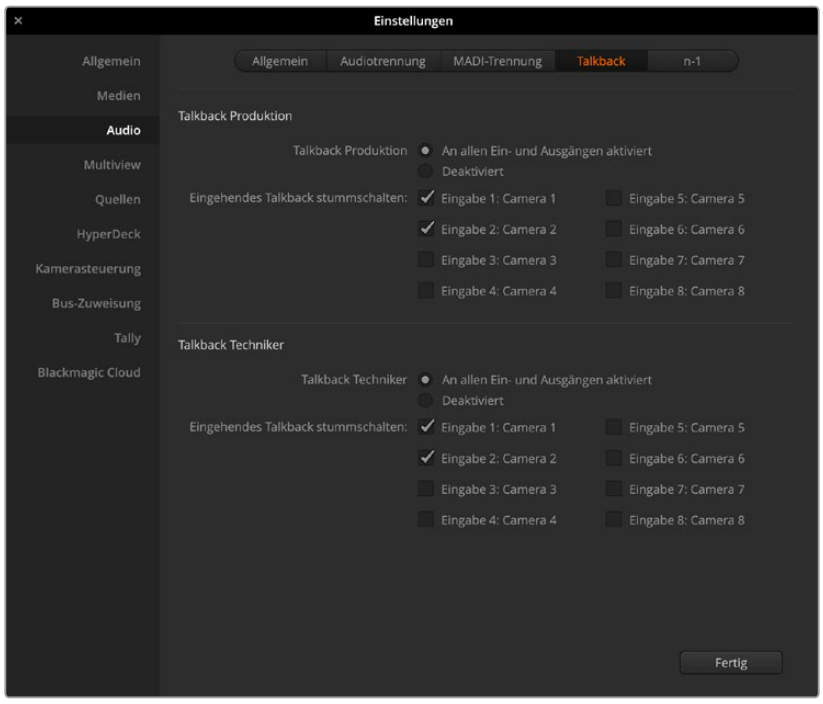


Aktivieren Sie die Kontrollkästchen, um MADI in separate Monokanäle zu teilen

Talkback

Richten Sie das Verhalten der Sprechverbindung über die „Talkback“-Registerkarte ein. Die Talkback-Signale der Produktionsleute sind in SDI-Kanäle 15 und 16 eingebettet, die der Techniker in SDI-Kanäle 13 und 14. Die Sprechverbindung lässt sich über das Kontrollkästchen ein- oder ausschalten.

Zum Erzielen von Effekten kann ein Ausgang Ihres ATEM über einen Eingang durchgeschleift werden. Manchmal verursacht das eine Feedback-Schleife in den SDI-Audiokanälen. Schalten Sie in diesem Fall die SDI-Talkback-Kanäle stumm, indem Sie die STUMM-Kontrollkästchen neben beiden Eingängen anklicken. Um eingehendes Talkback stummzuschalten, versehen Sie die Talkback-Kontrollkästchen „Produktion“ und „Technik“ mit einem Häkchen.



Stummschaltung eingehender Talkbacksignale der Produktion an den Eingängen

Ausgabe

Passen Sie die Audio-Rückführung für SDI, Remote-Quelle und Auxiliary im „Ausgabe“-Menü der ATEM Television Studio HD8 Mischer an.

SDI-Audio

In diesem Menü wählen Sie Ihre gewünschte Option für die Audio-Rückführung aus. Diese umfassen „Programm-Mix“, „Monitoring“, „Talkback Produktion“, „Talkback Techniker“ und „n-1“. Geben Sie bei Auswahl von „n-1“ die Audioquelle über das Menü vor. Dies entfernt die ausgewählte Quelle aus der Audio-Rückführung.

Auxiliary-Audio

Ist bei der Verteilung von Auxiliary-Ausgabesignalen „n-1“ für eine Eingabe aktiviert, werden mit dem Programmton alle Eingaben im Mix außer dieser ausgegeben.

Audio von Remote-Quellen

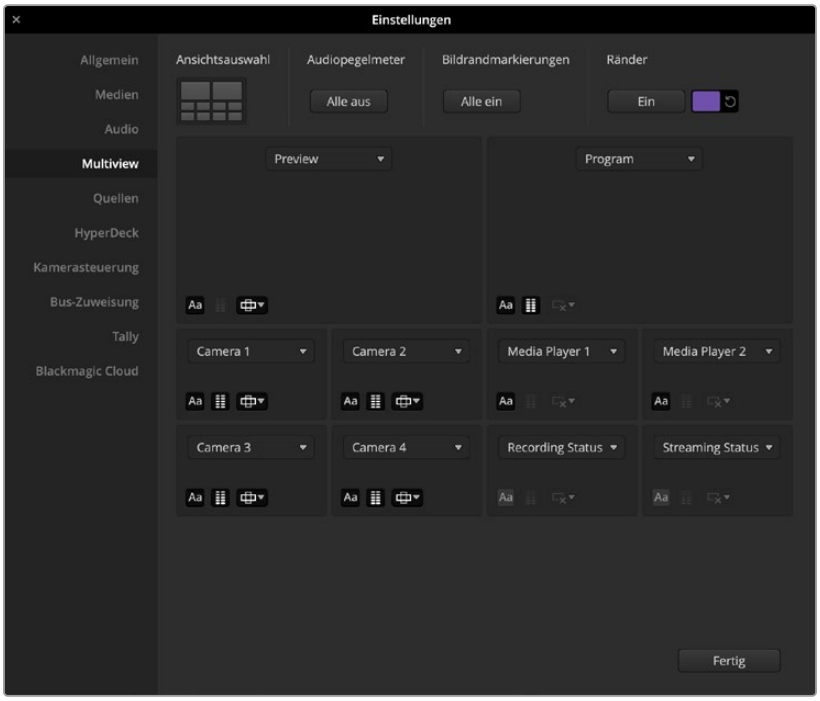
Bei Verwendung von Remote-Quellen mit den ATEM Television Studio HD8 ISO Modellen können Sie die Audio-Rückführung im Menü „Rückführung zu“ bestimmen. Geben Sie bei Auswahl von „n-1“ die Audioquelle über das Menü vor. Dies entfernt die ausgewählte Quelle aus der Audio-Rückführung.

n-1

Mit den Einstellungen für „n-1“ beim ATEM Television Studio 4K8 können Sie den Ton aus dem rückgeführten Programmfeed stummschalten. Bei Live-Schaltungen kann es bspw. passieren, dass der Ton zeitversetzt ankommt. Hört der Berichtende eine Rückkopplung der eigenen Stimme im rückgeführten Programmfeed, stört das womöglich. Ist für eine Eingabe „n-1“ aktiviert, werden mit dem Programmton alle Eingaben im Mix außer dieser ausgegeben.

Multiview-Einstellungen

Über die Einstellungen unter „Multi View“ geben Sie das Multiview-Layout vor. Standardmäßig werden oben zwei große Videofenster und darunter acht kleinere Fenster angezeigt. Außerdem lässt sich jeder Multiview-Quadrant entweder auf eine große oder vier kleinere Ansichten einstellen. So können Sie sich jeweils 4, 7, 10, 13 oder 16 gleichzeitige Ansichten einrichten. Klicken Sie unter „Ansichtsauswahl“ in die einzelnen Quadranten, um zwischen 1 und 4 Ansichten zu wechseln.



Konfigurieren der Multiview-Ansichten

Die Audiopegelmeter lassen sich für alle Quell- und Programmansichten Ihres Mischers ein- oder ausgeschalten. Aktivieren Sie dazu unter „Multi View“ die Schaltfläche „Alle ein“. Klicken Sie auf das Audiopegelsymbol in den einzelnen Ansichten, um diese einzeln ein- oder auszuschalten.

Beim Sichten jeder Quell- und Programmansicht können Sie Schutzbereich-Markierungen zuschalten, um zu prüfen, dass Ihr Programm auf jeden Bildschirm passt. Es werden Bildrandmarkierungen im Verhältnis 16:9 für Workflows mit horizontalem Video oder 9:16 mit vertikalem Video angezeigt. Aktivieren Sie „Alle“, um beide Bildrandmarkierungen einzuschalten.

Multiview hält auch eine Tally-Funktion bereit. Damit werden alle Quellen, die auf die Ebene über den Programm- oder Vorschauausgang gelegt sind, rot bzw. grün umrandet. Eine rote Umrandung zeigt den Gebrauch der Quelle am Programmausgang an. Eine grüne Umrandung zeigt an, dass eine Quelle am Vorschauausgang anliegt. Mit den „Ränder“-Einstellungen können Sie eine Umrandung deaktivieren oder im „Farbe“-Menü eine Farbe wählen. Wenn sich der Multiviewer im Modus für die Vorschau oder die Programmausgabe befindet, werden auch die Multiview-Labels in Rot oder Grün angezeigt. Labels können in jedem Fenster durch Klicken auf das „Aa“-Icon deaktiviert werden.

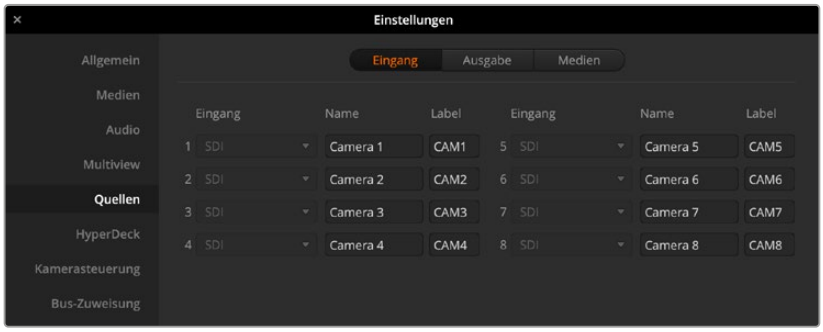
Multiview bietet zusätzliche Statusansichten für Streaming, Aufzeichnung und Audio. Dies ermöglicht es Ihnen, den Speicherplatz auf Datenträgern oder beim Streamen die Datenrate zu kontrollieren. Näheres zu den verfügbaren Ansichten finden Sie im Abschnitt „Verwenden von Multiview“ in dieser Bedienungsanleitung.

Quellen

Auf der „Quellen“-Registerkarte können Sie die Kennungen für die Ein- und Ausgänge und die Media Player des Mischers ändern. Dabei hat jeder Ein- und Ausgang einen langen und einen kurzen Namen.

Die Langversion unterstützt bis zu 20 Zeichen. Die Anzeige erfolgt in verschiedenen Quellauswahl-Dropdown-Menüs auf dem Software-Bedienpanel, in den Onscreen-Labels der Multiview-Fenster und auf den LCDs des Mischers. Die Kurzversion mit 4 Zeichen dient zur Erkennung der Eingangs-Schaltflächen auf dem Software-Bedienpanel.

Um einen Eingangsnamen zu ändern, klicken Sie auf das Textfeld, geben Sie den Text ein und aktivieren Sie „Bestätigen“. Der Eingangsname wird dann in Multiview, auf dem Software-Bedienpanel und angeschlossenen Mischern aktualisiert.Damit die Kurz- und Langversionen von Labels übereinstimmen, ist es ratsam, sie zur gleichen Zeit zu ändern. So würde man beispielsweise „Camera 1“ als Langversion und CAM1 als Kurzversion des Labels eingeben.



Geben Sie die Lang- und Kurzversionen der Namen für Ein- und Ausgänge vor

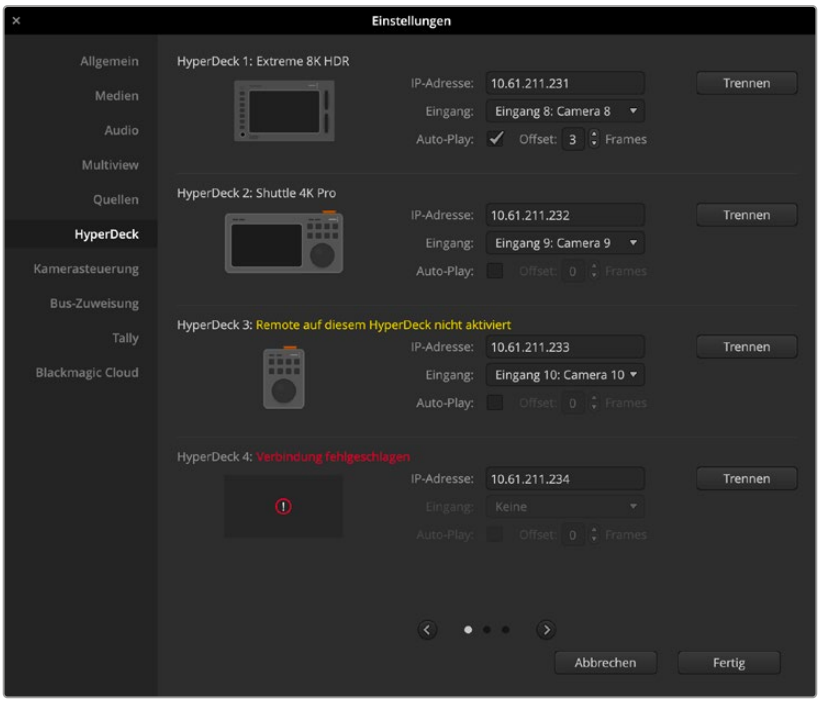
Bei ATEM Television Studio HD8 ISO Modellen können Sie Remote-Kameras in Ihrem lokalen Netzwerk oder über das Internet über die „Quellen“-Registerkarte hinzufügen. Näheres finden Sie im Abschnitt „Zusätzliche Funktionen von ISO-Modellen“ weiter hinten in dieser Bedienungsanleitung.

HyperDeck Einstellungen

An ATEM Television Studio Mischer können Sie bis zu zehn HyperDeck Diskrekorder anschließen und über einen Computer mit ATEM Software Control steuern. Über die „HyperDeck“-Einstellungen in der Software können Sie die IP-Adressen angeschlossener HyperDecks konfigurieren und die Eingänge vorgeben, mit denen diese Rekorder verbunden sind. Hier aktiviert bzw. deaktiviert man

auch die „Auto-Play“-Einstellung einzelner Rekorder, und gibt deren Frame-Offset-Werte für sauberes Schneiden vor.

Die Status-Indikatoren über den einzelnen HyperDecks zeigen Ihnen an, ob der Verbindungsaufbau zu einem Rekorder gelungen ist und ob seine Remote-Taste aktiviert ist.



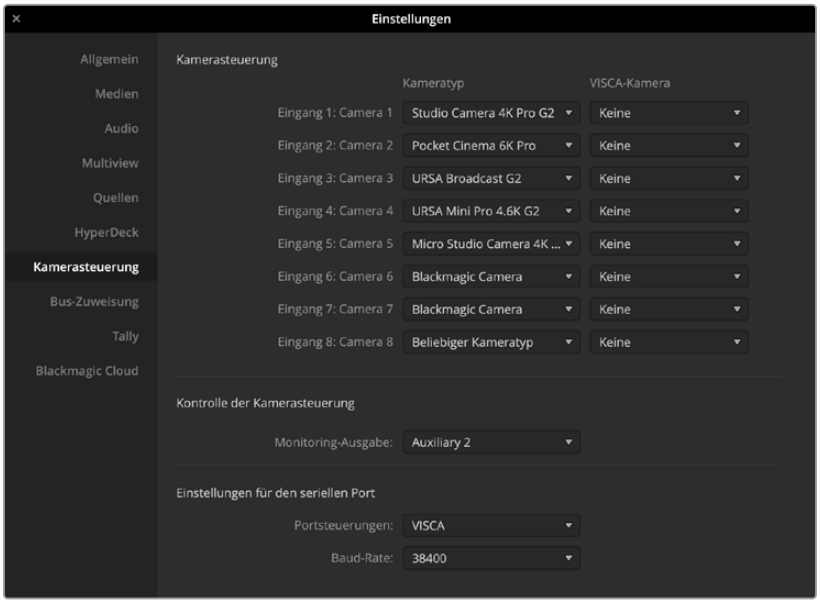
Schließen Sie bis zu zehn HyperDeck Rekorder an

Versehen Sie Ihre HyperDeck Eingänge mit individuellen Labels, damit sie in einer Liste leichter erkennbar sind.

Näheres zur Einrichtung von HyperDecks mit Ihrem ATEM Mischer und zur Konfiguration der HyperDeck Einstellungen finden Sie im Abschnitt „HyperDeck Steuerung“ in dieser Bedienungsanleitung.

Einstellungen für die Kamerasteuerung

Die Einstellungen für die Kamerasteuerung dienen dazu, Kameras Eingängen zuzuweisen und die Monitoring-Ausgabe auszuwählen.



Kamerasteuerung

Im „Kameratyp“-Menü geben Sie für die einzelnen Eingänge eine Blackmagic Kamera vor oder wählen bei Einsatz von Fremdkameras die Option „Beliebiger Kameratyp“. Die Auswahl der korrekten Kamera für den jeweiligen Eingang gewährleistet auch korrekt eingestellte Parameter für diese Kamera.

So fügen Sie über VISCA-over-IP gesteuerte PTZ-Kameras oder PTZ-Kameraköpfe hinzu:

1. Wählen Sie aus dem „Kameratyp“-Menü die Option „Beliebiger Kameratyp“.
2. Klicken Sie unter „VISCA-Kamera“ in das zugehörige Menü. Wenn Sie bereits eine VISCA-Kamera ausgewählt haben, erscheint diese in der Liste. Ansonsten klicken Sie auf die Option VISCA-IP-KAMERA HINZUFÜGEN.
3. Geben Sie im Menü VISCA-IP-KAMERA HINZUFÜGEN für die gewünschte PTZ-Kamera oder den PTZ-Kamerakopf die IP-Adresse ein. Sie können auch einen eigenen Kameranamen eingeben. Klicken Sie auf „Hinzufügen“.

Monitoring der Kamerasteuerung

Für das Monitoring der Kamerasteuerung können Sie einen beliebigen SDI-Ausgang oder den Webcam-Ausgang benutzen. Beim Steuern Ihrer Kameras über das Kamerasteuerfenster kontrollieren Sie über die Monitoring-Ausgabe jegliche Anpassungen. Klicken Sie zur Auswahl der gewünschten Ausgabe in das Menü.

Einstellungen für den seriellen Port

Wie dieser Port genutzt wird, geben Sie im Menü „Portsteuerung“ vor. Die Optionen sind „Keine“, „VISCA“ oder „GVG“. GVG verwendet die Einstellung GVG100, eine verbreitete Legacy-Schnittstelle zur Kommunikation mit Equipment wie linearen Schnittplätzen. Bei Auswahl von „VISCA“ wählen Sie die Baudrate „9600“ oder „38400“.

Um Remote-VISCA-Kameras zu finden, klicken Sie auf den Button „VISCA-Kamera-Setup“.

Es erscheint ein Fenster mit verfügbaren seriellen VISCA-Kameras. VISCA-IP-Kameras können auch durch Klicken auf das „+“-Icon hinzugefügt werden. Wurden VISCA-Kameras gefunden, können diese im „VISCA-Kamera“-Menü den jeweiligen Eingängen zugewiesen werden. Um eine VISCA-over-IP-Kamera zu entfernen, klicken Sie auf das „-“-Icon.

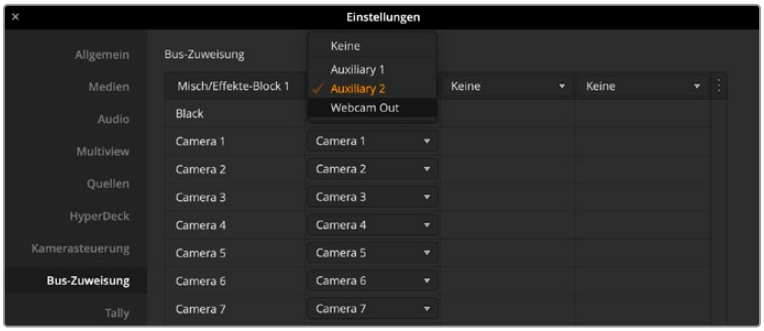
Bus-Zuweisung

Mit ATEM Television Studio Mischern können Sie Auxiliary- und Webcam-Ausgänge verbinden, sodass diese den Vorgängen des primären M/E-Blocks (M/E) folgen, um mehrere Ausgaben für dasselbe Programm zu gestalten, wobei die Follower-Ausgänge von der Programmzeile gesteuert werden.

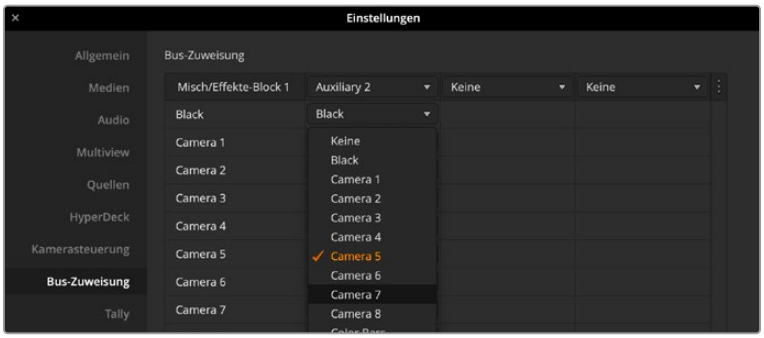
Über den „Bus-Zuweisung“-Tab in den „Einstellungen“ können Sie Quellen an den Auxiliary-Ausgängen der Follower oder am Webcam-Ausgang ersetzen, um ausgewählte Eingänge zu überschreiben. Einmal vorgegebene Follower führen dann dieselben Schnitte und Übergänge wie die Programm-Tastenreihe aus, können aber bei Bedarf andere Quellen ausgeben. Wir weisen darauf hin, dass es hier um Ausgaben mit einfachen Hartschnitten geht, die keine der Übergänge enthalten, die Sie ggf. in Ihrem Programm verwenden. Beispiel: Ersetzen Sie zur Lokalisierung einer Sendung die Titelgrafiken auf den einzelnen Ausgängen durch verschiedene Sprachversionen. Der Follower führt dann jeden Übergang synchron mit dem Primärsignal aus, ersetzt dabei alle Übergänge durch einfache Schnitte und zeigt gleichzeitig die von Ihnen zugewiesenen lokalisierten Grafiken an, was zu bis vier unterschiedlichen Programmausgängen führt.

So richten Sie eine Quellenersetzung ein:

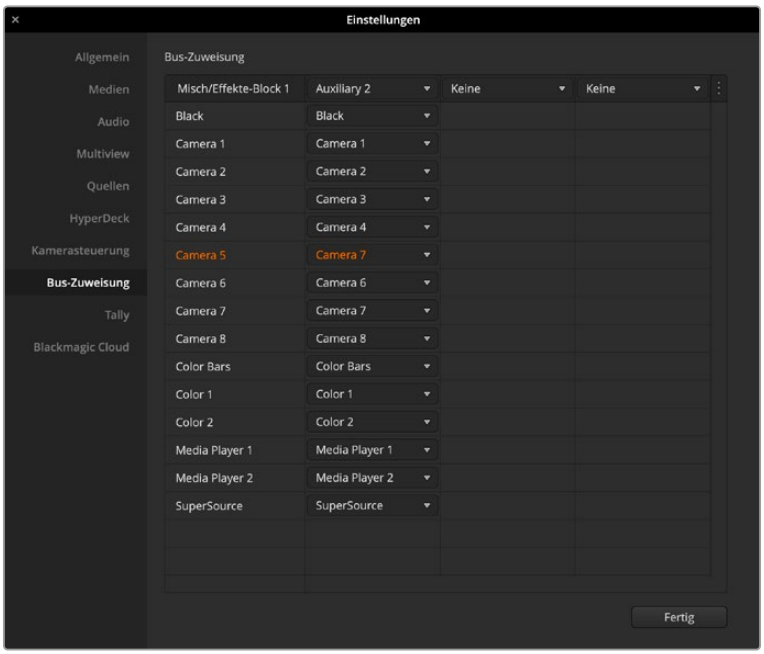
1. Wählen Sie über das Menü oben in der zweiten Spalte einen Auxiliary- oder Webcam-Ausgang aus, den Sie als Follower verwenden möchten, bspw. „Auxiliary 2“. ATEM Television Studio HD8 Mischer haben zwei Auxiliary-Ausgänge. ATEM Television Studio 4K8 Modelle verfügen über zehn Auxiliary-Ausgänge.



2 In diesem Beispiel wird Kamera 5 ersetzt. Navigieren Sie unter „Auxiliary 2“ für „Camera 5“ zur korrespondierenden Quellenliste und klicken Sie auf das Listenmenü.



3 Wählen Sie aus der Liste „Camera 7“ aus. Im „Mix-Effekte-Block 1“ erscheint „Camera 5“ orangefarben markiert. Dies signalisiert, dass eine Kamera ersetzt wurde.



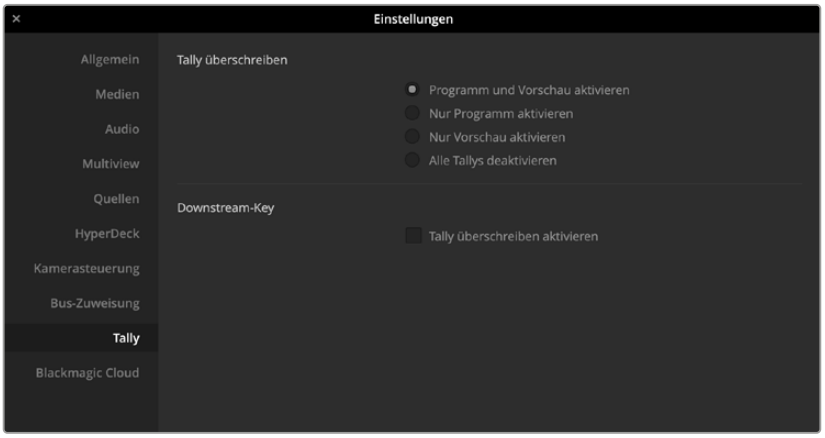
Wenn Sie jetzt im Mix-Effekte-Programm zu „Camera 5“ mit einem Hartschnitt oder Übergang zu „Camera 5“ wechseln, erfolgt auf „Auxiliary 2“ ein Hartschnitt zu „Camera 7“. Um dies in der Praxis zu sehen, leiten Sie die Signale für „Programm“ und „Auxiliary 2“ an Ihren Multiview-Ausgang.

Wir weisen darauf hin, dass es hier um Ausgaben mit einfachen Hartschnitten geht, die keine der Übergänge enthalten, die Sie ggf. in Ihrem Programm verwenden.

Tally

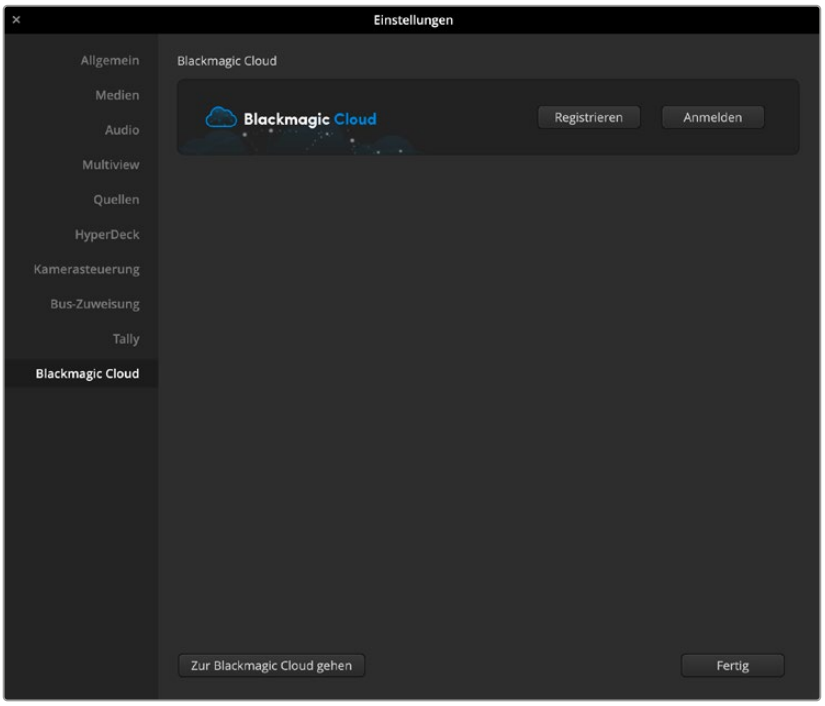
Aktivieren Sie für jeden M/E-Block das Tally über das „Tally“-Menü. Tallys lassen sich unabhängig für jeden einzelnen M/E einrichten, sodass M/Es verschiedene Tally-Ausgaben haben können.

Um ein Tally zu deaktivieren, während ein Downstream-Key auf Sendung ist, klicken Sie in das Kontrollkästchen „Tally überschreiben aktivieren“.



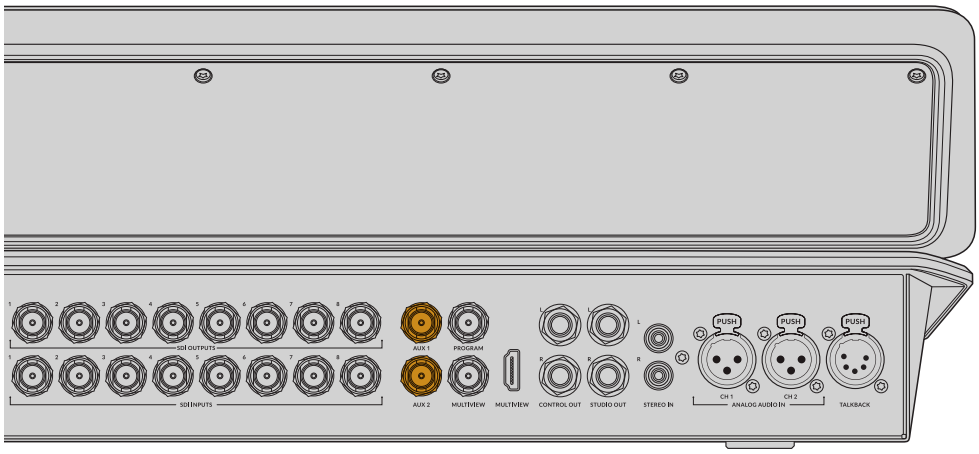
Blackmagic Cloud

Zum Streamen von Inhalten an den Blackmagic Cloud Stream Router oder zum Synchronisieren von Projekten mit Blackmagic Cloud müssen Sie sich bei Blackmagic Cloud anmelden. Dies erfolgt über das Blackmagic Cloud-Menü im „Einstellungen“-Fenster oder über die Livestream-Palette.

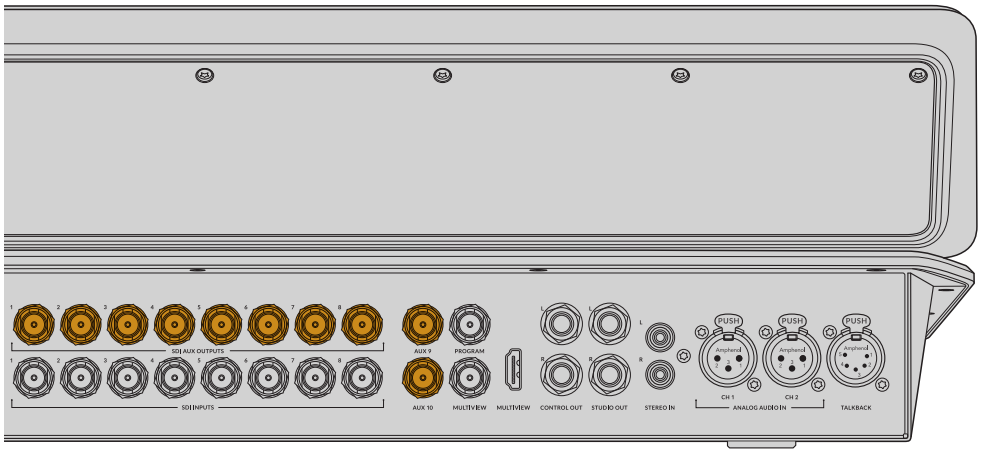


Auxiliary-Ausgänge

Über die separaten SDI-Auxiliary-Ausgänge und den Webcam-Ausgang Ihres ATEM Mischers lassen sich verschiedene Eingabesignale und interne Quellen routen. Die Auxiliary-Ausgänge sind mit den Ausgängen von Kreuzschienen vergleichbar. Man kann darüber sämtliche Videoeingaben, Farbgeneratoren, Media Player, Programme, Vorschauen und sogar Farbbalken ausgeben. ATEM Television Studio HD8 Mischer haben drei Auxiliary-Ausgänge. ATEM Television Studio 4K8 Modelle verfügen über 11 Auxiliary-Ausgänge.



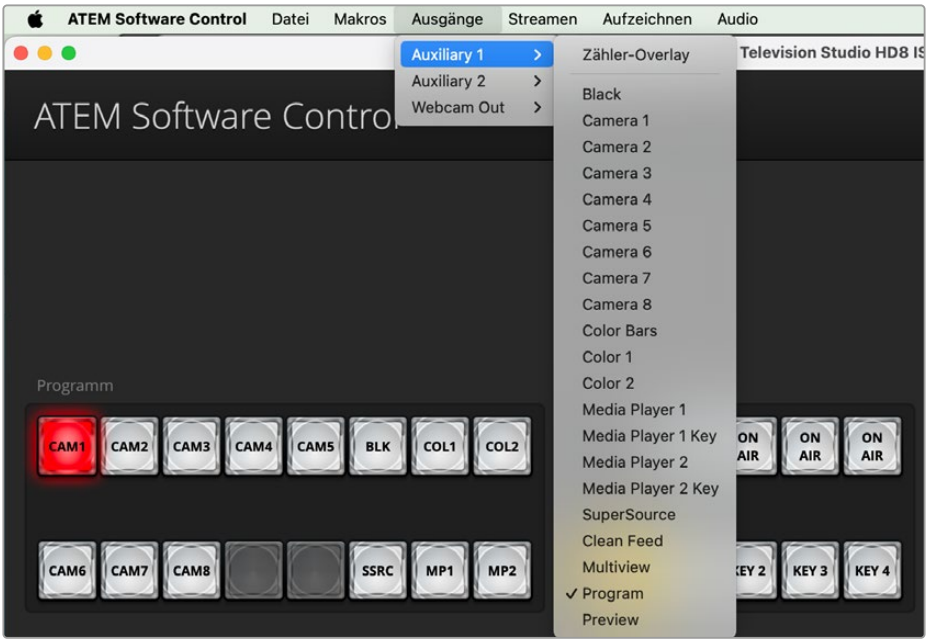
Auxiliary-Ausgänge am ATEM Television Studio HD8



Auxilliary-Ausgänge am ATEM Television Studio 4K8

Signalverteilung über die Auxiliary-Ausgänge

Die Signalverteilung der Auxiliary-Ausgänge wird im speziellen „Auxiliary“- oder „Ausgänge“-Menü vorgenommen. Aktivieren Sie das Menü und scrollen Sie in der Liste zu der Quelle, die Sie ausgeben möchten. Nach erfolgter Auswahl schaltet die Ausgabe des ausgewählten Aux-Ausgangs sofort um. Die aktuelle Quelle ist an dem mit einem Häkchen versehenen Menüpunkt erkennbar. Es sind verschiedene Quellen verfügbar, u. a. Schwarz, alle Videoeingänge, Farbbalken, Füll- und Key-Outputs der Media Player, Programm-, Vorschau- und Clean-Feeds.



„Ausgabe“-Menü am ATEM Television Studio HD8

Aux-Ausgänge sind extrem leistungsstark und ermöglichen viel Spannendes, beispielsweise alternative Mischerausgaben. Häufig werden bei Konzerten und Live-Vorstellungen über Aux-Ausgänge Videoprojektoren und Bühnen-Videowände bespielt. Die Multimedia-Aspekte der meisten modernen Live-Vorstellungen sind komplex. Deshalb sind die Aux-Ausgänge so konzipiert, dass Sie all diese Displaygeräte über Ihren ATEM steuern können.

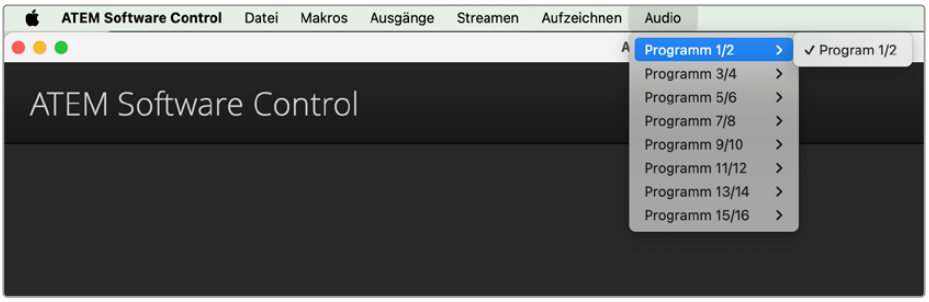
Kanalzuweisung der Audioausgaben

Jeder der eingebetteten Audiokanäle lässt sich einem Videoausgang des Mischers zuweisen. Demnach können Sie diverse Tonquellen den Kanälen in der SDI-Videoausgabe zuweisen, um sie mit den HyperDeck Rekordern aufzuzeichnen.

Beispiel: Vielleicht möchten Sie ein Mikrofon mit einer Kamera verbinden, um dessen Signale als spezifische Eingabe den Kanälen 3 und 4 der Programmausgabe zuzuweisen. Wenn Sie nun in den „HyperDeck“-Einstellungen die Aufzeichnung von vier oder mehr Tonkanälen vorgeben, erhalten Sie unabhängig vom Audiomix eine Rohaufzeichnung der Kameramikrofone. Auf diese spezifischen Tonquellen kann jeder Toningenieur beim Tonmischen in der Postproduktion zugreifen.

Diese Audioverteilungsfunktion gibt Ihnen die Kontrolle über alle eingebetteten Audiokanäle in der SDI-Videoausgabe und ist sehr praktisch.

Ihr ATEM Mischer nimmt dann die im „Audio“-Menü vorgegebene Signalverteilung der Audiokanäle für die Programmausgabe vor.



Optionen für die Audiosignalverteilung des ATEM Television Studio in ATEM Software Control

Der Programmmix ist immer den Kanälen 1 und 2 zugewiesen und Techniker-Talkback den Kanälen 13 und 14. Alle anderen Kanäle können individuell verteilt werden. Alle anderen Kanäle können jedoch separat über einen der SDI-, MADI-, XLR-, RCA- oder Mikrofoneingänge zugewiesen werden.

Zuweisen von Programmaudio in ATEM Software Control

1. Klicken Sie in der oberen Menüleiste auf das „Audio“-Menü.
2. Wählen Sie zwei Audiokanäle für den Programmton und dann im rechtsseitigen Menü den SDI-Eingang, dem Ihr Ton zugewiesen werden soll. Beispiel: Um Kanäle 3 und 4 von SDI-Eingang 2 den Kanälen 3 und 4 der Programmausgabe zuzuweisen, wählen Sie „Audio-Ausgabe 3/4“ im ersten Listenmenü und „SDI-Eingang 2 Audio 3/4“ in der zweiten Liste.

Verwenden von SuperSource

ATEM Television Studio Mischer verfügen über eine als SuperSource bezeichnete Bild-im-Bild-Funktion zur gleichzeitigen Darstellung mehrerer Videoquellen auf einem Bildschirm. Beispiel: Wenn Sie eine Diskussion zwischen vier Rednern übertragen, können Sie alle über einen Hintergrund legen. Ihr ATEM Mischer zeigt den gesamten SuperSource Prozessor als Videoeingabe an.

Einrichten von SuperSource

Einrichten können Sie den SuperSource Prozessor in ATEM Software Control über die „Paletten“-Registerkarte oder auf dem Mischerbedienfeld durch Drücken der SuperSource Taste links neben dem LCD.

Ansicht von SuperSource

Um den SuperSource Prozessor einzurichten, müssen Sie ihn auf Ihrem Bildschirm sehen können. Dafür gibt es zwei Möglichkeiten. Weisen Sie SuperSource über die Ausgabemenüs einem der SDI-Ausgänge zu. Alternativ platzieren Sie SuperSource in ein Fenster Ihres Multiview-Layouts.

Positionieren von Quellen

SuperSource Einstellungen

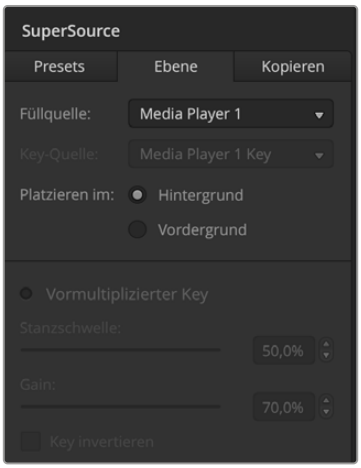
Öffnen Sie die SuperSource Menüpalette und wählen Sie eines der vier Preset-Layouts, das Ihrem gewünschten Look am nächsten kommt. Durch diese Aktion werden die Fenster automatisch an den in der Software angezeigten Positionen platziert. Wählen Sie über das Steuerungsmenü das anzupassende Fenster. Nun können Sie die X- und Y-Position sowie die Größe jeden einzelnen Fensters ändern. Um das Fenster aus der SuperSource Ansicht zu entfernen, deaktivieren Sie das Kontrollkästchen „Fenster aktivieren“. Mit den „Zuschneiden“-Einstellungen lassen sich die Seiten der Fenster zuschneiden. Klicken Sie auf das „Zuschneiden“-Kontrollkästchen und geben Sie die Parameter für die obere, untere, rechte und linke Seite vor. Um Position, Größe oder Zuschnitt des Fensters oder alle Parameter zurückzusetzen, klicken Sie auf das Symbol rechts neben „Fenstersteuerung“.

Drücken Sie am ATEM Television Studio Mischer auf die mit SuperSource beschriftete Taste. Navigieren Sie dann mit den Pfeiltasten der Systemsteuerung durch die SuperSource Einstellungen. Drehen Sie auf der zweiten Seite des SuperSource Menüs den Multifunktionsregler „Presets“, um das Layout vorzugeben. Drücken Sie dann die Multifunktionstaste „Preset anwenden“ oberhalb des LCDs. Sobald ein Fenster ausgewählt ist, werden alle zusätzlichen Einstellungen ebenso wie die Joystick-Steuerung auf dieses Fenster angewendet.

Größe und Position des Fensters lassen sich über die dritte Menüseite mit den Multifunktionsreglern unterhalb des LCDs anpassen. Schneller geht es jedoch mit dem Joystick des Panels. Bewegen Sie den Joystick, um die X- und Y-Positionen zusammen zu ändern. Drehen des Joysticks im Uhrzeigersinn vergrößert das Fenster, Drehen gegen den Uhrsinn verkleinert sie.

Material für Hintergrund- und Vordergrundebenen

Klicken Sie auf die „Ebene“-Registerkarte, um die Einstellungen für die Ebene aufzurufen. Wählen Sie dann Ihre Füllquelle aus dem Menü. Bei Gebrauch des Mischerbedienpanels können Sie die Füllquelle über den Quellauswahl-Bus wählen. Platzieren Sie die Quelle in den Hinter- oder Vordergrund. Sobald der Vordergrund vorgegeben ist, wählen Sie die Key-Quelle im Menü der Software oder mit dem Quellauswahl-Bus des Mischerbedienpanels.



Hintergrund-Einstellungen für Ebenen

Geben Sie bei aktiviertem Optionsfeld vor, ob Ihre Grafik vormultipliziert ist oder nicht. Ist sie vormultipliziert, klicken Sie auf das Kontrollkästchen. Dies erlaubt die Platzierung der Ebene über die aktivierten Fenster. Bei nicht vormultiplizierten Ebenen erzielen Sie Ihr gewünschtes Ergebnis mithilfe der im Abschnitt „Keying auf ATEM Mischern“ beschriebenen Steuerfunktionen „Clip“ und „Gain“. Sie können die Stanze auch invertieren.

Auf dem Mischerbedienpanel navigieren Sie anhand der Pfeiltasten der Systemsteuerung zu den Einstellungen. Wählen Sie mit dem Regler „Füllquellen“ Ihre Ebene aus. Geben Sie dann mit den Multifunktionstasten über dem LCD die Platzierung der Ebene im Vordergrund oder im Hintergrund vor. Ist die Füllquelle vormultipliziert, navigieren Sie zu den folgenden Einstellungsseiten und vergewissern Sie sich, dass „VORMULT. KEY EIN“ aktiviert ist. Dies erlaubt die Platzierung der Ebene über ein oder mehrere aktivierte Fenster. Bei nicht vormultiplizierten Ebenen erzielen Sie Ihr gewünschtes Ergebnis mithilfe der im Abschnitt „Keying“ beschriebenen Steuerfunktionen „Stanzschwelle“ und „Gain“. Möglicherweise muss auch der Key invertiert werden.

Einstellungen kopieren

Kopieren der Einstellungen für Fenster 1 zu Fenster 2

Um einen Kopiervorgang in ATEM Software Control auszuführen, rufen Sie per Klick auf die Schaltfläche „Kopieren“ das Dialogfeld „Fenstereinstellungen kopieren“ auf. Die Einstellungen des aktuell aktivierten Fensters lassen sich schnell und mühelos kopieren und auf ein anderes oder mehrere andere Fenster anwenden. So entsteht ein exaktes Abbild mit einem einzigen Klick! Die kopierten Fenster erscheinen direkt hinter dem Master-Fenster und verwenden dieselbe Quelle wie das Masterfeld.

Um Einstellungen direkt auf einem ATEM Television Studio Mischer anzupassen, navigieren Sie zur letzten Seite des SuperSource Menüs. Bestimmen Sie mit den Multifunktionstasten unter dem LCD das zu kopierende Fenster und das Fenster, zu dem kopiert werden soll. Mit dem Regler können Sie auch alle Fenster kopieren.

SuperSource auf Sendung schalten

Auf Ihrem ATEM Mischer wird der gesamte SuperSource Prozessor als Videoeingabe angezeigt. Um Ihre soeben erstellte Komposition zu verwenden, wählen Sie SuperSource auf dem Programmbus in ATEM Software Control oder direkt auf dem Mischerbedienfeld.

Mischereinstellungen speichern und wiederherstellen

Nach vollbrachter Einrichtung Ihres ATEM Mischers können Sie Ihre Einstellungen auf zweierlei Weise speichern.

Start-Status speichern

Wenn Sie dieselben Mischereinstellungen für alle Ihre Produktionen verwenden, können Sie diese als standardmäßigen Start-Status speichern. Bei jedem Öffnen von ATEM Software Control werden dann Ihre gespeicherten Einstellungen und Presets geladen. Löschen lassen sich diese Einstellungen mit der Option „Start-Status verwerfen“.

Einstellungen als XML-Datei speichern

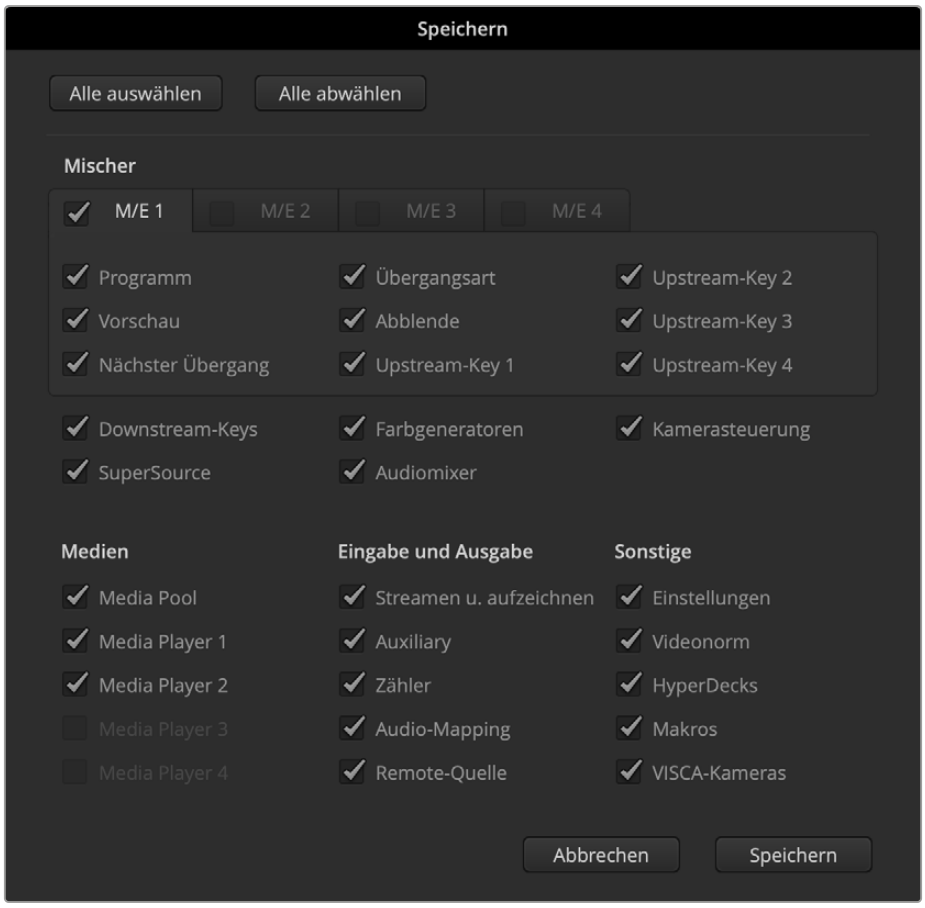
Wenn Ihr Workflow mehrere Produktionen mit unterschiedlichen Setups umfasst, können Sie die Versionen mit „Speichern als“ festhalten. Diese starke Feature spart viel Zeit bei Liveproduktionen, wo regelmäßig dieselben Einstellungen verwendet werden. Bspw. lassen sich auf einem Laptop oder USB-Laufwerk gespeicherte Kameraeinstellungen, Bauchbinden und komplexe Key-Einstellungen im Nu wiederherstellen.

So speichern Sie Einstellungen:

1. Gehen Sie auf die Menüleiste in ATEM Software Control und wählen Sie „Datei“ > „Speichern nach“ aus.
2. Es öffnet sich ein Fenster, das Sie nach einem Dateinamen und Zielordner fragt. Treffen Sie Ihre Auswahl und klicken Sie dann auf „Speichern“.
3. Nun öffnet sich das Feld zum Speichern des Mischerstatus mit den Kontrollkästchen mit allen auf dem jeweiligen Block Ihres ATEM Mischers verfügbaren Einstellungen. Das Kontrollkästchen „Alle auswählen“ ist standardmäßig aktiviert. Ist beim Speichern „Alle auswählen“ aktiviert, speichert ATEM Software Control Ihre gesamten Mischereinstellungen. Um spezifische Einstellungen zum Speichern auszuwählen, können Sie Einstellungen individuell deaktivieren. Alternativ entfernen Sie alle Einstellungen, indem Sie einmal auf „Alle auswählen“ klicken, um sie zu deaktivieren. Dann können Sie die spezifischen Einstellungen auswählen, die Sie speichern wollen.
4. Klicken Sie auf „Speichern“. Die Statusanzeige unten rechts im Feld bestätigt den abgeschlossenen Speichervorgang.

ATEM Software Control speichert Ihre Einstellungen in einer XML-Datei und legt sie zusammen mit den Inhalten des ATEM Media Pools in einem Ordner ab.

Nach erfolgter Speicherung Ihrer Einstellungen können Sie durch Auswahl von „Datei“ > „Speichern“ oder Drücken der Tasten Command S für Mac oder Strg S für Windows jederzeit eine Schnellspeicherung durchführen. Dies überschreibt Ihren vorherigen Speichervorgang nicht, sondern fügt Ihrem Zielordner eine neue, mit einem Zeit- und Datumsstempel unverwechselbar gekennzeichnete XML-Datei hinzu. Das bedeutet, Sie können bei Bedarf jederzeit einen früheren Speichervorgang wiederherstellen.



ATEM Software Control lässt Sie alle Einstellungen Ihres Mischers für Ihre Liveproduktionen speichern und wiederherstellen bzw. umspeichern, einschließlich Key-Einstellungen, Übergangsarten, Media Pool Inhalten und mehr

Auf Ihrem Laptop gespeichert können Sie Ihre Mischereinstellungen mühelos mit an den Drehort nehmen. Schließen Sie Ihren Laptop an einen beliebigen ATEM Mischer an und stellen Sie Ihre Mischereinstellungen im Nu wieder her.

Bei hektischen Liveproduktionen kann es passieren, dass man vor lauter Konzentration auf den Augenblick nach beendeter Produktion vergisst, gespeicherte Dateien zu sichern.

Um bestimmte Einstellungen beizubehalten, speichern Sie sie auf Ihrem Computer und auf einem externen Laufwerk, wie z. B. einem USB-Laufwerk. Auf diese Weise können Sie Ihre Einstellungen bei sich führen und verfügen über ein Backup, falls die Einstellungen auf Ihrem Computer versehentlich gelöscht werden.

So werden Einstellungen wiederhergestellt:

1. Gehen Sie auf die Menüleiste in ATEM Software Control und wählen Sie „Datei“ > „Wiederherstellen“.
2. Es öffnet sich ein Fenster, das Sie nach der zu öffnenden Datei fragt. Wählen Sie Ihre zu speichernde Datei und klicken Sie auf „Öffnen“.
3. Nun wird Ihnen ein Fenster mit aktiven Kontrollkästchen für Ihre auf den einzelnen Blocks des ATEM Mischers gespeicherten Einstellungen angezeigt. Lassen Sie „Alle auswählen“ aktiviert, um alle Ihre gespeicherten Einstellungen wiederherzustellen oder aktivieren Sie nur die Kontrollkästchen für ausgewählte, wiederherzustellende Einstellungen.
4. Klicken Sie auf „Wiederherstellen“.

Auf Werkseinstellungen zurücksetzen

Um Ihren ATEM Mischer auf die Werkseinstellungen zurückzusetzen, öffnen Sie das ATEM Setup Dienstprogramm und klicken auf „Wiederherstellen“. Die vor dem Zurücksetzen auf die Werkseinstellungen gespeicherten Einstellungen des Mischers bleiben erhalten.

Mischen mit ATEM Software Control

Der „Mischer“-Arbeitsraum ist die Hauptsteueroberfläche des Mischers. Bei Liveproduktionen können über den „Mischer“-Arbeitsraum Quellen ausgewählt und auf Sendung gebracht werden.

Hier wählen Sie die Übergangsart aus, betätigen Upstream- und Downstream-Keyer und schalten Abblenden ein oder aus. Über die Menüpaletten rechts auf der Benutzeroberfläche lassen sich die Übergangseinstellungen wie z. B. die Übergangsraten anpassen, Farbgeneratoren angleichen, Media Player steuern, Upstream- und Downstream-Keyer anpassen sowie das Tempo von Abblenden vorgeben.

Betrieb mit einer Maus oder einem Trackpad

Die Betätigung von Schaltflächen, Schiebereglern und Blendenhebel auf dem Software-Bedienpanel erfolgt per Maus über einen Computer oder per Trackpad bei Einsatz eines Laptops.

Führen Sie zur Aktivierung einer Schaltfläche einen Linksklick auf ihr aus. Um einen Schieberegler zu aktivieren, klicken Sie ihn an und ziehen Sie ihn mit gedrückter linker Maustaste. Um den Blendenhebel zu steuern, klicken Sie mit gedrückter linker Maustaste auf seinen Ziehpunkt und schieben Sie diesen auf- oder abwärts.

Verwenden von Tastatur-Hotkeys

Mit Hotkeys können einige Funktionen über eine normale QWERTY-Tastatur – siehe nachstehende Tabelle – bequem gesteuert werden:

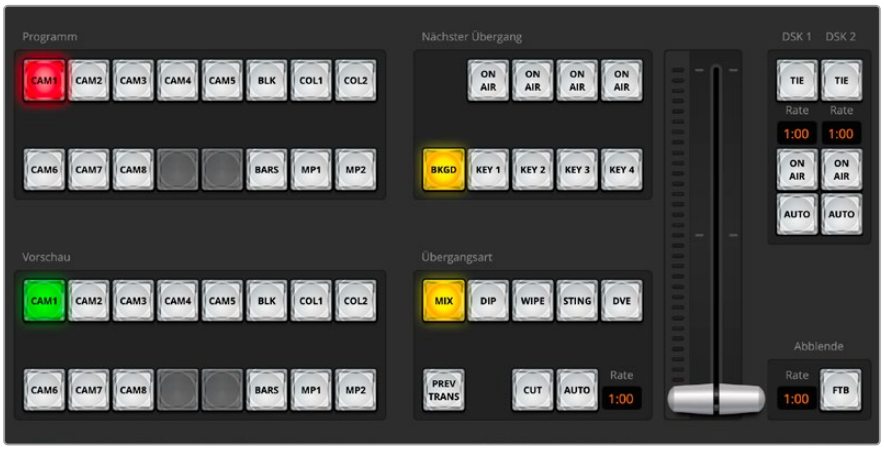
Hotkeys	Funktion
<1> - <0>	Vorschau der Quellen der Mischereingänge 1–10. 0 = Eingang 10.
<Shift> <1> - <0>	Vorschau der Quellen der Mischereingänge 11–20. Shift 0 = Eingang 20.
<Steuerung> <1> - <0>	Schaltet die Mischerquelle der Eingänge 1–10 heiß („Hot switching“) auf Programmausgabe.
<Steuerung> drücken und loslassen, dann <1> - <0>	Schaltet die Mischerquelle der Eingänge 1–10 heiß („Hot switching“) auf Programmausgabe. Das heiße Umschalten bleibt aktiv und die CUT-Schaltfläche leuchtet rot auf.
<Steuerung> <Shift> <1> - <0>	Schaltet die Mischerquelle der Eingänge 11–20 heiß („Hot switching“) auf Programmausgabe.

<Steuerung> drücken und loslassen, dann <Shift> <1> - <0>	Schaltet die Mischerquelle der Eingänge 11–20 heiß („Hot switching“) auf Programmausgabe. Das heiße Umschalten bleibt aktiv und die CUT-Schaltfläche leuchtet rot auf.
<Steuerung>	Schaltet aktuell eingeschaltetes „Hot Switching“ aus. Die CUT-Schaltfläche ist weiß erleuchtet.
<Leertaste>	CUT
<Return> oder <Eingabe>	AUTO

Näheres zum Gebrauch der Mischer-Bediensoftware siehe folgende Abschnitte.

Misch/Effekte (M/E)

Die Auswahl externer oder interner Quellen für die Vorschau des nächsten Übergangs oder seiner On-air-Schaltung erfolgt im „Mischer“-Arbeitsraum über den Misch/Effekte-Steuerblock, wo sich alle Schaltflächen zur Quellauswahl für die Programm- und Vorschaubusse befinden.



Misch/Effekte-Block auf dem ATEM Television Studio

Quellauswahl-Schaltflächen für den Programmbus

Die Schaltflächen der Quellauswahl für den Programmbus dienen zum Heißschalten von Hintergrundquellen auf den Programmausgang. Die jeweils auf Sendung befindliche Quelle ist an einer rot erleuchteten Taste erkennbar.

Quellauswahl-Schaltflächen für den Vorschaubus

Die Quellauswahl-Schaltflächen für den Vorschaubus dienen zur Auswahl einer Hintergrundquelle auf dem Vorschauausgang. Diese Quelle wird nach Abschluss des nächsten Übergangs auf den Programmbus gelegt. Die aktuell ausgewählte Vorschauquelle wird mit einer grün erleuchteten Schaltfläche angezeigt.

Die Quellauswahl-Schaltflächen für den Programmbus stimmen mit denen des Vorschaubusses überein.

EINGÄNGE	Es ist für jeden externen Mischereingang eine Eingangs-Schaltfläche vorhanden.
SCHWARZ	Eine intern durch den Mischer erstellte Quelle in schwarzer Farbe.
SUPERSOURCE	Mit dem als SuperSource bezeichneten Bild-im-Bild-Prozessor stellt man mehrere Quellen auf einem Bildschirm gleichzeitig dar. Drücken Sie die Shift-Taste für Farbbalken.
FARBBALKEN	Eine intern durch den Mischer erstellte Quelle für farbige Balken. Drücken Sie SuperSource und die Shift-Taste für Farbbalken.
FARBE 1 und 2	Eine intern durch den Mischer erstellte Farbquelle.
MEDIA 1 und 2	Interne Media Player, die im Mischer gespeicherte Standbilder und Clips anzeigen.

Übergangssteuerung und Upstream-Keyer

Übergangssteuerung

CUT

Die CUT-Schaltfläche führt einen sofortigen Übergang der Programm- und Vorschauausgaben per Hartschnitt aus, wobei der ausgewählte Übergangsstil außer Kraft gesetzt wird.

AUTO und RATE

Mit der AUTO-Schaltfläche führt man den ausgewählten Übergang innerhalb des im RATE-Display vorgegebenen Zeitraums automatisch aus. Die Übergangsrate für die einzelnen Übergangsarten wird in der jeweiligen Übergangs-Palette für diese Art vorgegeben. Bei Aktivierung der entsprechenden Übergangsart-Schaltfläche wird sie im RATE-Fenster des Steuerblocks „Übergangssteuerung“ angezeigt.

Die AUTO-Schaltfläche leuchtet für die Dauer des Übergangs rot auf, wobei sich das RATE-Display im Verlauf des Übergangs ständig aktualisiert und die Anzahl der jeweils verbleibenden Frames anzeigt. Bei ATEM Television Studio Mischern aktualisiert sich der Blendenhebel-Indikator fortwährend und zeigt den Verlauf des Übergangs visuell an.

Blendenhebel

Der virtuelle Blendenhebel dient als Alternative zur AUTO-Schaltfläche und erlaubt dem Bediener, Übergänge manuell mit einer Maus zu steuern. Die AUTO-Schaltfläche leuchtet für die Dauer des Übergangs rot auf, wobei sich das RATE-Display im Verlauf des Übergangs ständig aktualisiert und die Anzahl der jeweils verbleibenden Frames anzeigt. Der Blendenhebel-Indikator des Mischers aktualisiert sich während des Übergangs und zeigt so den Verlauf an.

Übergangsart

Mit den Übergangsart-Schaltflächen kann der Bediener eine dieser fünf Übergangsarten auswählen: Mix, Dip, Wipe, DVE und Stinger. Die ausgewählte Übergangsart wird durch eine gelb erleuchtete Schaltfläche angezeigt. Die ausgewählten Schaltflächen sind anhand der entsprechenden Registerkarte im Übergangsmenü erkenntlich. Beispiel: Wenn Sie bei geöffneter Menü-Palette auf „Wipe“ klicken, zeigt die Palette automatisch die „Wipe“-Registerkarte an. Dort können Sie Änderungen wie die Dauer oder die Musterart an der Wischblende vornehmen.

ARM

Die ARM-Schaltfläche aktiviert die automatische Wiedergabe von einem angeschlossenen HyperDeck, der unmittelbar nach einem Übergang auf dem Vorschau-Bus ausgewählt wurde. Ähnlich wie bei der Auto-Play-Funktion beginnt der auf dem Vorschau-Bus ausgewählte HyperDeck mit der Wiedergabe, sobald Sie zum Auslösen des Übergangs die CUT- oder AUTO-Schaltflächen drücken. Um die ARM-Funktion zu nutzen, halten Sie die Umschalttaste gedrückt und klicken auf die ARM-Schaltfläche, die nun die STING-Schaltfläche ersetzt. Bei einmaligem Drücken wird die Auto-Play-Wiedergabe für den ausgewählten HyperDeck-Eingang nur beim nächsten Übergang gestartet. Um ARM im aktivierten Zustand zu belassen, halten Sie die Umschalttaste auf Ihrer Tastatur gedrückt und klicken zweimal auf die ARM-Schaltfläche.

Man beachte, dass jegliche über das „Einstellungen“-Menü des HyperDeck eingestellte Vorlaufzeit ignoriert wird, wenn ARM aktiviert ist.

PREV TRANS

Die Schaltfläche PREV TRANS aktiviert den Übergangsvorschaumodus. Dies erlaubt dem Bediener, einen Mix-, Dip-, Wipe- oder DVE-Übergang mit dem Blendenhebel auszuführen und ihn in der Vorschauausgabe zu prüfen. Bei Aktivierung von PREV TRANS sehen Sie, dass sich Vorschau- und Programmausgabe gleichen. Um sich des gewünschten Ergebnisses zu versichern, lässt sich Ihr ausgewählter Übergang nun mit dem Blendenhebel mühelos ausprobieren. Äußerst praktisch, um Fehler im Live-Sendebetrieb zu vermeiden!

Nächster Übergang

Die Tasten BKGD (Hintergrund), KEY 1, KEY 2, KEY 3, KEY 4 dienen zur Auswahl von Elementen, die mit dem nächsten Übergang in den On-air- oder Off-air-Betrieb übergehen. Die Anzahl der verfügbaren Keyer hängt von Ihrem Mischermodell ab. Alle Keys können bei Ablauf des primären Übergangs ein- und ausgeblendet werden. Alternativ können Sie Keys ausschließlich für individuelle Übergänge auswählen, sodass die primäre Übergangssteuerung zum Ein- und Ausblenden von Keys benutzt werden kann.

Bei der Auswahl von Elementen für den nächsten Übergang ist der Mischer-Bediener gut beraten, die Vorschauvideoausgabe anzusehen. Diese gibt akkurat wieder, wie die Programmausgabe nach erfolgtem Übergang aussehen wird. Ist nur die BKGD-Schaltfläche aktiviert, so erfolgt der Übergang von der aktuellen Quelle im Programmbus zu der auf dem Vorschaubus ausgewählten Quelle ohne jegliche Keyer. Sie können für die Ausführung von Übergängen auch ausschließlich Keyer auswählen und den aktuellen Hintergrund während der Dauer des Übergangs live beibehalten.

ON AIR

Die „ON AIR“-Schaltflächen zeigen an, welche Keys aktuell auf Sendung sind. Sie dienen ebenfalls dazu, einen Key per Hartschnitt sofort auf Sendung zu schalten oder ihn wegzuschalten.

Downstream-Keyer (DSK)

TIE

Die TIE-Schaltfläche aktiviert den DSK auf dem Vorschauausgang zusammen mit den nächsten Übergangseffekten und verknüpft ihn mit der primären Übergangssteuerung. Der DSK kann dann beim nächsten Übergang auf Sendung gebracht werden.

Der DSK führt den Übergang innerhalb des auf dem RATE-Display im Übergangssteuerblock angezeigten Zeitraums aus. Ist der DSK verknüpft, bleibt dies ohne Wirkung auf die Signalverteilung zum Clean Feed 1.

ON AIR

Die „ON AIR“-Schaltflächen dienen dazu, den DSK hart on air oder off air zu schalten. Sie zeigen ebenfalls an, ob der DSK aktuell auf Sendung ist oder nicht. Die Taste ist erleuchtet, wenn der DSK aktuell auf Sendung ist.

AUTO

Die AUTO-Schaltflächen mischen den DSK in dem im DSK RATE-Fenster angezeigten Zeitraum on air oder off air. Dies ähnelt der primären AUTO-Rate, die im Übergangssteuerblock angezeigt wird, beschränkt sich jedoch auf den spezifischen Downstream-Keyer. Diese Funktion dient zum Ein- und Ausblenden von grafischen Buttons und Logos, wie z. B. Live- oder Replay-Infografiken während der Produktion. Die Übergänge der Hauptprogrammproduktion bleiben dabei unberührt.

Downstream-Key und Abblende

Fade to Black (FTB)

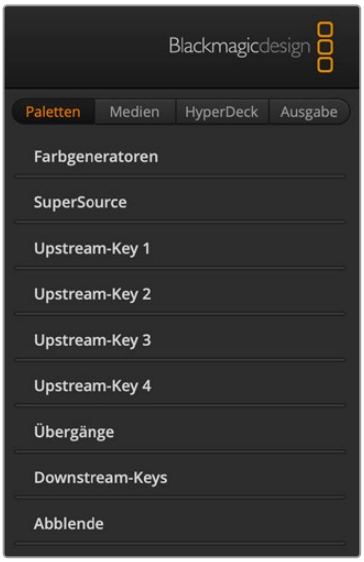
Die FTB-Schaltfläche blendet die gesamte Programmvideoausgabe nach Schwarz ab. Dies erfolgt in dem im RATE-Fenster der Abblende spezifizierten Zeitraum. Sobald die Abblende der Programmausgabe nach Schwarz erfolgt ist, blinkt die FTB-Schaltfläche so lange rot, bis sie erneut angeklickt wird. Dies bewirkt eine Aufblende von Schwarz in der gleichen Zeitspanne. Alternativ kann man das Intervall über die Abblende-Menüpalette ändern. Die Abblende bzw. FTB wird meistens zu Beginn oder am Ende einer Produktion oder für Schnitte auf Werbepausen eingesetzt. Diese Funktion gewährleistet das gleichzeitige Ausblenden aller Ebenen des Mischers. Eine Vorschau ist für die Blende nach Schwarz nicht möglich. Sie können den Audiomixer so einstellen, dass der Ton zusammen mit Ihrer FTB ausgeblendet wird. Wählen Sie hierfür die AFV-Schaltfläche auf dem Master-Kanalfader der Audioausgabe aus.

Menüpaletten

Das Software-Bedienpanel verfügt über folgende Registerkarten mit Menüpaletten und Optionen: „Paletten“, „Media Player“ und „Aufzeichnung“. Die Anordnung der Menüpaletten verdeutlicht die Reihenfolge der Bearbeitungsschritte des Mischers. Sie können die Menüpaletten aus Platzgründen vergrößern bzw. verkleinern und sie auf- und abwärts scrollen, um gewünschte Anpassungen einzustellen.

Paletten-Registerkarte

Die Paletten-Registerkarte gibt Zugriff auf folgende Untermenüs:



Farbgeneratoren 1 und 2

ATEM Mischer verfügen über zwei Farbflächengeneratoren, die über die jeweilige Farbgeneratoren-Menüpaletten konfigurierbar sind. Die Farbauswahl erfolgt per Pipette oder über die Einstellung des Farbtons (H), der Sättigung (S) und der Luminanz (L).

SuperSource

ATEM Television Studio Mischer verfügen über eine als SuperSource bezeichnete Bild-im-Bild-Funktion zur gleichzeitigen Darstellung mehrerer Videoquellen auf einem Bildschirm. Einzelheiten finden Sie im Abschnitt „Arbeiten mit SuperSource“ weiter hinten in dieser Bedienungsanleitung.

Upstream-Keyer

Es sind vier Upstream-Keyer vorhanden, die man über die „Upstream-Keyer“-Paletten konfiguriert. Jeder Keyer hat seine eigene Menüpalette, über die er sich jeweils als Luma-Key, Chroma-Key, Pattern-Key oder DVE konfigurieren lässt.

Auf der ausgewählten Menüpalette werden alle für die Konfiguration des Keyers verfügbaren Parameter angezeigt. Der Gebrauch der Upstream-Keyer wird an späterer Stelle in dieser Bedienungsanleitung näher erklärt.

Übergänge

Die Menüpalette „Übergänge“ lässt Sie die Parameter der einzelnen Übergangsarten konfigurieren. Beispielsweise verfügt die Menüpalette über eine Drop-Down-Box, wo Sie die Dip-Quelle auswählen können. Für Wischblenden zeigt die Menüpalette alle verfügbaren Wipe-Muster an. Es gibt zahlreiche Übergangsvarianten und viele Übergänge lassen sich durch die Kombination von Einstellungen und Funktionen auf der Übergänge-Menüpalette erstellen.

HINWEIS: Mit der bloßen Auswahl einer spezifischen Übergangsart auf dieser Menüpalette werden lediglich die Einstellungen für diesen Übergang angepasst. Nun ist noch die Art des auszuführenden Übergangs im Bereich Übergangssteuerung auf dem Software-Bedienpanel oder direkt auf dem Mischer auszuwählen. Aus Gründen der Bedienfreundlichkeit mischen manche Benutzer lieber mit einem Hardware-Bedienpult, stellen Übergänge aber über die Menüpaletten des Software-Bedienpanels ein. Das Software-Bedienpanel und die Hardware-Bedienpulte arbeiten parallel und spiegeln alle Einstellungen wider, sodass sie sich in beliebiger Kombination einsetzen lassen.

Downstream-Keyer

Die Downstream-Keyer konfiguriert man auf der Menüpalette „Downstream-Keys“. Auf der Menüpalette befinden sich Drop-down-Boxen zur Auswahl der auf den Keyer zu legenden Füll- und Keysignale, Schieberegler zur Einstellung der Stanzschwellen- und Gainwerte, vormultiplizierten Keys sowie Maskeneinstellungen. ATEM Television Studio Mischer verfügen über zwei Downstream-Keyer.

Abblende

Die Menüpalette „Abblende“ dient zur Einstellung der Übergangsrate der FTB bzw. Blende nach Schwarz. Das Kontrollkästchen „AFV“ (Audio folgt Video) bietet eine Abkürzung für den Weg über die AFV-Schaltfläche des Masterkanalfaders an. Die Aktivierung dieser Feature blendet den Ton im Takt mit der Abblende aus.

Registerkarte „Medien“

Über „Medien“ greifen Sie auf die Bedienelemente zur Steuerung der Media Player Ihres ATEM Mischers und angeschlossener HyperDeck Rekorder zu.

Media Player

Die Media Player des ATEM Mischers dienen zur Wiedergabe von Clips und Standbildern, die im integrierten Mischerspeicher, dem sogenannten Media Pool, vorliegen. Die Drop-down-Liste dient zur Auswahl von Standbildern oder Clips, die über die Media Player Eingabe abgespielt oder verfügbar gemacht werden. Ein ausgewählter Clip lässt sich mit den Transportsteuerelementen abspielen, pausieren und in Schleife abspielen. Es sind auch Steuerelemente für den schrittweisen Vor- und Rücklauf durch die Frames eines Clips vorhanden. ATEM Television Studio Mischer verfügen über zwei Media Player.

Registerkarte „HyperDeck“

Über „HyperDeck“ können Sie bis zu zehn HyperDecks steuern.

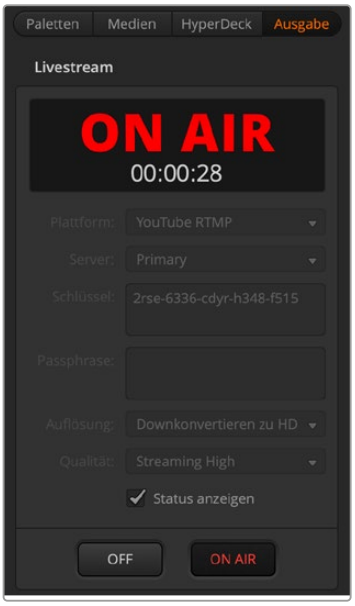
HyperDecks

Sie können bis zu zehn HyperDeck Diskrekorder anschließen und über die „HyperDeck“-Menüpalette in ATEM Software Control steuern. Um die Anzahl der angezeigten HyperDecks zu ändern, klicken Sie auf das Zahnradsymbol und wählen Sie die Anzahl in der Liste. Näheres erfahren Sie im Abschnitt „HyperDeck Steuerung“ in dieser Bedienungsanleitung.

Registerkarte „Ausgabe“

Verwenden Sie die „Ausgabe“-Registerkarte zum Einrichten der Einstellungen für Livestreaming und Aufzeichnung. Verwenden Sie die „Ausgabe“-Registerkarte auch zum Anpassen von Timecode- und Zählereinstellungen und zum Aufzeichnen von Standbildern.

Livestream



Mit dieser wichtigen Ausgabeoption richten Sie auf Ihrem Mischer Ihren Livestream ein, indem Sie die Daten Ihrer Streaming-Plattform eingeben. Nach Vorgabe aller Einstellungen starten Sie Ihre Übertragung durch Anklicken des „ON AIR“-Buttons. Durch Klicken auf OFF stoppen Sie die Übertragung.

Der Livestream-Status macht mit dem großen roten „ON AIR“-Indikator klar erkenntlich, dass Sie auf Sendung sind. Hier erscheint auch der Timecode-Generator, den Sie anhand der Timecode-Optionen einrichten können.

Plattform	Klicken Sie auf das „Plattform“-Menü und wählen Sie die Streaming-Plattform für Ihre Sendung. Verfügbar sind u. a. Facebook Live, YouTube Live und Twitch.
Server	Geben Sie den nächstgelegenen Server zu Ihrem Standort vor, indem Sie den gewünschten Server im „Einstellungen“-Fenster per Klick aus dem Menü wählen.
Key	Geben Sie hier den Streamschlüssel ein, den die Streaming-Plattform Ihrer Sendung zugewiesen hat. Wie Sie sich einen Streamschlüssel besorgen, wird unter „Einholen eines Streamschlüssels“ im Abschnitt „Streaming“ erklärt.
Passphrase	Geben Sie bei Gebrauch eines Streaming-Dienstes mit dem SRT-Streaming-Protokoll die Ihnen von Ihrem Streaming-Dienst-Konto zugewiesene Passphrase ein.
Auflösung	Den Livestream eines auf 2160p eingestellten ATEM Television Studio 4K8 Mischers können Sie in HD downkonvertieren oder ihn durch Auswahl der Option „Auflösung“ in der Mischernorm beibehalten.

Qualität	Wählen Sie die gewünschte Streaming- und Aufzeichnungsqualität für Ihren Stream. Diese Einstellung bietet folgende Optionen: ▪ HyperDeck Hoch 45–70 Mbit/s ▪ HyperDeck Mittel 25–45 Mbit/s ▪ HyperDeck Niedrig 12–20 Mbit/s ▪ Streaming Hoch 6–9 Mbit/s ▪ Streaming Mittel 4,5–7 Mbit/s ▪ Streaming Niedrig 3–4,5 Mbit/s Einzelheiten zu den Qualitätseinstellungen finden Sie in diesem Abschnitt.

Wie Sie anhand dieser Optionen Direktstreaming über eine Ethernet-Verbindung einrichten, einschließlich wie Sie einen Streamschlüssel einholen, erfahren Sie im Abschnitt „Streamen“ weiter hinten in dieser Bedienungsanleitung.

Obwohl die Einstellungen schön unkompliziert sind und Sie bloß den Streaming-Dienst und ein paar andere Optionen vorzugeben brauchen, gibt es eine XML-Datei mit zusätzlichen Einstellungen. Versierte Benutzer können dieser Datei weitere Streaming-Dienste hinzufügen und das Streaming-Menü mit Einstellungen niedrigerer Ebene individualisieren. Wie Sie mit XML-Dateien Einstellungen speichern und wiederherstellen wird im Abschnitt „Speichern und Wiederherstellen von Mischereinstellungen“ erklärt.

Streaming und HyperDeck Qualitätseinstellungen

Die mit der Qualitätseinstellung verwendete Datendurchsatzrate richtet sich nach der Videonorm, in der Ihr Mischer betrieben wird. Beispiel: Wenn Sie fürs Streamen die hohe Qualitätsstufe „HyperDeck Hoch“ wählen und in 1080p/24 arbeiten, wird die Datenrate 6 Mbit/s verwendet.

Die für „HyperDeck Hoch“ verwendeten Datenraten sind 45–70 Mbit/s, die Datenraten für „HyperDeck Mittel“ 25–45 Mb/s und für „HyperDeck Niedrig“ 12–20 Mbit/s. Für die Übertragung von Daten übers Internet sind die Streaming-Datenraten niedriger. Die Datenrate für „Streaming Hoch“ ist 6–9 Mbit/s, die für „Streaming Mittel“ 4,5–7 Mbit/s und die für „Streaming Niedrig“ 3–4,5 Mbit/s.

Sie werden bemerken, dass es für jede Einstellung zwei Datenraten gibt. Die niedrigere Rate wird für die niedrigeren Frameraten 24p, 25p und 30p verwendet. Die höhere Datenrate wird für die höheren Frameraten 50p und 60p verwendet. Wichtig: Die Standardeinstellung für die Streaming-Qualität ist „Streaming Hoch 6–9 Mbit/s“. Dies bietet einen Streaming-Kanal von sehr hoher Qualität und eine recht gute Aufzeichnungsqualität.

Wenn Sie nicht streamen, wählen Sie einfach eine der HyperDeck Qualitätseinstellungen. Diese bieten die gleiche Qualität wie die Einstellungen des HyperDeck Studio Mini und gute Datendurchsatzraten für die Übertragung von hochwertigen Aufzeichnungen. Mit der aktuellsten für den HyperDeck Studio Mini herausgegebenen Software können jedoch auch die Streaming-Datenraten niedrigerer Qualität abgespielt werden.

Aufzeichnen

Wenn Sie Ihren Stream aufzeichnen, verwalten Sie in diesem Menü Ihre Datenträger und bestimmen den Start und Stopp der Aufzeichnung. Für alle verbundenen Blackmagic Kameras kann man hier auch einen Dateinamen eingeben und das Auslösen der Aufzeichnung einrichten. Näheres zur Formatierung von Medien für die Aufzeichnung finden Sie im Abschnitt „Datenträger vorbereiten“.

Dateiname	Geben Sie vor Aufzeichnungsbeginn einen Dateinamen in das Dateinamenfeld ein. Bestätigen Sie ihn durch einen Klick irgendwo außerhalb des Felds. Wenn die Aufzeichnung gestoppt und wieder gestartet wird, wird der Dateiname mit hochzählenden Versionsnummern versehen.
Laufwerke	Mit Ihrem Mischer verbundene formatierte Datenträger werden im Aufzeichnen-Fenster aufgelistet. Um Datenträger zuzuweisen, wählen Sie diese im Menü aus. Das Laufwerksfenster zeigt die Speicherkapazität und die verbleibende Aufzeichnungszeit an. Es wird immer zuerst auf den Datenträger mit dem meisten freien Speicherplatz aufgezeichnet, dann auf den Datenträger mit den nächstmeisten Platz. Sie können das Ziellaufwerk für die Aufzeichnung aber auch manuell wechseln, indem Sie den WECHSELN-Button anklicken. Das ist praktisch, wenn auf dem aktuellen Datenträger weniger als 5 Minuten Aufzeichnungszeit verbleiben und Sie an einer bestimmten Stelle Ihrer Sendung auf den nächsten Datenträger umschalten wollen.
WECHSELN	Ein Klick auf diesen Button schaltet die Aufzeichnung vom aktuellen Ziellaufwerk auf den Datenträger mit dem meisten verfügbaren Platz um.

TIPP Alternativ wechseln Sie zwischen Datenträgern, indem Sie auf dem Bedienpanel des ATEM Television Studios die SWITCH-Taste drücken.

STOP-Button	Klicken Sie auf STOP, um die Aufzeichnung anzuhalten.
REC-Button	Klicken Sie auf den mit REC beschrifteten Aufnahme-Button, um die Aufzeichnung zu starten.
Status anzeigen	Aktivieren Sie diese Feature durch Anklicken des gleichnamigen Kontrollkästchens in den Aufzeichnungsoptionen. Die Statusanzeige erscheint unten rechts auf der ATEM Software Control Bedienoberfläche und zeigt den Aufzeichnungsstatus an. Während der Aufzeichnung leuchtet der REC-Indikator rot und zeigt das aktuelle Laufwerk und die verbleibende Aufzeichnungszeit an.
Aufzeichnen: Auf allen Kameras	Hiermit geben Sie vor, dass auf allen verbundenen Blackmagic Kameras aufgezeichnet wird, sobald Sie den REC-Button drücken. Das ist eine praktische Funktion zur Aufzeichnung isolierter Feeds von jeder einzelnen Kamera für den späteren Schnitt. Die Kameras werden automatisch angewiesen, in Blackmagic RAW unter Verwendung der zuletzt eingerichteten Qualitätseinstellung aufzuzeichnen.

Synchronisieren mit Blackmagic Cloud

Über die Kollaborationsplattform Blackmagic Cloud können Sie im Team arbeiten und DaVinci Resolve Projekte zum weltweiten Zugriff freigeben.

Wenn Sie sich auf Ihrem ATEM Mischer in Blackmagic Cloud anmelden, können Sie bestimmen, dass Ihre Aufzeichnung oder Ihr ISO-Projekt sowie Clips von einer externen Festplatte oder einem Flash-Laufwerk direkt in ein DaVinci Resolve Cloud Projekt geladen werden. Alternativ lässt sich der aufgezeichnete Stream direkt in Ihren privaten Blackmagic Cloud Speicher hochladen, ohne dass er mit einem Resolve Cloud Projekt synchronisiert wird.

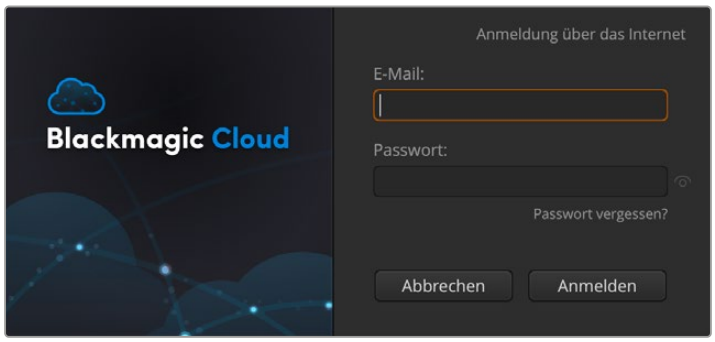
Anmelden in Blackmagic Cloud

Bevor Sie sich auf Ihrem ATEM Mischer in Blackmagic Cloud anmelden, müssen Sie Ihren ATEM Mischer mit dem Internet verbinden. Schließen Sie ihn dafür über den Ethernet-Port mit einem Netzwerkkabel an einen Internetrouter oder Netzwerk-Switch an.

So melden Sie sich auf einem ATEM Television Studio in Ihrem Blackmagic Cloud Konto an:

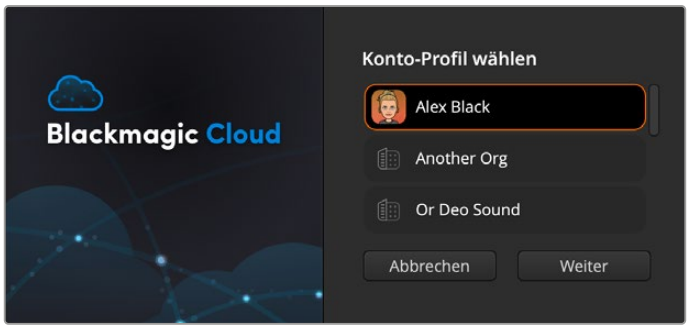
1 Klicken Sie auf den „Ausgabe“-Tab und öffnen Sie das Menü „Aufzeichnen“.

2 Aktivieren Sie die Option „Mit Blackmagic Cloud syncen“ und klicken Sie dann zum Öffnen des Anmeldefensters auf den „Anmelden“-Button.



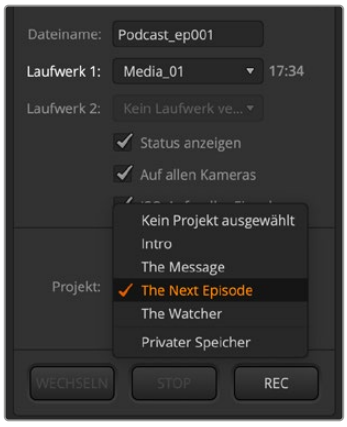
3 Geben Sie Ihre Angaben in die E-Mail- und Passwort-Felder ein und klicken Sie auf „Anmelden“. Alternativ klicken Sie oben rechts auf „Login übers Internet“, um sich über einen Webbrowser anzumelden.

4 Es erscheint ein Fenster, in dem Sie für Ihr Blackmagic Cloud Konto ein persönliches Profil oder ein Organisationsprofil wählen. Klicken Sie auf das gewünschte Profil und klicken Sie auf „Weiter“.



Wenn Sie sich in Blackmagic Cloud angemeldet haben, wählen Sie im „Projekt“-Menü das mit Ihren Medien zu synchronisierende Projekt aus. Im Menü werden bestehende Blackmagic DaVinci Cloud Projekte angezeigt.

Wird Ihr Projekt nicht aufgelistet oder Sie wollen ein neues Projekt einrichten, passen Sie Ihre Einstellungen an oder erstellen Sie in DaVinci Resolve ein neues DaVinci Resolve Cloud Projekt.

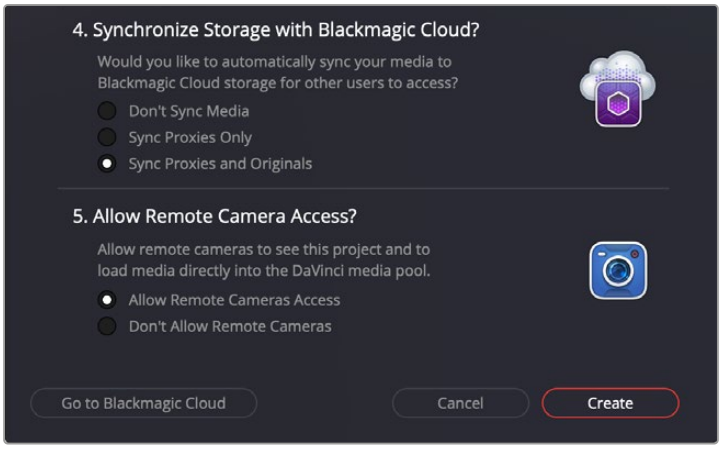


Zugriff in DaVinci Resolve zulassen

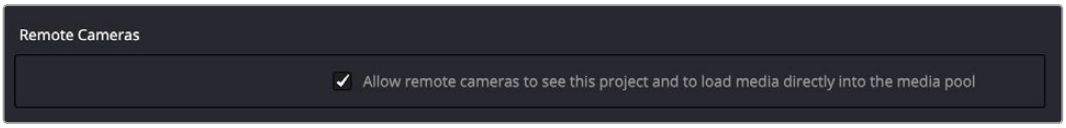
Indem Sie in den DaVinci Resolve Einstellungen den Remote-Kamerazugriff erlauben, können Sie Clips von Ihrem ATEM Mischer in neue und bestehende Blackmagic Cloud Projekte hochladen. Wenn der Remote-Zugriff für ein Projekt aktiviert ist, wird dieses im „Aufzeichnen“-Tab im „Projekt“-Menü angezeigt.

So geben Sie den Zugriff auf ein neues Projekt frei:

1. Starten Sie DaVinci Resolve. Wählen Sie im Projektmanagerfenster den „Cloud“-Tab und geben Sie Ihre Anmeldedaten für Blackmagic Cloud ein.
2. Wählen Sie eine Blackmagic Cloud Projektbibliothek aus der Projektbibliothekliste und klicken Sie auf „Neues Projekt“.
3. Geben Sie bei geöffnetem Fenster die Projektdaten für das neue Projekt ein. Aktivieren Sie im Fenster für das neue Cloud-Projekt die Optionen „Proxys und Originale synchronisieren“ und „Remote-Kamerazugriff erlauben“ und klicken Sie auf „Erstellen“.



Um Clips in ein vorhandenes DaVinci Resolve Projekt hochzuladen, öffnen Sie die Projekteinstellungen und wählen „Blackmagic Cloud“. Aktivieren Sie in den „Remote-Kameras“-Einstellungen die Option „Erlaubt Remote-Kameras den Zugriff auf dieses Projekt sowie das Hochladen von Medien direkt in die Mediathek“.



Wenn der Mischer mit dem Internet verbunden und in Ihrem Blackmagic Cloud Konto angemeldet ist, erscheint das Blackmagic Cloud Projekt im „Aufzeichnen“-Tab Ihres ATEM Mischers.

Näheres zu DaVinci Resolve Cloud Projekten finden Sie im englischsprachigen DaVinci Resolve Handbuch. Das Handbuch steht zum Download unter https://www.blackmagicdesign.com/de/support/family/davinci-resolve-and-fusion bereit.

Standbild aufzeichnen

Um ein Standbild aus Ihrer Sendung zu erfassen, klicken Sie einfach auf die Schaltfläche „Standbild aufzeichnen“. Damit verfügen Sie über eine Art Standbildspeicher und können so erfasste Bilddateien im Media Pool ablegen. Standbilder können Sie unmittelbar in den Media Player laden und in Ihrer Sendung verwenden oder Sie im Media Pool auf Ihrem Computer speichern.

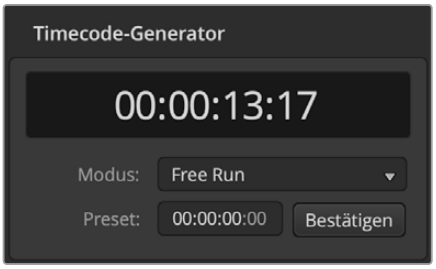
So speichern Sie den Media Pool:

1. Gehen Sie auf die Menüleiste oben am Bildschirm und klicken Sie auf „Datei speichern unter“.
2. Wählen Sie den gewünschten Speicherort aus.
3. Klicken Sie auf „Speichern“.

Jetzt ist Ihr Media Pool auf Ihrem Computer gespeichert. Sie können nun auf die erfassten Standbilder zugreifen und sie in Ihrer Grafiksoftware verwenden.

Timecode-Generator

Sobald Sie ATEM Software Control starten, erstellt der Timecode-Generator automatisch Uhrzeit-Timecode. Man kann den Zähler aber auch manuell auf Null zurückzustellen oder einen neuen Wert für den Timecode-Start eingeben.



Der Timecode-Generator lässt sich auf die Betriebsmodi „Uhrzeit“ oder „Free Run“ einstellen. Für letzteren gibt man den Timecode manuell vor

So geben Sie einen Timecode-Wert manuell vor:

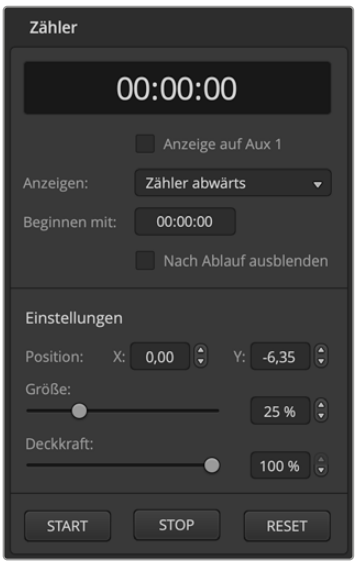
1. Klicken Sie im „Betriebsmodus“-Menü auf die Option „Free Run“.
2. Geben Sie einen Timecode-Wert in das kleinere der beiden Timecode-Zählfelder ein. Beim Eingeben werden neue Werte in grün angezeigt.
3. Um die Änderung zu bestätigen und den Timecode zu starten, klicken Sie auf „OK“.

Uhrzeit

Ein an Ihren Computer angeschlossener ATEM Television Studio Mischer synchronisiert seinen Timecode mit der Uhrzeit des Computers. Der Mischer hat eine interne Uhr, die auch nach Trennen des Mischers vom Computer ungefähr sechs Tage lang oder bis zur vollständigen Entleerung des Akkus weiterläuft und Uhrzeit-Timecode zählt. Solange ein Computer per USB verbunden ist, wird der Mischerakku aufgeladen.

Zähler

Die Zähleroption des ATEM Television Studio HD8 ermöglicht es, in Ausgabe 1 ein Zähler-Overlay einzublenden. Das ist praktisch für den Monitor eines Sprechers, dem der angezeigte Zähler das Zeitlimit seiner Präsentation anzeigt oder ihn die bereits verflossene Zeit verfolgen lässt.

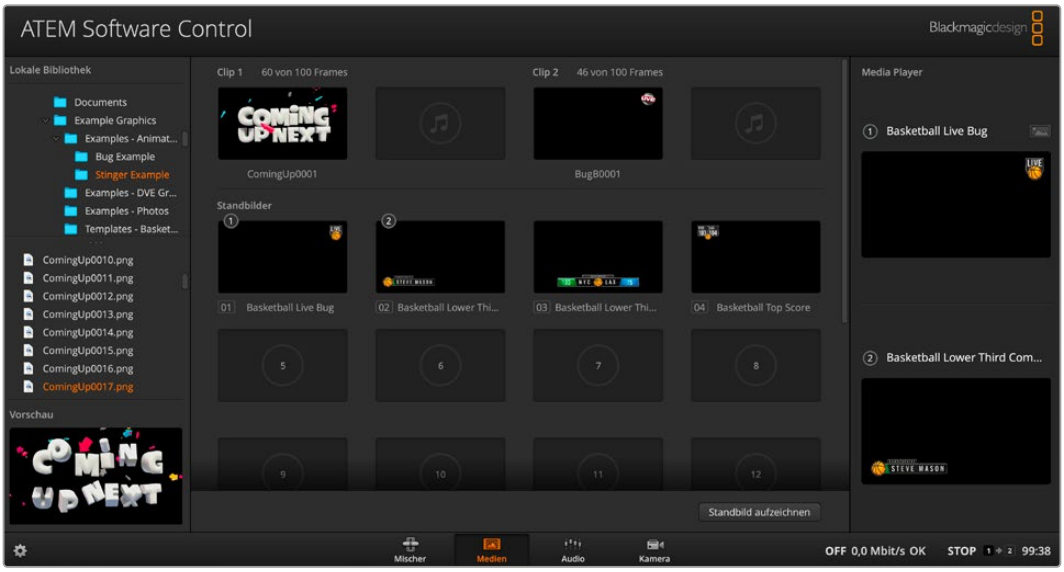


So stellen Sie den Zähler ein:

1. Wählen Sie die Modi „Zähler abwärts“ oder „Zähler aufwärts“ aus.
2. Geben Sie fürs Abwärtszählen eine Startzeit und eine Zeitbegrenzung vor.
3. Über die Einstellungen können Sie die Position des Zähler-Overlays sowie seine Größe und Deckkraft bestimmen.
4. Nach erfolgter Einstellungsvorgabe können Sie den Zähler starten. Vergewissern Sie sich, dass die Option „Zähler-Overlay“ aktiviert ist, indem Sie im „Ausgänge“-Menü in der oberen Toolbar prüfen, dass das Zähler-Overlay für Ausgang 1 aktiviert ist.

ATEM Media Pool

Um den „Medien“-Arbeitsraum zu öffnen, klicken Sie auf die „Medien“-Registerkarte in der unteren Mischer-Toolbar. Über den „Medien“-Arbeitsraum von ATEM Mischern können Sie Grafiken wie Standbilder und Videoclips in den Mischer laden und sie beliebigen Media Playern Ihres Mischers zuweisen. Die zwei Hauptbereiche im „Mischer“-Arbeitsraum sind das linksseitige Browse-Fenster und rechts daneben der Media Pool und die Media Player.



Klicken Sie auf die „Medien“-Registerkarte am unteren Rand, um den Media Pool zu öffnen

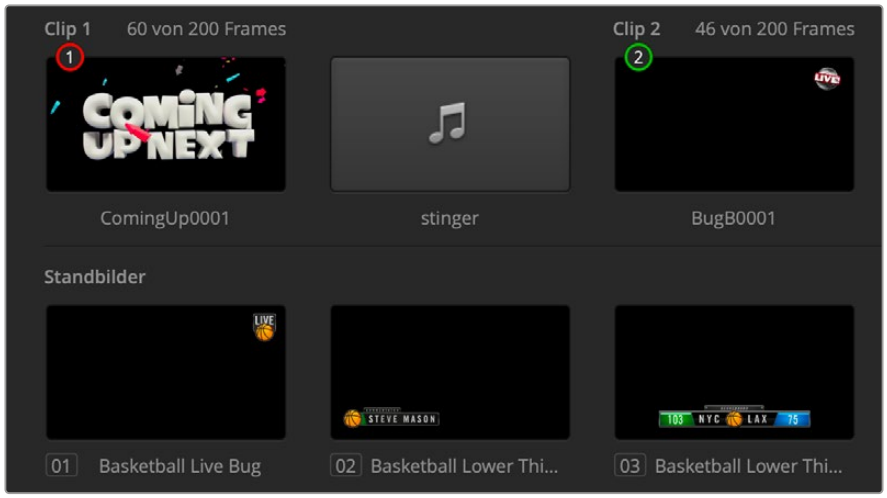
Das Browse-Fenster

Das Browse-Fenster ist ein vereinfachter Dateibrowser, mit dem Sie auf Ihrem Computer navigieren und nach Bilddateien suchen können. Es werden alle an Ihren Computer gekoppelten Datenträger angezeigt und Sie können darin befindliche Ordner auswählen. Klicken Sie auf die Pfeile neben den jeweiligen Ordnern, um Unterordner einzusehen. Ausgewählte Dateien werden im Vorschau-Fenster links unten auf der Bedienoberfläche angezeigt. Der ATEM Media Pool unterstützt die Standbildformate PNG, TGA, BMP, GIF, JPEG und TIFF. Audiodateien müssen die Formate WAV, MP3 oder AIFF haben. Diese Dateien lassen sich in den Media Pool laden.

Das „Media Pool“-Fenster

Für in den Media Pool geladene Dateien erscheint an den jeweiligen Standbild- und Clip-Plätzen ein Miniaturbild. An den Clip-Plätzen wird ein Bild aus der Mitte der geladenen Sequenz angezeigt. Die über den Clip-Plätzen angezeigten Informationen geben Aufschluss über die Anzahl der in einem geladenen Clip enthaltenen Standbilder und über die maximal zulässige Anzahl von Bildern für Ihr gewähltes Videoformat. Standbilder sind mit einer Platznummer versehen, die sie für die Zuordnung erkenntlich machen. Der Dateiname eines jeden geladenen Standbilds oder Clips wird unter seinem jeweiligen Platz angezeigt. So behalten Sie den Überblick über geladene Stills und Clips. Die Liste mit geladenen Clips und Standbildern mit Namen und Nummern erscheint in der „Media Player“-Palette im „Mischer“-Arbeitsraum, auf ATEM Hardware-Bedienpulten in der „Media Pool“-Ansicht sowie im Photoshop Plug-in. An der Frontblende des Mischers erscheint nur der Standbildname, sofern ein Platz belegt ist.

Die oben links im Thumbnail erscheinenden Nummern zeigen an, welche Plätze welchen relevanten Media Playern zugewiesen sind. Wird ein Media Player Platz an den Programmausgang gelegt, wechselt die Farbe des die Nummer umgebenden Kreises auf Rot, da dieser Platz nun auf Sendung ist. Der Nummernkreis eines am Vorschauausgang anliegenden Platzes wird in Grün angezeigt.



Dateien browsen und laden

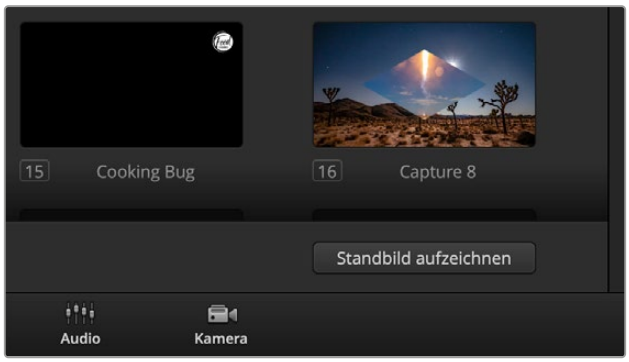
So einfach ist das Laden von Standbildern: Ziehen Sie das Still einfach aus dem Browse-Fenster und legen Sie es an einem unbelegten Platz im Media Pool ab. Um einen bewegten Clip zu laden, müssen Sie eine Sequenz von Standbildern laden. Befindet sich die Sequenz in einem Ordner, klicken und ziehen Sie den Ordner vom Browse-Fenster und legen Sie ihn an einem der beiden Clip-Plätze ab. Liegt die Sequenz nicht in einem einzelnen Ordner ab, klicken Sie zur Auswahl einer solchen Sequenz auf die erste Datei in der Sequenz und scrollen Sie nach unten. Shift-klicken Sie dann auf die letzte Datei in dieser Sequenz. Jetzt lassen sich die markierten Dateisequenzen an einen beliebigen der beiden Clip-Plätze in den Media Pool ziehen. Sie können begleitende Audiodateien für Ihren Clip laden, beispielsweise zum Abspielen eines Stinger-Übergangs. Ziehen Sie hierfür die Audiodatei aus dem Browser und legen Sie diese am Audio-Platz neben Ihrem Clip-Platz ab. Den Audio-Platz erkennen Sie am Tonsymbol.

Beim Ablegen eines Standbilds, Clips oder einer Audiodatei an einem Platz zeigt ein Fortschrittsbalken den Status des Ladevorgangs an. Sie können selbst dann mehrere Dateien in den Media Pool legen, wenn der Kopiervorgang der ersten Bilder noch im Gange ist, da sie zum Download nacheinander vorgesehen werden. Durch das Verschieben eines Clips oder Standbilds in ein Fenster mit vorhandenem Inhalt wird dieser überschrieben.

Die Zuweisung von Media Playern lässt sich über das „Media Player“-Menü im „Mischer“-Arbeitsraum ändern, indem Sie Ihren gewünschten Clip bzw. Still aus der Dropdown-Liste „Media“ selektieren. Klicken Sie unter „Medien“ einfach auf den Pfeil, um Media Pool Plätze aus einer Liste auszuwählen.

Alternativ können Sie die Medienzuweisung im „Media Player“-Menü im Systemsteuerblock oder sogar per Export aus Photoshop über die Option „ATEM Mischer Media Pool“ vornehmen. Näheres zum Photoshop Export-Plug-in finden Sie im Abschnitt „Arbeiten mit Adobe Photoshop und ATEM Mischern“ weiter hinten in diesem Handbuch.

Standbild aufzeichnen



Klicken Sie auf „Standbild aufzeichnen“, um aus der Sendung ein Standbild zu erfassen

Sie können Standbilder aus Ihrer Sendung auch über die rechts unten im Media Pool befindliche Schaltfläche „Standbild aufzeichnen“ erfassen. Ein Klick auf die Schaltfläche legt ein Standbild am nächsten verfügbaren Platz in Ihrem Media Pool ab.

Arbeiten mit dem Audiomixer

Der „Audio“-Arbeitsraum dient zum Mischen von Ton, der über SDI, Analogaudio oder MADI-Audio in den ATEM Mischer eingeht oder in den integrierten Media Playern abliegt.

Kameras, Media Player, MADI- und externe Audioquellen sind am oberen Rand des Audiomixerfensters zusammen mit dem Master-Audioausgang für die Programmausgaben des Mischers aufgelistet.

Unter jeder Audioquelle befindet sich ein Audiopegelmeter, ein Kanalfader zur Einstellung des maximalen Audiopegels sowie ein Drehregler zur Einstellung der Links/Rechts-Balance des Audiokanals. Der rechts im Audiomixer befindliche Master-Kanalfader dient zur Einstellung der Verstärkung der Audiopegel an den SDI-Programmausgängen. Er hat seinen eigenen Audiopegelmeter. Die Monitorlautstärkeregler und -schaltflächen dienen zur Einstellung separater Audiopegel und erlauben das Prüfen einzelner Audioausgänge per Solo-Monitoring.

Über die unter dem jeweiligen Audiopegelmeter angeordnete Schaltfläche wird bestimmt, ob Audio beim Mischen ständig verfügbar ist oder nur dann, wenn die Quelle auf Sendung ist. Anhand der Solo- bzw. Kopfhörerschaltfläche wird vorgegeben, ob die Audioquelle für das Solo-Monitoring zu verwenden ist.

Der Audiomixer zeigt Tally-Rotlichter für alle aktuell on air befindlichen Audioquellen an und bei aktiviertem AFV zusätzlich Audiopegel, Lautstärke sowie Schaltflächen zur Auswahl des zu benutzenden Tons

Tally

Ist der Ton einer Quelle auf Sendung, zeigt die Software dies mit einem Tally-Rotlicht an. Da externer Ton standardmäßig auf Sendung ist, leuchtet das Tally-Licht EXT normalerweise rot. In den Beispielen auf dieser Seite sind Cam4 und Cam7 erleuchtet, weil das Audio dieser Quellen immer eingeschaltet ist. Wenn AFV aktiviert ist und die mit dem jeweiligen Kanal verknüpfte Kamera nicht auf Sendung ist, leuchtet das Tally-Licht mattgelb. Dasselbe gilt für das Tally-Licht des Master-Faders, wenn die AVF-Taste des Master-Faders aktiviert ist. Bei aktivierter FTB blinkt das Tally-Licht des Master-Kanalfaders rot.

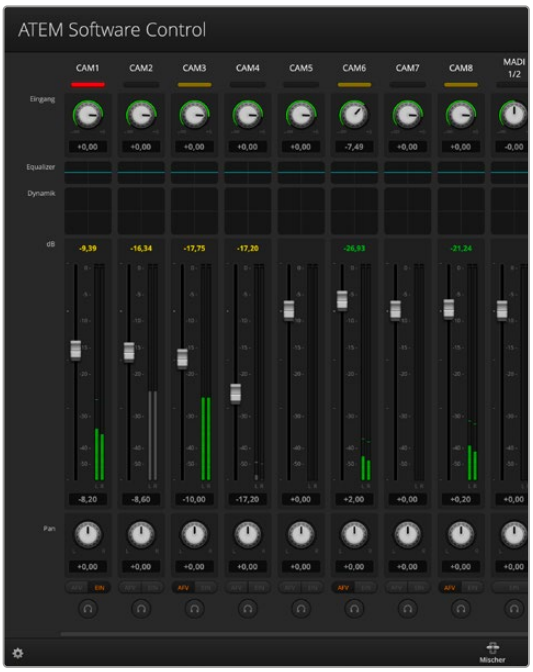
Audiopegel

Ziehen Sie den Audiopegel-Kanalfader in die gewünschte Richtung, um den Audiopegel für jede Kamera und die Audioquelle einzustellen. Die orangefarbene Zahl unter den einzelnen Audiopegelmetern gibt den mit dem Kanalfader eingestellten maximalen Audiopegel an.

Die Zahl über dem Audiopegelmeter gibt den von der Audioquelle erreichten maximalen Audiopegel an. Eine grüne Zahl steht für niedrige bis mittlere Audiopegel. Schlägt der Audiopegelmeter regelmäßig ins Rote aus und die über ihm angegebene Zahl bleibt unverändert rot, senken Sie zur Vermeidung von Tonverzerrungen den Audiopegel. Nach erfolgter Anpassung des Audiopegels ist es ratsam, die rote Zahl durch einmaliges Klicken zurückzusetzen. Beobachten Sie die neue Zahl einen Moment lang und vergewissern Sie sich, dass sie nicht sofort nach oben schießt und an einer roten Zahl stecken bleibt. Wenn das geschieht, ist der Audiopegel ggf. noch weiter zu reduzieren.

Audiobalance

Der Audiomixer unterstützt Stereo-Audio von allen Audioquellen. Die Links/Rechts-Audiokanalbalance einer Kamera oder anderen Audioquelle lässt sich durch Anpassen des Drehreglers in die gewünschte Balancestellung bringen.



Der ausgegraute Audiopegelmeter für Cam1 zeigt, dass der Ton dieser Kamera nicht eingesetzt wird, da weder die dazugehörige Schaltfläche EIN noch AFV aktiviert ist. Für Cam2 ist AFV vorgegeben. Der Ton dieser Kamera wird jedoch zurzeit nicht verwendet, da sie, wie an ihrem mattgelben Tally-Licht kenntlich, nicht auf Sendung ist. Für Cam4 und Cam7 ist direktes Mischen jeweils mit EIN aktiviert. Die Tally-Lichter dieser Kameras bleiben demnach selbst dann erleuchtet, wenn sich zurzeit eine andere Kamera auf Sendung befindet. Die Audiopegelmeter für Cam3, Cam5, Cam6 und Cam8 zeigen an, dass von diesen Kameras kein Audio ausgeht.

Auswahl von Audioquellen

Die EIN- und AFV-Schaltflächen unterhalb der einzelnen Audiopegelmeter dienen zur Auswahl der Audioquellen, die an den Programmausgang des Mischers zu legen sind.

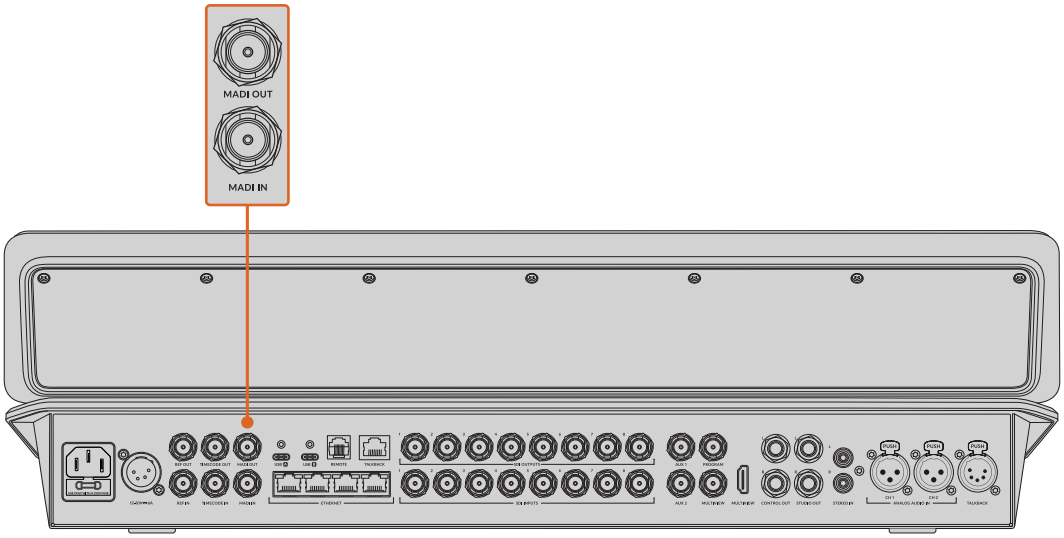
EIN	Die Auswahl von EIN aktiviert direktes Mischen und bewirkt, dass eingehende Audiosignale ständig in die Programmausgabe gemischt werden. Das gilt selbst dann, wenn die zugehörige Videoquelle nicht on air ist. Die rote Tally-Leuchte bleibt erleuchtet, da das Audio fortwährend auf Sendung ist. Durch Auswahl dieser Option wird Audio Follow Video (AFV) automatisch deaktiviert.
AFV	Audio Follow Video (AFV) ermöglicht das Ausblenden von Audio beim Wechsel von Eingaben. Das Audio wird nur zum Programmausgang geschickt, wenn der Eingang auf Sendung und das Tally-Rotlicht über ihm erleuchtet ist. Im Off-air-Zustand leuchtet das Tally-Licht mattgelb. Die Auswahl dieser Option bewirkt eine automatische Deaktivierung der Einstellung EIN für direktes Mischen.

Master-Audiopegelausgabe

Der rechts im Audiomixer befindliche Master-Kanalfader dient zur Einstellung der Verstärkung der Audiopegel an den SDI-Programmausgängen. Er hat seinen eigenen Audiopegelmeter. Wählen Sie die AFV-Schaltfläche der Master-Audiopegelausgabe aus, um die AFV-Blende-nach-Schwarz-Feature zu aktivieren. So blenden Sie Ihr Master-Audio per Klick auf die FTB-Schaltfläche aus.

Verwenden der MADI-Ports

Ihr ATEM Mischer unterstützt Digitalaudio per MADI-Protokoll, einer digitalen Schnittstelle zur mehrkanaligen Audioübertragung (Multichannel Audio Digital Interface). MADI ist vor allem bei professionellen Audioherstellern, Broadcastern und Highend-Tonstudios beliebt. Die MADI-Ports sind mit robusten BNC-Verbindern ausgestattet. Sie übertragen Audiodaten über 75-Ohm-Koaxialkabel von bis zu 100 Metern Länge.



BNC-Anschlüsse für MADI-Audio und 1/4-Zoll-TRS-Anschlüsse für eingehendes und ausgehendes Analogaudio

MADI In

Die MADI-Kanäle 1–32 empfangen Digitalaudio bei einer Tiefe von 24 Bit mit einer Abtastrate von 48 kHz. Sie sind mit weiteren 16 Stereokanälen im Audiomixer verbunden, die man mit gleichen EQ-Werten und gleicher Dynamik wie die Tonmixkanäle für die Videoeingabe in die Programmausgabe mischen kann. Diese zusätzlichen 16 Stereoeingaben bieten Ihnen die Möglichkeit, direkt im ATEM Mischer anspruchsvolle Tonmischungen zu erstellen.

MADI Out 1

MADI-Ausgang 1 übermittelt folgende Quellen:

Kanäle 1–16	Kanäle 1 und 2 der SDI-Eingänge 1–8
Kanäle 17/18	Audio von Media Player 1
Kanäle 19/20	Audio von Media Player 2
Kanäle 20/21	Externes Mikrofon
Kanäle 22/23	Externes XLR
Kanäle 23/24	Externes RCA
Kanäle 25/26	Programm-Mix
Kanäle 27/28	Monitor-Mix
Kanäle 29/30	Aux-Mix 1
Kanäle 31/32	Aux-Mix 2
Kanäle 33–48	Kanäle 3 und 4 der SDI-Eingänge 1–8
Kanäle 49–64	Nicht in Gebrauch

Kopfhörer-Einstellungen

Den Audiomixpegel für die Kopfhörerausgabe steuert man über die Kopfhörereinstellungen aus. Für die Kommunikation mit Kameraoperatoren können Sie über den 5-poligen XLR-Anschluss an der Rückseite ein Headset anschließen. Ein angeschlossenes Headset dient aber nicht allein für Talkback. Sie können über sein Mikrofon auch Off-Stimmen aufnehmen und über seinen Kopfhörer den Programmton prüfen.

In den Kopfhörereinstellungen können Sie die Lautstärke jeder Monitoring-Ausgabe einzeln anpassen. Bspw. falls Sie die Lautstärke für Talkback-Audio im Verhältnis zum Programmaudio erhöhen oder verringern möchten.

Master

Anhand des Masterpegel-Sliders können Sie die Lautstärke des Programmtons im Headset anpassen oder ihn ganz nach links ziehen, wenn Sie den Programmton nicht hören möchten.

Talkback

Mit dem Schieberegler für den Talkback-Pegel justieren Sie die Sprechlautstärke der Kameraoperatoren, mit denen Sie kommunizieren. Für Ihr Headset erzielen Sie die gewünschte Balance von Talkback und Programmton durch Justieren der Master- und Talkback-Schieberegler.

Mithörton

Mit dem Slider für die Mithörton-Lautstärke können Sie Ihre Stimme vom Headsetmikrofon in die Monitoring-Ausgabe mischen. Das ist praktisch, wenn Sie ein Headset mit Noise Cancelling einsetzen.

Erweiterte Steuerelemente für Fairlight

Die erweiterten Fairlight Audio-Steuerelemente von ATEM Television Studio Mischern dienen zum Gestalten und Verfeinern der Tonqualität an einzelnen Eingängen und am Master-Ausgang. Verfügbar sind bspw. Eingabepegel-Steuerelemente, ein parametrischer 6-Band-Equalizer und wirkungsvolle Dynamikeinstellungen. Dieser Abschnitt der Bedienungsanleitung stellt die verschiedenen Fairlight Audiosteuerelemente vor, mithilfe derer Sie den Tonmix Ihrer Live-Produktionen gestalten und verfeinern können.

Eingangspegel

Beim Einrichten eines Tonmixes beginnt man in der Regel damit, alle Eingaben zu normalisieren. Das bedeutet, dass man durch Justieren des Eingabepegel-Reglers an jedem Eingang alle Pegel unter Vermeidung von Übersteuerungen auf ihre höchste Amplitude einstellt.

Diese Regler befinden sich über den einzelnen Spuren unter dem Tally. Sie passen einen Pegel an, indem Sie auf den Regler klicken und diesen nach links ziehen, um den Pegel anzuheben bzw. nach rechts, um ihn zu senken. Durch Vorgabe der Eingangspegel werden alle Eingaben auf eine gemeinsame maximale Amplitude eingestellt, bei der es zu keinerlei Übersteuerungen kommt. Dann können Sie anfangen, gezieltere Änderungen und Verfeinerungen vorzunehmen.

Nachdem Sie Ihre Eingabepegel normalisiert haben, können Sie sich mithilfe des parametrischen 6-Band-Equalizers und der Dynamiksteuerelemente daran machen, die Attribute der einzelnen Audioeingaben zu gestalten und zu verfeinern.

Parametrischer 6-Band-Equalizer

Alle Eingänge und der Master-Ausgang verfügen über einen parametrischen 6-Band-Equalizer zum Steuern spezifischer Frequenzbereiche. So lässt sich damit bspw. niederfrequentes Rauschen oder unerwünschter Lärm in eingehendem Mikrofonton reduzieren. Es können mit dem EQ aber auch niedrige Frequenzen einer dünn klingenden Tonspur verstärkt oder einzelne Eingaben individualisiert werden, damit sie im finalen Mix besser herauszuhören sind. Das gibt Ihnen viele kreative Möglichkeiten.

Um den parametrischen Equalizer für einen Eingang oder den Master-Ausgang zu öffnen, klicken Sie auf den entsprechenden Equalizer-Indikator.

Klicken Sie auf den Equalizer-Indikator eines Eingangs, um das Fenster mit seinem parametrischen 6-Band-Equalizer zu öffnen

In der oberen Hälfte des Fensters erstreckt sich ein Graph mit von 1–6 nummerierten Indikatoren. Die nummerierten Indikatoren sind anpassbare Ziehpunkte für die Frequenzbänder 1–6.

Jedes Band des parametrischen 6-Band-Equalizers hat eine Spalte mit Einstellungen. Diese Einstellungen variieren je nach dem von Ihnen gesteuerten Band und den verwendeten Filtertypen.

Jeder Audioeingang hat seinen eigenen parametrischen Equalizer mit 6 Bändern

Um eine Einstellung zu modifizieren, müssen Sie das jeweilige Band zunächst aktivieren. Klicken Sie auf ein Band, um es zu aktivieren. Im aktivierten Zustand leuchtet die entsprechende Schaltflächen-Beschriftung blau. Nun können Sie die Einstellungen für dieses Band ändern. Oder klicken Sie für schnelle Anpassungen auf die Ziehpunkte und verschieben Sie sie.

TIPP Das Thema Bandfilter wird später in diesem Abschnitt ausführlicher behandelt.

Ziehpunkte

Der Ziehpunkt für jedes Frequenzband wird entlang der Kurvenlinie auf dem Graph angezeigt. Um die Frequenz für das jeweilige Band zu wählen oder den gewünschten Gain-Wert vorzugeben, klicken Sie auf seinen Ziehpunkt und verschieben Sie ihn. Durch Verschieben des Ziehpunkts mit Ihrer Maus werden Frequenz- und Gain-Einstellungen simultan modifiziert. Das bietet einen schnellen Weg für flinke, bandübergreifende Anpassungen im gesamten Frequenzbereich.

HINWEIS Um Änderungen mithilfe eines Ziehpunkts vorzunehmen, muss das Band aktiviert sein. Klicken Sie einfach auf das zu justierende Band. Die Beschriftung des aktivierten Bands leuchtet nun blau.

Beim Verschieben des Ziehpunkts nach links oder rechts werden aktualisieren sich nun die Frequenz- und Dezibelwerte in den Band-Einstellungen. Diese Auswirkungen spiegeln sich auch in den Frequenzbereich-Preset-Buttons „L“ (niedrig), „ML“ (mittelniedrig), „MH“ (mittelhoch) und „H“ (hoch) wider.

Frequenz-Regler

Die Frequenz-Regler bieten Ihnen eine Alternative zur Auswahl einer spezifischen Frequenz für ein einzelnes Frequenzband, um dieses zu modifizieren.

Frequenzbereich-Presets

Der Frequenzbereich für jedes Band wird anhand der Frequenzbereich-Presets vorgegeben. So ist bspw. unter „L“ für niedrige Frequenzen der Bereich von 30–395 Hz abgedeckt.

Als schnelles Testbeispiel, wie die Frequenzbereich-Presets die Frequenzspanne definieren, wählen Sie aus der Bandfilter-Liste die Option Notch-Filter aus. Klicken Sie dann auf das jeweilige Preset für die einzelnen Frequenzbereiche. Sie werden sehen, dass die Filtereffekte entsprechend Ihres ausgewählten Frequenzbereich-Presets entlang des Graphs positioniert werden. Auf diese Weise gibt man im Nu eine spezifische Frequenzspanne vor, auf die sich der Filter auswirken soll.

Die nachstehende Tabelle listet die Frequenzspannen der einzelnen Frequenzbereich-Presets auf.

Frequenzbereich-Preset	Frequenzbereich
Niedrig	30–395 Hz
Mittelniedrig	100 Hz–1,48 kHz
Mittelhoch	450 Hz–7,91 kHz
Hoch	1,4–21,7 kHz

Gain-Regler

Klicken Sie auf den Gain-Regler und ziehen Sie ihn nach links oder rechts, um den Lautstärkepegel für die ausgewählte Frequenz zu erhöhen oder zu senken.

Q-Faktor

Die Q-Faktor-Steuerung ist verfügbar, wenn der Bell-Filter auf die Bänder 2, 3, 4 und 5 angewendet wird. Dies gibt den Frequenzbereich vor, für den der Filter greift. Beispiel: Die Vorgabe des Mindestwerts lässt den Filter auf eine breite Spanne benachbarter Frequenzen zugreifen. Wird hingegen der Maximalwert vorgegeben, schmälert dies seinen Effekt auf eine winzige Spanne. Das ist wichtig, wenn benachbarte Frequenzen Tonattribute aufweisen, die Sie in Ihre vorzunehmende Änderung einbeziehen oder davon ausschließen möchten.

Achten Sie beim Justieren des Q-Faktors darauf, wie der Effekt den breiten, gerundeten Bogen der Kurve in eine Spitze umformt. Dies stellt visuell dar, welche in der Nähe der Zielfrequenz liegenden Frequenzbereiche betroffen sind.

TIPP Vergleichen Sie den modifizierten Ton mit seiner unveränderten Originalversion, indem Sie ganz oben im Equalizer-Fenster auf die Bypass-Schaltfläche klicken. So schalten Sie den Equalizer ein oder aus.

Band-Filter

Sie haben sechs verschiedene Typen von Band-Filtern zur Wahl: Es handelt sich dabei um Bell-, High-Shelf-, Low-Shelf- und Notch-Filter sowie Hochpass- und Tiefpassfilter. Mittels dieser Filter können Sie spezifische Zonen innerhalb des jeweiligen Frequenzbereichs regeln. Mit einem Low-Shelf-Filter können Sie bspw. den Lautstärkepegel in den niedrigen Frequenzen auf dem Graph dämpfen bzw. verstärken, wohingegen ein High-Shelf-Filter die höheren Frequenzen regelt.

Probieren Sie dies aus, indem Sie den Low-Shelf-Filter für Band 3 vorgeben und die Gain-Einstellung ändern. Wie Sie sehen werden, sind die Änderungen stärker auf die niedrigen Frequenzen auf dem Graph gewichtet.

Es folgen Beschreibungen für die einzelnen Filtertypen.

Bell

Dieser Filter mit Glockencharakteristik verstärkt oder dämpft eine Reihe von Frequenzen rund um den zu regelnden Frequenzbereich.

High-Shelf

Mit einem High-Shelf-Filter lässt sich der wahrgenommene Lautstärkepegel für höhere Frequenzen entlang des Graphen verstärken oder dämpfen.

Low-Shelf

Mit einem Low-Shelf-Filter lässt sich der wahrgenommene Lautstärkepegel für niedrigere Frequenzen entlang des Graphen verstärken oder dämpfen.

Notch

Dieser Filter dient dazu, eine definierte Frequenz zu entfernen bzw. zu eliminieren.

Hochpass

Mit einem Hochpassfilter lassen sich extrem niedrige Frequenzen glatt eliminieren, wobei hohe Frequenzen unbeeinträchtigt durchgelassen werden.

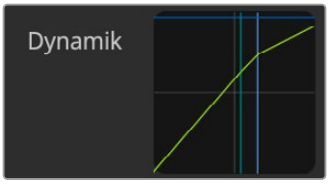
Tiefpass

Mit einem Tiefpassfilter lassen sich extrem hohe Frequenzen glatt eliminieren, wobei niedrige Frequenzen unbeeinträchtigt durchgelassen werden.

TIPP Es ist durchaus üblich, dass sich die Filterbereiche der einzelnen Bänder auf dem Graphen überlappen, da die Anpassungen zusammenwirken. So ist es bspw. möglich, dass Sie einen Low-Shelf-Filter auf Band 4 und einen Notch-Filter auf Band 5 anwenden, die beide eine Frequenz im gleichen Bereich reduzieren.

Dynamik-Steuerelemente

Neben dem parametrischen 6-Band-Equalizer verfügen Sie für den Feinschliff des Eingabe- und Master-Ausgabetons über Dynamik-Steuerelemente. Anhand des Equalizers regeln Sie die in einem Signal enthaltenen Frequenzen. Deren Verhalten geben Sie mit den Dynamik-Steuerelementen vor. Die Pegelstärke im Signal lässt sich modifizieren, bspw. indem Sie den Kontrastbereich zwischen hohen und niedrigen Pegeln erweitern. Oder per Gating eines Eingangs, um so vorzugeben, was im Signal abzuschwächen oder zu verstärken ist. Alternativ setzt man den Kompressor und den Limiter ein, um den Tonpegel insgesamt anzuheben und zu verstärken, ohne ihn zu übersteuern.



Auf die Dynamik-Steuerelemente für einzelne Eingänge und den Master-Ausgang greifen Sie per Klick auf den entsprechenden Dynamik-Indikator zu

Zusammen mit den Equalizer-Steuerelementen ermöglichen Ihnen diese wirkungsvollen Funktionen, den Ton präzise zu gestalten und zu definieren, um den Sound der Master-Ausgabe insgesamt zu optimieren.

Dieser Abschnitt beschreibt die Elemente Expander, Gate, Kompressor und Limiter.

Gebräuchliche Dynamik-Einstellungen

Für Expander/Gate, Kompressor und Limiter gibt es gängige Einstellungen, anhand derer Sie vorgeben, wie sich die einzelnen Funktionen auf den Ton auswirken. Bspw. den Pegelwert, ab dem die Funktion greift, wie lange sie wirkt, wie stark sie greift usw. Die verfügbaren Einstellungen richten sich nach den von Ihnen verwendeten Dynamik-Bedienelementen.

Schwellwert	Definiert den Lautstärkepegel, an dem die Funktion ausgelöst wird. Wenn Sie bspw. für den Kompressor einen Schwellwert von -20 dB vorgegeben haben, aktiviert Ihr Mischer die Komprimierung, sobald das Signal über -20 dB ausschlägt. Alternativ würde der Expander mit einer Einstellung von -40 dB erst dann vom Mischer ausgelöst werden, wenn der Signalpegel unter -40 dB sinkt.
Bereich	Diese Einstellung definiert die von der Funktion betroffene Dezibel-Wertspanne.
Ratio	Definiert die maximale Wirkung der einmal ausgelösten Funktion.
Attack	Gibt die Stetigkeit der Einschwingzeit bei ihrer Auslösung vor. Mit einer längeren Einschwingzeit dauert es bspw. länger, bis sich die Funktion auf das Signal auswirkt und sorgt für unauffälligere Einblendungen. Kürzere Einschwingzeiten eignen sich ggf. besser, wenn es um komplexe Vorgänge mit schnellen Variationen geht, bei denen eine längere Einschwingzeit zu Artefakten führen kann.
Hold	Hält die Dynamik-Funktion über einen definierbaren Zeitraum aufrecht.
Release	Das Gegenstück zur Einschwingzeit, da die Ausschwingzeit am Ende der Wirkungsdauer einer Funktion greift. Lässt zum Beispiel die jeweilige Dynamik-Funktion je nach Vorgabe allmählich oder abrupt auslaufen, sobald der Pegel sich aus dem Schwellwertbereich herausbewegt.

Expander/Gate

Der erste Satz an Dynamikparametern gibt die Wahl zwischen Dynamikvergrößerung und der Extremeinstellung über ein Gate (Tor), dem sogenannten Gating.

Die Dynamikvergrößerung betont Pegeldifferenzen, indem die Pegel der leiseren Teile des Signals im Verhältnis zu den lauteren gesenkt werden. Mithilfe eines Expanders lassen sich die Differenzen zwischen den leisen und lauten Teilen einer Spur betonen. Alternativ minimiert man damit durch Anheben des Dynamikumfangs eines Signals unerwünschte Störgeräusche.

Ein Gate funktioniert wie ein extrem eingestellter Expander, der die Pegelstärke absenkt oder sogar diejenigen Teile eines Signals stummschaltet, die in einen bestimmten Bereich fallen. Dies reduziert oder eliminiert Störgeräusche in den leisen Abschnitten einer Aufzeichnung. Mit einem Bereichswert zwischen 15 und 20 dB lassen sich bspw. die Atemgeräusche in einer Gesangsspur auf ein natürlich klingendes Niveau abschwächen.

Gating ist extrem wirksam und da es ausgesprochen tief greift, erfordert es besondere Aufmerksamkeit. Ein zu hoch angesetzter Schwellwert für ein Gate kann zu Artefakten führen, bspw. dem Abschneiden eines Silbenbeginns oder einem leisen Wortende. Kompensieren lässt sich dies durch leichtes Reduzieren des Schwellwerts oder durch Heraufsetzen der Ansprech- oder Abklingdauer („Attack“ und „Release“).

Kompressor

Mit Dynamikkompression können Sie die Spitzen eines Audiosignals abflachen und den Dynamikumfang des Signals einengen, um dann die generelle Pegelstärke ohne Übersteuerungen anzuheben. So kann man sicherstellen, dass die lauten Elemente eines Signals die leiseren Töne nicht übertönen. Alternativ glättet man so Schwankungen der im Signal vertretenen Audiopegel.

TIPP Es empfiehlt sich, den Kompressor erst nach erfolgter Vorgabe der EQ-Steuerwerte anzuwenden.

Make Up

Der auch als Ausgangspegel bezeichnete Parameter „Make Up“ gestattet es, das gesamte Signal zusammen mit den Kompressionseinstellungen anzuheben. Nachdem die lauten Tonbereiche durch die angewendete Kompression reduziert wurden, können Sie nun mit der Make-Up-Steuerung den Sound insgesamt hochziehen, ohne ihn zu übersteuern.

Limiter

Der Limiter verhindert das Ausschlagen von Signalspitzen über den vorgegebenen Höchstpegel. Mit einem solchen Begrenzer verhindert man starke Übersteuerungen. Bei einer Einstellung des Limiters auf -8 dB geht das Eingangssignal bspw. nie über diesen Wert hinaus. Durch Anpassen der Ansprech- und Abklingeinstellungen Attack, Hold und Release wird bestimmt, wie schonend der Limiter das Signal beeinflusst.

Charakteristiken der Dynamik-Steuerelemente

Steuerung	Minimum	Standard	Maximum
Expander/Gate			
Expander-Steuerung*			
Schwellwert	-50 dB	-45 dB**	0 dB
Bereich	0 dB	18 dB	60 dB
Ratio	1.0:1	1.1:1	10:1
Attack	0,5 ms	1,4 ms	30 ms
Hold	0,0 ms	0,0 ms	4 s
Release	50 ms	93 ms	4 s
Gate-Steuerung*			
Schwellwert	-50 dB	-45 dB**	0 dB
Bereich	0 dB	18 dB	60 dB
Attack	0,5 ms	1,4 ms	30 ms
Hold	0,0 ms	0,0 ms	4 s
Release	50 ms	93 ms	4 s
Kompressor			
Kompressor-Steuerung			
Schwellwert	-50 dB	-35 dB	0 dB
Ratio	1.0:1	2.0:1	10:1
Attack	0,7 ms	1,4 ms	30 ms
Hold	0,0 ms	0,0 ms	4 s
Release	50 ms	93 ms	4 s
Limiter			
Limiter-Steuerung			
Schwellwert	-50 dB	-12 dB	0 dB
Attack	0,7 ms	0,7 ms	30 ms
Hold	0,0 ms	0,0 ms	4 s
Release	50 ms	93 ms	4 s

* Die Expander-/Gate-Steuerelemente bleiben für die Master-Dynamik unbenutzt.

** Der standardmäßige Expander-/Gate-Schwellwert für die Master-Dynamik beträgt -35 dB. Für Mikrofon-Dynamik und XLR-Dynamik beträgt der standardmäßige Expander-/Gate-Schwellwert -45 dB.

Arbeiten mit der Kamerasteuerung

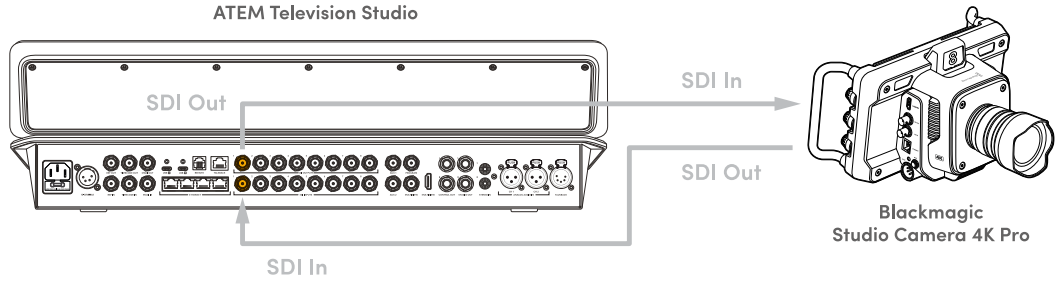
In ATEM Software Control öffnet ein Klick auf die „Kamera“-Registerkarte den Arbeitsraum für die Kamerasteuerung. Von dort können Sie verschiedene Blackmagic Kameras, wie die Blackmagic Studio Camera 6K Pro und die URSA Broadcast G2, über Ihren ATEM Mischer steuern. Einstellungen wie Blende, Gain und Fokus sowie die Schärfe- und Zoom-Steuerung lassen sich bei Einsatz kompatibler Objektive bequem justieren. Sie können auch den Farbabgleich mehrerer Kameras vornehmen und mit dem DaVinci Resolve Primary Color Corrector einzigartige Looks kreieren.

Die ATEM Kamerasteuerung funktioniert durch Übermittlung von Datenpaketen über alle nicht abwärtskonvertierten SDI-Ausgänge Ihres ATEM Mischers. Sie können also einen SDI-Ausgang Ihres Mischers an den SDI-Eingang für den Return-Feed Ihrer Kamera anschließen. Die Kamera erkennt die Steuerungspakete über die SDI-Verbindung und ermöglicht Ihnen, kamerainterne Funktionen zu steuern.

ATEM Kamerasteuerung

Anschließen von Kameras:

1. Verbinden Sie den „SDI Out“-Ausgang Ihrer Blackmagic Kamera mit einem beliebigen „SDI In“-Eingang Ihres ATEM Mischers.
2. Verbinden Sie einen beliebigen SDI-Ausgang Ihres ATEM Mischers – mit Ausnahme von Multiview-Ausgängen – mit dem Programm-SDI-Eingang Ihrer Kamera. Die Multiview-Ausgänge übermitteln keine Kamerasteuerungssignale.
3. Passen Sie in den Einstellungen Ihrer Kamera die ID-Nummer an Ihren Mischereingang an. Wenn Studiokamera 1 an den ATEM Mischereingang „Input 1“ angeschlossen ist, muss auch die Kameranummer in den Einstellungen Ihrer Kamera auf 1 eingestellt sein. So wird das Tally-Signal an die richtige Kamera übermittelt.



„Kamera“-Arbeitsraum

Starten Sie ATEM Software Control und klicken Sie am unteren Rand der Benutzeroberfläche auf die Registerkarte mit dem Kamerasymbol. Nun wird Ihnen eine Zeile mit Kamerabedienfeldern angezeigt, die Tools zum Anpassen und Verfeinern des Bildes der einzelnen Kameras enthalten. Die Bedienfelder sind einfach anzuwenden. Klicken Sie mit Ihrer Maus die Symbole an oder nehmen Sie Anpassungen per Klicken und Ziehen vor.

Auswahl der zu steuernden Kameras

Über die Schaltflächenzeile im oberen Bereich des „Kamera“-Arbeitsraums wählt man die zu steuernde Kamera anhand ihrer Nummer aus. Wenn im Arbeitsraum Bedienfelder für mehrere Kameras angezeigt werden oder das Farbkorrekturfenster geöffnet ist, können Sie über diese Schaltflächen die jeweils zu steuernde Kamera auswählen. Wenn Sie einen Ausgang zur Kontrolle Ihrer Kamerasteuerung belegt haben, drücken Sie diese Schaltflächen, um die zu steuernde Kamera zu wechseln. Dann wird die Videoausgabe dieser Kamera an den in den Mischereinstellungen vorgegebenen Ausgang gesendet.

Kanalstatus

In der Kanalstatus-Box am oberen Rand der einzelnen Kamerabedienfelder werden Kamerakennung, On-air-Status und die Sperrschaltfläche angezeigt. Ein Klick auf die Sperrschaltfläche sperrt alle Bedienelemente für eine bestimmte Kamera. Ist die Kamera auf Sendung, leuchtet der Kanalstatus rot und es erscheint die On-air-Warnung.

Kamera-Einstellungen

Die unten links neben dem Masterrad befindliche Schaltfläche für Kamera-Einstellungen dient zum Einschalten der Farbbalken-Funktion für die Blackmagic Studio Camera, URSA Mini und URSA Broadcast, sowie zum Justieren der Detailschärfe für das Bildsignal einzelner Kameras.

Die Kanalstatus-Box in jedem Kamerabedienfeld zeigt an, welche Kamera sich auf Sendung befindet. Justieren Sie anhand der Farbräder die Einstellungen von Lift, Gamma und Gain einzelner YRGB-Kanäle

Farbbalken anzeigen/verbergen

Blackmagic Kameras verfügen über eine integrierte Farbbalken-Einstellung, die sich durch Aktivieren der entsprechenden Modi anzeigen bzw. verbergen lässt. Eine sehr praktische Feature, anhand derer Sie beim Aufbau für Ihre Liveproduktion einzelne Kameras visuell identizifieren können. Farbbalken stellen auch Testtöne bereit, was Sie die Tonpegel der einzelnen Kameras bequem prüfen lässt.

Schärfe

Diese Einstellung dient zur Liveschärfung des Bilds direkt von Ihren Kameras. Reduzieren oder erhöhen Sie das Schärfungsniveau mithilfe folgender Optionen: „Schärfe aus“, „Standardschärfe“ für geringfügige Scharfzeichnung, „Mittlere Schärfe“ oder „Hohe Schärfe“.

Farbrad

Das Farbrad ist eine leistungsstarke Funktion des DaVinci Resolve Farbkorrektors, um farbliche Anpassungen an den Einstellungen für „Lift“, „Gamma“ und „Gain“ einzelner YRGB-Kanäle vorzunehmen. Sie können die anzupassende Einstellung per Klick auf eine der drei über dem Farbrad befindlichen Schaltflächen auswählen.

Masterrad

Passen Sie mithilfe des nachstehenden Farbrads die Kontraste aller YRGB-Kanäle auf einmal an oder justieren Sie jeweils nur die Leuchtdichte der Einstellungen für Lift, Gamma und Gain.

Reset-Symbole

Jedes Kamerabedienfeld verfügt rechts unten über ein Reset-Symbol. Über diese Schaltfläche bestimmen Sie, welche Farbkorrektureinstellungen zurückgesetzt, kopiert oder eingefügt werden sollen. Jedes Farbrad verfügt über seine eigene Reset-Schaltfläche. Klicken Sie sie an, um eine

Einstellung auf ihren Standardwert zurückzusetzen oder um sie zu kopieren bzw. einzufügen. Gesperrte Steuerelemente bleiben von der Einfügefunktion unberührt.

Mit dem Master-Resetsymbol unten rechts im Farbkorrekturfenster setzt man die Farbräder für Lift, Gamma und Gain sowie die Einstellungen für Kontrast, Sättigung, Farbton und Lum-Mix zurück. Farbkorrektureinstellungen können in einzelne Kamerabedienfelder oder für einen einheitlichen Look in alle kopiert werden. Die Einstellungen für Blende, Fokus, Grob und Schwarzabhebung bleiben von der Einfügefunktion unberührt. Bei Anwendung von „In alle einfügen“ fordert Sie ein Warnhinweis auf, den Vorgang zu bestätigen. Dies verhindert das versehentliche Einfügen neuer Einstellungen für auf Sendung befindliche Kameras.

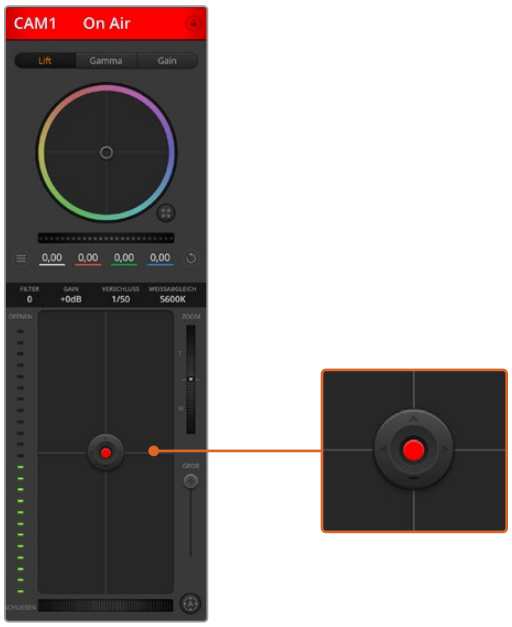
Bei Anwendung von „In alle einfügen“ fordert Sie ein Warnhinweis auf, den Vorgang zu bestätigen. Dies verhindert das versehentliche Einfügen neuer Einstellungen für auf Sendung befindliche Kameras

Steuerung der Blende/Schwarzabhebung

Blende und Schwarzabhebung werden über den kreisförmigen Button im Fadenkreuz der einzelnen Kamerabedienfelder gesteuert. Dieser Button leuchtet rot, wenn die Kamera auf Sendung ist.

Ziehen Sie den Button zum Öffnen oder Schließen der Blende nach oben oder unten. Bei gedrückter Shift-Taste ist nur der Blendenwert anpassbar.

Ziehen Sie den Button nach links oder rechts, um den Wert für die Schwarzabhebung zu reduzieren oder zu erhöhen. Bei gedrückter Command-Taste (Mac) bzw. gedrückter Strg-Taste (Windows) lässt sich die Schwarzabhebung separat justieren.



Der Button für die Blende/Schwarzabhebung leuchtet rot, wenn die jeweilige Kamera auf Sendung ist

Zoom-Steuerung

Bei Einsatz kompatibler Objektive mit elektronischer Zoomfunktion können Sie Ihr Objektiv mithilfe der Zoom-Steuerung ein- und auszoomen. Das Steuerelement funktioniert ähnlich wie eine Zoomwippe an einem Objektiv, wenn an einem Ende ein Tele- und am anderen ein Weitwinkelobjektiv angebracht ist. Klicken Sie auf die ZOOM-Steuerung über dem GROB-Schieberegler und ziehen Sie sie zum Einzoomen nach oben bzw. zum Auszoomen nach unten.

Grob-Einstellung

Mit dem Grob-Schieberegler rechts neben dem Blenden-/Schwarzabhebungs-Button lassen sich die zulässigen Blendenwerte begrenzen. Diese Funktion hilft zu verhindern, dass überbelichtete Bilder auf Sendung gehen.

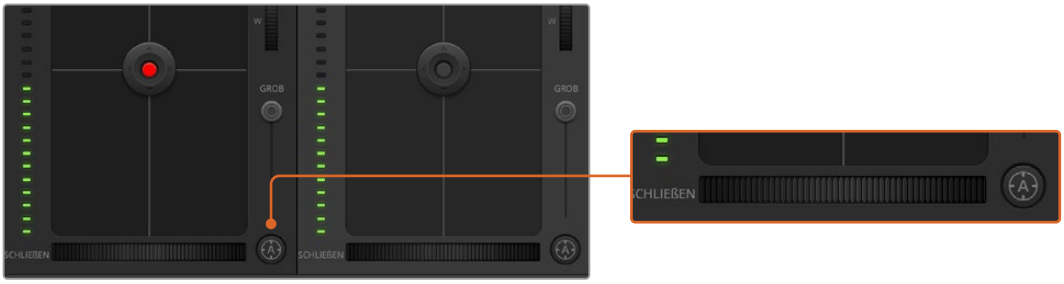
Öffnen Sie zum Einstellen des Grob-Grenzwertes die Blende mithilfe der Blendensteuerung so weit es geht. Ziehen Sie dann den GROB-Regler nach oben oder unten, um den optimalen Blendenwert einzustellen. Jetzt verhindert der Grob-Grenzwert beim Einstellen der Blende, dass Ihr optimaler Blendenwert überschritten wird.

Blenden-Indikator

Der Blenden-Indikator links neben dem Blenden-/Schwarzabhebungs-Button stellt visuell dar, wie weit die Blende geöffnet oder geschlossen ist. Der Blenden-Indikator wird durch die Grob-Einstellung beeinflusst.

Autofokus-Button

In jedem Kamerabedienfeld befindet sich rechts unten ein Autofokus-Button. Klicken Sie auf diesen, um bei Einsatz eines Objektivs mit elektronischer Blendensteuerung automatisch zu fokussieren. Wichtig: Die meisten Objektive unterstützen elektronische Fokussierung. Stellen Sie jedoch bei Objektiven, die sowohl automatisch als auch manuell fokussierbar sind, den Autofokusmodus ein. Bei manchen Objektiven erfolgt dies durch Vorwärts- oder Rückwärtsschieben des Fokussierrings.



Klicken Sie zur Scharfstellung eines kompatiblen Objektivs auf den Autofokus-Button oder ziehen Sie den Fokussier-Regler nach rechts oder links

Manuelle Fokussierung

Mithilfe des unten in jedem Kamerabedienfeld befindlichen Fokussierrings können Sie Ihre Kamera manuell scharfstellen. Ziehen Sie den Fokussierring nach links oder rechts, um die Schärfe manuell einzustellen. Prüfen Sie dabei anhand des Videofeeds von der Kamera, ob Ihr Bild gewünscht scharf ist.

Kameraeinstellung Gain

Über die Kameraeinstellung „Gain“ können Sie die von der Kamera wiedergegebenen hellen Bereiche zusätzlich verstärken. Wichtig ist dies beim Filmen in Niedriglichtsituationen, um den Sensor mit zusätzlicher Verstärkung (Gain) lichtempfindlicher zu machen. Dies verhindert eine Unterbelichtung Ihrer Aufnahmen. Sie können Gain abschwächen oder verstärken, indem Sie den Pfeil links oder rechts neben der dB-Anzeige anklicken.

Bei Bedarf können Sie den Gain-Wert verstärken. Beispielsweise bei Außendrehs, wenn Sie Ihr Bild im schwächer werdenden Licht eines Sonnenuntergangs aufhellen möchten. Zu beachten ist hierbei, dass mehr Gain auch stärkeres Bildrauschen bewirkt.

Verschlusszeit-Steuerung

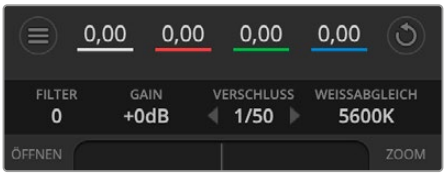
Die Verschlusszeit-Steuerung ist zwischen dem Farbrad und der Blenden-/Schwarzabhebungs-Steuerung platziert. Reduzieren oder erhöhen Sie die Verschlusszeit, indem Sie Ihren Mauszeiger über die Verschlusszeit-Anzeige schieben und den Links- oder Rechtspfeil anklicken.

Eventuelles Lichtflimmern lässt sich durch Senken der Verschlusszeit beseitigen. Durch eine niedrigere Verschlusszeit lassen sich Ihre Bilder ohne die Gain-Einstellung aufhellen, da der Bildsensor länger dem Licht ausgesetzt wird. Eine höhere Verschlusszeit reduziert auch

Bewegungsunschärfe und bietet sich daher für gestochen scharfe Action-Shots mit minimaler bewegungsbedingter Unschärfe an.

Weißabgleich

Die Weißabgleicheinstellung neben der Verschlusszeitanzeige lässt sich durch Anklicken der Links- und Rechtspfeile an beiden Seiten der Farbtemperaturanzeige anpassen. Verschiedene Lichtquellen geben warmes oder kaltes Licht aus, was Sie anhand des Weißabgleichs kompensieren können. Dies gewährleistet, dass weiße Bereiche in Ihrem Bild weiß bleiben.



Schieben Sie Ihren Mauszeiger über die Anzeigen für Filter, Gain, Verschlusszeit oder Weißabgleich. Dies ruft zu beiden Seiten dieser Einstellungen Pfeile auf, mit denen Sie sie justieren können

DaVinci Resolve Primary Color Corrector

Wer mit Farbkorrektur vertraut ist, kann statt der für Mischer gebräuchlichen CCU-Benutzeroberfläche der Kamerasteuerung für eine Benutzeroberfläche optieren, die dem Tool für die primäre Farbkorrektur eines Postproduktions-Gradingsystems gleicht.

Für die primäre Farbkorrektur sind Blackmagic Kameras mit dem integrierten DaVinci Resolve Primary Color Corrector ausgestattet. Wer bereits mit DaVinci Resolve gearbeitet hat, kann seine Erfahrungen bei Liveproduktionen für kreatives Colorgrading in einer Blackmagic Kamera einsetzen, da dies genauso funktioniert. Das Farbkorrekturfenster lässt sich von jedem Kamerabedienfeld aus ausklappen und bietet eine erweiterte Farbkorrektursteuerung mit zusätzlichen Einstellungen und einer Bedienoberfläche mit allen Tools für die primäre Farbkorrektur.

Klicken Sie auf das DaVinci Resolve Primary Color Corrector Symbol, um das Farbkorrekturfenster zu erweitern und Einstellungen anzupassen

Zur Verfügung stehen Ihnen hier Farbräder und Einstellungen wie Sättigung, und die Einstellungen für Schatten, Mitteltöne und Lichter sind alle gleichzeitig sichtbar. Wechseln Sie einfach über die Schaltflächen am oberen Fensterrand zwischen den Kameras hin und her.

Die Farbräder für Lichter, Mitten und Schatten im Farbkorrekturfenster

Farbräder

Führen Sie an beliebiger Stelle im Farbrad einen Klick und eine Ziehbewegung aus:
Achten Sie darauf, dass die Farbbalance-Anzeige selbst nicht bewegt werden muss. Die unter der Farbbalance-Anzeige gelegenen RGB-Parameter verschieben sich analog zur Farbbalance-Justierung und reflektieren so an einzelnen Kanälen vorgenommene Anpassungen.

Führen Sie mittels Shift-Klick eine Ziehbewegung im Farbrad aus:
Versetzt die Farbbalance-Anzeige auf die absolute Position des Mauszeigers und gestattet schnellere, und extremere Anpassungen.

Führen Sie im Farbrad einen Doppelklick aus:
Setzt die Farbanpassung zurück, ohne die Anpassung des Masterrads für dieses Steuerelement zu berühren.

Klicken Sie in einem Farbrad auf das Reset-Symbol oben rechts:
Setzt die Farbbalance zusammen mit dem ihr zugehörigen Masterrad zurück.

Masterräder

Benutzen Sie die unter den Farbrädern befindlichen Masterräder, um Lift, Gamma und Gain für jeden YRGB-Kanal individuell anzupassen.

Durch Drehen nach links wird der ausgewählte Parameter des Bilds verdunkelt, durch Drehen nach rechts wird er erhellt. Wenn Sie eine Anpassung vornehmen, ändern sich dabei die darunter liegenden YRGB-Parameter und reflektieren Ihre soeben vorgenommene Anpassung. Führen Sie bei gedrückt gehaltener ALT- bzw. Command-Taste eine Drehbewegung nach links oder rechts aus, um nur den Y-Wert anzupassen. Da der Farbkorrektor sich der YRGB-Verarbeitung bedient, können Sie Ihre Kreativität ausleben und einzigartige Optiken allein durch Anpassung des Y-Kanals erzielen. Am besten lassen sich Anpassungen am Y-Kanal vornehmen, wenn die „Lum Mix“-Einstellung für YRGB-Verarbeitung nach rechts gesetzt ist. Für reguläre RGB-Verarbeitung hingegen setzt man sie nach links. Normalerweise arbeiten die meisten DaVinci Resolve Coloristen mit dem YRGB-Farbkorrektor, da dieser mehr Möglichkeiten zur Steuerung der Farbbalance bietet, ohne dabei die hellen Bereiche (Gain) insgesamt zu beeinflussen.

Kontrast-Einstellung

Unter „Kontrast“ stellen Sie die Spanne zwischen den dunkelsten und hellsten Tonwerten in einem Bild ein. Steigern oder verringern Sie die Verschlusszeit, indem Sie den Regler nach rechts oder links drehen. Die Standardeinstellung beträgt 50 %.

Pivot-Einstellung

Nach erfolgter Anpassung der Kontrasteinstellung justiert man anhand des Pivot-Werts den Mittelwert des Kontrasts. Der Pivot-Regler balanciert den Kontrast aus, indem entweder der einen oder der anderen Seite der Luminanzskala Priorität gegeben wird. Durch Anheben des Werts steigern Sie die gesamte Helligkeit und Klarheit des Bilds. Dies erfolgt auf Kosten der Schatten, die damit reduziert werden.

Sättigungseinstellung

Unter „Sättigung“ lässt sich der Farbanteil im Bild erhöhen oder verringern. Die Standardeinstellung beträgt 50 %.

Lum-Mix-Einstellung

Blackmagic Kameras sind mit einem integrierten DaVinci Resolve Tool für die primäre Farbkorrektur ausgestattet. DaVinci baut seit Anfang der 1980er Jahre Farbkorrektursysteme und es werden mehr Hollywood-Spielfilme mit DaVinci Resolve gegradet als mit jeder anderen Applikation.

Demnach verfügen Sie mit dem integrierten Farbkorrektor Ihrer Kamera über allerlei einzigartige Features für mehr kreativen Spielraum. Eine davon ist die YRGB-Verarbeitung.

Für das Colorgrading können Sie wahlweise RGB-Verarbeitung oder YRGB-Verarbeitung einsetzen. High-End-Coloristen favorisieren die YRGB-Verarbeitung, da diese mehr Kontrolle über die Farbe gewährt, die Anpassung separater Kanäle ermöglicht und mehr kreative Möglichkeiten bietet.

Ist der Lum-Mix-Regler nach rechts gezogen, bedeutet das eine 100-prozentige Ausgabe des YRGB-Korrektors. Ist der Lum-Mix-Regler nach links gezogen, bedeutet das eine 100-prozentige Ausgabe des RGB-Korrektors. Der Lum-Mix-Regler kann beliebig weit nach rechts oder links gezogen werden, um eine im entsprechenden Verhältnis gemischte Ausgabe der RGB- und YRGB-Korrektoren zu bewirken.

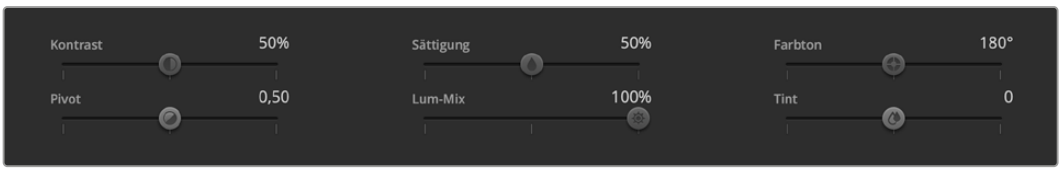
Welche Einstellung ist die richtige? Das ist bei diesem rein kreativen Vorgang allein Ihre Entscheidung. Es gibt kein richtig und falsch, denn es zählt nur, was Ihnen am besten gefällt!

Farbtoneinstellung

Mit „Farbton“ lassen sich alle Farbtöne in einem Bild um den gesamten Umfang des Farbrads drehen. Die Standardeinstellung von 180 Grad zeigt die ursprüngliche Farbtonverteilung an. Erhöhen bzw. Reduzieren dieses Werts bewirkt, dass alle Farbtöne gemäß der auf dem Farbrad sichtbaren Farbtonverteilung gedreht werden.

Tint-Einstellung

Durch Anpassen der Tönung wird dem Bild Grün oder Magenta hinzugefügt, um die Farben auszugleichen. Dies ist hilfreich beim Filmen in künstlichem Licht wie Leuchtstoffröhren und Natriumdampflampen.



Kontrast, Sättigung, Farbton und Lum-Mix lassen sich durch Ziehen des Schiebereglers justieren

Einstellungen synchronisieren

Bei Anschluss einer Kamera werden die Signale zur Steuerung der Kamera vom Mischer an die Blackmagic Kamera übermittelt. Wird an der Kamera selbst versehentlich eine Einstellung geändert, setzt die Kamerasteuerung diese Einstellung automatisch zurück, damit die Synchronisation mit dem Mischer erhalten bleibt.

Betrieb Ihres ATEM Mischers

Interne Videoquellen

Zusätzlich zu den SDI-Eingängen verfügt der Mischer über acht interne Quellen, die für eine Produktion verwendbar sind. Auf dem Software-Bedienpanel werden die Namen von internen Quellen sowohl in Lang- als auch Kurzversion dargestellt. Auf dem ATEM Mischer stellen lange Namenskürzel die jeweiligen internen Quellen dar. Die Labels veranschaulichen, um welche Quellen es sich handelt.

Schwarz

Intern generiertes Schwarz steht als Quelle zur Verfügung und lässt sich in der Produktion als schwarze Farbfläche einsetzen.

Farbbalken

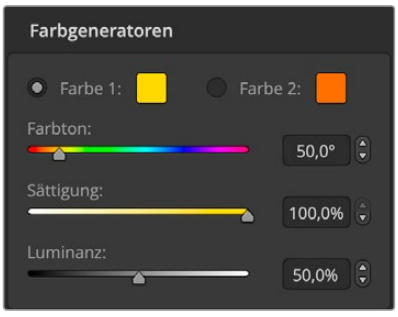
Als Quelle verfügbare, intern generierte Farbbalken. Anhand der Farbbalken lassen sich über den Mischer ausgegebene Videosignale überprüfen. Praktisch sind Farbbalken auch zum Programmieren von Chroma-Keys mit einem Vektorskop-Monitor.

Farbgeneratoren

ATEM Mischer verfügen über zwei benutzerdefinierbare Farbquellen, mit denen sich beliebige Farbflächen zum Gebrauch in einer Produktion erstellen lassen. Mit Farbquellen lassen sich Wischblenden mit farbigen Umrandungen versehen oder die bei Dip-Übergängen zu durchlaufenden Farben erstellen, wie z. B. bei einem Übergang durch blitzschnell eingeblendetes Weiß.

Gehen Sie zur Anpassung einer Farbquelle auf dem Software-Bedienpanel auf die Menüpalette „Farbe“ und klicken Sie auf das farbige Kästchen. Dies ruft den Color Picker auf, wo Sie eine Farbauswahl treffen können. Wählen Sie auf dem ATEM Mischer in der Systemsteuerung die Option „Farbe“. Passen Sie dann „Farbton“, „Sättigung“ und „Luminanz“ an.

Wichtig: Die tiefsten Farben sind auf 50 % Luminanz eingestellt.



ATEM Mischer verfügen über zwei benutzerdefinierbare Farbquellen, mit denen sich beliebige Farbflächen zum Gebrauch in einer Produktion erstellen lassen

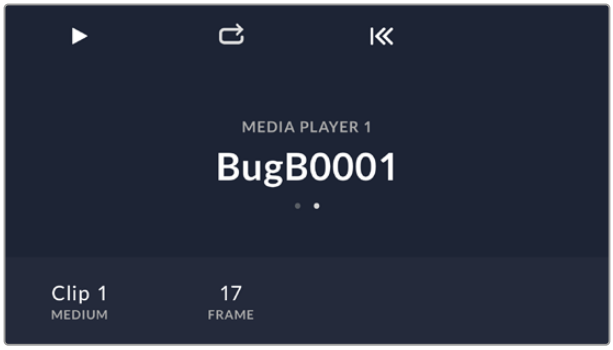
Media Player

Jede Quelle verfügt über einen Füll-und-Key-Ausgang (z. B. Cut). Die Füllquellen der Media Player werden als Media Player 1 oder 2 bezeichnet. Media Player Key-Quellen werden als Media Player 1 Key, Media Player 2 Key usw. bezeichnet

Die Media Player Quellen dienen zum Abspielen von Standbildern und Clips aus dem Media Pool. Die Füllquellen zeigen die Farbkanäle des ausgewählten Clips oder Standbilds an. Die Key-Schnittquellen hingegen zeigen den schwarzen und weißen Alphakanal des ausgewählten Standbilds oder Clips an. Media Player können in vielen Bereichen der Produktion eingesetzt werden.

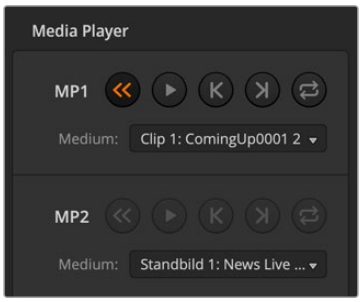
So steuern Sie die Media Player von ATEM Television Studio Mischern:

1. Navigieren Sie mithilfe der Menütasten im Steuerblock „System Control“ zum Media Player Menü, indem Sie auf die „Media Player“-Taste drücken.
2. Wählen Sie den zu steuernden Media Player mit den Multifunktionstasten über dem LCD.
3. Benutzen Sie den Drehregler, um einen Clip oder ein Standbild im Media Pool zu wählen.
4. Wenn Sie einen bewegten Clip gewählt haben, drücken Sie auf die Rechtspfeiltaste. Dies aktiviert die Transportelemente Wiedergabe/Stopp, Loop, Zurück und Frame für den Clip.



So steuern Sie die Media Player über das Software-Bedienpanel

1. Wählen Sie im „Mischer“-Arbeitsraum die Menüpalette „Media Player“ aus.
2. Selektieren Sie in der Dropdown-Liste „Medium“ einen Clip oder ein Standbild aus dem Media Pool.
3. Nach erfolgter Auswahl eines bewegten Clips werden die folgenden Steueroptionen für den Transport des Clips freigegeben: Start, Zurückspulen, Abspielen/Pause, Vorwärtsspulen und Schleife. Wählen Sie zum Abspielen eines Clips in einer Schleife die Loop-Schaltfläche aus und klicken Sie auf „Abspielen“. Der Media Player wiederholt den Clip so lange, bis Stopp ausgewählt wird.



In ATEM Software Control ist jeweils ein Clip in die beiden Media Player geladen

Alle Übergangsarten

Zu den Hauptfunktionen eines Broadcast-Mischers zählt das Ausführen von Übergängen, um von einer in die nächste Videoquelle überzuleiten. Dank der unzähligen Kombinationen aus Übergangseffekten und -arten sind der Kreativität keine Grenzen gesetzt. So können Sie Ihre Produktion ganz nach Ihrem Geschmack aufpeppen.

Übergänge können vom ATEM Mischer aus oder in ATEM Software Control ausgeführt werden. Dieser Abschnitt erläutert, wie Sie die verschiedenen auf Ihrem Mischer verfügbaren Übergänge ausführen.

Hartschnitte

Ein Hartschnitt (Cut) ist der elementarste Übergang, der sich mit dem Mischer ausführen lässt. Bei einem Hartschnitt wechselt die Programmausgabe abrupt von einer Bildquelle zur nächsten.

Programmausgabe für einen Hartschnitt

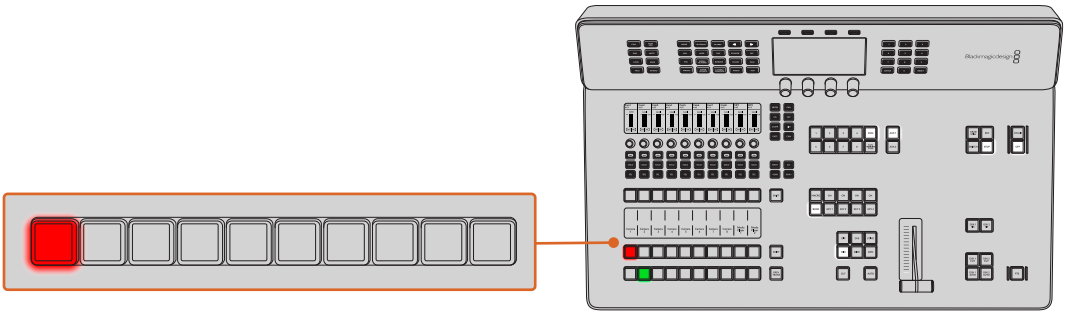
Ein Hartschnitt lässt sich direkt vom Programmbus oder mithilfe der CUT-Taste im Übergangssteuerblock ausführen.

Programm-Bus

Bei einem Hartschnitt vom Programmbus ändert sich ausschließlich das Hintergrundsignal, während alle Upstream- und Downstream-Keys ihren aktuellen Status beibehalten.

So führen Sie einen Hartschnitt vom Programmbus eines ATEM Television Studio Mischers aus:

Wählen Sie auf dem PROGRAM-Bus die Videoquelle, die Sie auf den Programmausgang legen wollen. Die Programmausgabe wechselt dann per Hartschnitt abrupt zur neuen Quelle.



Um einen Hartschnitt vom Programmbus auszuführen, drücken Sie eine der Quelltasten auf dem PROGRAM-Bus

So führen Sie einen Hartschnitt vom Programmbus des Software-Bedienpanels aus:

Wählen Sie im Programmbus die Videoquelle aus, die Sie als nächstes auf den Programmausgang legen wollen. Die Programmausgabe wechselt dann per Hartschnitt abrupt zur neuen Quelle.

So führen Sie einen Hartschnitt auf dem Software-Bedienpanel mit einer Tastatur aus:

1. Aktivieren Sie die Großbuchstabensperre oder halten Sie die Shift-Taste gedrückt.
2. Drücken Sie auf der Tastatur die Zifferntaste jener Videoquelle, die Sie auf den Programmausgang legen wollen. Die Programmausgabe wechselt dann per Hartschnitt abrupt zur neuen Quelle.

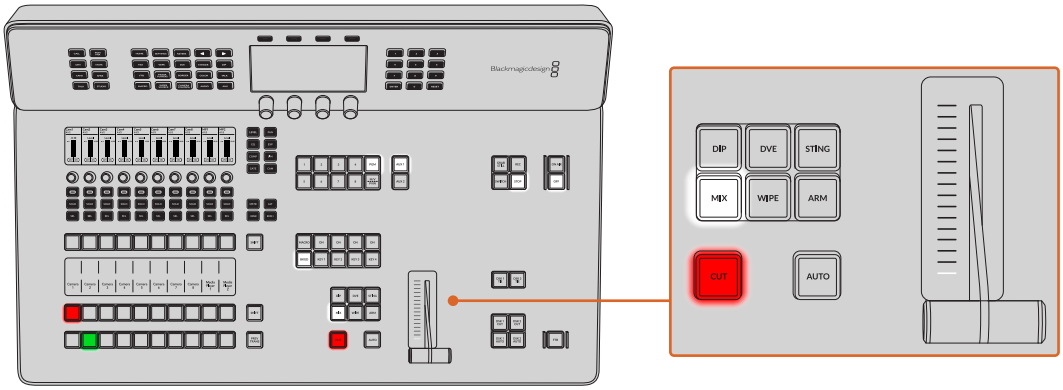
CUT-Schaltfläche bzw. -Taste

Bei Ausführung eines Hartschnitts mit der CUT-Taste, wechselt auch der Status aller für den nächsten Übergang ausgewählten Upstream-Keys und aller an die Übergangssteuerung geknüpften Downstream-Keys. Beispiel: Ein an die Übergangssteuerung geknüpfter Downstream-Key, der aktuell nicht auf Sendung ist, wird on air geschaltet oder, wenn er aktuell auf Sendung ist, off air. Analog werden alle für den nächsten Übergang ausgewählten Upstream-Keys auf Sendung geschaltet, wenn sie nicht on air sind und umgekehrt.

So führen Sie einen Hartschnitt mit der CUT-Taste auf einem ATEM Television Studio aus:

1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen. Die Programmausgabe bleibt dabei unverändert.
2. Drücken Sie im Übergangssteuerblock die CUT-Taste. Die auf den Programm- und Vorschaubussen ausgewählten Quellen wechseln ihre Plätze und zeigen an, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

Es ist empfehlenswert, Übergänge im Übergangssteuerblock auszuführen. So lassen sich Videoinhalte als Vorschauausgabe prüfen, ehe Sie sie auf den Programmausgang legen. Auf diese Weise lässt sich z. B. die Fokussierung einer Kamera bestätigen.



So führen Sie einen Hartschnitt mit der CUT-Schaltfläche auf dem Software-Bedienpanel aus:

1. Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen. Die Programmausgabe bleibt dabei unverändert.
2. Klicken Sie im Übergangssteuerblock auf die CUT-Schaltfläche. Die auf den Programm- und Vorschaubussen ausgewählten Quellen wechseln ihre Plätze und zeigen an, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

Die Hartschnitttaste CUT ist eine der Übergangsarttasten

So führen Sie einen Hartschnitt auf dem Software-Bedienpanel mit einer Tastatur aus:

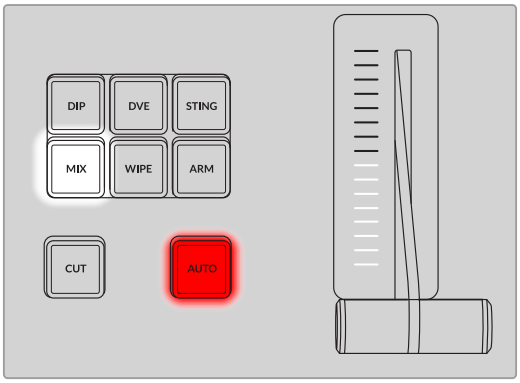
1. Vergewissern Sie sich, dass die Großbuchstabensperre deaktiviert ist.
2. Drücken Sie auf der Tastatur die Zifferntaste, die der Videoquelle entspricht, die Sie auf den Programmausgang legen wollen. Die Auswahl der Quelle erfolgt auf dem Vorschaubus. Die Programmausgabe bleibt unverändert.
3. Drücken Sie die Leertaste. Die auf den Programm- und Vorschaubussen ausgewählten Quellen wechseln ihre Plätze und zeigen an, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

Automatische Übergänge

Mit AUTO können Sie Übergänge von Programm- und Vorschauquellen mit einer vorgegebenen Rate automatisch ausführen. Bei diesem Vorgang wechselt auch der Status aller für den nächsten Übergang ausgewählten und an die Übergangssteuerung geknüpften Downstream-Keys. Automatische Übergänge lassen sich mithilfe der AUTO-Schaltfläche bzw. -Taste im Übergangssteuerblock ausführen. Die Übergänge Mix, Dip, Wipe, DVE und Stinger lassen sich alle automatisch ausführen.

So führen Sie einen automatischen Übergang auf einem ATEM Television Studio Mischer aus:

1. Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Wählen Sie die Übergangsart im Übergangssteuerblock aus.
3. Geben Sie in der Systemsteuerung die Übergangsrate vor und passen Sie für den Übergang ggf. weitere Parameter an.
4. Drücken Sie die AUTO-Taste im Übergangssteuerblock, um den Übergang einzuleiten.



Für diverse Übergangsarten sind jeweils dedizierte Auswahltasten vorhanden, bspw. DIP, MIX und WIPE

Während des Übergangs leuchten die zuvor roten und grünen Tasten auf den Programm- und Vorschaubussen beide rot. Dies zeigt einen aktuell ablaufenden Übergang an. Der Blendenhebel-Indikator zeigt Position und Verlauf des Übergangs an. Das sich aktualisierende Display „Transition Rate“ gibt die Anzahl der bis zum Abschluss des Übergangs verbleibenden Frames an.

Nach Abschluss des Übergangs werden die auf den Programm- und Vorschaubussen ausgewählten Quellen ausgetauscht. Dies verdeutlicht, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

Jeder Übergangstyp hat eine eigene, separat einstellbare Übergangsrate, mithilfe derer man schnellere Übergänge ausführen kann, indem man einfach die Übergangsart auswählt und die AUTO-Taste drückt. Die zuletzt verwendete Übergangsrate wird für die jeweilige Übergangsart beibehalten, bis sie geändert wird.

Ein Produktionsmischer bietet mehrere Möglichkeiten, von einem Bild zum nächsten überzugehen. Im Allgemeinen wird der Wechsel von einer Hintergrundquelle auf eine andere mit einem einfachen Hartschnitt ausgeführt.Die Übergänge der Kategorien Mix, Dip, Wipe und DVE ermöglichen den Wechsel zwischen zwei Hintergrundquellen durch langsames Einblenden der einen und gleichzeitiges Ausblenden der anderen. Stinger- und Grafik-Wischblenden fallen in besondere Kategorien, die in einem späteren Abschnitt behandelt werden. Die Übergänge Mix, Dip, Wipe und DVE werden als automatische oder manuelle Übergänge in der Übergangssteuerung ausgeführt.

Die Übergangsschaltfläche AUTO gehört zur Tastengruppe der Übergangsarten

So führen Sie einen automatischen Übergang auf dem Software-Bedienpanel aus:

1. Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Wählen Sie die Übergangsart mithilfe der Schaltflächen im Übergangssteuerblock aus.
3. Aktivieren Sie auf der „Einstellungen“-Registerkarte in der „Übergänge“-Menüpalette dieselbe Übergangsart wie im Übergangssteuerblock.
4. Geben Sie die „Rate“ für den Übergang vor und passen Sie bei Bedarf weitere Parameter an.
5. Betätigen Sie die AUTO-Schaltfläche im Übergangssteuerblock, um den Übergang einzuleiten.
6. Während des Übergangs leuchten die zuvor roten und grünen Tasten auf den Programm- und Vorschaubussen beide rot auf. Dies zeigt einen aktuell ablaufenden Übergang an. Der virtuelle Blendenhebel zeigt Position und Verlauf des Übergangs automatisch an. Das sich aktualisierende „Rate“-Display gibt die Anzahl der bis zum Abschluss des Übergangs verbleibenden Frames an.
7. Nach Abschluss des Übergangs werden die auf den Programm- und Vorschaubussen ausgewählten Quellen ausgetauscht. Dies verdeutlicht, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

So führen Sie einen automatischen Übergang auf dem Software-Bedienpanel mit einer Tastatur aus:

1. Vergewissern Sie sich, dass die Großbuchstabensperre deaktiviert ist.
2. Drücken Sie auf der Tastatur die Zifferntaste, die der Videoquelle entspricht, die Sie auf den Programmausgang legen wollen. Die Auswahl der Quelle erfolgt auf dem Vorschaubus. Die Programmausgabe bleibt unverändert.
3. Wählen Sie die Übergangsart mithilfe der Schaltflächen im Steuerblock „Übergangsart“ aus.
4. Aktivieren Sie auf der „Einstellungen“-Registerkarte in der „Übergänge“-Menüpalette dieselbe Übergangsart wie im Übergangssteuerblock.
5. Geben Sie die „Rate“ für den Übergang vor und passen Sie bei Bedarf weitere Parameter an.
6. Drücken Sie die Return- oder Eingabetaste, um den Übergang einzuleiten.

Während des Übergangs leuchten die zuvor roten und grünen Tasten auf den Programm- und Vorschaubussen beide rot auf. Dies zeigt einen aktuell ablaufenden Übergang an. Der virtuelle Blendenhebel zeigt Position und Verlauf des Übergangs automatisch an. Das sich aktualisierende „Rate“-Display gibt die Anzahl der bis zum Abschluss des Übergangs verbleibenden Frames an.

Nach Abschluss des Übergangs werden die auf den Programm- und Vorschaubussen ausgewählten Quellen ausgetauscht. Dies verdeutlicht, dass die vorher auf Vorschau liegende Videoquelle jetzt auf Programm liegt und umgekehrt.

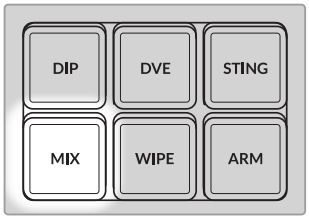
Mix-Übergänge

Ein Mix ist ein allmählicher Übergang von einer Quelle zu einer anderen. Er erfolgt durch schrittweises Verschmelzen von zwei Quellen, die sich im Verlauf des Effekts praktisch überlappen. Die Dauer des Übergangs bzw. die Dauer der Überlappung lässt sich durch Ändern der Mix-Rate anpassen.

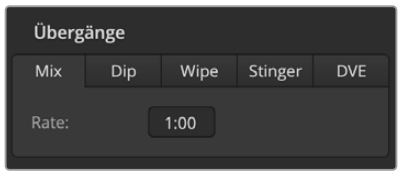
Programmausgabe eines Mix-Übergangs

So führen Sie einen Mix-Übergang auf dem ATEM Television Studio aus:

1. Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Drücken Sie die MIX-Taste, um die Mix-Übergangsart auszuwählen. Die Systemsteuerung navigiert automatisch zum Menü ÜBERGÄNGE.
3. Justieren Sie die Mix-Rate über das LC-Display anhand des Multifunktionsreglers. Das Display mit der Übergangsrate im Steuerblock des Mischers aktualisiert sich dabei dynamisch. Sie können die Rate auch über den Ziffernblock eingeben.
4. Führen Sie die Blende als automatischen Übergang oder manuell im Übergangssteuerblock aus



Drücken Sie die MIX-Taste und stellen Sie die Übergangsrate über das LCD-Menü ein



Einstellung der Rate für Mix-Übergänge

So führen Sie einen Mix-Übergang auf dem Software-Bedienpanel aus:

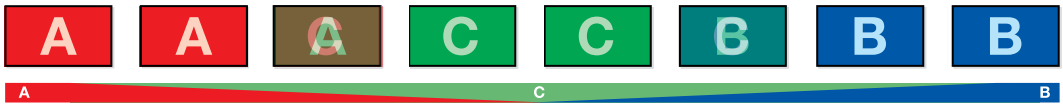
1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Wählen Sie im Übergangssteuerblock die Übergangsart „Mix“ aus.
3. Erweitern Sie die Menüpalette „Übergänge“ und wählen Sie aus der Menüleiste „Übergangsart“ die Option „Mix“ aus.
4. Passen Sie die Mix-Zeitspanne an, indem Sie eine Zahl in das „Rate“-Fenster eingeben. Das „Rate“-Display im Übergangssteuerblock aktualisiert sich entsprechend.
5. Führen Sie die Blende als automatischen Übergang oder manuell im Übergangssteuerblock aus

Parameter der Mix-Übergänge

Rate	Die Mix-Übergangsrate in Sekunden : Frames

Dip-Übergänge

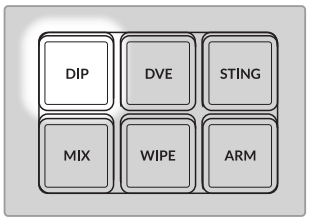
Ein Dip verläuft so ähnlich wie ein Mix, da auch hier eine Videoquelle allmählich in eine andere übergeht. Bei einem Dip wird jedoch schrittweise eine dritte Videoquelle, die Dip-Quelle, eingemischt. Beispielsweise bietet sich ein Dip-Übergang an, wenn für einen Übergang blitzschnell Weiß oder ein Sponsorenlogo eingeblendet werden soll. Die Dauer des Dip-Übergangs und die Dip-Quellen sind vom Benutzer definierbar.



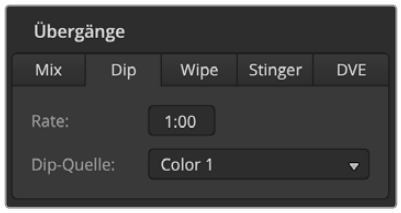
Programmausgabe eines Dip-Übergangs

So führen Sie einen Dip-Übergang auf einem ATEM Television Studio aus:

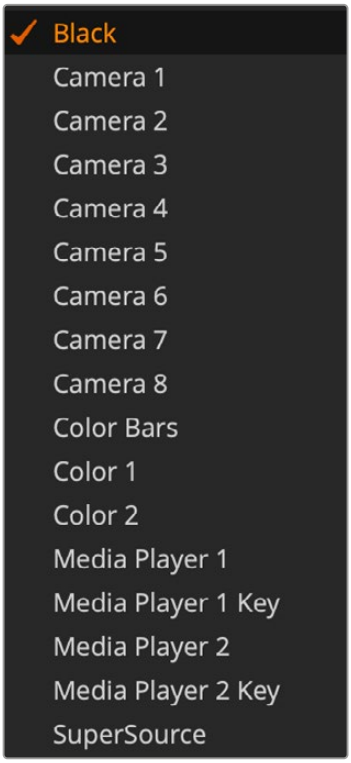
1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Drücken Sie die DIP-Taste, um einen Dip-Übergang zu wählen. Das LCD-Menü zeigt dann automatisch die Übergangseinstellungen an.
3. Justieren Sie die Dip-Rate mithilfe des Drehreglers unter dem LCD. Sie können die Rate auch über den Ziffernblock eingeben.
4. Wählen Sie die Dip-Quelle mit dem entsprechenden Drehregler. Benutzen Sie den „Source Select“-Bus, um eine Dip-Quelle auszuwählen.
5. Führen Sie die Blende als automatischen Übergang oder manuell über die Bedienelemente im Übergangssteuerblock aus.



Drücken Sie die DIP-Taste im Übergangssteuerblock und geben Sie dann mithilfe der Regler über das LCD-Menü die Dip-Quelle und die Übergangsrate vor



Einstellungen für Dip-Übergänge



Dip-Quellen-Menü

So führen Sie einen Dip-Übergang auf dem Software-Bedienpanel aus:

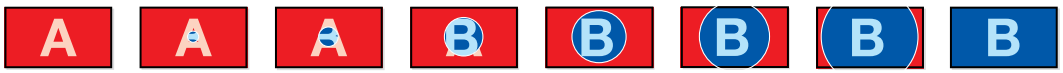
1. Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Wählen Sie im Übergangssteuerblock die Übergangsart „Dip“ aus.
3. Erweitern Sie die Menüpalette „Übergänge“ und wählen Sie aus der Menüleiste „Übergangsart“ die Option „Dip“ aus.
4. Justieren Sie die Dip-Rate, indem Sie einen Zahlenwert in das „Rate“-Fenster eingeben. Das „Rate“-Display im Übergangssteuerblock aktualisiert sich entsprechend.
5. Wählen Sie die Dip-Quelle aus.
6. Führen Sie die Blende als automatischen Übergang oder manuell über die Bedienelemente im Übergangssteuerblock aus.

Parameter für Dip-Übergänge

Rate	Die Dip-Übergangsrate in Sekunden und Frames.
Dip-Quelle	Die Dip-Quelle ist ein beliebiges Videosignal im Mischer, das als Zwischenbild für den Dip-Übergang fungiert. In der Regel ist dies ein Farbgenerator oder Media Player.

Wipe-Übergänge

Ein Wipe ist eine Wischblende von einer Quelle zur nächsten, bei dem die gegenwärtige Quelle durch eine andere Quelle ersetzt wird, die dabei ein geometrisches Muster bildet. Dies könnte bspw. ein Kreis oder eine Raute sein, der bzw. die sich vergrößert.

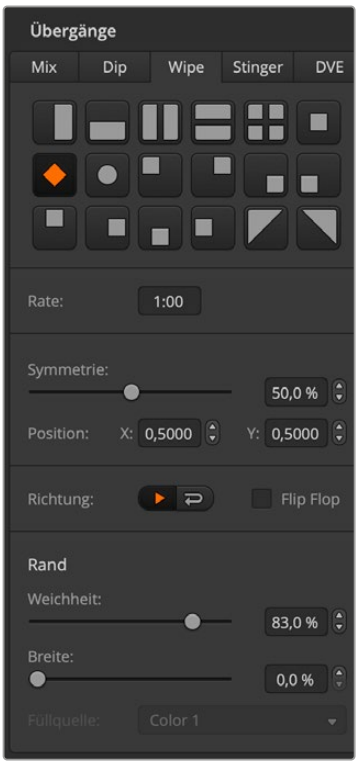


Programmausgabe einer Wischblende

So führen Sie einen Wipe-Übergang auf einem ATEM Television Studio aus:

1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Drücken Sie die WIPE-Taste, um die Wipe-Übergangsart auszuwählen. Das LCD-Menü zeigt dann automatisch die Übergangseinstellungen an.
3. Wählen Sie das Wipe-Muster und die Rate mit dem Systemsteuerungsregler. Die Richtung der Wischblende gibt man mit den Tasten vor.
4. Anhand der Pfeiltasten links vom LCD navigieren Sie zu allen verfügbaren Wipe-Eigenschaften, bspw. Position, Symmetrie und Randquelle.

5 Führen Sie die Blende als automatischen Übergang oder manuell über die Bedienelemente im Übergangssteuerblock aus.



Einstellungen der Wipe-Übergänge

So führen Sie einen Wipe-Übergang auf dem Software-Bedienpanel aus:

1 Wählen Sie auf dem Vorschaubus PREVIEW die Videoquelle aus, die Sie auf den Programmausgang legen wollen.

2 Wählen Sie im Übergangssteuerblock die Übergangsart „Wipe“ aus.

3 Erweitern Sie die Menüpalette „Übergänge“ und wählen Sie die Registerkarte „Wipe“ aus.

4 Geben Sie hier die Einstellungen für benutzerdefinierte Wipe-Übergänge vor.

5 Führen Sie die Blende als automatischen Übergang oder manuell im Übergangssteuerblock aus

Parameter für Wipe-Übergänge

Rate	Die Dauer des Wipe-Übergangs in Sekunden und Frames.
Symmetrie	Über Symmetrie lässt sich das Seitenverhältnis des Musters steuern. Beispiel: Durch Justieren der Symmetrie können Sie aus einem Kreis eine Ellipse machen. Auf dem ATEM Mischer lässt sich die Symmetrie mithilfe des Drehregelers justieren.
Position	Ein positionierbares Wipe-Muster kann mit einer Positionsvorgabe versehen werden, indem die Mitte des Musters an die gewünschte Stelle verschoben wird. Auf dem Mischer erfolgt dies mit den Drehreglern und auf dem Software-Bedienpanel mit den Positionsfeldern „X“ und „Y“.
Richtung umkehren	Dieser Parameter kehrt den Bewegungsablauf von geschlossenen Mustern wie Kreisen, Rauten und Rechtecken um. Das Muster verkleinert sich nun ausgehend von den Rändern des Bildschirms zur Mitte hin. Im aktivierten Zustand leuchtet der Text orangefarben.
Flip Flop	Bei aktiviertem „Flip Flop“-Modus wechselt die Richtung des Übergangs nach jedem Ausführen von „Normal“ zu „Umkehren“ bzw. umgekehrt. Im aktivierten Zustand leuchtet der Text orangefarben.
Rand-weichheit	Die Ränder der Wipe-Muster lassen sich durch Anpassen der Weichzeichnungsparameter von scharf bis unscharf einstellen.
Rand	Breite der Umrandung.
Füllquelle für Umrandung	Jede beliebige Signalquelle im Mischer ist als Quelle einer Umrandung für einen Wipe-Übergang einsetzbar. Beispiel: Eine breite Umrandung, deren Quelle der Media Player ist, lässt sich für Sponsoren- oder Brandingmaterial einsetzen.

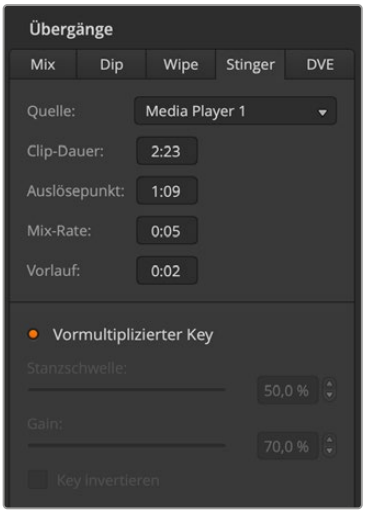
Stinger-Übergänge

Zur Ausführung eines Stinger-Übergangs wird ein Clip aus dem Media Player eingesetzt. Bei diesem Clip handelt es sich normalerweise um eine grafische Animation, die per Keying auf den Hintergrund gelegt wird. Sobald diese Animation beim Abspielen den gesamten Bildschirm ausfüllt, wird unter ihr ein Cut- oder Mix-Übergang des Hintergrunds ausgeführt. Beispiel: In Sportprogrammen ist dies eine sehr beliebte Übergangsart zum Ein- und Ausblenden sofortiger Wiederholungen. Der Stinger-Übergang setzt einen speziellen, in den Übergangssteuerblock integrierten Keyer ein. So bleiben sämtliche Upstream- und Downstream-Keyer für das Compositing Ihrer Programmausgabe verfügbar. Der folgende Abschnitt erklärt, wie Stinger-Übergänge programmiert und ausgeführt werden.

Ausführen eines Stinger-Übergangs

So führen Sie einen Stinger-Übergang auf einem ATEM Television Studio aus:

1. Drücken Sie im Übergangssteuerblock die STING-Taste.
2. Benutzen Sie den mit QUELLE gekennzeichneten Multifunktionsregler neben dem LCD, um den gewünschten Media Player auszuwählen. Benutzen Sie die Pfeiltasten, um bei Bedarf zusätzliche Werte für Vorlauf, Auslöser, Mix und Dauer zu ändern.
3. Nachdem Sie den richtigen Media Player für den Stinger-Übergang vorgegeben haben, konfigurieren Sie den Media Player. Drücken Sie hierfür auf die MEDIA PLAYER Multifunktionstaste neben dem LCD.
4. Wählen Sie im „Media Player“-Menü das zu verwendende Standbild bzw. den Clip im Media Pool aus, indem Sie den MEDIEN-Multifunktionsregler drehen. Stellen Sie bei Bedarf den Frame ein, mit dem der Clip starten soll, indem Sie den entsprechenden FRAME-Multifunktionsregler drehen.
5. Führen Sie den Übergang als AUTO-Übergang vom Übergangssteuerblock aus.



Einstellungen für Stinger-Übergänge

So führen Sie einen Stinger-Übergang auf dem Software-Bedienpanel aus:

1. Klicken Sie im Übergangssteuerblock auf die Schaltfläche STING.
2. Bestimmen Sie nun im Quellen-Menü den Media Player für den Übergang. Vergewissern Sie sich, dass der Media Player den gewünschten Clip enthält.
3. Justieren Sie Clip-Dauer, Auslösepunkt, Mix-Rate sowie bei Bedarf die Vorlauf-Parameter.
4. Führen Sie den Übergang als AUTO-Übergang vom Übergangssteuerblock aus.

   Stinger-Übergänge können nicht manuell per Blendenhebel ausgeführt werden.

Parameter der Stinger-Übergänge

Quelle	Der Media Player, der zum Abspielen des Clips für den animierten Übergang eingesetzt wird.
Clip-Dauer	Die Clip-Dauer bezieht sich auf die Länge der Animation. Normalerweise sollten Dauer und Länge der Animation gleich sein. Über die Einstellung der Dauer lässt sich auch das Clip-Ende abschneiden.
Auslösepunkt	Der Auslösepunkt ist der Zeitpunkt, an dem der Mischer den Hintergrund-Mix-Übergang einleitet, der sich unter der Animation vollzieht. In der Regel ist dies der Punkt, an dem die Animation den gesamten Bildschirm ausfüllt.
Mix-Rate	Die Mix-Rate definiert die Dauer des Mix-Übergangs von Vorschau auf Programm, der sich unter der Animation vollzieht. Um anstelle eines Mix-Übergangs einen Hartschnitt vorzugeben, stellen Sie die Framerate auf 1 ein.
Vorlauf	Vorlauf ist eine Methode, mit der sich der Anfang eines Clips abschneiden lässt. Die maximale Vorlaufzeit beträgt 3:00 Sekunden.
Vormultiplizierter Key	Identifiziert das Stanzsignal des Media Player Clips als vormultiplizierten Key.
Stanzschwelle	Über die Einstellung „Stanzschwelle“ wird die Pegelschwelle angepasst, mit der das Stanzsignal sein Loch in den Clip schneidet, der über den Media Player abgespielt wird. Durch Verringern der Stanzschwelle wird mehr vom Hintergrund offenbart. Bei komplett schwarzem Hintergrundvideo ist der Stanzschwellenwert zu niedrig.
Gain	Die „Gain“-Einstellung sorgt für eine elektronische Modifikation des Weichzeichnungswerts der Key-Kanten im vom Media Player abgespielten Clip. Passen Sie Gain an, bis die gewünschte Weichzeichnung erreicht ist, ohne dass die Leuchtdichte (Helligkeit) des Hintergrundvideos berührt wird.
Key invertieren	Kehrt die Wirkung des Keys um.

Es ist wichtig zu wissen, dass die Zeitvorgaben für Auslöser, Mix und Dauer voneinander abhängig sind. Beispielsweise darf die Rate für Auslöser + Mix die Gesamtdauer des Übergangs nicht überschreiten. Es ist auch zu beachten, dass die im Fenster „Übergangsrate“ angegebene Zeit der Gesamtdauer + Vorlauf entspricht.

DVE-Übergänge

Ihr Mischer verfügt über einen leistungsfähigen DVE-Prozessor für Übergänge mit digitalen Videoeffekten, sogenannten DVE. Bei einem DVE-Übergang wird ein Bild auf unterschiedliche Weise durch ein anderes Bild ersetzt. Beispiel: Mit einem DVE-Übergang lässt sich das gegenwärtige Bild stauchen und vom Bildschirm schieben. Dies enthüllt das darunter liegende, neue Bild.

So führen Sie einen DVE-Übergang auf einem ATEM Television Studio aus:

1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Drücken Sie die DVE-Übergangstaste, um einen DVE-Übergang zu wählen. Die DVE-Einstellungen erscheinen auf dem LCD-Menü.

HINWEIS Wird der DVE bereits als Upstream-Key eingesetzt, ist ein DVE-Übergang erst dann auswählbar, wenn der Key off air genommen und für den nächsten Übergang deaktiviert ist. Näheres finden Sie unter „DVE-Ressourcen teilen“ weiter hinten in diesem Kapitel.

3. Konfigurieren Sie die DVE-Parameter über das LCD-Menü „DVE“ anhand der Multifunktionsregler und -tasten. Hier können Sie Parameter wie das DVE-Muster sowie die Bewegungsart und -richtung vorgeben und die Übergangsrate für den DVE anpassen. Mit den Pfeiltasten neben dem LCD navigieren Sie durch zusätzliche Einstellungen.

4 Führen Sie den Übergang als automatischen oder manuellen Übergang per AUTO-Taste oder Blendenhebel aus.

Einstellungen für DVE-Übergänge

So führen Sie einen DVE-Übergang auf dem Software-Bedienpanel aus:

1 Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.

2 Wählen Sie im Übergangssteuerblock die Übergangsart „DVE“ aus.

3 Erweitern Sie die Menüpalette „Übergänge“ und wählen Sie die Registerkarte „DVE“ aus.

Wird der DVE bereits als Upstream-Key eingesetzt, ist die DVE-Schaltfläche erst dann auswählbar, wenn der Key „Off Air“ und für den nächsten Übergang deaktiviert ist. Weitere Einzelheiten finden Sie im Abschnitt „DVE-Ressourcen teilen“ weiter unten.

Passen Sie den Übergang mit den Einstellungen der DVE-Menüpalette nach Ihren Wünschen an.

4 Führen Sie die Blende als automatischen Übergang oder manuell im Übergangssteuerblock aus

Parameter für DVE-Übergänge

Muster	Wählen Sie für das DVE-Muster zwischen „Push“ und „Squeeze“.
Bewegung	Unter „Bewegung“ legen Sie die Richtung für den Musterübergang fest.
DVE-Rate	Die Dauer des DVE-Übergangs in Sekunden und Frames. Auf ATEM Television Studio Mischern justieren Sie die DVE-Übergangsrate durch Drehen des Reglers „DVE-Rate“. Die neue Rate erscheint sofort unter dem Fenster mit der Übergangsrate im Übergangssteuerblock.
Richtung	Die normale Richtung wendet den DVE-Effekt auf das Programm an und bringt so den Vorschaukanal zum Vorschein.
Richtung umkehren	Dieser Modus kehrt die Richtung um und bewirkt, dass der DVE auf den Vorschaukanal angewendet wird. Im Umkehrmodus wird das Programm von einem DVE mit dem Vorschauvideo verdeckt.
Flip Flop	Bei aktiviertem „Flip Flop“-Modus wechselt die Richtung des Übergangs nach jedem Ausführen von „Normal“ zu „Umkehren“ bzw. umgekehrt.

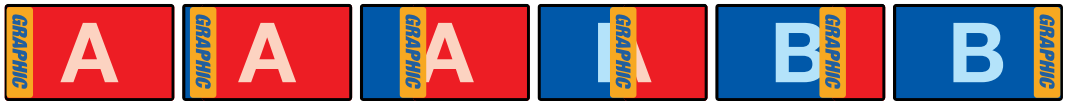
Parameter für DVE-Keys

Key aktivieren	Aktiviert bzw. deaktiviert den DVE-Key. Der DVE-Key ist aktiviert, wenn die Taste erleuchtet ist.
Vormultiplizierter Key	Wählt den DVE-Key als vormultiplizierten Key aus.
Stanzschwelle	Über diese Einstellung wird die Schwelle angepasst, anhand der das Stanzsignal sein Loch schneidet. Durch Verringern der des Stanzschwellenwerts wird mehr vom Hintergrund offenbart. Bei komplett schwarzem Hintergrundvideo ist der Stanzschwellenwert zu niedrig.
Gain	Durch Abstimmen des Gain-Faktors wird bestimmt, wie viele Anteile von der Hintergrund- und der Key-Füllquelle an den Kanten des Keys gemischt werden, um diese weichzuzeichnen. Passen Sie Gain an, bis die gewünschte Weichzeichnung erreicht ist, ohne dass die Leuchtdichte oder Helligkeit des Hintergrundvideos berührt wird.
Key invertieren	Ist der Key nicht vormultipliziert, wird das Stanzsignal umgekehrt. Was vorher ausgeschnitten wurde, wird nun eingefügt und umgekehrt.

DVE-Ressourcen teilen

ATEM Mischer verfügen über einen DVE-Kanal, der zum Ausführen von DVE-Übergängen oder als Upstream-Keyer eingesetzt werden kann. Wenn Sie einen DVE-Übergang auswählen und der DVE gegenwärtig anderswo im System benutzt wird, ist die DVE-Übergangsart nicht verfügbar. Auf dem Mischer ist die DVE-Taste dann deaktiviert. Um den DVE-Übergang zu verwenden, muss der DVE am aktuellen Einsatzort freigegeben werden. Vergewissern Sie sich, dass die gegenwärtig auf den Programm- oder Vorschaubussen liegenden Upstream-Keyer keine DVE-Keys sind und der „Fliegende Key“-Modus deaktiviert ist. Um einen DVE vom Upstream-Keyer zu lösen, ändern Sie die Key-Art auf eine beliebige andere Art außer DVE oder deaktivieren Sie „Fliegender Key“. Der so freigegebene DVE ist nun für einen DVE-Übergang verfügbar.

Grafik-Übergänge sind eine beliebte Übergangsart, bei der DVE zum Einsatz kommen. Hierbei bewegt sich eine über den Hintergrundübergang gelegte Grafik über den Bildschirm. Bei einem Grafik-Wipe schiebt sich eine Grafik entlang eines horizontalen Wipes, wobei im Wesentlichen der Rand des Wipe-Übergangs ersetzt wird. Bei einem Grafik-Mix rotiert eine Grafik über einem Mix-Übergang auf dem Bildschirm. Grafik-Übergänge sind ideal, um ein Senderlogo oder ein Objekt wie einen Fußball über den Bildschirm zu wirbeln und dabei einen neuen Hintergrund zu enthüllen. Für Grafik-Übergänge dient ein in den Übergangssteuerblock integrierter Spezial-Keyer. So bleiben alle Upstream- und Downstream-Keyer für das Compositing des Ausgabesignals verfügbar. Der nachstehende Abschnitt erklärt die Erstellung und Ausführung von Grafik-Übergängen.



Die obige Abbildungssequenz ist ein Beispiel der Programmausgabe eines Wipe-Übergangs mit einer Grafik

Ausführen von Grafik-Übergängen

So führen Sie einen Grafik-Übergang auf einem ATEM Television Studio aus:

1. Drücken Sie die DVE-Übergangstaste im Übergangssteuerblock. Das Menü für die DVE-Einstellungen erscheint auf dem LCD.

   Ist der DVE bereits als Upstream-Key in Gebrauch, ist die DVE-Übergangsart erst dann wieder wählbar, wenn dieser Key off air und für den nächsten Übergang deaktiviert ist. Näheres finden Sie unter „DVE-Ressourcen teilen“ in diesem Kapitel.

2. Drücken Sie im LCD-Menü die „Effekt“-Multifunktionstaste, um die „Effekt“-Einstellungen zu öffnen.

   Die Standardrichtung verläuft von links nach rechts. Die Richtung kann jedoch geändert werden, indem Sie RICHTUNG UMKEHREN wählen. Ist die Option FLIP FLOP aktiviert, ändert sich die Richtung bei jedem Ausführen des Übergangs, statt sich immer in dieselbe Richtung zu bewegen.

3 Drücken Sie die Rechtspfeiltaste im Systemsteuerblock, um die Key-Einstellungen anzupassen. Aktivieren Sie den Key und wählen Sie die Füll- und Key-Quelle aus. Um die Key-Parameter zu öffnen und einen Key zu modifizieren, drücken Sie die Rechtspfeiltaste im Systemsteuerblock. So würden Sie bspw. die Stanzschwellen- und Gain-Einstellungen eines Keys ändern.

TIPP Üblicherweise wird für einen Grafik-Übergang als Quelle eine in den Media Player geladene Grafik eingesetzt. Standardmäßig wird bei Auswahl eines Media Players als Füllquelle automatisch der Key-Kanal des Media Players als Key-Quelle vorgegeben und der vormultiplizierte Key aktiviert. D. h. der Mischer wählt automatisch eine Grafik mit einer in den Alphakanal eingebetteten Key-Matte aus. Wenn Sie eine separate Mediendatei von einem anderen Media Player oder eine andere Eingabequelle verwenden möchten, können Sie den vormultiplizierten Key deaktivieren und die Keyquelle ändern.

4 Führen Sie den Übergang als automatischen Übergang per AUTO-Taste oder als manuellen Übergang per Blendenhebel aus.

So führen Sie einen Grafik-Übergang auf dem Software-Bedienpanel aus:

1 Aktivieren Sie im Übergangssteuerblock die DVE-Schaltfläche.

Ist der DVE bereits als Upstream-Key in Gebrauch, ist die DVE-Übergangsart erst dann wieder wählbar, wenn dieser Key off air und für den nächsten Übergang deaktiviert ist. Näheres finden Sie unter „DVE-Ressourcen teilen“ im nächsten Abschnitt.

2 Erweitern Sie die Menüpalette „Übergänge“ und wählen Sie die Übergangsart DVE aus. Anhand der Vor- oder Zurückpfeile können Sie eine andere DVE-Art vorgeben.

3 Wählen Sie unter den Optionen für Effekte den Übergang „Grafik-Wipe“

4 Wählen Sie die Füllquelle und Stanzquelle für die Grafik aus der Dropdown-Liste aus.

5 Passen Sie, wenn erforderlich, die Key-Parameter an.

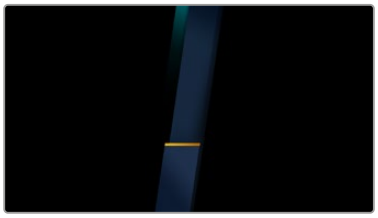
6 Führen Sie die Blende als automatischen Übergang oder manuell über die Bedienelemente im Übergangssteuerblock aus.

Beschreibung der Parameter für Grafik-Wipe-Übergänge

Rate	Die Rate gibt die Dauer eines Übergangs in Sekunden und Frames an. Die Anpassung der Rate erfolgt mit dem Rate-Regler oder durch Eingabe einer Zahl auf dem Ziffernblock und Drücken der Enter-Taste.
Normal	Normalerweise bewegt sich eine Grafik von links nach rechts. In der Systemsteuerung des Mischers wird die normale Richtung durch die Worte „Richtung umkehren“ in weißer Farbe angezeigt.
Richtung umkehren	Kehrt die Richtung der Grafik um, sodass sie sich von rechts nach links bewegt. Auf dem ATEM Mischer erscheinen die Worte „Richtung umkehren“ bei aktivierter Einstellung in Orange.
Flip Flop	Bei aktiviertem „Flip Flop“-Modus wechselt die Richtung des Übergangs nach jedem Ausführen von „Normal“ zu „Umkehren“ bzw. umgekehrt. Die Richtung des nächsten Übergangs ist an den Lichtern NORMAL und UMKEHREN erkenntlich.
Füllquelle	Das Füllsignal ist die Grafik, die sich auf den Übergang gelegt über den Bildschirm bewegt.
Key-Quelle	Das Stanzsignal ist ein Graustufenbild, das den zu entfernenden Bereich der Grafik definiert, damit das Füllsignal korrekt über den Wipe-Übergang gelegt werden kann.

Bilder für Grafik-Wipes

Für die Grafik-Wischblenden-Funktion wird eine statische Grafik benötigt. Diese bewegt sich als Rand horizontal über den Bildschirm. Es sollte eine vertikale Grafik im Stil eines Banners sein, die nicht mehr als 16 % der gesamten Bildschirmbreite einnimmt.



Für Grafik-Wipes erforderliche Bildschirmbreiten

2160p	Beim Betrieb eines ATEM Television Studio 4K8 Mischers bei 2160p sollte die Grafik nicht mehr als 230 Bildpunkte breit sein.
1080i	Wird der Mischer bei 1080i betrieben, sollte die Grafik nicht mehr als 116 Bildpunkte breit sein.
720p	Wird der Mischer bei 720p betrieben, sollte die Grafik nicht mehr als 77 Bildpunkte breit sein.

Manuelle Übergänge

Manuelle Übergänge zwischen Programm- und Vorschauquellen können Sie mit dem Blendenhebel im Übergangssteuerblock per Hand ausführen. Die Übergänge Mix, Dip, Wipe und DVE können alle manuell ausgeführt werden.

So führen Sie einen manuellen Übergang auf dem Software-Bedienpanel oder dem Bedienpanel von ATEM Television Studio Mischern aus:

1. Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.
2. Wählen Sie die Übergangsart im Übergangssteuerblock aus.
3. Um den Übergang auszuführen, schieben Sie den Blendenhebel manuell von einem Ende ans andere.Die nächste Bewegung des Blendenhebels leitet einen neuen Übergang ein.

4 Während des Übergangs leuchten die zuvor rot und grün leuchtenden Tasten bzw. Schaltflächen der Programm- und Vorschaubusse alle rot. Dies zeigt an, dass aktuell ein Übergang ausgeführt wird. Auf dem ATEM Mischer zeigt auch der LED-Indikator am Blendenhebel die Position und den Fortschritt des Übergangs an. Auf dem Software-Bedienpanel sind Position und Fortschritt des Übergangs am virtuellen Blendenhebel erkennbar.

5 Nach Abschluss des Übergangs werden die auf den Programm- und Vorschaubussen ausgewählten Quellen vertauscht. Dies verdeutlicht, dass die vorher auf Vorschau bzw. Preview liegende Videoquelle jetzt auf Programm bzw. Program liegt und umgekehrt.

Übergangsvorschau

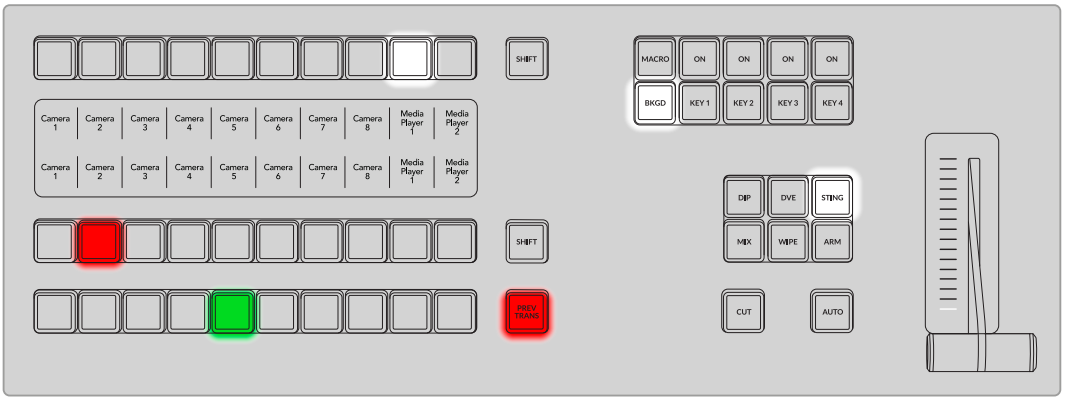
ATEM Mischer verfügen über eine leistungsfähige Vorschau-Feature, mit der Sie Übergänge auf dem Vorschauausgang überprüfen und anpassen können. Im Übergangsvorschau-Modus können Sie einen Übergang bestätigen, ehe Sie ihn auf Sendung ausführen.

So sichten Sie eine Übergangsvorschau auf dem Software-Bedienpanel oder dem Bedienpanel von ATEM Television Studio Mischern:

1 Wählen Sie auf dem Vorschaubus „Preview“ die Videoquelle aus, die Sie auf den Programmausgang legen wollen.

2 Wählen Sie die Übergangsart mit den jeweiligen Tasten bzw. Schaltflächen im Übergangssteuerblock.

3 Betätigen Sie die Taste bzw. Schaltfläche PREV TRANS, um den Mischer in den Übergangsvorschau-Modus zu versetzen. PREV TRANS leuchtet dann rot auf und die Vorschauausgabe wechselt, sodass sie nun die Programmausgabe widerspiegelt.



4 Um den Übergang auf dem Vorschauausgang vorher zu betrachten, schieben Sie den Blendenhebel manuell von einem Ende an das gegenüberliegende. Die Programmausgabe bleibt dabei unverändert.

5 Betätigen Sie die „PREV TRANS“-Taste bzw. Schaltfläche, um den Mischer in den Übergangsvorschau-Modus zu versetzen.

Keying auf ATEM Mischern

Keyer sind leistungsstarke Produktionswerkzeuge, mit denen sich aus verschiedenen Quellen stammende visuelle Elemente auf dasselbe Videobild legen lassen.

Dies erfolgt, indem mehrere Ebenen von Video oder Grafiken über ein Hintergrundvideo gelegt werden. Durch Veränderung der Transparenz verschiedener Teile dieser Ebenen wird die Hintergrundebene sichtbar gemacht. Diesen Vorgang bezeichnet man als Keying. Zur Erstellung dieser selektiven Transparenz gibt es mehrere Techniken, die den verschiedenen Arten von Keyern, die auf Ihrem Mischer verfügbar sind, entsprechen.

Im Folgenden werden die gleichermaßen „upstream“ oder „downstream“ verwendbaren Luma- und Linear-Keyer erklärt. Auch werden die Upstream-Key-Arten Chroma, Muster und DVE erklärt.

So funktioniert Keying

Für einen Key sind zwei Videoquellen erforderlich: ein Füllsignal und ein ebenfalls als Key bzw. Key-Signal bezeichnetes Schnitt- oder Stanzsignal. Das Füllsignal enthält ein Videobild, das auf den Hintergrund gelegt wird. Das Key-Signal hingegen dient zur Auswahl der durchsichtig zu machenden Bereiche des Füllsignals. Als Füll- und Stanzsignale können beliebige interne Quellen des Mischers sowie seine externen Signaleingaben ausgewählt werden. Als Quellen für Füll- oder Stanzsignale sind Standbilder wie auch bewegte Bilder einsetzbar.

Auf dem Software-Bedienpanel erfolgt die Auswahl der Füll- und Key-Signale über die Menüpaletten der Upstream- und Downstream-Keys. Auf dem ATEM Mischer werden Füll- und Key-Signale über den Auswahlbus bestimmt.

Der Mischer setzt zwei Typen von Keyern ein: Upstream-Keyer und Downstream-Keyer. Der M/E-Block des Mischers weist vier Upstream-Keyer auf, die auch als Effekt-Keyer bezeichnet werden. Jeder Upstream-Keyer lässt sich als Luma-, Linear-, vormultiplizierter, Chroma-, Muster- oder DVE-Key anlegen. Der dedizierte DSK-Block verfügt über zwei Downstream-Keyer. Beide Downstream-Keyer lassen sich als Luma- oder Linear-Key einrichten.

Luma-Key

Ein Luma-Key – auch Helligkeitsstanze oder Luminanz-Key genannt – besteht aus einer einzelnen Videoquelle, die das Videobild enthält, und wird auf den Hintergrund gelegt. Alle durch die Leuchtdichte bzw. Luminanz des Videosignals definierten schwarzen Bereiche werden transparent, sodass der darunterliegende Hintergrund enthüllt wird. Da die herauszuschneidenden Bereiche nur mit einem Bild definiert werden, setzt ein Luma-Key dasselbe Signal für Füllung und Stanze ein. Die nachstehenden Abbildungen sind ein Beispiel für ein Bild, das durch Zusammensetzen des Hintergrunds mit den Luma-Key-Signalen entstanden ist.

Kombinieren eines Hintergrunds mit Füll- und Stanzsignalen in Form eines Luma-Keys

Hintergrund

Ein bildschirmfüllendes Bild, häufig von einer Kamera stammend.

Füllung

Die Füllung ist die Grafik, die Sie auf Ihren Hintergrund gelegt zeigen wollen. Hinweis: Die finale Komposition weist keinerlei Schwarz von der Grafik auf, da alle schwarzen Bereiche aus dem Bild herausgeschnitten wurden.

Linear-Key

Ein Linear-Key besteht aus zwei Videoquellen: einem Füllsignal und einem Key- bzw. Stanzsignal. Das Füllsignal enthält ein Videobild, das über den Hintergrund gelegt wird. Das Key-Signal hingegen enthält eine Graustufenmaske, die dazu dient, jene Bereiche des Füllsignals zu definieren, die transparent werden sollen. Da es sich bei den Füll- und Stanzsignalen jeweils um Videoeingaben handelt, können beide Elemente auf dem Bildschirm in Bewegung sein. Das nachstehende Beispiel zeigt, wie aus der Kombination eines Hintergrunds mit den Füll- und Stanzsignalen ein finales Bild wird.

Kombinieren eines Hintergrunds mit Füll- und Stanzsignalen in Form eines Luma-Keys

Hintergrund

Ein bildschirmfüllendes Bild, häufig von einer Kamera stammend.

Füllung

Die Füllung ist die Grafik, die Sie auf Ihren Hintergrund gelegt zeigen wollen. Die schwarzen Teile der Grafik bleiben erhalten, da das Key-Signal die Transparenz des Füllsignals festlegt. Das Füllsignal wird häufig von einem Grafiksystem generiert.

Key

Ein Graustufenbild, das den zu entfernenden Bereich des Bilds definiert. So kann das Füllsignal präzise auf den Hintergrund gelegt werden. Das Stanzsignal wird häufig von einem Grafiksystem generiert.

Vormultiplizierter Key

Von modernen Grafiksystemen oder Textgeneratoren erstellte Füll- und Stanzsignale werden in der Regel als sogenannte vormultiplizierte Keys (Pre-multiplied Keys) oder Shaped Keys ausgegeben. Ein vormultiplizierter Key ist eine Sonderkombination aus Füll- und Stanzsignal, wobei das Füllsignal mit dem Stanzsignal über einem schwarzen Hintergrund vormultipliziert wurde. In Photoshop erstellte Bilder, die einen Alpha-Kanal enthalten, sind vormultipliziert.

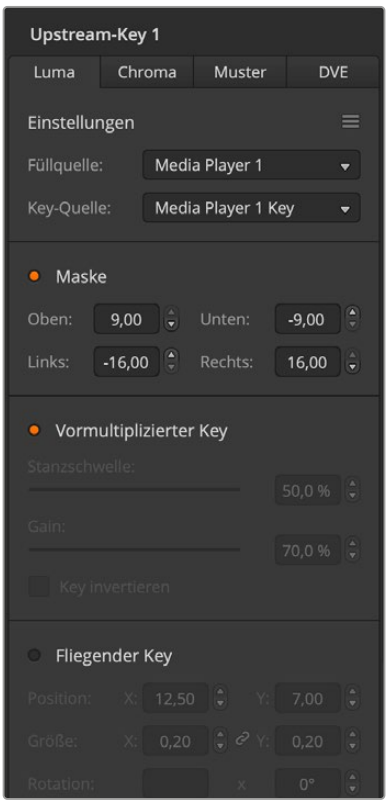
ATEM Mischer sind mit automatischer Key-Anpassung für vormultiplizierte Keys ausgestattet. Ist die Einstellung „Vormultiplizierter Key“ aktiviert, stellt das System die Stanzschwellen- und Gain-Parameter automatisch ein.

Generieren Sie bei Verwendung eines in Photoshop erstellten Bildes die Grafiken über einer schwarzen Hintergrundebene und legen Sie alle Inhalte auf die darüberliegenden Ebenen. Vergewissern Sie sich, dass Ihre Photoshop-Datei einen Alpha-Kanal enthält, den der ATEM Mischer zum Überblenden der Grafik über das Live-Video verwenden kann. Wenn Sie die Datei als Targa-Bilddatei gespeichert oder direkt in den Media Pool geladen haben, können Sie für den Keyer das Attribut „Vormultiplizierter Key“ wählen und so einen gelungenen Key erzielen.

Da Photoshop-Dateien generell vormultipliziert sind, sollten Sie beim Keying mit diesen Dateien auf Ihrem ATEM Mischer immer die vormultiplizierten Einstellungen verwenden.

Ausführen eines Upstream-Luma/Linear-Keys

Da Luma- und Linear-Keys dieselben Parameter verwenden, erfolgt ihre Einstellung auf dem Software-Bedienpanel und dem ATEM Mischer in einem gemeinsamen Menü, dem sogenannten Luma-Key-Menü. Die Auswahl der Füll- und Stanzquellen definiert, ob es sich bei einem Key um einen Luma-Key oder einen Linear-Key handelt. Bei einem Luma-Key stammen die Füll- und Stanzsignale aus derselben Quelle. Bei einem Linear-Key stammen die Füll- und Stanzsignale aus unterschiedlichen Quellen.



Die Menüpalette „Upstream Key“ enthält auf jedem Tab ein Menü zum Zurücksetzen von Parametern. Wählen Sie im Menü die Bereiche aus, die Sie zurücksetzen möchten.

So richten Sie einen Luma/Linear-Key als Upstream-Keyer 1 auf einem ATEM Television Studio Mischer ein:

1. Drücken Sie die Taste KEY 1, um den Keyer auf dem Vorschauausgang zu aktivieren. Dies aktiviert auf dem Systemsteuerungs-LCD automatisch das Keyer-Menü. Alternativ drücken Sie die KEYERS-Taste, um das Menü direkt aufzurufen.
2. Wählen Sie mithilfe des Reglers unterhalb von „Key-Art“ die Option „Luma“.
3. Drehen Sie die Regler für FÜLLQUELLE und KEY-QUELLE, um eine Füll- und Key-Quelle auszuwählen.

TIPP Alternativ können Sie die Füll- und Key-Quellen auch mit den entsprechenden Quellauswahltasten vorgeben.

4. Scrollen Sie nach Auswählen der Key-Art sowie Füll-und-Key-Quellen mit den Rechts- und Linkspfeiltasten durch die weiteren Menüpunkte und justieren Sie Key-Parameter wie die Einstellungen für Maske, Gain, Stanzschwelle, vormultiplizierte Keys usw. anhand der Regler.

Einrichten eines Luma/Linear-Keys für Upstream Keyer 1 auf dem Software-Bedienpanel

1. Erweitern Sie unter „Paletten“ das Menü „Upstream-Key 1“ und wählen Sie die Registerkarte „Luma“.
2. Wählen Sie die „Füllquelle“ und die „Key-Quelle“.

Um einen Luma-Key auszuführen, wählen Sie für Füllung und Stanze dieselbe Quelle aus.

Justieren Sie die Key-Parameter zur Feinabstimmung des Keys. Die Parameter für Luma-Keys sind in der nachfolgenden Tabelle näher beschrieben.

Parameter für mit Upstream-Keyern ausgeführte Luma/Linear-Keys:

Maske	Aktiviert eine rechteckige Maske, die sich mithilfe der jeweiligen Parameter oben, unten, links und rechts anpassen lässt.
Vormultiplizierter Key	Identifiziert das Stanzsignal als vormultiplizierten Key.
Stanzschwelle	Über diese Einstellung wird die Schwelle angepasst, anhand der das Stanzsignal sein Loch schneidet. Durch Verringern der des Stanzschwellenwerts wird mehr vom Hintergrund offenbart. Bei komplett schwarzem Hintergrundvideo ist der Stanzschwellenwert zu niedrig.

Gain	Durch Abstimmen des Gain-Faktors wird bestimmt, wie viele Anteile von der Hintergrund- und der Key-Füllquelle an den Kanten des Keys gemischt werden, um diese weichzuzeichnen. Passen Sie Gain an, bis die gewünschte Weichzeichnung erreicht ist, ohne dass die Leuchtdichte oder Helligkeit des Hintergrundvideos berührt wird.
Key invertieren	Invertiert das Stanzsignal. Was vorher ausgeschnitten wurde, wird nun eingefügt und umgekehrt.
Fliegender Key	Aktiviert bzw. deaktiviert digitale Videoeffekte, sog. DVE.

Ausführen eines Downstream-Luma- oder Linear-Keys

So richten Sie einen Luma/Linear-Key als Downstream-Keyer 1 auf einem ATEM Television Studio Mischer ein:

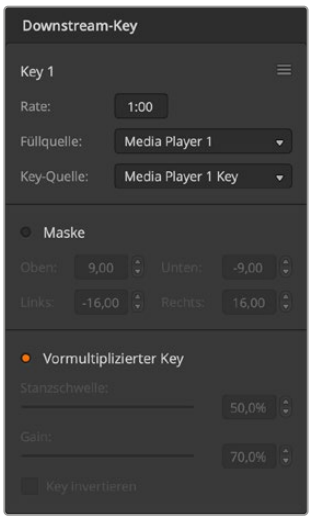
1. Drücken Sie die Taste DSK 1 TIE, um den Downstream-Keyer auf dem Vorschauausgang zu aktivieren. Dieser Vorgang ruft automatisch das Downstream-Key-Menü auf dem LCD auf. Alternativ drücken Sie die KEYERS-Taste und anschließend die Rechtspfeiltaste, um direkt auf das Menü zuzugreifen.
2. Drücken Sie die Multifunktionstaste DSK 1 oder DSK 2 und wählen Sie den zu verwendenden Downstream-Keyer.

TIPP Sie brauchen keine Key-Art vorzugeben, da ein Downstream-Keyer immer ein Luma-Key ist.

3. Wählen Sie mit den Drehreglern unterhalb des LCD-Menüs die Quellen für Füllung und Key. Alternativ verwenden Sie zum Auswählen der Füll- und Key-Quelle die entsprechenden Tasten Quellauswahltasten.
4. Scrollen Sie nach Auswählen der Füll-und-Key-Quellen mit den Rechts- und Linkspfeiltasten durch die weiteren Menüpunkte mit Key-Parametern wie den Einstellungen für Maske, Gain, Stanzschwelle, vormultiplizierten Keys usw.

Einrichten eines Luma- oder Linear-Keys für Downstream-Keyer 1 auf dem Software-Bedienpanel

1. Wählen Sie die Menüpalette „Downstream-Key 1“ aus.
2. Spezifizieren Sie die Füll- und Stanzquellen mit den als „Füllquelle“ und „Key-Quelle“ gekennzeichneten Dropdown-Steuerelementen. Um einen Luma-Key auszuführen, wählen Sie für Füllung und Stanze dieselbe Quelle aus.
3. Justieren Sie die Key-Parameter zur Feinabstimmung des Keys.

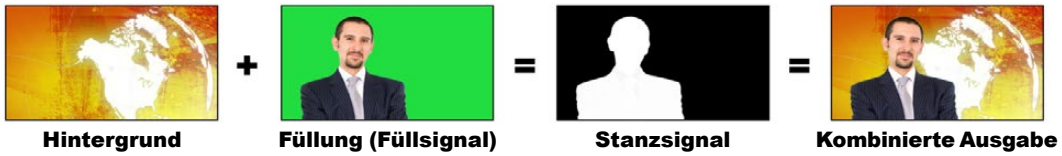


Einstellungen der Downstream-Keyer

Chroma-Key

Ein Chroma-Key dient bei Fernseh-Wettervorhersagen häufig dazu, den Eindruck zu erwecken, der Moderator befände sich vor einer riesigen Landkarte. In Wirklichkeit steht er aber vor einem blauen oder grünen Hintergrund im Studio. Für einen Chroma-Key werden mit einem speziellen Verfahren zwei Videobilder kombiniert. Dabei wird aus einem Bild die Farbe entfernt, was ein darunterliegendes Bild enthüllt. Diese Methode wird auch als Farb-Keying, farbbasierte Bildfreistellung, Farbstanzen, Greenscreen- oder Bluescreen-Technik bezeichnet.

Häufig werden als Hintergründe für Chroma-Keys mit dem Computer generierte Grafiken verwendet. Dafür lässt sich ein externer Computer mühelos an Ihren ATEM Mischer anschließen. Dies erfolgt über den HDMI-Ausgang des Computers oder mit einer Videokarte der Produktserien DeckLink oder Intensity von Blackmagic Design. Sie können dann Videoclips auf Ihrem ATEM Mischer abspielen. Wenn Sie einen grünen Hintergrund auf Ihre Animationen rendern, können Sie mit diesem Grün stanzen, um schnelle, saubere Animationen beliebiger Länge zu erstellen. Da es sich um computergeneriertes Grün handelt, ist es eine sehr kontrastarme Farbe, die ideal fürs Keying ist.



Kombinieren eines Hintergrunds mit Füllsignal und Chroma-Key

Hintergrund

Ein bildschirmfüllendes Bild. Bei einem Chroma-Key ist das häufig eine Wetterkarte.

Füllung

Das über das Hintergrundvideo zu legende Bild. Bei einem Chroma-Key stammt dieses Bild von der Kamera, die auf den Wettermoderator, der auf den Greenscreen zeigt, gerichtet ist.

Key/Stanze

Bei einem Chroma-Key wird das Key-/Stanzsignal aus dem Füllsignal generiert.

Ausführen eines erweiterten Chroma-Keys

Der ATEM Mischer bietet einen Advanced Chroma Keyer, d. h. einen erweiterten Keyer, mit präzisen Chromasampling- und Anpassungsoptionen. Diese Steuerelemente helfen Ihnen, optimale Keys und einen besseren Mix aus Vorder- und Hintergrund zu erzielen, um glaubwürdigere visuelle Effekte zu gestalten.

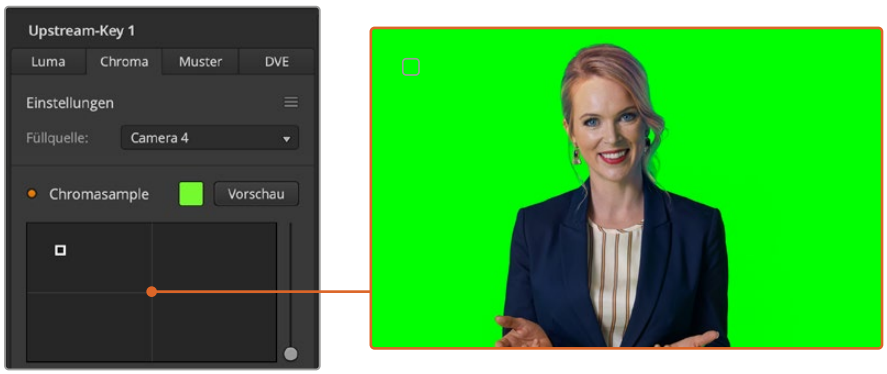
So richten Sie einen Chroma-Key als Upstream-Keyer 1 auf einem ATEM Television Studio Mischer ein:

1. Drücken Sie die Taste KEY 1, um Keyer 1 auf dem Vorschauausgang zu aktivieren. Dies aktiviert auf dem Systemsteuerungs-LCD automatisch das Keyer-Menü. Alternativ drücken Sie die KEYERS-Taste, um das Menü direkt aufzurufen.
2. Wählen Sie die Key-Art „Chroma“ mit dem entsprechenden „Key-Art“-Drehregler aus.
3. Wählen Sie ebenfalls mithilfe des entsprechenden LCD-Reglers die Füllquelle. Normalerweise ist diese Quelle das Bild von einer auf einen Moderator vor einem Greenscreen gerichteten Kamera oder eine in den Media Player geladene Grafik. Alternativ können Sie eine Füllquelle auch mit der entsprechenden Taste im Quellauswahl-Bus vorgeben.
4. Auf den Bildschirm mit den Chroma-Anpassungen greifen Sie anhand der Rechtspfeiltaste zu.
5. Klicken Sie auf die „Chromasample“-Schaltfläche.

So richten Sie einen Chroma-Key als Upstream-Keyer 1 auf dem Software-Bedienpanel ein:

1. Erweitern Sie die Menüpalette „Upstream-Key 1“ und wählen Sie in der „Key-Art“-Leiste „Chroma“ aus.
2. Wählen Sie die Füllquelle aus. Normalerweise ist diese Quelle das Bild von einer auf einen Moderator vor einem Greenscreen gerichteten Kamera oder eine in den Media Player geladene Grafik.
3. Klicken Sie auf die „Chromasample“-Schaltfläche.

   Bei aktiviertem Chromasampling wird ein neues Feld mit einem als Kästchen angezeigten Cursor angezeigt. Der Cursor ist auch in der Vorschauausgabe zu sehen.



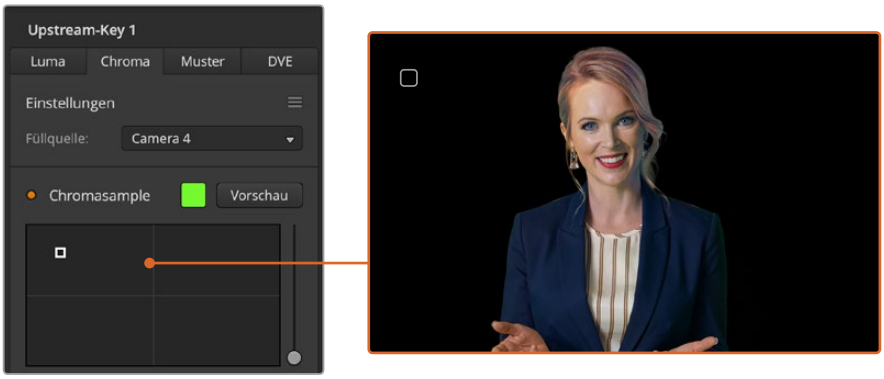
In der Einstellung „Chromasample“ können Sie das Cursor-Kästchen auf den Bildschirmbereich schieben, den Sie als Muster verwenden wollen

4. Klicken Sie auf das Cursor-Kästchen und ziehen Sie es an den als Muster zu verwendenden Bildbereich.

Wählen Sie hierfür einen repräsentativen Bereich aus, der ein möglichst breites Luminanzspektrum Ihres Greenscreens abdeckt. Die standardmäßige Größe des Cursor-Kästchens ist auf ebenmäßig ausgeleuchtete Greenscreens eingestellt und somit für die meisten passend. Treten in Ihrem Greenscreen große Farbtonvariationen auf, passen Sie die Größe des Kästchens an, indem Sie auf den Slider rechts vom Sample-Fenster klicken und ihn auf- oder abwärts ziehen. Verwenden Sie den entsprechenden Regler auf Ihrem Mischer, um die Position des Cursor-Kästchens zu verschieben und anhand der Z-Achse seine Größe zu verändern.

TIPP Beim Sampling von ungleichmäßigen Greenscreens empfiehlt es sich, zuerst eine Probe aus dem dunkelsten Bereich zu entnehmen. Vergrößern Sie erst danach das Kästchen des Cursors. So erzielen Sie einen präziseren Key.

Sie können Ihren Key jederzeit in der Vorschau sichten, indem Sie die „Vorschau“-Schaltfläche über dem „Chromasample“-Fenster aktivieren oder in der Systemsteuerung die entsprechende Taste über dem LCD für die Chromavorschau anklicken.



Über die „Vorschau“-Schaltfläche können Sie in der Vorschauausgabe prüfen, wie Ihr Key aussieht

Verfeinern Ihres Keys mithilfe von Key-Anpassungen

Wenn Sie ein brauchbares Chromasample erstellt haben, das das Gros Ihres Greenscreens entfernt, aber insgesamt die Vordergrundelemente beibehält, geht es an die Feinabstimmung Ihres Keys anhand der Key-Anpassungsbedienelemente. Um auf ATEM Television Studio Mischern zum Menü mit den Chroma-Anpassungen zu navigieren, drücken Sie die Rechtspfeiltaste.

Vordergrund

Justieren Sie mit dem „Vordergrund"-Slider bzw. -Drehregler die Opazität der Vordergrundmaske. Dies bestimmt die Stärke des Vordergrunds im Verhältnis zum Hintergrund. Durch Hochziehen des Sliders können Sie kleine transparente Bereiche im Vordergrundbild ausfüllen. Wir empfehlen beim Verschieben dieses Sliders sofort zu Stoppen, sobald der Vordergrund keine transparenten Stellen mehr aufweist.

Hintergrund

Der „Hintergrund"-Slider bzw. -Drehregler passt die Opazität des ausgestanzten Bildbereichs an. Füllen Sie anhand des Sliders kleine Vordergrundartefakte aus, die im zu entfernenden Bildbereich übriggeblieben sind. Wir empfehlen, den Slider so weit zu bewegen, bis der ausgestanzte Bereich durchgängig opak ist.

Key-Kante

Der „Key-Kante"-Slider bzw. Drehregler verschiebt die Kante Ihres Stanzbereichs nach innen oder außen. Dies erleichtert es, Hintergrundelemente unmittelbar von der Kante Ihres Vordergrunds wegzurücken bzw. den Vordergrund etwas auszudehnen, wenn der Key zu extrem ist. Sehr praktisch erweist sich dies besonders bei feinen Details wie Haarsträhnen. Wir empfehlen, den Slider solange zu verschieben, bis die Kante Ihres Keys weitgehend sauber ist und keine Hintergrundartefakte mehr sichtbar sind.

Mithilfe der Bedienelemente für die Key- oder Chroma-Anpassung lassen sich Ihre Vordergrundelemente sauber vom Hintergrund trennen.

Chromakorrektur anhand von Farbeinstreuungs- und Streulichtunterdrückung

Durch das von einem Greenscreen reflektierte Licht können grüne Kanten an Vordergrundelementen ebenso wie ein genereller Grünstich im Vordergrund bzw. Füllbild entstehen. Das nennt man Farbeinstreuung bzw. Spill und Streulicht. Anhand der „Chromakorrektur"-Einstellungen kann man von Farbeinstreuung und Streulicht beeinträchtigte Vordergrundbereiche verbessern. Diese Key-Bereiche lassen sich in den „Chromakorrektur"-Einstellungen korrigieren:

Spill

Justieren Sie den Spill-Slider, um die Farbtönung an den Kanten der Vordergrundelemente zu entfernen. Wie zum Beispiel ein durch Reflektionen vom Greenscreen verursachter Grünstich.

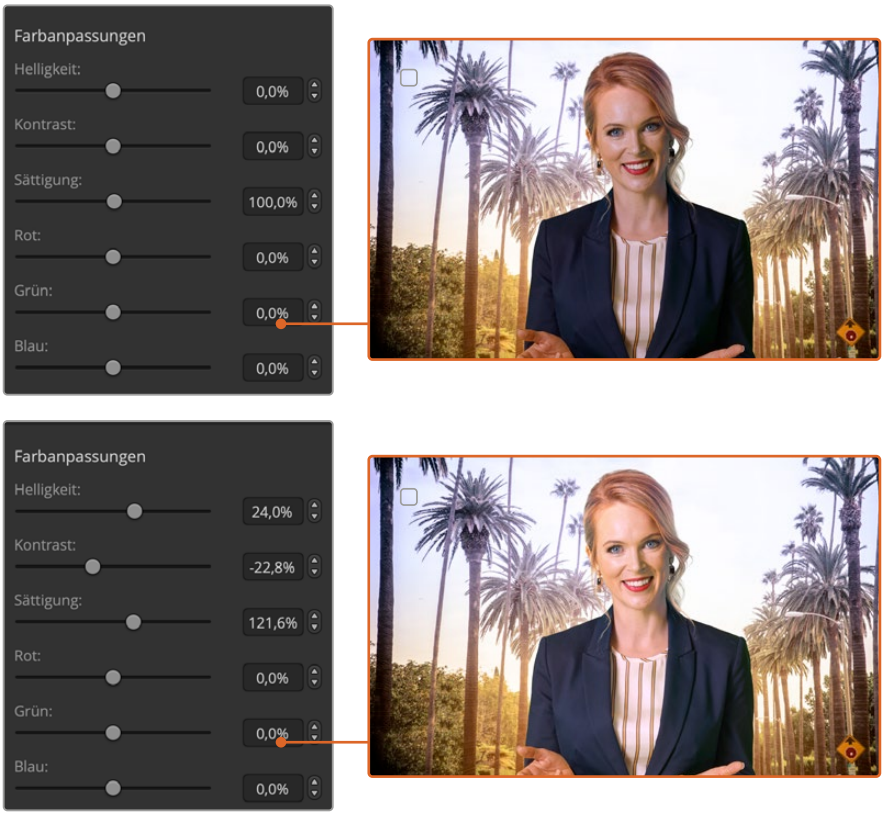
Reflexlichtunterdrückung

Streulichtunterdrückung entfernt gleichmäßig über alle Vordergrundelemente verteilte Grünstiche.

Anpassen von Vordergrund und Hintergrund

Wenn der Vordergrund zufriedenstellend von Ihrem Greenscreen getrennt ist und Sie die Spill- und Streulicht-Unterdrückung justiert haben, greifen Sie zu den Bedienelementen für Farbanpassungen, um Ihren Vordergrund an den Hintergrund anzupassen.

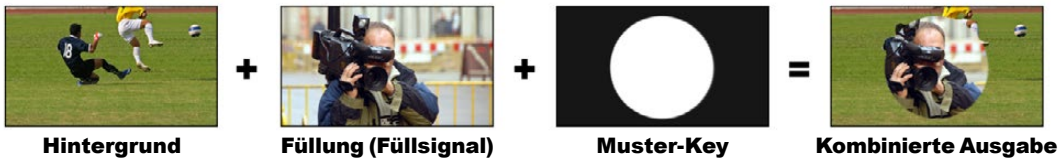
Justierungen an Helligkeit, Kontrast, Sättigung und Farbbalance Ihres Vordergrundbilds helfen, das Bild mit dem Hintergrund zu verschmelzen. So wirkt das Ganze glaubwürdiger.



Passen Sie mit diesen Farbabgleichseinstellungen den Vorder- und Hintergrund an

Muster-Key

Ein Muster-Key dient dazu, eine aus einem Bild ausgeschnittene geometrische Form auf ein anderes Bild gelegt anzuzeigen. Für einen Muster-Key wird das Key- bzw. Stanzsignal durch den internen Mustergenerator des Mischers erstellt. Zur Programmierung des gewünschten Stanzsignals kann der interne Mustergenerator 18 Formen von bestimmbarer Größe und Position erstellen.



Ein Hintergrundbild wird mit einem Füll- und Muster-Key kombiniert

Hintergrund

Der Hintergrund ist ein bildschirmfüllendes Bild.

Füllung

Ein anderes bildschirmfüllendes Bild, das auf das Hintergrundbild gelegt werden soll.

Key/Stanze

Für einen Muster-Key wird das Key- bzw. Stanzsignal durch den internen Mustergenerator des Mischers erstellt.

Ausführen eines Upstream-Muster-Keys

So richten Sie einen Muster-Key als Upstream-Keyer 1 auf einem ATEM Television Studio Mischer ein:

1. Drücken Sie die Taste KEY 1 für den nächsten Übergang, um den Key auf dem Vorschauausgang zu aktivieren. Dies aktiviert auf dem Systemsteuerungs-LCD automatisch das Keyer-Menü. Durch Drücken der Taste KEY 1 wird der Key mit dem nächsten Übergang verknüpft, sodass er auf Sendung geht, sobald der nächste Übergang ausgeführt wird.
2. Wählen Sie im LCD-Menü „Keyer“ mit dem entsprechenden Multifunktionsregler die Key-Art „Muster“.
3. Wählen Sie dann ebenfalls mit dem jeweiligen Regler oder durch Drücken einer Quelltaste im Quellauswahlbus eine Füllquelle aus.
4. Drehen Sie die entsprechenden Multifunktionsregler, um das gewünschte Muster für den Key sowie seine Größe vorzugeben.
5. Drücken Sie die Links- und Rechtspfeiltasten der Systemsteuerung, um durch die Parameter für den Muster-Key zu navigieren. Passen Sie die Einstellungen anhand der Steuerregler an. Überprüfen Sie die Verfeinerungen des Keys in der Vorschauausgabe.

TIPP Bei manchen Mustern kann der mittige Punkt umpositioniert werden. Verschieben Sie die Position des Musters mit dem jeweiligen Regler. Navigieren Sie zum Zurücksetzen der Musterposition zur Musterart-Einstellung. Ändern Sie dort das Muster und kehren Sie zu Ihrem ausgewählten Muster zurück, um seine Position auf die Standardeinstellung zurückzusetzen.

Einstellungen für Muster-Keys

So richten Sie einen Muster-Key als Upstream-Keyer 1 auf dem Software-Bedienpanel ein:

1. Erweitern Sie die Menüpalette „Upstream-Key 1“ und wählen Sie in der „Key-Art“-Leiste „Muster“ aus.
2. Wählen Sie die Füllquelle aus.
3. Wählen Sie das Key-Muster aus.
4. Justieren Sie zum Verfeinern des Keys die Key-Parameter. Die Parameter für Muster-Keys werden in der nachstehenden Tabelle beschrieben.

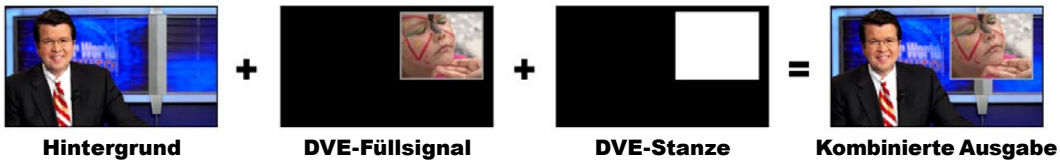
Größe	Vergrößert bzw. verkleinert die Dimension des selektierten Musters.
Symmetrie	Bei manchen Mustern lässt sich die Symmetrie oder das Seitenverhältnis anpassen. So können aus kreisförmigen Mustern horizontale oder vertikale Ellipsen gemacht werden.
Weichheit	Verändert die Weichzeichnung an der Kante des Stanzsignals.
Muster invertieren	Mit „Invertieren“ wird der Bereich umgekehrt, der mit der Füllquelle überdeckt wird. Füllen Sie bspw. den Bereich außerhalb eines Kreises, indem Sie einen kreisförmigen Wipe-Übergang wie gewünscht positionieren und dann „Invertieren“ aktivieren.
Fliegender Key	Aktiviert bzw. deaktiviert digitale Videoeffekte (DVE)

Anpassen der X-/Y-Position eines Musters

Bei manchen Mustern lässt sich der Mittelpunkt in eine andere Position bringen. Um ein Muster zu positionieren, navigieren Sie zum Musterauswahlmenü des Keyers, den Sie einrichten. Verschieben Sie das Muster mit den Funktionsreglern horizontal oder vertikal. Um das Muster erneut zu zentrieren, betätigen Sie die Musterauswahltaste im Pattern- bzw. Muster-Menü. Dies setzt die Position und Symmetrie des Musters zurück.

DVE-Key

DVE (Digitale Videoeffekte) dienen zur Erstellung von umrandeten Kästen für Bild-im-Bild-Effekte. Die meisten Modelle verfügen über einen Kanal mit 2D-DVE, der Größenanpassung und Umrandungen erlaubt und eine Schattenwurf-Funktion bietet.



Kombinieren eines Hintergrundbilds mit DVE-Füll- und DVE-Key/Stanzsignal

Hintergrund

Der Hintergrund ist ein bildschirmfüllendes Bild.

Füllung

Ein weiteres bildschirmfüllendes Bild, das größenreduziert oder mit einer Umrandung versehen auf den Hintergrund gelegt wird.

Key/Stanze

Für einen DVE-Key wird das Key-/Stanzsignal durch den internen DVE-Generator des Mischers erstellt.

Ausführen eines Upstream-DVE-Keys

So richten Sie einen DVE-Key als Upstream-Keyer 1 auf einem ATEM Television Studio Mischer ein:

1. Drücken Sie im Block mit den Tasten für den nächsten Übergang KEY 1, um den Keyer auf dem Vorschauausgang zu aktivieren.
2. Wählen Sie im LCD-Menü „Keyer“ mit dem entsprechenden Multifunktionsregler den DVE-Key.
3. Wählen Sie dann ebenfalls mit dem jeweiligen Regler oder mit einer Quelltaste im Quellauswahlbus eine Füllquelle aus.
4. Navigieren Sie mit den Rechts- und Linkspfeiltasten im Systemsteuerungsblock durch die DVE-Parameter und verwenden Sie die Multifunktionsregler, um Einstellungen wie Position, Größe, Maskenparameter, Lichtquelle, Rand und Keyframes für die Bewegung anzupassen.

TIPP Wenn Sie Ziffern für Einstellungen über den Ziffernblock vorgeben, halten Sie, um Negativwerte zuzulassen, die RESET-Taste einige Sekunden lang gedrückt. Ein erneutes Festhalten der Taste bringt die Standardwerte zurück.

Einrichten eines DVE-Keys für Upstream Keyer 1 auf dem Software-Bedienpanel

1 Erweitern Sie die Menüpalette „Upstream-Key 1“ und wählen Sie auf der „Key-Art“-Leiste „DVE“ aus.

2 Wählen Sie die Füllquelle aus.

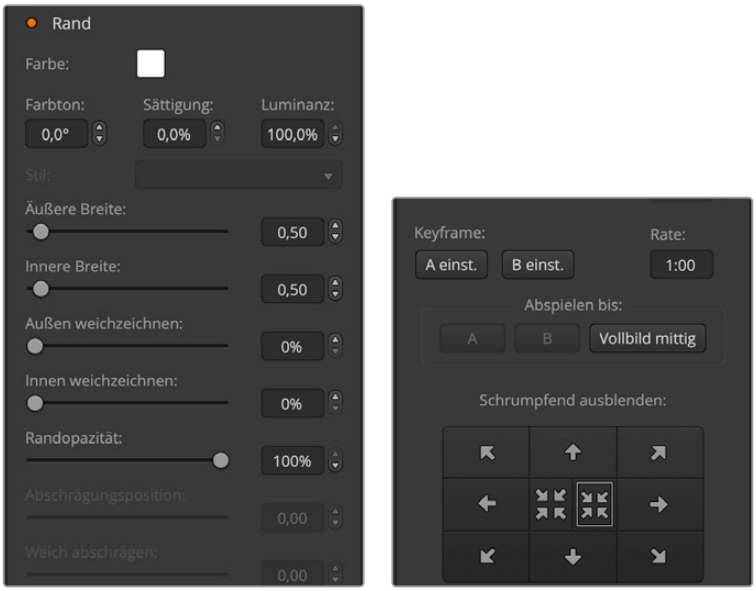
3 Justieren Sie die Key-Parameter zur Feinabstimmung des Keys. Die Parameter für DVE-Keys werden in der nachstehenden Tabelle beschrieben.

Einstellungen für DVE-Keys

DVE-Parameter

Füllquelle	Quelle für den anzupassenden DVE.
Größe	Die X- und Y-Werte passen die horizontale und vertikale Größe des DVE an.
Maske	Aktiviert eine rechteckige Maske, die sich mithilfe der jeweiligen Parameter oben, unten, links und rechts anpassen lässt.
Schatten	Passt den Einfallswinkel der Lichtquelle auf den DVE oder das Bild-im-Bild an. Eine Änderung dieser Einstellung wirkt sich auf die Umrandung und, sofern vorhanden, auf den Schattenwurf aus.

DVE mit Umrandungen versehen



Parameter für DVE-Umrandungen

Die Umrandungsparameter werden mithilfe der Regler und Multifunktionstasten bzw. Schaltflächen der Systemsteuerung angepasst. Da mehrere Parameter anzupassen sind, dienen die Weich/Farbe- und Shift-Schaltflächen zur Umschaltung auf die Parameter, die mit dem jeweiligen Button angepasst werden.

Rand	Aktiviert bzw. deaktiviert die Umrandung.
Farbe	Passt die Farbe der Umrandung an.
Farbton	Ändert den Farbton der Umrandung. Der Farbtonwert wird durch seine Position auf dem Farbrad dargestellt.
Sättigung	Ändert den Sättigungsgrad der Umrandungsfarbe.
Luma	Ändert die Leuchtdichte bzw. Helligkeit der Umrandungsfarbe.
Äußere Breite	Passt die äußere Breite der Umrandung an.
Innere Breite	Passt die Innenbreite der Umrandung an.
Außen weichzeichnen	Passt die Weichzeichnung der äußeren Kante der Umrandung an, die das Hintergrundvideo berührt.
Innen weichzeichnen	Passt die Weichzeichnung der Innenkante der Umrandung an. Dieser Weichzeichnungs-Parameter passt die Innenkante der Umrandung an, die das Video berührt.
Randopazität	Passt die Lichtdurchlässigkeit der Umrandung an. Verwenden Sie diese Einstellung zur Erstellung transparenter farbiger Umrandungen.

Key-Maskierung

Upstream- und Downstream-Keyer verfügen über eine anpassbare rechteckige Maske, mit der sich scharfe Kanten und sonstige Artefakte aus dem Videosignal ausschneiden lassen. Die Maske kann nach links, rechts, oben und unten gesteuert werden. Maskierung lässt sich auch als kreatives Werkzeug zur Erstellung rechteckiger Ausschnitte auf dem Bildschirm einsetzen.

Auf einem Hardware-Bedienpult erfolgt die Einrichtung einer Maske für jeden Upstream- und Downstream-Keyer über die Menüs EFFEKT-KEYS oder DSK-KEYS im Maskenmenü der Systemsteuerung.

Auf dem Software-Bedienpanel erfolgt die Einrichtung einer Maske für jeden Upstream- oder Downstream-Keyer über die Menüpaletten auf der „Einstellungen“-Registerkarte.

Fliegender Key

Für die Upstream-Key-Arten Luma, Chroma und Muster ist die Einstellung „Fliegender Key“ verfügbar. Bei verfügbarem DVE-Kanal können mit der Einstellung „Fliegender Key“ digitale Videoeffekte auf den Key angewendet werden.

Ausführen von Upstream-Keyer-Übergängen

Der Zugriff auf die Upstream-Keyer erfolgt über den Übergangs- oder den Systemsteuerungsblock. Upstream-Keyer lassen sich mithilfe der Tasten bzw. Schaltflächen unter „Next Transition“ bzw. „Nächster Übergang“ oder die ON- bzw. EIN-Buttons auf den Programmausgang legen und entfernen.

ON-Tasten und „ON AIR“-Schaltflächen

Schalten Sie Upstream-Keyer über den Programmausgang on bzw. off air, in dem Sie die ON-Tasten bzw. „ON AIR“-Schaltflächen wie folgt verwenden:

1. Betätigen Sie die ON-Tasten bzw. „ON AIR“-Schaltflächen über der entsprechenden KEY-Taste im Block „Next Transition“ bzw. „Nächster Übergang“, um den Upstream-Key auf dem Programmausgang abrupt ein- oder auszuschalten.
2. Die ON-Taste/„ON AIR“-Schaltfläche zeigt auch an, ob der Upstream-Keyer auf dem Programmausgang gegenwärtig ein- oder ausgeschaltet ist.

Tasten für den nächsten Übergang

Upstream-Keyer lassen sich mithilfe der Tasten bzw. Schaltflächen für den nächsten Übergang auf den Programmausgang legen oder entfernen.

1. Wählen Sie die gewünschten Elemente für den nächsten Übergang mit BKGD, KEY 1, KEY 2, KEY 3 und KEY aus.
2. Prüfen Sie die Vorschauausgabe, die Ihnen präzise anzeigt, wie Ihre Programmausgabe bei der Ausführung des Übergangs aussehen wird.
3. Um den Übergang auszuführen, aktivieren Sie CUT oder AUTO oder benutzen Sie den Blendenhebel.

Die folgenden Beispiele veranschaulichen verschiedene Methoden, wie man mehrere Keys auf den Programmausgang legt bzw. von diesem entfernt. Im nachstehenden Beispiel enthält KEY 1 den Grafik-Button LIVE oben links im Bild. KEY 2 hingegen enthält den Grafik-Button LIVE unten rechts im Bild.

Beispiel 1:

In diesem Beispiel ist gegenwärtig keiner der Upstream-Keyer auf Sendung. Für den nächsten Übergang ist KEY 1 ausgewählt. Somit ändert sich der Status von KEY 1 mit dem nächsten Übergang und wird aktiviert, sodass er in der Programmausgabe zu sehen ist.

Steuerblock mit den Tasten für den nächsten Übergang vor dem Übergang | Programmausgabe vor dem Übergang | Programmausgabe nach dem Übergang

Beispiel 2:

In diesem Beispiel zeigt die erleuchtete ON-Taste bzw. „ON AIR"-Schaltfläche an, dass KEY 1 gegenwärtig auf Sendung ist. Für den nächsten Übergang ist KEY 1 ausgewählt. Dies bedeutet, dass sich der Status von KEY 1 mit dem nächsten Übergang ändert und KEY 1 ausschaltet, sodass er in der Programmausgabe nicht sichtbar ist.

Steuerblock mit den Tasten für den nächsten Übergang vor dem Übergang | Programmausgabe vor dem Übergang | Programmausgabe nach dem Übergang

Beispiel 3:

In diesem Beispiel zeigen die erleuchteten ON-Tasten bzw. „ON AIR"-Schaltflächen an, dass KEY 1 und KEY 2 gegenwärtig auf Sendung sind. Für den nächsten Übergang ist das Hintergrundvideo ausgewählt, wie an der erleuchteten BKGD-Taste erkennbar ist. Dies bedeutet, dass beim nächsten Übergang nur das Hintergrundvideo wechselt und KEY 1 sowie KEY 2 auf Sendung bleiben.

Steuerblock mit den Tasten für den nächsten Übergang vor dem Übergang | Programmausgabe vor dem Übergang | Programmausgabe nach dem Übergang

Beispiel 4:

In diesem Beispiel sind KEY 1 und KEY 2 auf Sendung. Für den nächsten Übergang sind das Hintergrundvideo BKGD und KEY 2 ausgewählt. Dies bedeutet, dass beim nächsten Übergang das Hintergrundvideo und der Status von KEY 2 wechseln. KEY 2 wird ausgeschaltet, sodass er in der Programmausgabe nicht sichtbar ist.

Steuerblock mit den Tasten für den nächsten Übergang vor dem Übergang | Programmausgabe vor dem Übergang | Programmausgabe nach dem Übergang

Es gibt mehrere Methoden, um einen Key auf den Programmausgang zu legen. Ein Key lässt sich ein- oder ausschalten, auf- oder abblenden oder zusammen mit einem Hintergrundübergang auf- oder abblenden. Upstream-Keyer werden mithilfe der Tasten für den nächsten Übergang auf den Programmausgang gelegt. Die Überleitung von Downstream-Keyern erfolgt mithilfe eigener Übergangs-Tasten oder mithilfe der Taste DSK TIE, die den Übergang an den Haupt-Übergangssteuerblock binden.

Ausführen von Downstream-Keyer-Übergängen

Downstream-Keyer verfügen über eigene Übergangs-Tasten und Übergangsratenfenster. Nach erfolgter Konfiguration lässt sich ein Downstream-Keyer mit einer der drei folgenden Methoden leicht auf den Programmausgang legen bzw. von diesem entfernen:

1. Drücken Sie die Taste DSK CUT, um einen Downstream-Keyer auf dem Programmausgang abrupt ein- oder auszuschalten.
2. Benutzen Sie die Taste DSK AUTO, um einen Downstream-Keyer schrittweise mit der im DSK-Rate-Fenster angezeigten Rate auf den Programmausgang überzuleiten bzw. von diesem zu entfernen.
3. Benutzen Sie den Button DSK TIE, um den Downstream-Key an den Haupt-Übergangssteuerblock zu binden. Nach erfolgter Anbindung des DSKs wird dieser zusammen mit einer beliebigen, im Haupt-Übergangssteuerblock ausgewählten Übergangsart mit der im Übergangssteuerblock spezifizierten Rate ein- oder ausgeblendet.

   Durch Aktivierung des Buttons DSK TIE wird die Anzeige des Downstream-Keyers auf der Vorschauausgabe bewirkt.

   Ein an den Haupt-Übergangssteuerblock gebundener Downstream-Keyer-Übergang kann nicht in der Vorschau betrachtet werden. Ist der Button DSK TIE bei Umschaltung auf den Übergangsvorschau-Modus aktiviert, wird die Anbindefunktionalität ignoriert, bis der Übergangsvorschau-Modus ausgeschaltet ist.

DSK-Parameter

Stanzschwelle	Über diese Einstellung wird die Schwelle angepasst, anhand der das Stanzsignal sein Loch schneidet. Durch Verringern der Stanzschwelle wird mehr vom Hintergrund offenbart. Bei komplett schwarzem Hintergrundvideo ist der Stanzschwellenwert zu hoch.
Gain	Durch Abstimmen des Gain-Faktors wird bestimmt, wie viele Anteile von der Hintergrund- und der Key-Füllquelle an den Kanten des Keys gemischt werden, um diese weichzuzeichnen. Passen Sie Gain an, bis die gewünschte Weichzeichnung erreicht ist, ohne dass die Leuchtdichte (Helligkeit) des Hintergrundvideos berührt wird.
Rate	Die Mix-Rate gibt den Zeitraum vor, in dem der Downstream-Keyer auf- oder abgeblendet wird.
Key invertieren	Invertiert das Stanzsignal. Was vorher ausgeschnitten wurde, wird nun eingefügt und umgekehrt.
Vormultiplizierter Key	Identifiziert das Stanzsignal als vormultiplizierten Key.

Streaming

Mit Ihrem ATEM Mischer können Sie mithilfe spezieller Tasten auf dem Bedienpanel direkt auf Plattformen wie YouTube und Twitch streamen. Um mit dem Streamen zu beginnen, müssen Sie in ATEM Software Control zunächst einen Streamschlüssel einrichten.

Einholen eines Streamschlüssels

Wählen Sie in ATEM Software Control die zu verwendende Plattform und geben Sie alle relevanten Einstellungen für Ihren Stream vor. Wenn Sie eine Sendung auf einem Kanal einrichten, den Sie regelmäßig verwenden, werden diese Einstellungen auf Ihrem Mischer gespeichert. Somit können Sie vom Mischer jederzeit auch über eine andere Internetverbindung direkt senden.

Dieser Abschnitt erläutert die Vorgehensweise zum Konfigurieren der Einstellungen für YouTube Studio und Twitch.

TIPP Beim Einrichten Ihrer Sendung empfiehlt es sich, auch gleich eine Standby-Grafik in den Media Player in ATEM Software Control zu laden, um damit schnell einen Test auszuführen, bevor Sie auf Sendung gehen. Schalten Sie die Grafik hierfür auf den Programmausgang.

Konfigurieren von Einstellungen für Blackmagic Cloud

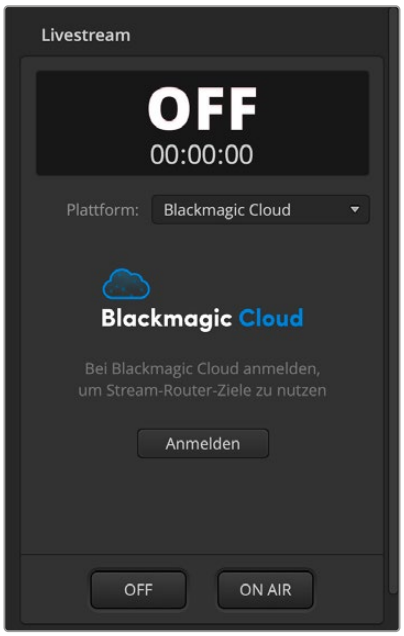
Der Blackmagic Cloud Stream Router ist ein virtueller Videorouter, mit dem Sie Live-SRT- und RTMP-Videostreams über Blackmagic Cloud verbinden und routen können.

Bevor Sie mit dem Streaming beginnen können, muss Ihrem Profil in Blackmagic Cloud eine Stream-Router-Quelle zugewiesen sein. Dies erfolgt über ein persönliches oder ein Unternehmensprofil in Ihrem Blackmagic Cloud-Konto oder indem Ihnen eine Quelle durch einen anderen Blackmagic Cloud-Benutzer zugewiesen wird.

Sobald ein Quelleneingang konfiguriert ist, können Sie mit dem Streamen beginnen.

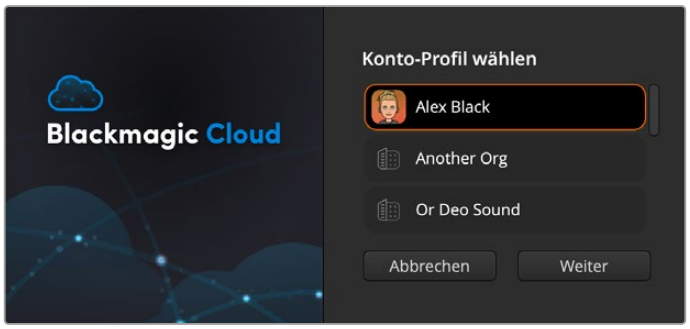
So streamen Sie an Blackmagic Cloud:

1. Öffnen Sie die „Livestream“-Palette und klicken Sie auf das „Plattform“-Menü.
2. Wählen Sie aus der Liste „Blackmagic Cloud“ aus. Wenn Sie nicht bereits in Blackmagic Cloud angemeldet sind, klicken Sie auf den Butten „Anmelden“.



3 Geben Sie im „Anmelden“-Fenster Ihre Details in die E-Mail- und Passwortfelder ein und klicken Sie auf „Anmelden“. Alternativ klicken Sie oben rechts auf die Option „Login über das Internet“, um sich über einen Webbrowser anzumelden.

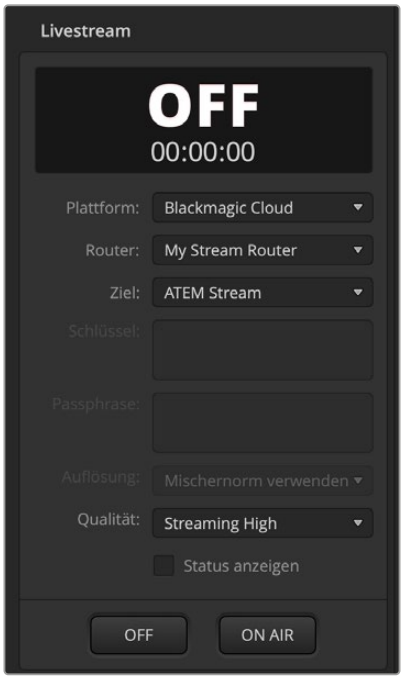
4 Wählen Sie das Blackmagic Profil aus, an das Sie streamen möchten. Dies kann ein persönliches oder ein Unternehmensprofil sein.



5 Klicken Sie auf „Fertig“, um das Einstellungsfenster zu schließen und zur Live-Stream-Palette zurückzukehren.

Nach der erfolgreichen Anmeldung werden die verfügbaren Stream-Router-Ziele in der Liste angezeigt.

6 Wählen Sie den Router und das Ziel für den Stream aus den Menüs aus. Wenn Ihnen nur ein Stream-Router-Ziel zugewiesen wurde, wird dieses Ziel standardmäßig im Menü angezeigt.



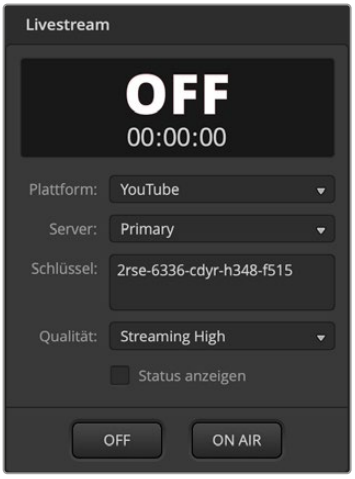
Um den Stream zu starten, klicken Sie auf ON AIR oder drücken am Mischer die ON AIR-Taste. Ist Ihre Sendung zu Ende, brechen Sie die Übertragung ab, indem Sie auf den OFF-Button klicken oder am Mischer die OFF-Taste drücken. Sobald Sie einen Stream-Router-Eingang ausgewählt haben, bleibt die Verbindung bestehen, auch wenn Ihr Live-Stream auf „Off“ gesetzt ist. Wenn Sie den Stream-Router-Eingang am Ende Ihrer Produktion freigeben möchten, wählen Sie „Keine“ aus der Router- oder Zielliste aus.

TIPP Beim Einrichten Ihrer Sendung empfiehlt es sich, auch gleich eine Standby-Grafik in den Media Player in ATEM Software Control zu laden und zum Testen auf den Programmausgang zu schalten, bevor Sie die Grafik on air schalten.

Konfigurieren der Einstellungen für YouTube Studio

1. Melden Sie sich in Ihrem YouTube-Konto an. Klicken Sie im Menü „Erstellen“ auf „Live gehen“.
2. Wenn aufgefordert, geben Sie vor, ob der Livestream „sofort“ oder „später“ beginnen soll. Wählen Sie aus den Optionen die gewünschte Streaming-Software aus.
3. Klicken Sie neben dem Stream-Titel auf „Bearbeiten“, um Stream-Angaben wie Name und Beschreibung zu bearbeiten und Ihre Zielgruppe festzulegen.
4. Geben Sie die passende Zielgruppeneinstellung vor und klicken Sie auf „Speichern“.
5. Oben rechts im Vorschau-Fenster erscheint ein automatisch generierter Streamschlüssel. Klicken Sie auf das Icon, um den Streamschlüssel zu kopieren.

Fügen Sie den kopierten Streamschlüssel für Ihre Sendung dann in ATEM Software Control in das Feld mit den Stream-Informationen ein.



1. Klicken Sie in den Menüpaletten in ATEM Software Control auf die „Ausgabe“-Registerkarte. Öffnen Sie die „Livestream“-Palette.
2. Stellen Sie als Plattform YouTube ein, indem Sie auf das Menü klicken und in der Menüliste „YouTube“ auswählen. Geben Sie für den Server „Primär“ vor.
3. Fügen Sie den aus YouTube kopierten Streamschlüssel in die „Schlüssel“-Einstellung ein.
4. Setzen Sie die Streaming-Qualität auf niedrig, mittel oder hoch. Dies gibt zugleich die Ausgabequalität für Aufzeichnungen über den USB-C-Port vor.
5. Nun, da alle Streaming-Angaben vorgegeben sind, empfiehlt sich ein schneller Test, um alles zu prüfen. Drücken Sie die „ON AIR“-Taste an Ihrem Mischer oder klicken Sie in der „Livestream“-Palette auf ON AIR.

Jetzt ist YouTube Studio sendebereit. Es kann einen Moment dauern, bis der Puffer initialisiert wird. Nach erfolgter Zwischenspeicherung erscheint im YouTube Studio Manager die „Livestream starten“-Schaltfläche. Die brauchen Sie bloß anzuklicken.

Und schon wird Ihr Stream gesendet!

Um zu testen, ob alles rund läuft, klicken Sie auf das „Teilen“-Icon. Kopieren Sie den Link und geben Sie ihn in Ihrem Internetbrowser in ein neues Fenster oder einen neuen Tab ein. So bekommen Sie Ihren Livestream angezeigt, wie ihn auch Ihr Publikum sehen würde.

Ist Ihre Sendung zu Ende, brechen Sie die Übertragung ab, indem Sie am Mischer die Stream-Taste OFF drücken.

Konfigurieren der Einstellungen für Twitch

1. Melden Sie sich in Ihrem Twitch-Account an. Klicken Sie oben rechts auf der Seite auf Ihren Account-Avatar.
2. Klicken Sie auf „Creator-Dashboard“.
3. Wählen Sie in den Einstellungen die Option „Stream“.
4. Es wird automatisch ein primärer Streamschlüssel erstellt. Klicken Sie auf „Kopieren“.

Fügen Sie den kopierten Streamschlüssel für Ihre Sendung dann in ATEM Software Control in das Feld mit den Stream-Informationen ein.

1. Klicken Sie in den Menüpaletten in ATEM Software Control auf die „Ausgabe“-Registerkarte. Öffnen Sie die „Livestream“-Palette.
2. Stellen Sie als Plattform Twitch ein, indem Sie auf das Menü klicken und in der Menüliste „Twitch“ wählen.
3. Klicken Sie in der Menüliste auf die Einstellung „Server“ und wählen Sie den nächstgelegenen Server zu Ihrem Standort.
4. Fügen Sie den aus Twitch kopierten Streamschlüssel in die „Schlüssel“-Einstellung ein.
5. Setzen Sie die Streaming-Qualität auf niedrig, mittel oder hoch. Dies gibt zugleich die Ausgabequalität für Aufzeichnungen über den USB-C-Port vor.
6. Nun, da alle Streaming-Angaben vorgegeben sind, empfiehlt sich ein schneller Test, um alles zu prüfen. Drücken Sie die „ON AIR“-Taste an Ihrem ATEM Mischer oder klicken Sie in der „Livestream“-Palette auf ON AIR

Damit sind Sie auf Sendung! Um Ihre Sendung zu prüfen, klicken Sie auf Ihren Account-Avatar und wählen Sie „Zurück zu Twitch“. Klicken Sie dann im Twitch-Hauptfenster erneut auf Ihren Account-Avatar und wählen Sie „Kanal“. Nun ist Ihre Sendung auf Ihrem Kanal zu sehen und über dem Fenster erscheint die Live-Anzeige.

Direktstreaming über Ihre Computer-Internetverbindung

Nachdem Sie ATEM Software Control mit Ihrem Mischer verbunden haben, richten Sie direktes Streaming über die Internetverbindung Ihres Computers ein. Wenn keine Kabelverbindung verfügbar ist, können Sie so die WLAN-Internetverbindung Ihres Computers verwenden.

So richten Sie Ihren ATEM Mischer für Softwaresteuerung und Direktstreaming ein:

1. Verbinden Sie Ihren ATEM Mischer mit einem freien Ethernet-Port an Ihrem Computer. Es mag einen Moment dauern, bis das DHCP das Gerät findet und ihm eine IP-Adresse zuweist.
2. Starten Sie ATEM Software Control.
3. Dort wird Ihr ATEM Television Studio Mischer nun als ein in Ihr Netzwerk eingebundener ATEM Mischer aufgeführt. Wählen Sie Ihren Mischer einfach aus der Liste aus.
4. Klicken Sie auf „Verbinden“.
5. Konfigurieren Sie Ihren Computer so, dass die Internetverbindung über Ethernet freigegeben ist.

So konfigurieren Sie die Internet-Freigabe auf einem Mac-Computer: Klicken Sie in den Systemeinstellungen auf „Freigaben“ und dann in der Liste der Dienste auf „Internetfreigabe“. Ist Ihr Mac über WLAN mit dem Internet verbunden, wählen Sie aus dem Drop-down-Menü „Verbindung teilen:“ die Option „WLAN“. Setzen Sie in der Liste „Mit Computern über:“ einen Haken bei „Ethernet“ und einen weiteren in der Liste der Dienste bei „Internetfreigabe“. Wenn Sie gefragt werden, ob Sie die Internetfreigabe wirklich aktivieren möchten, klicken Sie auf „Start“.

So konfigurieren Sie die Internet-Freigabe auf einem Windows-Computer: Geben Sie ins Windows-Suchfeld „Netzwerkeigenschaften anzeigen“ ein und drücken Sie die Entertaste. Führen Sie einen Rechtsklick auf der Internetverbindung aus und klicken Sie auf „Eigenschaften“. Erlauben Sie anderen Benutzern im Netzwerk unter „Netzwerk- und Freigabecenter“, die Internetverbindung dieses Computers zu nutzen. Wählen Sie im Menü eine Netzwerkverbindung und klicken Sie auf „OK“.

Die Schaltflächen und Anzeigen in ATEM Software Control leuchten nun. Sie können Ihren Mischer nun genauso betreiben wie über den USB-C-Port. Ihr ATEM Mischer ist nun zum direkten Streaming über Ihren Computer eingerichtet.

Smartphone-Tethering

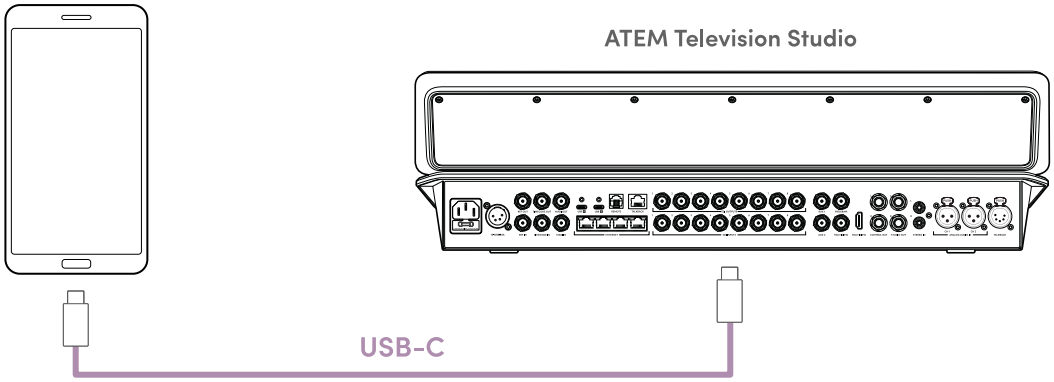
Nachdem Sie Ihren ATEM Mischer fürs Streaming an YouTube, Twitch oder andere Plattformen eingerichtet haben, können Sie über Ihr Smartphone direkt streamen. So können Sie sich im Nu einrichten und von jedem Ort in alle Welt streamen. Dazu ist lediglich eine 4G- oder 5G-Mobilfunkverbindung oder eine WLAN-Verbindung erforderlich, die umgekehrtes Tethering unterstützt.

1. Schließen Sie Ihr Smartphone einfach an einen der USB-C-Ports Ihres Mischers an.
2. Stellen Sie danach sicher, dass der Hotspot auf Ihrem Smartphone aktiviert ist.

Gehen Sie auf iOS-Geräten zu „Einstellungen“ > „Persönlicher Hotspot“, um sicherzustellen, dass die Option „Zugriff für andere erlauben“ aktiviert ist.

Wischen Sie auf Android-Geräten vom oberen Rand nach unten, um ins Quick-Menü zu gelangen. Tippen Sie auf das Hotspot-Icon und halten Sie es gedrückt, um dann USB-Tethering zu aktivieren.

Nun können Sie die „ON AIR“-Taste an Ihrem ATEM Mischer drücken und live gehen.



Wenn Ihr ATEM Mischer sowohl über Ethernet als auch über ein Smartphone verbunden ist, können Sie in ATEM Setup über die Verbindungspriorität bestimmen, mit welcher Verbindung gestreamt wird.

Zusätzliche Features des ISO-Modells

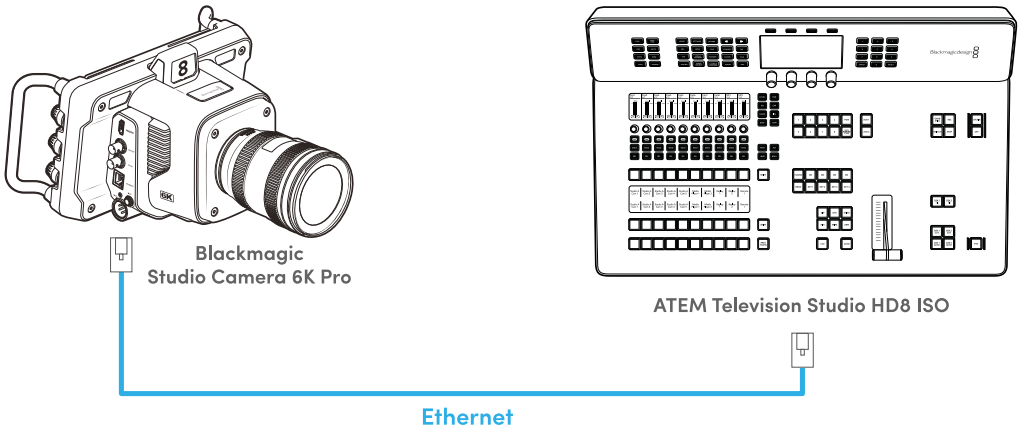
ATEM Television Studio HD8 ISO Mischer verfügen über zusätzliche Funktionen mit mehr Optionen für Ihre Sendung. Diese umfassen die separate Aufzeichnung des Signals von jedem Eingang und, beim Streamen per Ethernet, die Verbindung mit ortsfernen Quellen. Somit können Sie zusätzliche Kameras auf Ihrem lokalen Netzwerk oder von anderen Orten auf der Welt einbinden.

In manche Blackmagic Design Kameras, bspw. die Blackmagic Studio Camera 6K Pro und die URSA Broadcast G2, ist eine Streaming-Engine verbaut, die die Kamera befähigt, direkt an den ATEM Television Studio HD8 ISO zu streamen.

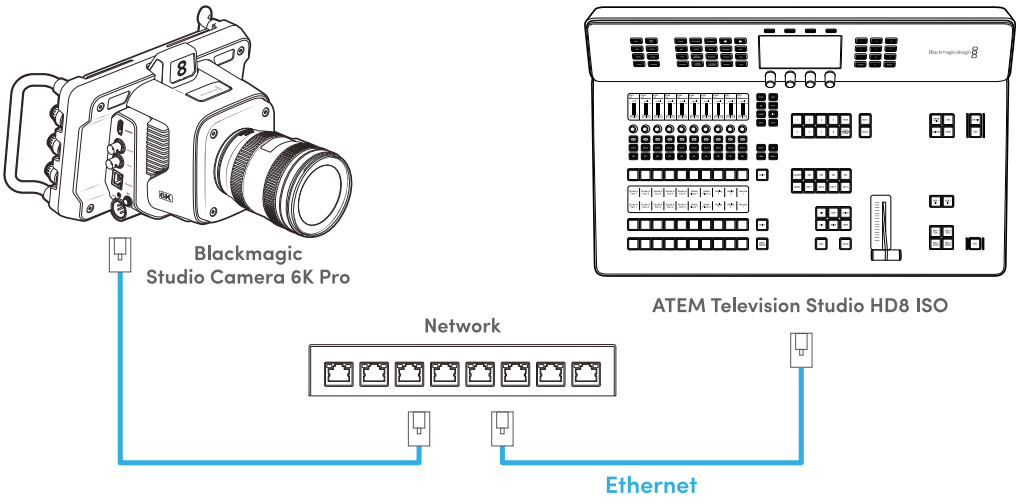
Verbinden von Remote-Quellen über ein lokales Netzwerk

Der ATEM Television Studio HD8 ISO und die Blackmagic Studio Camera 6K Pro sind beide standardmäßig auf DHCP eingestellt. Sobald Sie beide über Ethernet verbunden haben, sind es nur noch wenige Schritte zum Streamen.

Direkte Verbindung



Verbindung über einen Netzwerk-Switch

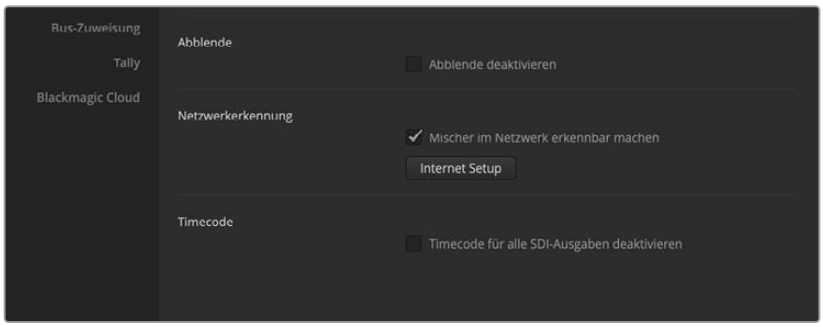


Versichern Sie sich zunächst, dass Ihr Mischer auf dem Netzwerk zu sehen ist, indem Sie die allgemeinen Einstellungen in ATEM Software Control prüfen.

1 Starten Sie ATEM Software Control.

2 Öffnen Sie das Menü „Einstellungen“, indem Sie unten links auf das Zahnradsymbol klicken.

3 Gehen Sie dann zur letzten Einstellung im Tab „Allgemein“ und vergewissern Sie sich, dass die Option, die den Mischer im Netzwerk erkennbar macht, aktiviert ist.

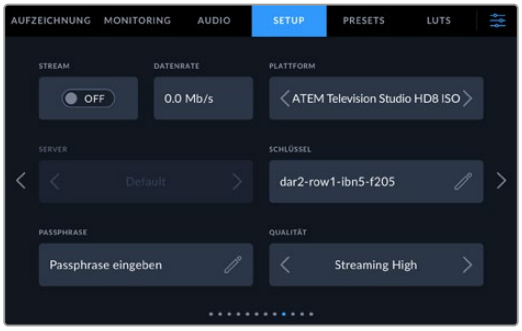


Wenn Sie sicher sind, dass Ihr Mischer im Netzwerk erkennbar ist, können Sie Ihre Kameras einrichten. Bei Verwendung eines lokalen Netzwerks identifiziert der Mischer einzelne Kameras anhand des Kameranamens auf der digitalen Filmtafel. Werden mehrere Quellen angeschlossen, empfiehlt es sich daher, jeder Kamera einen anderen Kameranamen zu geben, bspw. A, B, C oder Cam 1, Cam 2 usw. Dann sind sie mischerseitig besser erkennbar. Näheres zum Einrichten von Kameranamen finden Sie im Abschnitt „Eingeben von Metadaten“ in der Bedienungsanleitung Ihrer Kamera.

So starten Sie das Streamen von der Kamera:

1 Drücken Sie die MENU-Taste auf Ihrer Kamera und tippen Sie auf den SETUP-Tab.

2 Navigieren Sie im SETUP-Tab zu den Livestream-Einstellungen und wählen Sie unter „Plattform:“ den ATEM Television Studio HD8 ISO.



3 Tippen Sie auf den „Streamen“-Button, um den Stream zu starten. Den laufenden Stream erkennen Sie am nun blau leuchtenden Schriftzug „Live“. Wenn Sie die Streamdaten auf Ihrer Kamera aktiviert haben, werden Informationen zur Datenrate in der Blickfeldanzeige (HUD) eingeblendet.

Auswählen der Eingabe

Sobald Sie von der Kamera aus streamen, können Sie diese in ATEM Software Control im „Quellen“-Tab als Eingabequelle vorgeben.

So geben Sie eine Remote-Quelle als Eingabe vor:

1 Wählen Sie in ATEM Software Control im Menü „Einstellungen“ den „Quellen“-Tab.

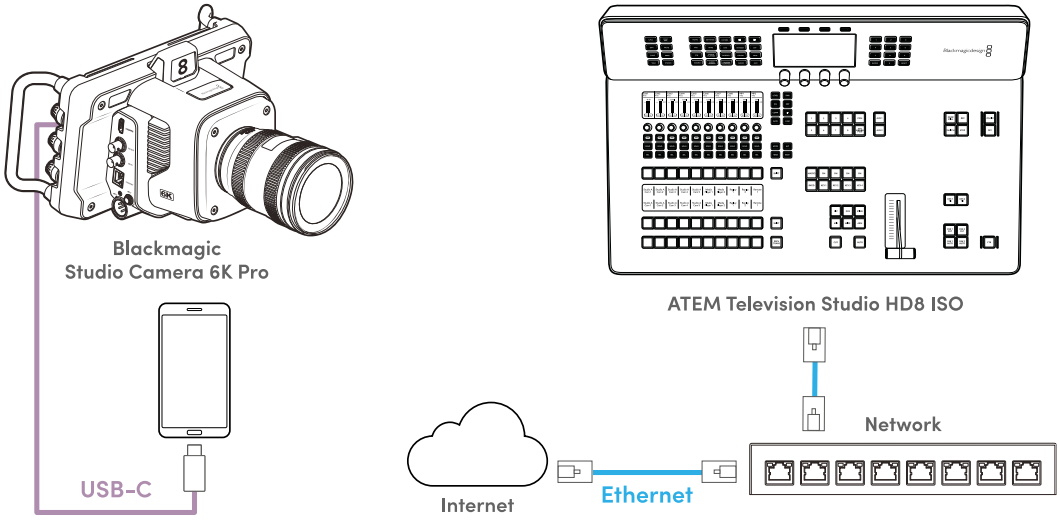
2 Klicken Sie auf das Menü neben Eingang 1. Die Kamera erscheint nun unter der Kamera-ID aus der digitalen Filmtafel in der Liste.

3 Wählen Sie die Quelle aus. Sobald Sie den Eingang ausgewählt haben, sollte das Kamerasignal nun in Ihrer Multiview-Ansicht erscheinen. Sie können den Eingang nun so nutzen wie jeden anderen SDI-Eingang.

Um Tally und Kamerasteuerung zu aktivieren, richten Sie Ihre ATEM Kamera-ID mit der gleichen Nummer ein, wie der Eingang, dem die Kamera auf dem Mischer zugewiesen wurde. Auf diese Weise erkennt die Kamera das Tallysignal für den Eingang und Sie können Änderungen anhand der Einstellungen „Kamerasteuerung“ auf dem Mischer oder in ATEM Software Control vornehmen. Sobald ein Eingang zugewiesen wurde und die Kamera zu streamen beginnt, richten Blackmagic Studio Cameras eine passende Kamera-ID für diesen Eingang ein. Bei anderen Kameras lässt sich die ATEM Kamera-ID nur ändern, wenn die Kamera nicht streamt. Demnach sollte der Operator den Vorgang stoppen und nach erfolgter Einrichtung einer korrekten ID erneut starten. Näheres zum Einrichten einer ATEM Kamera-ID finden Sie in der Bedienungsanleitung Ihrer Blackmagic Design Kamera. Näheres zum Einrichten einer ATEM Kamera-ID finden Sie in der Bedienungsanleitung Ihrer Blackmagic Design Kamera.

Verbinden von Remote-Quellen über das Internet

Mit ATEM Television Studio HD8 ISO Mischern können Sie auch ortsferne Quellen von überall auf der Welt hinzufügen. Somit kann ein Remote-Nutzer sein Kamerasignal über das Internet streamen. Benutzt wird dafür wahlweise eine statische Ethernet-Verbindung oder eine per Smartphone-Tethering erstellte Verbindung. Sie können einen Schlüssel in ATEM Software Control erstellen und eine XML-Datei mit den erforderlichen Verbindungsinformationen exportieren. Schicken Sie die XML-Datei per E-Mail an den Kameraoperator, der die Datei dann in seine Kamera importiert und sofort mit dem Streamen beginnen kann.



Beim Erstellen eines Streamschlüssels müssen Sie zu allererst sicherstellen, dass Ihr Mischer für externe Netzwerke sichtbar ist.

1 Öffnen Sie in ATEM Software Control „Einstellungen“, indem Sie unten links auf das Zahnradsymbol klicken.

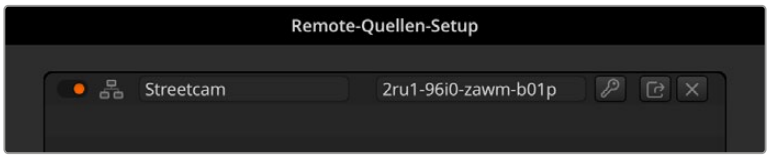
2 Klicken Sie im Tab „Allgemein“ unter „Netzwerkerkennung“ auf „Internet einrichten“.

3 Klicken Sie auf „Automat. erkennen“ Ihr ATEM Television Studio HD8 ISO analysiert die Internetverbindung und zeigt die öffentliche IP-Adresse des Mischers, den ausgewählten Port und den Internetstatus an. Wird „Global sichtbar“ angezeigt, ist alles einsatzbereit. Wenn in der Internetstatus-Anzeige die Meldung „Portweiterleitung fehlgeschlagen“ erscheint, ist möglicherweise eine weitere Konfiguration für Ihr Netzwerk oder vonseiten des Internetanbieters erforderlich. Bitten Sie in diesem Fall Ihren Internetanbieter oder Netzwerkadministrator, die Portweiterleitung für Ihre Internetverbindung auf „TCP Port 1935“ einzurichten. Diese Fachleute wissen, wie man das macht.

4 Erscheint in der Statusanzeige „Global sichtbar“, klicken Sie auf „Fertig“. Nun können Sie über den „Quellen“-Tab im Einstellungen-Fenster einen Streamschlüssel generieren.

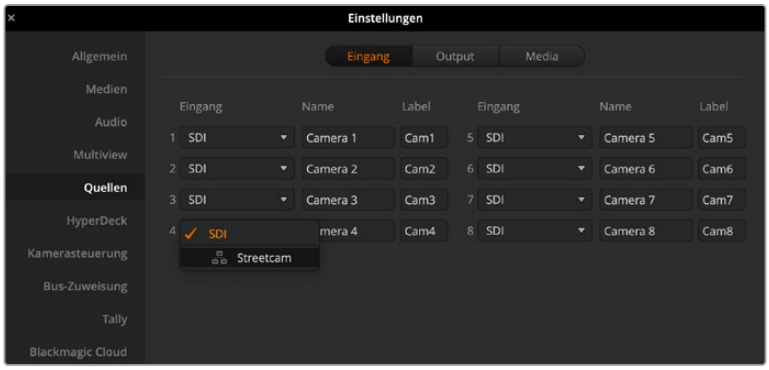
5 Klicken Sie links auf „Quellen“ und danach unten im Fenster auf „Remote-Quellen-Setup“.

6 Klicken Sie unten im Fenster auf „Quelle manuell hinzufügen“. Daraufhin erscheint im Setup-Fenster ein Schlüssel. Um den Quellennamen zu ändern, klicken Sie in das Textfeld. Möglicherweise hilft es bei der Auswahl einer Remote-Quelle im „Quellen“-Tab, den standardmäßigen Namen durch einen leichter identifizierbaren zu ersetzen. Ein Klick auf das Schlüssel-Symbol generiert ein neues Passwort.



7 Klicken Sie auf den „Freigabe“-Button und folgen Sie den Anweisungen zum Speichern der Einstellungen in einer XML-Datei. Speichern Sie die XML-Datei und schicken Sie die Datei dann per E-Mail an den Kameraoperator. Der Kameraoperator kann die erhaltene Datei nun auf einen USB-Speicher oder eine SD-Karte speichern und sie in die Kamera importieren.

8 Sobald ein Streamschlüssel generiert wurde, können Sie die Quelle über das „Eingang“-Menü wählen. Es ist also möglich, den Eingang zuzuweisen, ehe die Remote-Kamera zu streamen beginnt. Sobald die Kamera streamt, erscheint das Signal in Ihrer Multiview-Ansicht. Wählen Sie im „Quellen“-Tab unter „Eingang“ einen Eingang aus der Liste, indem Sie auf den Quellnamen klicken, für den Ihr soeben exportierter Streamschlüssel gilt.



9 Zusätzlich zu Ihrer E-Mail mit dem Streamschlüssel können Sie dem Operator mitteilen, welchen Eingang Sie zugewiesen haben, damit er die ATEM Kamera ID für den entsprechend nummerierten Eingang einstellt. Wenn die ATEM Kamera-ID mit der Eingangsnummer des Mischers übereinstimmt, erkennt die Kamera das Tally-Signal für diesen Eingang. Das Tally an Ihrer Kamera funktioniert dann ordnungsgemäß. Änderungen können über die „Kamerasteuerung“-Einstellungen auf dem Mischer oder in ATEM Software Control vorgenommen werden. Bei Blackmagic Studio Cameras aktualisiert sich die ATEM Kamera-ID automatisch, sobald die Kamera einem Eingang zugewiesen ist und zu streamen beginnt.

Näheres zum Einrichten einer ATEM Kamera-ID oder zum Importieren einer XLM-Datei finden Sie in der Bedienungsanleitung zum jeweiligen Blackmagic Kameramodell.

Anschließen von Quellen von einem Stream-Router

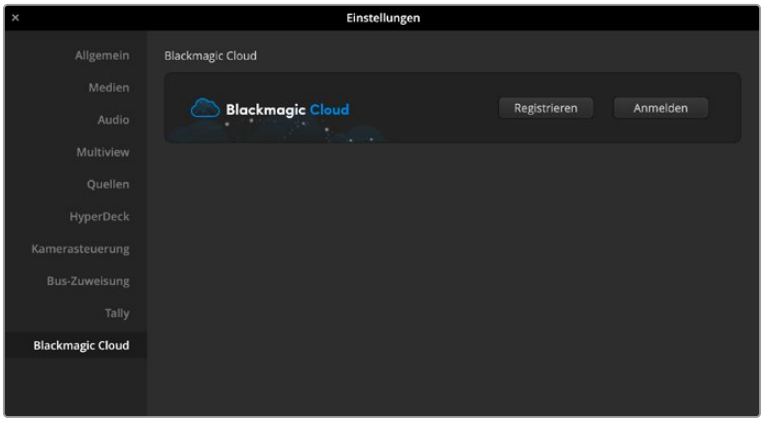
Der Blackmagic Cloud Stream Router ist ein virtueller Videorouter, mit dem Sie Live-SRT- und RTMP-Videostreams über Blackmagic Cloud verbinden und routen können. Der Stream-Router unterstützt die Kamerasteuerung und Tally.

Bevor Sie eine Quelle verbinden können, muss Ihrem Profil in Blackmagic Cloud ein Stream-Router-Ausgang zugewiesen sein. Dies erfolgt über ein persönliches oder ein Unternehmensprofil in Ihrem Blackmagic Cloud-Konto oder indem Ihnen eine Quelle durch einen anderen Blackmagic Cloud-Benutzer zugewiesen wird.

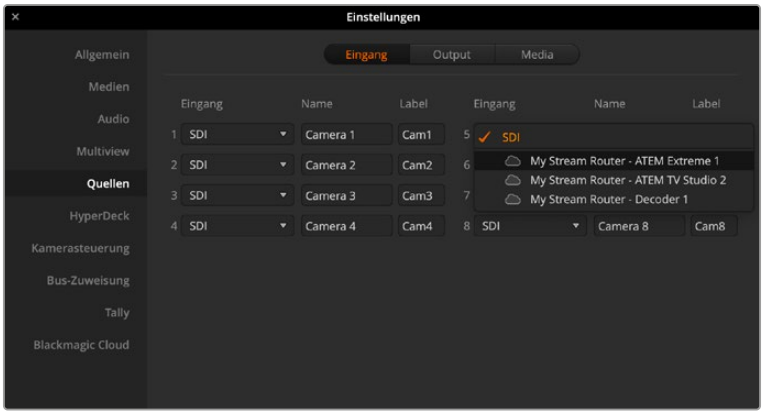
Wurde ein Stream-Router-Ausgang konfiguriert, kann er über den Quellen-Tab hinzugefügt werden.

So fügt man eine Quelle von einem Stream-Router hinzu:

1 Bevor Sie eine Stream-Router-Quelle hinzufügen können, müssen zuerst sicherstellen, dass Sie in Blackmagic Cloud angemeldet sind.



2 Wählen Sie nach erfolgter Anmeldung den „Quellen“-Tab aus. Klicken Sie auf das Menü neben dem Eingang, den Sie verbinden möchten. In diesem Beispiel ist das Eingang 5. Alle Ihnen zugewiesenen Stream-Router-Ausgänge werden in der Liste mit einem Cloud-Symbol links neben dem Namen angezeigt, gefolgt von den Namen des Stream-Routers und des Ausgangs.



3 Nun müssten Sie den Stream auf Ihrem Multiviewer sehen können. Erscheint keine Anzeige, überprüfen Sie, ob dem Stream-Router in Blackmagic Cloud eine Quelle zugewiesen ist. Der verbundene Eingang wird über dem Namen des Ausgangs angezeigt.

Wiederholen Sie die Schritte, um zum ATEM Television Studio HD8 ISO bis zu 8 Streaming-Quellen hinzuzufügen.

TIPP Bei Auswahl einer Quelle direkt aus dem Stream-Router, bleibt diese Verbindung auch nach dem Abmelden bestehen. So ist der Eingang Ihres Stream-Routers bei der nächsten Anmeldung in Blackmagic Cloud bereits voreingestellt.

Wenn Sie den Stream-Router-Ausgang für andere Blackmagic-Geräte freigeben möchten, beispielsweise einen Blackmagic Streaming Decoder oder einen ATEM Mini Extreme ISO G2 Mischer, schalten Sie Ihren Eingang einfach auf eine beliebige HDMI-Quelle um. Für die Freigabe war das schon alles.

Sollten Sie vergessen haben, den Eingang vor dem Abmelden zu ändern, melden Sie sich über einen Webbrowser bei Blackmagic Cloud an und schalten die Benutzerzuweisung des Stream-Routers auf „Nicht zugewiesen“ und dann wieder auf „Mich selbst“.

Falls Ihnen der Ausgang ursprünglich von jemand anderem zugewiesen wurde, müssen Sie sich lediglich an Ihren Blackmagic Cloud-Administrator oder einen Benutzer mit Konfigurationsberechtigung wenden.

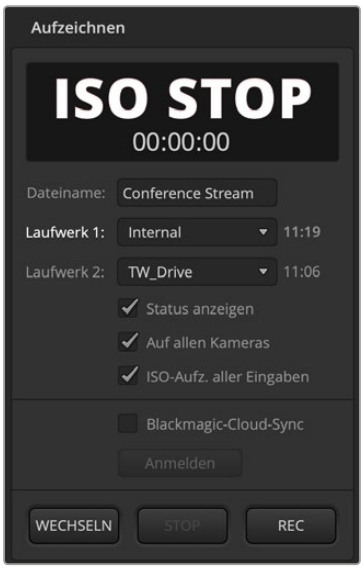
Aufzeichnen von isolierten (ISO) Dateien

Der ATEM Television Studio HD8 ISO kann eine separate Videodatei von jedem der Videoeingänge aufzeichnen. Die Dateien mit den isolierten Signaleingaben werden als „ISO“-Dateien bezeichnet.

Standardmäßig zeichnen ATEM ISO-Mischermodelle eine Videodatei der Programmausgabe auf. Wenn Sie jedoch die Aufzeichnung von ISO-Dateien auswählen, ändert das den Aufzeichnungsmodus. Dann wird ein gesamter Ordner mit dem Content, einschließlich der Dateien mit den Video- und Audioeingaben sowie einer DaVinci Resolve Projektdatei, aufgezeichnet.

Aufzeichnen von ISO-Dateien

Um ISO-Dateien und andere Elemente in einem Ordner aufzuzeichnen, gehen Sie einfach zur Aufzeichnen-Palette in ATEM Software Control. Wählen Sie dort die Einstellung „Alle Eingaben als ISO“. Wenn Sie jetzt im Menü auf „Aufzeichnen“ klicken oder am Bedienpanel die REC-Taste drücken, legt Ihr Mischer einen Ordner mit den Inhalten an.



Aktivieren Sie für ISO-Aufzeichnungen auf der Menüpalette „Aufzeichnen“ das Kontrollkästchen „Alle Eingaben als ISO“

Es ist wichtig, einen ausreichend schnellen Datenträger einzusetzen. Wir empfehlen ein hochwertiges Laufwerk, da viele mechanische Festplatten nicht schnell genug sind, um die neun Streams H.264-HD-Video zu verarbeiten. Die aktuellste Liste mit empfohlenen USB-C-Laufwerken finden Sie unter www.blackmagicdesign.com/de/support.

HINWEIS: Wenn die Videonorm Ihres Mischers auf ein Format mit Halbbild-Abtastung wie 1080i/60 eingestellt ist, deaktiviert dies die ISO-Aufzeichnung.

Was enthält der ISO-Ordner?

Der Aufzeichnungsordner übernimmt den Namen aus dem Aufzeichnungsmenü. In diesem Ordner werden die ISO-Dateien und die Aufzeichnung des Hauptprogramms gespeichert. Wird jedoch im ISO-Modus aufgezeichnet, landet auch die Programmdatei in diesem Ordner mit den anderen Elementen.

Die ISO-Dateien enthalten die von allen Eingängen aufgezeichneten Feeds. Sie werden in einem Unterordner namens „Video ISO Files“ abgelegt. Diese Videodateien sind exakte Aufzeichnungen der Videosignale, die über die einzelnen angeschlossenen SDI-Eingänge eingehen. Die ISO-Dateien enthalten überdies synchronisierten Timecode und die mit der jeweiligen Kameranummer assoziierten Metadaten. So können Sie die Multicam-Funktion beliebiger Schnittprogramme verwenden. Zur Vereinfachung der Schnittarbeit enthalten alle ISO-Dateien auch dasselbe Programmaudio wie die Mastervideodatei.

Da die ISO-Dateien Metadaten und Kameranummer sowie synchronisierten Timecode enthalten, können Sie mit der „Sync Bin“-Funktion in DaVinci Resolve im Nu zwischen Perspektiven wechseln und einen Schnitt zusammenstellen.

Hier sei angemerkt, dass aus dem Media Pool verwendete Grafiken automatisch in einem Unterordner namens „Media Files“ abgelegt werden. Dieser Unterordner befindet sich im Ordner „Video ISO Files“. Dies ermöglicht es Ihnen, in Ihrem Liveprogramm verwendete Titel später im Schnitt nachzubilden.

Es werden auch Audiodateien für Ton von jedem Eingang und von den Mikrofonen aufgezeichnet. Die Audiodateien werden in einem Unterordner namens „Audio Source Files“ abgelegt. Diese sendetauglichen Dateien im WAV-Format sind professionelle Stereodateien. Darin sind keine im internen Audiomixer ggf. vorgenommene Verarbeitungsschritte oder EQ enthalten.

Demnach sind diese Dateien „sauber“ und können zur Gestaltung eines komplett neuen Soundmix‘ in einer professionellen Audiosoftware verwendet werden. Die Audiodateien enthalten Timecode und sind mit den Videodateien synchronisiert.

Das spannendste Element, das im Projektordner gespeichert wird, ist jedoch die DaVinci Resolve Projektdatei. Diese Datei wurde anhand der Mischervorgänge erstellt, die Sie seit Beginn Ihrer Aufzeichnung ausgeführt haben. Aktuell können die Ergebnisse einer Reihe von Mischerfunktionen aufgezeichnet werden. Wenn Sie einen Doppelklick auf dieser Datei ausführen, öffnet sich DaVinci Resolve mit einer kompletten Timeline all dieser Schnitte.

Aktuell unterstützte ATEM Mischerfunktionen umfassen Cut- und Mix-Edits zwischen allen Videoeingaben und dem Media Player sowie Downstream-Titel und Blenden nach Schwarz. Das sind die am häufigsten verwendeten Funktionen, deren Ergebnisse im Videoschnitt in DaVinci Resolve wiederhergestellt werden. Weitere Funktionen werden mit künftigen Softwareaktualisierungen nachgereicht.

Aufnahme anfügen

Wenn Sie den Projektnamen beim Aufzeichnen unverändert lassen, wird die Aufnahme per „Append“ an Ihre zuvor auf einen Datenträger aufgezeichnete DaVinci Resolve Projektdatei angefügt. Das ist sehr praktisch, weil Sie jederzeit aufgrund von Fehlern oder für Pausen unterbrechen und anschließend weiter aufzeichnen können. Beide Aufzeichnungen werden in derselben Timeline geöffnet und lassen sich so zusammenfügen, dass der Zuschauer sie als nahtlos wahrnimmt. Soll nicht im „Append“-Modus aufgezeichnet werden, vergewissern Sie sich, dass der Projektname geändert wurde, oder benutzen Sie ein leeres USB-Laufwerk.

Vorteile beim Schnitt eines Liveprojekts

Die Bearbeitung des Bildmaterials von Live-Events bringt zahlreiche Vorteile. Man kann hinterher sehr schnell Schnitte bearbeiten und vor dem Upload eine neue Masterdatei ausrendern. Somit sind Sie nicht auf die beim Streamen vorgenommenen Schnitte beschränkt, da Sie die Datei noch vor dem Hochladen ändern können.

Anhand von ISO-Aufzeichnungsfunktionen und Editing gestalten Sie Programme schneller. Sie brauchen nur einen ATEM Television Studio HD8 ISO Mischer als Multitrack-Rekorder einzusetzen, um verschiedene Kameraperspektiven an die Schnittplätze zu schicken.

Beim Importieren des DaVinci Resolve Projekts sehen Sie, wie Ihre Liveproduktion nahezu unmittelbar als neuer Schnitt nachgebildet wird. Jetzt können vor dem Upload noch schnell ein paar kreative Verfeinerungen gemacht werden.

Was befindet sich auf den verschiedenen Ebenen?

Normalerweise verläuft die Verarbeitung im Mischer von den Mischereingängen links auf dem Bedienpanel nach rechts zu den Ausgabefunktionen. Der Mischer ist nämlich eine Pipeline der Liveverarbeitung, die beginnend mit den Videoeingaben alle verwendeten Mischerfunktionen durchläuft und mit der Videoausgabe endet.

Beim Videoschnitt ist alles ganz anders. Man hat es in einer Schnittsoftware mit einem Stapel von Ebenen zu tun. Die zuunterst befindliche Ebene wird von den darüber liegenden Ebenen verdeckt. Das heißt, ein auf Ebene 2 befindlicher Clip verdeckt jegliche Clips auf Ebene 1. In der Regel wird mit Schnitten und Überblendungen auf Ebene 1 gearbeitet. Weitere Elemente werden auf darüber gelegenen Ebenen platziert. Somit würde ein auf Ebene 3 gelegter Clip sämtliche auf Ebenen 1 und 2 befindliche Clips verdecken. In einem komplexen Schnitt können Dutzende Ebenen enthalten sein.

Um zu verstehen, was beim Importieren Ihrer Projektdatei in DaVinci Resolve geschieht, schauen Sie sich nach erfolgtem Import einfach das Projekt an. Sie werden sehen, dass verschiedene Arbeitsvorgänge auf verschiedenen Schnitt-Ebenen abgelegt wurden.

Ebene 1	Ebene 1 enthält die Hauptschnitte zwischen Quellen. Dort sieht man die aneinandergereihten Clips und ggf. Schnittmarken und Überblendungen. Diese Ebene wurde anhand der Mischvorgänge Ihrer Haupteingaben erstellt. Sämtliche Schnitte der Videoeingaben und die Standbildquelle werden auf Ebene 1 gelegt.
Ebene 2	Ebene 2 ist für den Downstream-Keyer. Auf einem ATEM Mischer folgt der Downstream-Keyer im Anschluss an den Übergangssteuerblock. Für den Schnitt bedeutet das, dass dieser mit Ebene 2 assoziierte Keyer die auf Ebene 1 platzierten Hauptschnitte überschreiben kann. Wenn Sie eine Grafik mit Alphakanal an den Downstream-Keyer legen und auf Sendung schalten, wird diese Grafik, z. B. ein Titel, dadurch der Videoausgabe beigefügt. Dieses Element befindet sich auf Ebene 2 und blendet somit dieselbe Grafik mit Alphakanal über Ebene 1 ein.
Ebene 3	Ebene 3 dient für Abblenden. Abblenden (FTB) sind der letzte Verarbeitungsschritt des Mischers. Sie blenden alle Ebenen des Mischers nach Schwarz aus. Abblenden werden gewöhnlich am Ende einer Sendung oder als Überleitung zu Werbung eingesetzt. Abblenden befinden sich auf Ebene 3, weil damit, genau wie beim Mischer, alle darunter liegenden Ebenen überschrieben werden. Eine Abblende (FTB) ist ein Videogenerator für Schwarz mit je einer Überblendung am Anfang und Ende.

Schnittmarken verschieben

Ein Vorteil beim Schneiden ist, dass man Schnittmarken nachträglich verschieben kann. Beim Liveproduzieren geht manchmal alles sehr schnell und da gerät man leicht ins Schleudern. Bspw. bei einer Interviewsendung mit mehreren schnell redenden Personen, die sich gegenseitig ins Wort fallen. Beim Schneiden hat man dabei womöglich nicht gleich jeden Sprecher exakt getroffen.

Durch Verschieben der Schnittmarken kann man dafür sorgen, dass der Schnitt erfolgt, bevor eine Person zu sprechen beginnt. In einer Livemischung reagiert man mit seinen Edits auf das Geschehen. Darum können Schnitte erst erfolgen, wenn eine Person zu sprechen begonnen hat. Durch Verschieben der Schnittmarke lässt sich das aber später auf den Moment vor dem Sprecheinsatz korrigieren. So erhält das Programm mehr Schliff.

Um einen Schnitt vorzuziehen, scrollen Sie zur Schnittmarke in der Timeline. Setzen Sie Ihre Maus danach auf die Schnittmarke in der unteren Timeline. Es erscheint ein Cursor, der wie eine doppelte Klammer aussieht. Wenn Sie nun einen Klick und eine Ziehbewegung nach links ausführen, verschiebt das die Schnittmarke an einen früheren Zeitpunkt. Führen Sie hingegen einen Klick und eine Ziehbewegung nach rechts aus, verschiebt das die Schnittmarke an einen späteren Zeitpunkt.

Verwenden Sie auf keinen Fall die Tools mit nur einem Balken und den kleinen Pfeilen. Das sind nämlich die Trim-In- und Trim-Out-Tools. Beim Bewegen der Maus im Bereich der Schnittmarken werden automatisch andere Tools angezeigt. Anhand der Trim-In- und Trim-Out-Tools können Sie die Dauer Ihrer gesamten Videospur verlängern bzw. kürzen. Dies hebt jedoch die Synchronisierung mit der darunter gelegenen grünen Tonspur auf.

Einstellungen ersetzen

Mithilfe der „Sync Bin“-Funktion durchsuchen Sie alle Einstellungen bis zu der Stelle, an der sich der Abspielkopf gerade befindet. Sie können damit Stellen reparieren, an denen Sie zur falschen Kamera geschnitten haben. Falls Sie noch mehr Zeit haben, können Sie Alternativen durchsehen, um bessere Einstellungen zu finden.

Sie finden die „Sync Bin“-Funktion oben links im Cut-Arbeitsraum. Nach Auswählen der Funktion wird oben links Ihr Media Pool eingeblendet und die Viewer-Ansicht ändert sich. Im Media Pool wird Ihnen eine Timeline mit verfügbaren Clips angezeigt und im Viewer eine Multiview-Ansicht aller vorhandenen Einstellungen. Das sind ausschließlich Einstellungen, die bis zu der Stelle synchronisiert wurden, an der Sie sich gerade in der Timeline befinden. Wenn Sie sich in der Timeline weiterbewegen, werden diese Einstellungen automatisch synchronisiert.

Stellen Sie sich die Sync Bin als eine Art Schnittassistenz vor, die Einstellungen für Sie heraussucht und sie in einer Mehrfachansicht aufbereitet, damit Sie sie für den Schnitt nutzen können.

Weil ATEM Television Studio HD8 ISO Mischermodelle an die Eingänge angeschlossene Quellen erkennen, zeichnen sie deren Signale als Videodateien auf und speichern die Kameranummern in den Metadaten der Dateien. Kamera 1 in der Sync Bin entspricht also der Videoquelle, die Sie an Eingang 1 des Mischers angeschlossen hatten. Kamera 2 entspricht Eingang 2 usw.

Um eine andere Einstellung auszuwählen, führen Sie die folgenden zwei Schritte aus: Wählen Sie zuerst die gewünschte Einstellung aus, indem Sie die In- und Out-Punkte setzen. Im nächsten Schritt schneiden Sie die Einstellung über die aktuelle Einstellung in Ihrer Timeline.

Scrollen Sie dazu an die Stelle in der Timeline, wo die zu ersetzende Einstellung anfängt. Sie werden den neuen Clip eine Ebene über dem bestehenden Clip bearbeiten. Die anderen Einstellungen werden Ihnen in der Multiview-Ansicht angezeigt. Sie beinhalten alle Videoeingaben, die über die Eingänge des ISO-Mischers aufgezeichnet wurden und Ihnen als Alternativen dienen.

Klicken Sie jetzt auf die gewünschte Einstellung. Sie wird im Vollbildmodus angezeigt. Außerdem wird sie an der aktuellen Stelle in der Timeline eingefügt und es wird ein In-Punkt gesetzt. Ein Out-Punkt wird zudem bei einer Clipdauer von 4 Sekunden gesetzt. Um den Out-Punkt zu verschieben, scrollen Sie in der Timeline einfach zu der Stelle, an der die neue Einstellung enden soll. Drücken Sie dann die Taste „O“. Der Out-Punkt wird dann an diese Position verschoben.

Sollten Sie nicht die richtige Einstellung ausgewählt haben, drücken Sie einfach die ESC-Taste. Damit kehren Sie zur Mehrfachansicht zurück, wo Sie eine andere Einstellung auswählen können.

Nach Auswählen der Einstellungen, möchten Sie sie in der Timeline platzieren. Dies tun Sie mithilfe des Schnittmodus „Source Overwrite“. Die Schnittmodi finden Sie mittig unter dem Media Pool. „Source Overwrite“ ist die letzte Schaltfläche ganz rechts. Beim Bewegen der Maus über die Schaltflächen werden Ihnen Tooltipps mit der Bezeichnung der Tools angezeigt.

Die „Source Overwrite“-Funktion ist clever. Sie analysiert den ausgewählten Clip und die Timeline, und fügt den Clip an exakt der richtigen Stelle mit dem passenden Timecode ein. Demnach werden alle Einstellungen, die Sie per „Source Overwrite“ in die Timeline einfügen, automatisch synchronisiert. Wenn Sie durch die Timeline scrollen, nach Einstellungen suchen und diese als Zwischenschnitte in die Timeline einfügen, brauchen Sie also keine In- und Out-Punkte in der Timeline zu setzen.

Der „Source-Overwrite“-Schnittmodus platziert den Clip immer eine Ebene über dem aktuellen Clip in der Timeline. Falls es noch keine zweite Ebene gibt, wird diese hinzugefügt und der Clip dort platziert. Weil die Zwischenschnitte auf der Ebene über dem Originalschnitt abgelegt werden, sind sie leicht aufzufinden.

Scrollen Sie einfach durch Ihre Timeline, wählen Sie Zwischenschnitte aus der Multiview-Ansicht der Sync Bin aus und ersetzen Sie so viele Einstellungen wie nötig.

Überblendungen hinzufügen

Eine weitere klasse Funktion für den Schnitt ist das Hinzufügen von Überblendungen in Ihrer Timeline. Beim Streamen mit geringer Bandbreite können Überblendungen blockartig wirken. Für Livestreams möchten Sie sie daher vermutlich nicht nutzen. Doch falls Sie Ihre Sendung im Nachhinein hochladen, möchten Sie möglicherweise Überblendungen hinzufügen, um das Programm dezenter und stilvoller zu gestalten.

An dieser Stelle können Sie zum Glätten des Bildflusses Überblendungen hinzufügen. In DaVinci können Sie Übergänge aus dem „Transition“-Menü auf beliebige Schnittmarken ziehen. Es gibt aber noch einen schnelleren Weg. Unten rechts im Media Pool des Cut-Arbeitsraums finden Sie drei Schaltflächen für Übergänge. Eine davon entfernt Übergänge und macht aus Schnittmarken Hartschnitte. Doch die mittlere „Dissolve“-Schaltfläche fügt eine Überblendung hinzu. Sie können einfach durch die Timeline scrollen und per Klick auf die mittlere Schaltfläche eine Überblendung hinzufügen.

Wenn Sie sich das Timeline-Lineal anschauen, sehen Sie eine kleine, auf- und ab hüpfende Dreiecksmarkierung. Sie schlägt Ihnen die Schnittmarke vor, an der DaVinci die Überblendung hinzufügen würde. Sie brauchen beim Klicken der „Dissolve“-Schaltfläche also nicht einmal einen In-Punkt in der Timeline zu setzen. Er wird automatisch am markierten Schnittpunkt eingefügt. Das geht sehr schnell und man kann die Überblendungen beim Durchscrollen einfach genau dort einfügen, wo man Sie braucht.

Langatmige Abschnitte oder Fehler herausschneiden

Teile einer Sendung können sich manchmal etwas hinziehen und gelegentlich müssen Sendungen wegen technischen Fehlern unterbrochen werden. Diese Abschnitte können Sie mithilfe des „Split Clips“-Tools herausschneiden. Links unter dem Media Pool gibt es ein Werkzeug, das aussieht wie eine Schere. Durch Anklicken dieses Tools trennen Sie alle Ebenen Ihrer Timeline. Wenn Sie nun auf einzelne Clips zwischen den Hartschnitten klicken und diese durch Drücken der „Entf“-Taste löschen, schließt sich die Lücke in der Timeline automatisch.

So einfach kann man bei Live-Events allgemeine Korrekturen vornehmen. Per Klick auf „Quick Export“ oben rechts im Cut-Arbeitsraum können Sie anschließend eine neue Masterdatei mit allen Änderungen exportieren.

Videoschnitt in DaVinci Resolve

Um das Arbeiten mit DaVinci Resolve zu verstehen, schauen Sie sich am besten im Internet einige Videotutorials an und laden sich zum Üben die kostenlose Version herunter. DaVinci Resolve ist sehr komplex und wird von High-End-Hollywood-Studios für Spielfilme eingesetzt. Der Cut-Arbeitsraum ist jedoch deutlich reduzierter und leicht zu erlernen. Weitere Informationen finden Sie im Internet.

Kamerainterne Aufzeichnung

Mit ATEM Television Studio HD8 ISO Mischermodellen lassen sich die Blackmagic Studio Camera 4K Pro, URSA Mini Pro und URSA Broadcast G2 per SDI steuern. Hierfür schließt man den Kameraeingang mit einem zweiten SDI-Kabel an einen der Mischerausgänge an. ATEM Television Studio HD8 ISO Mischer können auch per Ethernet über ein lokales Netzwerk oder per Internet verbundene ortsferne Kameras steuern.

Nützlich an der Softwaresteuerung ist auch die Möglichkeit, während der Aufzeichnung auf ein USB-Laufwerk zugleich direkt auf allen Kameras aufzuzeichnen. Dazu wählt man in der Menüpalette „Aufzeichnen“ die Option „Auf allen Kameras“.

Nützlich an der Softwaresteuerung ist auch die Möglichkeit, während der Aufzeichnung auf ein USB-Laufwerk zugleich direkt auf allen Kameras aufzuzeichnen. Dazu wählt man unter dem Menüpunkt „Aufzeichnen“ die Option „Auf allen Kameras“.

Ein Vorteil der kamerainternen Aufzeichnung ist, dass die Kameras in Blackmagic RAW aufnehmen. Das ergibt Dateien mit Filmgamma, die sich perfekt für anspruchsvollere Farbkorrekturen eignen. Weil die Dateien auf der Kamera in 4K aufgezeichnet werden, können Sie die Masterversion Ihrer Liveproduktion damit in Ultra HD produzieren. Obwohl es sich hier um HD-Mischer handelt, können Sie Masterversionen zum nachträglichen Upload oder für die Übertragung Ihrer Sendung in Ultra HD ausliefern.

Über die Verbindung zu den Kameras werden sowohl Timecode und Kameranummern als auch Dateinameninformationen übermittelt. Auf diese Weise werden die Blackmagic-RAW-Dateien mit dem Timecode des Mischers synchronisiert. Das erleichtert ihre Verwendung.

Um mit Blackmagic-RAW-Dateien aus den Kameras zu arbeiten, aktivieren Sie für den Stream unter dem Menüpunkt „Aufzeichnen“ unbedingt die Einstellung „Auf allen Kameras“. Kopieren Sie die Kameradateien nach Ende der Aufzeichnung in den Ordner „Video ISO files“ auf dem Mischer. Das ist deswegen so wichtig, weil DaVinci Resolve diese Dateien beim ersten Lesen und Öffnen der DaVinci Resolve Projektdatei benötigt.

Die parallele Verwendung von ISO-Dateien vom Mischer und der Blackmagic-RAW-Dateien von der Kamera führt jedoch zu Konflikten, da beide Dateien den gleichen Timecode und die gleiche Kameranummer haben. Für DaVinci Resolve ist dies jedoch unproblematisch, weil die Software standardmäßig die ISO-Dateien verwendet.

Um in Ihrem Projekt zu den höheraufgelösten Blackmagic-RAW-Dateien zu wechseln, klicken Sie oben rechts im Cut-Arbeitsraum auf die Schaltfläche „Camera Originals“. Das Symbol sieht aus wie eine kleine Kamera. Nach Auswählen der Schaltfläche sollten Sie eine Veränderung in der Timeline bemerken. Es sind nun die Blackmagic-RAW-Dateien ausgewählt, die in Filmgamma vorliegen.

Für einen schöneren Schnitt möchten Sie die Dateien möglicherweise einer Farbkorrektur unterziehen. Blackmagic-RAW-Dateien werden als Clean-Feeds ohne farbliche Korrekturen

aufgezeichnet. Um eine perfekte farbkorrigierte Masterversion zu erstellen, können Sie die leistungsstarken Werkzeuge für die Farbkorrektur in DaVinci Resolve nutzen.

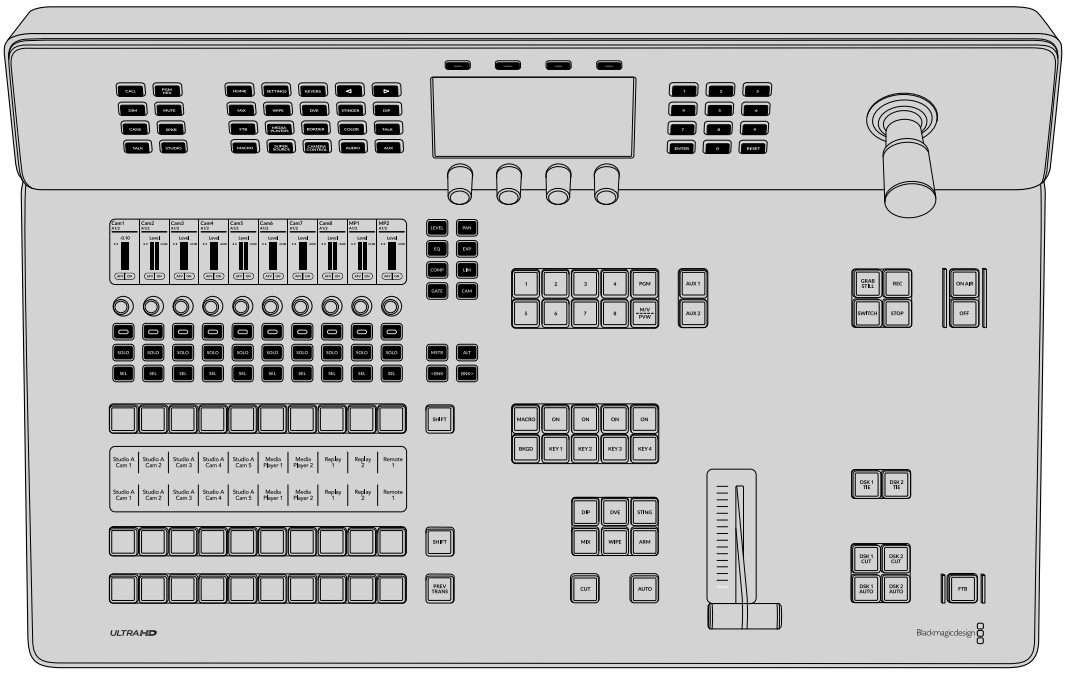
Um in Ultra HD auszuliefern, gehen Sie einfach ins Auflösungsmenü neben dem Kamerasymbol. Dort können Sie verschiedene Auflösungen und Bildverhältnisse auswählen. Ultra HD ist die oberste Option. Nachdem Sie diese ausgewählt haben, stellt sich Ihr gesamtes Projekt auf Ultra HD um und die Bilder werden schärfer.

Nicht von einer Kamera kommende Eingaben, wie bspw. Computer-Bildschirmpräsentationen, werden automatisch hochskaliert. Auch HD-Bilder aus dem Media Pool werden automatisch hochskaliert. Um Grafiken im Media Pool durch höheraufgelöste Versionen zu ersetzen, können Sie diese im entsprechenden Medienordner austauschen.

Wenn Sie jetzt einen Schnellexport machen, erfolgt der Export der Masterversion in Ultra HD. Und das von einem HD-Mischer!

Joystick am ATEM Television Studio 4K8

Der dreiachsige Joystick dient zum Vorgeben der Größe und Position von Keys, DVE und anderen Elementen. Sie können mit dem Joystick über VISCA auch die PTZ-Funktion von Kameras aus der Ferne steuern.



Steuerung per Joystick

Kameras mit dem Joystick steuern

Mit dem Joystick kann man über das gebräuchliche VISCA-Protokoll auch an einen Mischer angeschlossene Remote-Kameraköpfe steuern.

So wird der Joystick zu einem sehr effektiven Kontrollwerkzeug für die PTZ-Steuerung, d. h. die Schwenk-, Neige- und Zoom-Funktionen von fernbedienten Kameras. Auf diese Weise können Sie eine ganze Reihe von Kameras bequem auf einmal steuern. Drücken Sie die Taste CAMERA CONTROL und wählen Sie dann über die CAM-Multifunktionstaste einzelne Kameras aus. Justieren Sie Schwenk- und Neigebewegungen anhand des Joysticks.

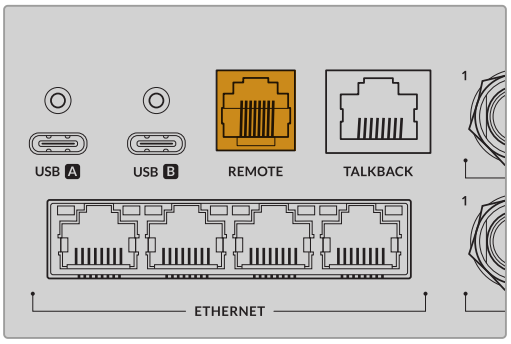
Die Neigerichtung Ihres Joysticks lässt sich wahlweise einrichten, indem Sie in den PANEL-EINSTELLUNGEN unter „Kamerasteuerung auf/ab“ die Option INVERTIERT oder NORMAL vorgeben. Mit INVERTIERT wird die Neigebewegung Ihres Joysticks umgekehrt.

Anschließen von Fernsteuerköpfen

Der ATEM Television Studio 4K8 kommuniziert mit ferngesteuerten Kameraköpfen über den mit REMOTE gekennzeichneten RS-422-Port. Der RS-422-Port am ATEM Television Studio 4K8 Modell ist eine RJ12-Buchse, die wie ein normaler Festnetztelefonanschluss aussieht.

Vergewissern Sie sich, dass für das „Remote“-Verhalten des RS-422-Ports Ihres Mischers auf dem LCD in den Einstellungen für „Serieller Port“ die Option „VISCA“ oder „GVG“ vorgegeben ist.

Man kann mehrere Fernsteuerköpfe anschließen, indem einzelne Köpfe über ihre RS-422-Ein- bzw. Ausgänge in Reihe geschaltet werden.



Einrichten der PTZ-Steuerung von Fernsteuerköpfen

Die Vorgabe sämtlicher Optionen für das PTZ-Setup erfolgt über das LCD-Menü „Einstellungen“. Öffnen Sie das Einstellungsmenü „Serieller Port“ durch Drücken der Pfeiltasten oder der Taste 8 auf dem Bedienpanel. Setzen Sie dort „Portsteuerung“ auf „VISCA“. Stellen Sie eine mit Ihrer PTZ-Kamera übereinstimmende Baudrate ein. Lesen Sie die passende Baudrate in der Bedienungsanleitung Ihrer Kamera nach.

Durch Drücken der Taste CAMERA CONTROL öffnen sich die Kameraeinstellungen. Wählen Sie dort erst die VISCA-Steuerung und dann die anzupassende Kamera. Zunächst gilt es jedoch sicherzustellen, dass alle angeschlossenen Kameras auch erkannt wurden.

Gehen Sie zum Erkennen angeschlossener Geräte wie folgt vor:

1. Drücken Sie die SETTINGS-Taste und navigieren Sie mit den Pfeiltasten zu den Einstellungen „Serieller Port“.
2. Drücken Sie die Multifunktionstaste ERKENNEN.

Die erste an Ihren Mischer angeschlossene Kamera wird auf dem LCD als „Camera 1“ angezeigt. Wenn Sie mehrere Kameras angeschlossen haben, können Sie einzelne Kameras durch Drehen der Multifunktionstaste KAMERA auswählen. Die Kameranummerierung erfolgt konsekutiv, beginnend mit dem zuerst angeschlossenen Remotehead bis zum zuletzt in Reihe geschalteten.

Wenn die Anzahl der auf dem LCD angezeigten Kameras nicht mit der tatsächlichen Anzahl Ihrer angeschlossenen Kameras übereinstimmt, vergewissern Sie sich, dass die Kameraköpfe mit Strom versorgt sind und deren RS-422-Ports sachgemäß angeschlossen sind. Sobald alle Kameraköpfe auf Ihrem ATEM Television Studio 4K8 Mischer angezeigt werden, können Sie mit der CAMERA-Multifunktionstaste einzelne Kameras auswählen. Prüfen Sie, ob alle funktionieren, indem Sie mit dem Joystick schnell einige Justierungen ausprobieren.

TIPP Die Kamerasteuerung ist bei genereller Kamerasteuerung per SDI standardmäßig auf SDI eingestellt. Drücken Sie bei Einsatz des VISCA-Protokolls also unbedingt die Multifunktionstaste für VISCA, um per VISCA auf die PTZ-Funktion von Kameras zuzugreifen.

PTZ-Steuerung via SDI

Alternativ können Sie PTZ-Kameraköpfe über SDI steuern. Beispiel: Sie können einen Kamerakopf über ein SDI-Signal steuern, indem Sie den rückgeführten Programmfeed von Ihrem Mischer an eine Kamera senden und die SDI-Signalausgabe des Expansionskabels an Ihren PTZ-Kamerakopf anschließen.

PTZ-Steuerung per Joystick

Die PTZ-Befehle des Joysticks sind sehr intuitiv. Drehen Sie den Joystick-Handgriff im oder gegen den Uhrzeigersinn, um ein- oder auszuzoomen. Drücken Sie ihn nach unten oder oben, um die Kamera zu neigen, bzw. nach links oder rechts, um sie zu schwenken. Die Steuerung reagiert mit unterschiedlicher Empfindlichkeit auf das Ausmaß der Joystick-Bewegung, was Ihnen sanfte Kamerabewegungen ermöglicht. Außerdem variiert der Empfindlichkeitsgrad ggf. auch zwischen Remoteheads.

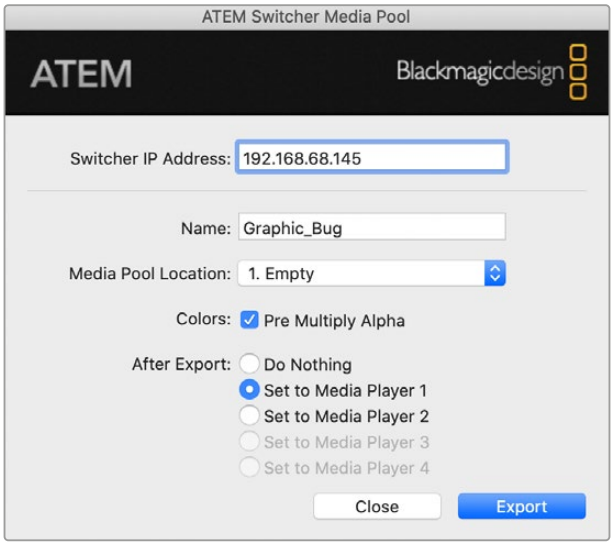
Näheres zur Verdrahtung einer PTZ-Einheit nach Ihren Anforderungen unter Einsatz eines regulären DB9-Verbinders für den RS-422-Port, siehe Abschnitt „Pin-Anschlüsse des seriellen Ports für Steuerungskabel“.

Arbeiten mit Adobe Photoshop und ATEM Mischern

Bei der Installation der ATEM Software auf Ihrem Computer wird gleich ein Photoshop Plug-in mitinstalliert, das Sie Photoshop-Grafiken direkt in den ATEM Media Pool laden lässt.

Somit können Sie Grafiken aus Adobe Photoshop, einer von 100 Prozent aller Grafikdesignkünstler benutzten Anwendung, akzeptieren. Sie können sogar die in einem Photoshop-Bild enthaltenen Ebenen beibehalten, wie z. B. verschiedene Titel in einer Grafik. Wählen Sie die gewünschten Photoshop-Ebenen aus und laden Sie diese dann einfach per Tastendruck herunter. Beim Herunterladen der Ebenen werden diese vor dem Download automatisch in Echtzeit auf ihre Hintergrundebene reduziert. Dies erfolgt ohne Zutun des Anwenders und Ihr Dokument bleibt durch den Export in Photoshop unverändert.

Das Plug-in für den ATEM Export erfordert Adobe Photoshop. Installieren Sie die ATEM Software erst nach Einspielung von Photoshop oder installieren Sie sie dann erneut. Dies gewährleistet, dass auch das Plug-in für den ATEM Export installiert wird.



Plug-in für den ATEM Export

Einrichten des Mischerstandorts für das Plug-in

Bei erstmaliger Ausführung des Export-Plug-ins für Photoshop werden Sie aufgefordert, den Standort Ihres Mischers auszuwählen. Dies geschieht mit der IP-Adresse des Mischers, anhand derer das Plug-in den Mischer findet, um mit diesem zu kommunizieren. Standardmäßig ist diese IP-Adresse auf 192.168.10.240 eingestellt. Dies ist die werkseitige ursprüngliche IP-Adresse des Mischers. Um mehrere Versionen derselben Photoshop-Datei zu exportieren, versehen Sie jede dieser exportierten Dateien im Fenster „Export Plug-in“ mit einem Namen. Hier wird auch bestimmt, ob die Dateien nach dem Export in einen Media Player gelegt werden sollen.

Vorbereiten von Grafiken für den Download

Für optimale Ergebnisse empfiehlt sich Photoshop-Material mit der gleichen Auflösung wie der auf Ihrem ATEM Mischer eingestellten Videonorm. Für 1080-HD-Formate sollte die Auflösung 1920 x 1080 Pixel betragen. Für 720p-HD-Formate wird eine Auflösung von 1280 x 720 Pixeln benötigt.

Achten Sie bei Photoshop-Material für ATEM Mischer darauf, keine Inhalte in die Hintergrundebene, sondern nur in die darüber liegenden Ebenen zu legen. Die Hintergrundebene muss immer aus einfarbigem, bildfüllendem Schwarz bestehen. Verwenden Sie für das Keying von Photoshop-Grafiken immer eine der für ATEM Keyer verfügbaren Einstellungen für vormultiplizierte Keys.

Als Starthilfe finden Sie im Ordner „Example Graphics“ einen Leitfaden und einige Grafikvorlagen. Dieser Ordner wurde zusammen mit der ATEM Switcher Software auf Ihrem Computer installiert.

Aktivieren Sie zum Download einer Grafik in den ATEM Media Pool das Exportmenü in Photoshop gefolgt von „Datei“ > „Exportieren“ und wählen Sie dann als Exportziel den ATEM Switcher Media Pool aus. Es erscheint ein Fenster, das Sie zur Vorgabe eines Speicherorts im Media Pool auffordert, in den der Download erfolgen soll. Diese Liste enthält die Dateinamen aller aktuell im Media Pool geladenen Grafiken. Wählen Sie erst den Speicherort für den Download und dann „Exportieren“.

Wenn Ihre Grafik eilig auf Sendung gehen soll, geben Sie vor, dass diese Grafik nach dem Download automatisch in einen der Media Player kopiert wird. So bringen Sie Bilder im Nu auf Sendung! Um die Grafikquellen der Media Player unberührt zu lassen, geben Sie mit der Option „Do Nothing“ bzw. „Nichts tun“ vor, dass diese Grafik nicht in die Media Player kopiert wird.

Die Einstellung für vormultipliziertes Alpha sollte fast immer aktiviert sein. Hierzu muss auf dem Mischer oder in ATEM Software Control die Einstellung „Vormultiplizierter Key“ ebenfalls eingeschaltet sein. Der Vorgang des Vormultiplizierens mischt die Grafikfarbe beim Export mit ihrem zugehörigen Alpha-Kanal. Das sorgt für glatte Kanten Ihrer Grafik, die sich sauber in das Video einfügen.

Mit Makros arbeiten

Was ist ein Makro?

Ein Makro ist eine einfache Methode zur Automatisierung einer Abfolge von Mischervorgängen. Die in Form von Makros einprogrammierten Sequenzen lassen sich per Tastendruck bzw. Mausklick wiederholen. So können Sie eine Sequenz von Übergängen zwischen mehreren Videoquellen aufzeichnen, wie z. B. Key-Effekte, Justierungen des Audiomixers, Einstellungen für die Kamerasteuerung und mehr. Zeichnen Sie alle Ihre Vorgänge mit einer MACRO-Taste bzw. „Makro“-Schaltfläche auf, um anschließend alle vorprogrammierten Aktionen auf Tastendruck bzw. per Klick sofort auszuführen. Die Aufzeichnung von Makros erfolgt wahlweise über das „Makros“-Fenster in ATEM Software Control, über die Systemsteuerung von ATEM Television Studio Mischern oder eine Kombination aus beiden. Makros werden in Ihrem ATEM Mischer gespeichert. Da Makros mit jeder Art von Bedienpanel anwendbar sind, kann ihre Wiedergabe von einem beliebigen Panel bzw. Pult ausgelöst werden.

Das Makrofenster in ATEM Software Control

Öffnen Sie das „Makros“-Fenster in ATEM Software Control, indem Sie im Titelmenü auf „Makros“ klicken oder auf einem Mac Umschalt+Befehl+M bzw. auf einem Windows PC Umschalt+Befehl+M drücken. „Makros“ ist ein schwebendes, frei auf Ihrem Desktop bewegbares Fenster. Dies gewährt Ihnen beim Wechsel zwischen den Arbeitsräumen „Mischer“, „Medien“, „Audio“ und „Kamera“ jederzeitigen Zugriff auf das Makrofenster. Beim Aufzeichnen eines Makros lässt sich sogar die Größe des Fensters reduzieren, indem Sie oben rechts auf das Minimieren-Symbol klicken.

Die Aufzeichnung von Makros kann an einem beliebigen der 100 Makroplätze erfolgen. Pro Ansicht werden jeweils 20 Makroplätze angezeigt. Klicken Sie am unteren Rand des Fensters auf einen der beiden Pfeile, um durch die Ansichtsseiten zu navigieren. Ein Klick auf die Schaltflächen „Erstellen“ bzw. „Ausführen“ wechselt die jeweils angezeigte „Erstellen“- bzw. „Ausführen“-Ansicht. So können Sie Ihre Makros aufzeichnen und während Ihrer Liveproduktion wiedergeben.

Aufzeichnen von Makros

Makros müssen übergreifend und in klar definierten Abfolgen von Anfang bis Ende aufgezeichnet werden. Dies sollte fehlerfrei erfolgen, da bei der Makroprogrammierung jede Einstellung, jeder Tastendruck und Mischervorgang aufgezeichnet werden. Beim Abspielen eines Makros werden alle von Ihnen aufgezeichneten Mischeraktionen exakt wiederholt.

Ganz wichtig: Ein Makro zeichnet lediglich Einstellungen auf, die Sie geändert haben. Beispiel: Soll ein Übergang von 3 Sekunden vorgegeben werden und die Übergangsrate Ihres Mischers steht bereits auf 3 Sekunden, so müssen Sie diese Dauer ändern und sie anschließend wieder auf 3 Sekunden zurücksetzen, damit diese Einstellung aufgezeichnet wird. Tun Sie dies nicht, wird Ihre gewünschte Übergangsrate nicht aufgezeichnet. Beim Abspielen des Makros übernimmt dieser dann einfach die zuletzt auf Ihrem Mischer eingestellte Übergangsrate. Sorgfältiges Arbeiten ist also das A und O!

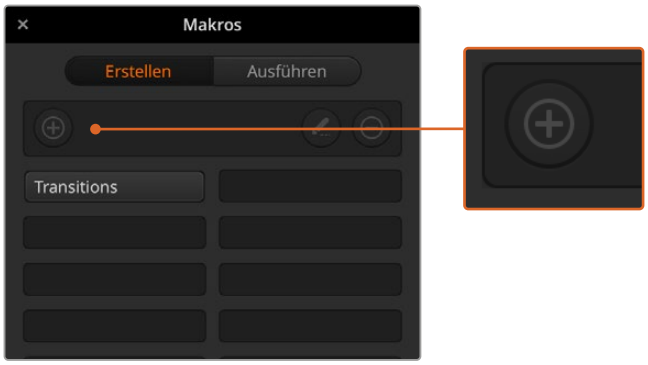
Wenn Einstellungen bei der Makroaufzeichnung geändert wurden und in einem bestimmten Zustand wiederhergestellt werden sollen, setzen Sie diese Einstellungen wieder zurück, während Sie die letzten Schritte des Makros aufzeichnen. Makros können sogar zum Zweck der Wiederherstellung von Einstellungen für verschiedene Projekte aufgezeichnet werden. Sie haben viele Möglichkeiten! Was bei der Makroprogrammierung zu bedenken ist: Ändern Sie alle Einstellungen, die gebraucht werden, um Ihre gewünschten speziellen Effekte zu erstellen.

Aufzeichnen von Makros mit ATEM Software Control

Im nachstehenden Beispiel erstellen wir einen Makro, der Ihrem ATEM Mischer vorgibt, einen 3 Sekunden langen Mix-Übergang von „Farbbalken“ nach „Farbe 1“ auszuführen, 2 Sekunden lang zu pausieren und dann einen Mix-Übergang von 3 Sekunden nach Schwarz vorzunehmen. Probieren Sie, diesen Makro auf Ihrem ATEM Mischer nachzubauen, um die erforderlichen Schritte für die Makroprogrammierung zu üben.

1. Starten Sie ATEM Software Control und öffnen Sie das „Makros“-Fenster.
2. Klicken Sie auf die „Erstellen“-Schaltfläche im Makrofenster, um die „Erstellen“-Ansicht aufzurufen.
3. Klicken Sie auf einen Makroplatz, an dem Ihr Makro gespeichert werden soll. Klicken Sie für dieses Beispiel auf den Makroplatz Nummer 1. Der ausgewählte Platz erscheint jetzt mit orangefarbener Umrandung.
4. Klicken Sie auf das „+”-Zeichen, um das Pop-up-Fenster für die Programmierung von Makros zu öffnen.

   Hier können Sie wahlweise einen Namen für Ihren Makro und Notizen eingeben. So behalten Sie den Überblick über angelegte Makros und sehen auf Anhieb, was jeder tut. Per Klick auf einen Makro werden Ihre Anmerkungen im Statusfenster angezeigt.



Um die Aufzeichnung eines Makros einzuleiten, wählen Sie einen Makroplatz aus und klicken Sie dann auf die „Makro“-Schaltfläche „Erstellen“. Geben Sie Ihre Anmerkungen ein und klicken Sie auf „Aufzeichnen“

5. Klicken Sie auf die „Aufzeichnen“-Schaltfläche.

   Das schließt das Pop-up-Fenster. Auf der Benutzeroberfläche Ihrer ATEM Bediensoftware erscheint nun eine rote Umrandung, die die laufende Aufzeichnung Ihres Makros anzeigt. Die rote Schaltfläche PAUSE HINZUFÜGEN befindet sich am oberen Rand der Benutzeroberfläche.

   Mit der aktivierten Makrospeicherung können Sie jetzt beginnen, Ihre Mischervorgänge auszuführen.

Während der Aufzeichnung fungiert die „Makro erstellen“-Schaltfläche als „Aufzeichnen“-Schaltfläche. Klicken Sie nach Abschluss aller Ihrer Mischeraktionen auf das Aufzeichnungssymbol, um die Aufzeichnung zu stoppen

6 Klicken Sie unten im Programmfenster auf die „Mischer“-Schaltfläche und öffnen Sie den „Mischer“-Arbeitsraum. Dies aktiviert Farbbalken für die Programmausgabe Ihres Mischers.

7 Wählen Sie im Vorschaufenster „Farbe 1“.

8 Öffnen Sie die Menüpalette „Übergänge“ und geben Sie dort „Mix“ vor.

   Ist die Registerkarte „Mix“ bereits ausgewählt, wählen Sie zunächst eine andere Übergangsart, z. B. „Wipe“, Klicken Sie dann erneut auf „Mix“, damit Ihr Mischer diese Einstellung aufzeichnet.

9 Ändern Sie die Übergangsrate jetzt auf 3:00. Dies gibt für die Dauer des Mix-Übergangs 3 Sekunden vor.

10 Klicken Sie im „Übergangsart“-Menü auf die AUTO-Schaltfläche. Ihr Mischer führt dann einen Mix-Übergang von Farbbalken nach Farbe 1 aus.

11 Um den Mischer so einzustellen, dass er vor Ausführung des nächsten Übergangs 2 Sekunden wartet, klicken Sie auf die Schaltfläche PAUSE HINZUFÜGEN, ehe Sie einen weiteren Übergang vorgeben. Das Fenster „Pause hinzufügen“ öffnet sich. Geben Sie für das Pausieren 5 Sekunden und 0 Frames vor und klicken Sie zur Bestätigung auf „Pause hinzufügen“.

   Warum eine 5-Sekunden-Pause setzen, obwohl nur eine 2-Sekunden-Pause gewünscht wird? Weil es zusätzlich zur Pause 3 Sekunden dauert, ehe der Mix-Übergang abgeschlossen ist. Darum müssen beim Einfügen einer Pause die Übergangsdauer selbst sowie die vor dem nächsten Übergang einzuhaltende Pause berücksichtigt werden.

   In diesem Beispiel dauert der Ablauf des Übergangs 3 Sekunden und die zweite Pause weitere 2 Sekunden. Es ist also eine Pausendauer von 5 Sekunden vorzugeben. Alternativ kann man auch zwei separate Pausen eingeben: Eine für die Dauer des Übergangs und eine weitere für die gewünschte Pausendauer. Sie haben die Wahl.

12 Wählen Sie auf dem Vorschaubus jetzt die „Blk“-Schaltfläche für Schwarz aus und klicken Sie im „Übergangsart“-Menü auf AUTO. Ihr ATEM Mischer führt einen Mix-Übergang nach Schwarz aus.

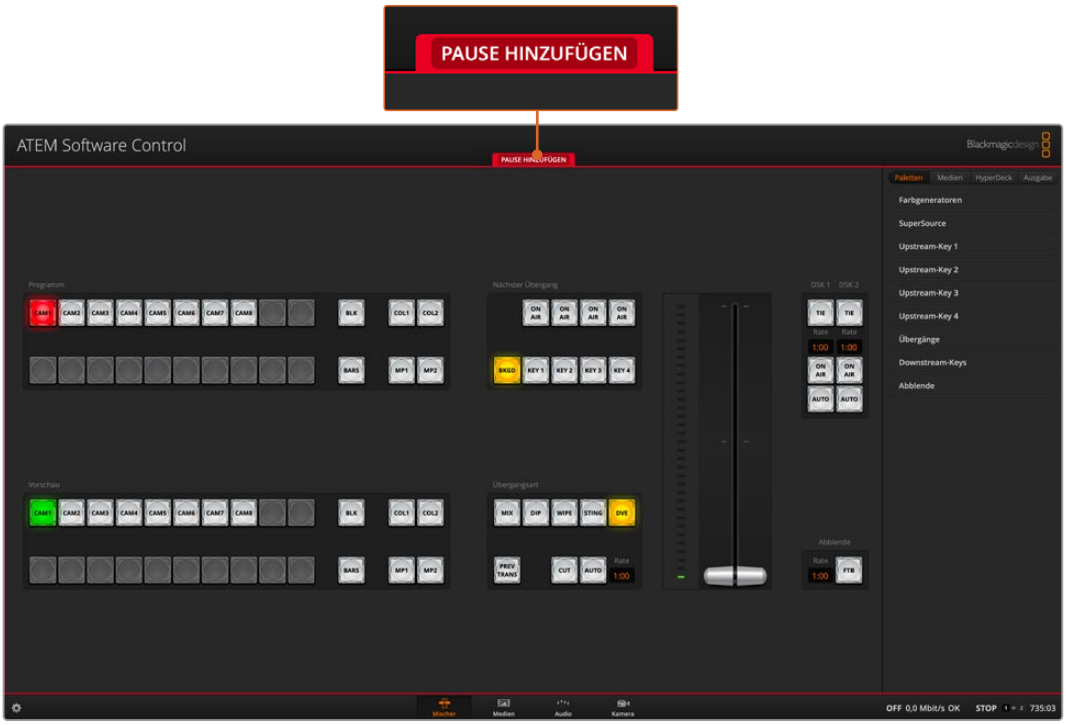
13 Klicken Sie dann im „Makros“-Fenster auf das Aufzeichnungssymbol, um die Aufzeichnung Ihres Makros zu stoppen.

   Der soeben gespeicherte Makro erscheint nun in Form eines Buttons an Ihrem ausgewählten Makroplatz. Um eine Vorschau Ihres Makros zu sehen, klicken Sie im „Makros“-Fenster auf „Ausführen“. Das ruft die „Ausführen“-Ansicht auf. Durch Auswahl von „Abrufen u. ausführen“ wird im Makrofenster vorgegeben, einen Makro nach Anklicken eines Makrobuttons sofort abzuspielen. Klicken Sie jetzt auf Ihren neuen Makro, den Sie „Übergänge“ genannt haben.

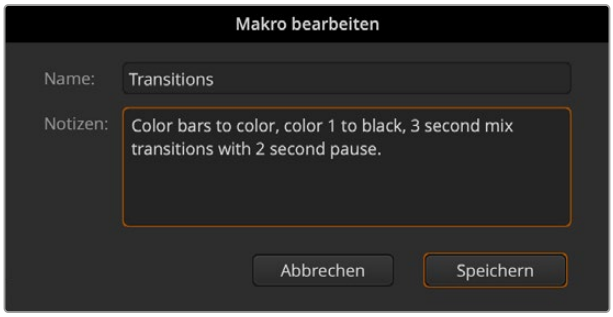
14 Soll die Wiedergabe Ihres Makros sofort nach Auswahl erfolgen, klicken Sie auf die „Abrufen u. ausführen“-Schaltfläche. Die Aktivierung dieser Feature gestattet Ihnen, Makros mit einem einzigen Mausklick zu laden und abzuspielen.

Wenn Ihr Makro gelungen ist, sollte Ihr ATEM Mischer jetzt innerhalb von 3 Sekunden einen Mix von Farbbalken nach Farbe 1 absolvieren, 2 Sekunden lang pausieren und dann einen weiteren Mix-Übergang von 3 Sekunden Dauer nach Schwarz ausführen. Ihr ATEM Mischer zeigt dabei in der Bediensoftware anhand einer orangefarbenen Umrandung an, dass gerade ein Makro abgespielt wird.

Verläuft Ihr Makro nicht in erwarteter Manier, zeichnen Sie ihn einfach erneut auf, indem Sie die vorherigen Schritte wiederholen.



ATEM Software Control zeigt die laufende Aufzeichnung eines Makros anhand einer roten Umrandung an. Mithilfe der oben an der roten Umrandung befindlichen Schaltfläche PAUSE HINZUFÜGEN, können Sie die Pausierungsdauern zwischen Mischervorgängen eingeben



Geben Sie einen Namen und Notizen für Ihren Makro ein, um den Überblick über die in diesem Makro gespeicherten Mischeraktionen zu behalten

Programmieren großer Makros

Bei der Programmierung von Makros können sogar Auslösebefehle für andere Makros mitgespeichert werden. Auf diese Weise sind mithilfe mehrerer kleinerer Makros spielend größere Makros programmierbar, d. h. Sie können aus wenigen Vorgängen bestehende Makros aufzeichnen und diese zu einem großen Makro zusammenfügen. Dies wird ermöglicht, da man im Fall von Fehlern bei der Programmierung eines großen Makros in einer kompletten Sequenz sonst die gesamte Sequenz von Anfang an neu erstellen und aufzeichnen müsste. Es ist viel einfacher, mit kleineren, aus weniger Vorgängen bestehenden Sequenzen zu arbeiten.

Die Aufzeichnung eines aus kleinen Makros bestehenden großen Makros gestattet Ihnen zudem, Ihren großen Makro zu bearbeiten, indem Sie lediglich die gewünschten kleinen Makros modifizieren und diese anschließend erneut zu einem großen Makro zusammenfügen.

Zusammenfügen von kleineren Makros zu einem großen Makro

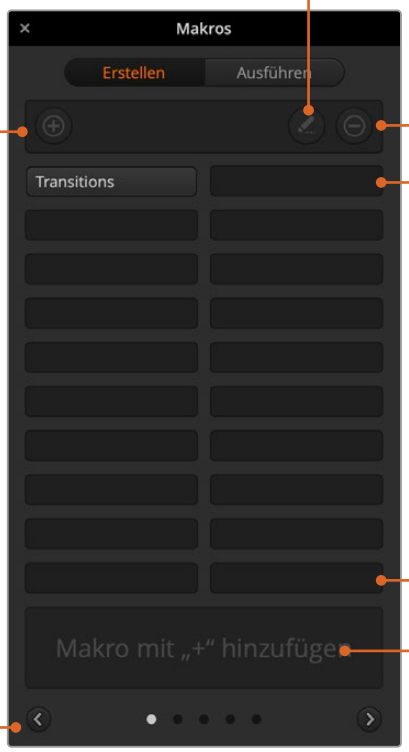
1. Leiten Sie die Aufzeichnung eines neuen Makros ein. Klicken Sie dann bei laufender Aufzeichnung des Makros auf die „Ausführen“-Schaltfläche, um die „Ausführen“-Ansicht aufzurufen.
2. Wählen Sie „Abrufen u. ausführen“ aus, um Makros per Klick auf eine Schaltfläche automatisch abzuspielen.
3. Spielen Sie Ihre Abfolgen von kleinen Makros samt den dazwischen eingefügten Pausen für die Dauer des jeweiligen kleinen Makros ab, bis der große Makro fertig ist.
4. Beenden Sie die Aufzeichnung. Jetzt haben Sie einen komplexen, leistungsstarken großen Makro, der sich aus kleinen Makros zusammensetzt, die Sie später bei Bedarf mühelos ändern können.

Die Anzahl der so ausführbaren Vorgänge ist unbegrenzt. Sie können mühelos komplexe Übergänge programmieren, einzigartige wiederholbare Effekte mithilfe von Keyern erstellen sowie häufig verwendete Einstellungen für die Blackmagic Studio Camera, Grafikeinblendungen und DVE einrichten. So ersparen Sie sich, diese beim Starten eines neuen Programms jedes Mal erneut zu erstellen. Makros bringen Spaß und sparen massenweise Zeit!

Fenster zur Erstellung von Makros

Die Schaltfläche „Makro erstellen“:
Ein Klick auf diese Schaltfläche öffnet das Pop-up-Fenster für die Makroprogrammierung. Hier können Sie den Namen eines neu zu speichernden Makros eingeben, unter „Notizen“ eine Beschreibung dieses Makros verfassen und die Aufzeichnung Ihres Makros per Klick auf „Aufzeichnen“ einleiten.

Pfeilschaltflächen und Seitensymbole:
Um auf mehr als 20 Makros zuzugreifen, klicken Sie unten im „Makros“-Fenster rechts auf den Pfeil. Dies öffnet die nächste Makro-Listenansicht. Ein Klick auf den linken Pfeil ruft die vorherige Makro-Listenansicht auf. Welche Makros Sie gerade betrachten, ist an den Listenansichts-Symbolen zwischen den Pfeilen ersichtlich.



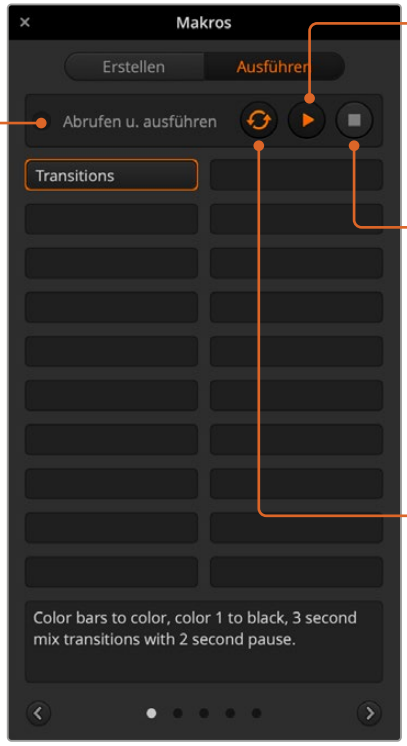
Schaltfläche zum Bearbeiten eines Makros:
Wählen Sie den zu bearbeitenden Makro aus. Klicken Sie dann auf die Schaltfläche zur Makrobearbeitung, um den Namen des Makros und die Notizen zu ändern.

Schaltfläche zum Löschen des Makros:
Wählen Sie den zu löschenden Makro aus und klicken Sie dann auf die Schaltfläche zum Löschen von Makros, um den ausgewählten Makro zu löschen.

Makroschaltflächen:
Nach Aufzeichnung eines Makros an einen ausgewählten Makroplatz erscheint dieser in Form einer Makro-Schaltfläche. Wurde der Name eines Makros während der Aufzeichnung entfernt, wird stattdessen die Nummer des ausgewählten Makroplatzes verwendet.

Statusfeld:
Dieses Feld zeigt nützliche Eingabeaufforderungen an, die Ihnen bei der erstmaligen Aufzeichnung und Wiedergabe von Makros helfen. Ein aktivierter Makro zeigt auch ggf. eingegebene Notizen an.

Fenster zum Ausführen von Makros



Abrufen und ausführen:
Durch Auswahl der Funktion „Abrufen u. ausführen“ lässt sich ein Makro per Klick auf die jeweilige Makro-Schaltfläche sofort abspielen. Ist „Abrufen u. ausführen“ deaktiviert, kann ein Makro per Klick auf die Makro-Schaltfläche geladen werden. Spielen Sie den Makro dann per Klick auf das Wiedergabesymbol ab.

Ausführen:
Wenn „Abrufen u. ausführen“ deaktiviert ist und Sie per Klick auf eine Makro-Schaltfläche einen Makro geladen haben, klicken Sie zum Abspielen dieses Makros auf das Wiedergabesymbol.

Stopp:
Ein Klick auf das Stoppsymbol hält die Wiedergabe von Makros nach Ablauf des aktuellen Vorgangs an. Beispiel: Wenn Sie mitten im Übergang auf Stopp drücken, führt der Mischer den angefangenen Übergang zu Ende und stoppt dann die Makrowiedergabe.

Endlosschleife:
Erfolgt die Wiedergabe eines Makros bei aktivierter Loop-Schaltfläche, wird Ihr Makro so lange abgespielt, bis Sie auf das Stoppsymbol klicken. Bei deaktivierter Loop-Funktion wird Ihr Makro komplett abgespielt.

Aufzeichnen von Makros mit einem ATEM Television Studio

Mit einem ATEM Television Studio können Sie Makros unabhängig von der Bediensoftware ATEM Software Control aufzeichnen und abspielen. Alle im Mischer-Arbeitsraum von ATEM Software Control ausführbaren Vorgänge lassen sich auch von Ihrem Mischerbedienpult aus vornehmen. Ob Sie Audio mischen, Grafiken im Media Pool anordnen oder Kameraeinstellungen justieren, ATEM Software Control gibt Ihnen bequemen Zugriff auf diese Einstellungsoptionen.

Die Tasten zum Aufzeichnen und Ausführen von Makros mit dem ATEM Television Studio befinden sich im Bereich der Systemsteuerung. Die Bezeichnungen Ihrer Makrotasten werden in Kurzform im Quellnamen-Display angezeigt.

Folgen Sie den nachstehenden Anweisungen, um den gleichen Makro eines Übergangs herzustellen, wie bereits mit ATEM Software Control vorgeführt. Dieses Mal erstellen Sie einen Makro am Makroplatz Nr. 6.

1. Drücken Sie die MAKROS-Multifunktionstaste, um alle Makros im LCD-Menü zu öffnen.
2. Wählen Sie mithilfe des Makro-Reglers unterhalb des LCDs den Makroplatz, an dem Sie Ihren Makro speichern wollen. Wählen Sie für dieses Beispiel den leeren Platz „6 – Leer“.
3. Um die Aufzeichnung zu starten, drücken Sie auf die Aufzeichnen-Multifunktionstaste über dem LCD. Es erscheint das Aufnahme-Icon als roter Punkt. Während der Aufzeichnung wird aus diesem Icon ein totes Quadrat. Zusätzlich ist das LCD rot umrandet.

Drücken Sie die Aufnahme-Multifunktionstaste, um das Aufzeichnen Ihres Makros zu starten

Während der Aufzeichnung erscheint rund um das LCD ein roter Rand

4 Wählen Sie auf dem „Programm“-Bus die Option „Farbbalken“ mit der SHIFT-Taste aus. Die blinkende Taste zeigt an, dass es sich um eine mit SHIFT ausgewählte Quelle handelt.

5 Drücken Sie die SHIFT-Taste, um „Farbe 1“ auf dem „Vorschau“-Bus auszuwählen. Geben Sie zur bequemeren Anwendung Tastenbelegungen vor, bspw. für Balken, Schwarz und Farbgeneratoren. Diese Funktionen können Sie einer beliebigen der ersten zehn Tasten des „Programm“- bzw. „Vorschau“-Busses zuweisen. Weitere Informationen finden Sie in dieser Bedienungsanleitung im Abschnitt „Tastenbelegung“.

6 Drücken Sie die Taste WIPE im Übergangsteuerblock, um sicherzustellen, dass Ihr Makro die Auswahl des Wipe-Übergangs speichert.

7 Setzen Sie die Rate im LCD-Menü „Wipe“ auf 2:00 Sekunden.

8 Drücken Sie im Übergangssteuerblock die AUTO-Taste, um den Wipe-Übergang von „Farbbalken“ zu „Farbe 1“ vorzunehmen.

9 Drücken Sie die MACRO-Taste, um zum Makrobildschirm zurückzukehren.

10 Um einen Makro einzurichten, warten Sie 2 Sekunden lang, ehe Sie den nächsten Übergang anwenden. Drücken Sie im LCD-Menü die Multifunktionstaste PAUSE HINZUFÜGEN und geben eine Dauer von 2 Sekunden vor, indem Sie die SEKUNDEN-Regler drehen. Um die Pause zu speichern, drücken Sie die BESTÄTIGEN-Multifunktionstaste.

11 Wählen Sie auf dem Vorschaubus jetzt mithilfe der SHIFT-Taste „Schwarz“, drücken Sie in der Übergangssteuerung die MIX-Taste und dann die AUTO-Übergangstaste. Ihr ATEM Mischer führt einen Mix-Übergang nach Schwarz aus.

12 Drücken Sie die MACRO-Taste, um zum Makro-Menü zurückzukehren. Um die Speicherung zu stoppen, drücken Sie die STOP-Multifunktionstaste.

Sie haben soeben einen Makro mit dem ATEM Television Studio aufgezeichnet. Dieser Makro erscheint als Makrobutton mit dem Kürzel 6, weil er am Makroplatz Nr. 6 positioniert ist. Sie können Ihren Makro benennen und mit Anmerkungen versehen, indem Sie in ATEM Software Control auf die Schaltfläche „Makro bearbeiten“ klicken.

Um den Makro auszuführen, drücken Sie die MACRO-Taste. Dies versetzt die Quellauswahlreihe des Bedienpanels in den Makromodus. Die Tasten leuchten im Makromodus blau auf. Drücken Sie jetzt auf die Taste „Makro 6“. Einen ablaufenden Makro erkennen Sie einfach an der grün blinkenden Makrotaste und an der orangefarbenen Umrandung des LCD-Menüs.

Wenn Ihr Makro erfolgreich eingerichtet wurde, bewirkt das Drücken einer Taste auf Ihrem ATEM Mischer, dass dieser einen 2-sekündigen Mix von Farbbalken zu Farbe 1 ausführt, 2 Sekunden lang pausiert und anschließend einen 2-sekündigen Mix-Übergang nach Schwarz ausführt. Um den Makro in Schleife abzuspielen, aktivieren Sie die Wiedergabe in Schleife durch Drücken der LOOP-Multifunktionstaste. Drücken Sie die Taste zum Deaktivieren der Schleife erneut.

Testen Sie Ihre Makros regelmäßig mit verschiedenen Mischereinstellungen. So gehen Sie sicher, dass alle Funktionen wunschgemäß ausgeführt und keine Befehle ausgelassen werden oder unbeabsichtigte Effekte entstehen.

HyperDeck Steuerung

Die HyperDeck Steuerung

Sie können bis zu zehn HyperDeck Rekorder an Ihren Mischer anschließen und über die Systemsteuerungstasten am ATEM Mischer oder über die „HyperDecks“-Menüpalette in ATEM Software Control steuern. Eine äußerst leistungsstarke Funktion! Mit zehn an Ihren Mischer angeschlossenen HyperDecks steht Ihnen sozusagen eine portable Videobandabteilung zur Verfügung, die Ihre Mischerausgaben erfassen oder Grafiken wiedergeben kann. Oder stellen Sie Ihren Mischer gar so ein, dass er auf Tastendruck automatisch voraufgezeichnete Segmente von den Rekordern abspielt!

Die Transportsteuerelemente finden Sie im Systemsteuerungsmenü des ATEM Television Studio Mischers und in der Menüpalette „HyperDeck“ von ATEM Software Control. Von dort steuern Sie die Videowiedergabe, Jog und Shuttle, das Überspringen von Clips, Pausieren usw. Auch Video können Sie damit aufzeichnen.

Kombiniert mit der leistungsstarken Makro-Funktion der ATEM Mischer eröffnet diese Feature ein Universum kreativer Möglichkeiten, die Ihre Liveproduktionen beflügeln können.

HyperDeck Studio HD Plus

Anschließen von HyperDecks

Das Anschließen von HyperDecks an Ihren Mischer geht so ähnlich wie bei Kameras und anderen Videoquellen, die man an die SDI-Eingänge des Mischers anschließt. Zusätzlich ist lediglich die Ethernet-Verbindung herzustellen, über die Ihr ATEM Mischer mit den HyperDeck Rekordern kommuniziert.

1. Binden Sie Ihren HyperDeck über den Ethernet-Port in das gleiche Netzwerk ein, mit dem auch Ihr ATEM Mischer verbunden ist.
2. Drücken Sie die REM-Taste (Remote) auf dem Bedienfeld des HyperDecks. Die nun erleuchtete REM-Taste zeigt die aktivierte Fernsteuerung des HyperDecks an. Wenn Sie einen HyperDeck Studio HD Mini benutzen, aktivieren Sie die Fernsteuerung über die Einstellungen-Registerkarte im LCD-Menü.
3. Verbinden Sie den SDI-Ausgang Ihres HyperDecks mit einem SDI-Eingang Ihres ATEM Mischers.
4. Um die Programmausgabe Ihres ATEM Mischers mit Ihrem HyperDeck aufzuzeichnen, verbinden Sie einen der SDI-Ausgänge Ihres Mischers mit dem SDI-Eingang Ihres HyperDecks.
5. Wiederholen Sie den Vorgang für jeden HyperDeck Rekorder, den Sie anschließen möchten.

Nach Verbinden Ihrer HyperDeck Rekorder mit Ihrem Mischer, können Sie einzelne HyperDeck Rekorder über die Systemsteuerung oder die LCD-Multifunktionstasten einrichten und steuern.

Drücken Sie zunächst im Systemsteuerungsblock die Einstellungstaste SETTINGS.

Drücken Sie die LCD-Multifunktionstaste über der Display-Anzeige „HyperDecks“, um das „HyperDeck“-Einstellungsmenü zu öffnen. Auf der ersten Menüseite sehen Sie unten links die Anzeige HYPERDECK und daneben die Anzeige EINGANG. Drehen Sie den Regler unter der HYPERDECK-Anzeige, um durch die verfügbaren HyperDecks zu scrollen.

Wählen Sie ein HyperDeck aus und geben Sie dann durch Drehen des Reglers den Eingang vor, über den der Rekorder an den Mischer angeschlossen ist. Beispiel: Ist HyperDeck 1 an den Mischereingang „SDI In 4“ angeschlossen, wählen Sie mit dem Drehregler unter der Eingangsanzeige „Camera 4“ aus. Bestätigen Sie Ihre Auswahl durch Drücken auf den Regler „Eingänge“.

Auf der zweiten Seite können Sie die Funktion AUTO-PLAY ein- oder ausschalten und einen Wert für Frame-Offset vorgeben. Bei aktivierter „Auto-Play“-Funktion spielt der HyperDeck Rekorder Video automatisch ab, sobald er auf den Programmausgang geschaltet wird. Beispiel: Geben Sie Ihrem HyperDeck einen Cue-Punkt für den Abspielstart Ihrer Quelle vor und drücken Sie in der Misch-Effekte-Programmreihe die INPUT-Taste, um die Quelle abzuspielen. Alternativ lässt sich die „Auto-Play“-Funktion deaktivieren, um ein Standbild als Cue-Punkt vorzugeben oder um die Videowiedergabe von Ihrem HyperDeck aus manuell auszulösen.

HyperDecks brauchen vor Einsatz der Wiedergabe einige Frames als Puffer, was den tatsächlichen Schnitt um eine vorgegebene Anzahl von Frames verzögert. So werden saubere Übergänge gewährleistet. Ganz so wie wenn man bei einem Videoband-Rekorder einen Vorlauf vorgibt. Die Länge dieser Verzögerung lässt sich durch Ändern der Zahl im OFFSET-Feld justieren. Unserer Erfahrung gemäß sorgen fünf Bilder in der Regel für einen sauberen Schnitt.

Nachdem Sie einem HyperDeck einen Eingang zugewiesen haben, geben Sie auch die IP-Adresse des Rekorders vor. Dann können ATEM Television Studio Mischer den HyperDeck Rekorder via Ethernet steuern.

Geben Sie die IP-Adresse für den HyperDeck Rekorder vor, indem Sie mit der Rechts- oder Linkspfeiltaste zur dritten Seite der HYPERDECK-Einstellungen navigieren. Alternativ drücken Sie vom Einstellungsmenü HYPERDECK aus auf dem Ziffernblock die Taste „3“.

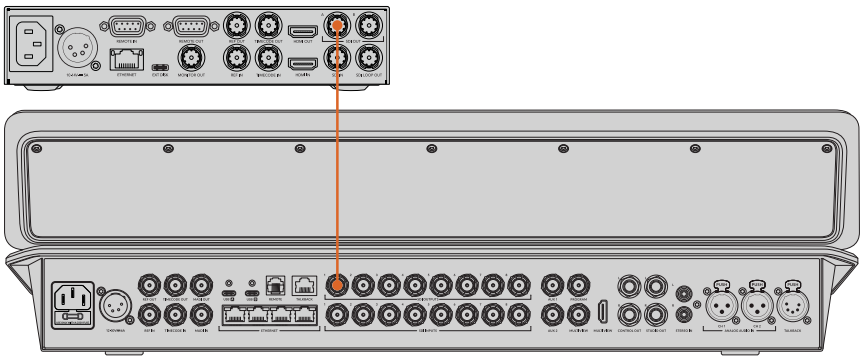
Diese Seite zeigt Ihnen eine IP-Adresse für den aktuell ausgewählten HyperDeck Rekorder an. Jede Zahl in der IP-Adresse ist mit dem darunter befindlichen Drehregler steuerbar. Ändern Sie diese Zahlen, indem Sie den entsprechenden Regler drehen, oder drücken Sie einmal auf den Regler, um eine Zahl über den Ziffernblock vorzugeben.

Gehen Sie so für jede Zahl der IP-Adresse vor.

Nach vollendeter Eingabe der IP-Adresse Ihres HyperDecks bestätigen Sie sie, indem Sie die Multifunktionstaste ÄNDERUNGEN SPEICHERN drücken. Um den Vorgang rückgängig zu machen, drücken Sie ABBRECHEN.

Um IP-Adressen für weitere HyperDecks einzugeben, wählen Sie das jeweilige HyperDeck über die erste Seite des Menüs mit den HyperDeck Einstellungen aus.

Sie können HyperDecks vom Mischer aus über die „Media Player“-Multifunktionstasten steuern. Näheres erfahren Sie im Abschnitt „HyperDeck Steuerung“ in dieser Bedienungsanleitung.



Anschließen des SDI-Ausgangs am HyperDeck Studio HD Plus an einen SDI-Eingang am ATEM Television Studio

Jetzt brauchen Sie Ihrem ATEM Mischer bloß noch den vom jeweiligen HyperDeck verwendeten Eingang und die IP-Adresse vorzugeben. Tun Sie das in ATEM Software Control in den Mischereinstellungen der „HyperDeck“-Registerkarte oder anhand der Multifunktionstasten für die Systemsteuerung an ATEM Television Studio Mischern.

HyperDeck Einstellungen

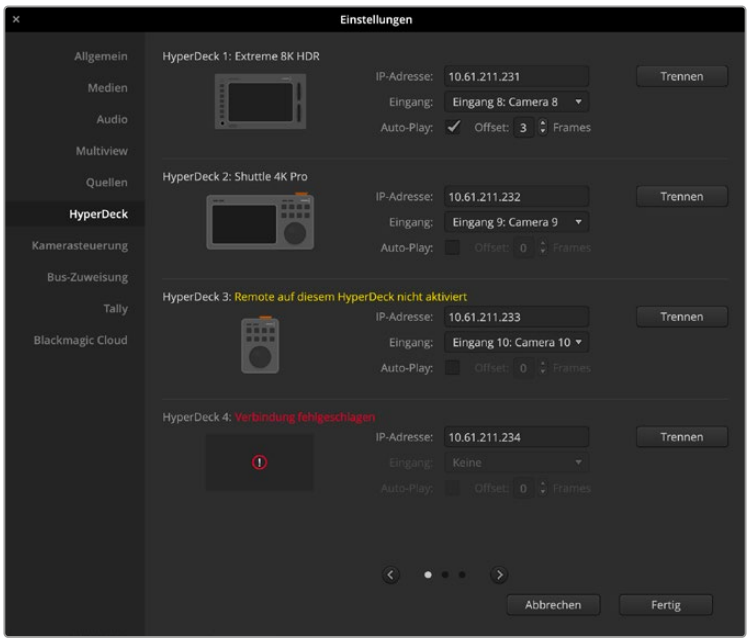
Die Verbindungseinstellungen für HyperDecks finden Sie in ATEM Software Control unter der „HyperDeck“-Registerkarte. Dort werden Ihnen die Optionen zur Einrichtung von bis zu zehn HyperDecks angezeigt.

Geben Sie hierfür einfach die IP-Adresse für jeden HyperDeck in das Feld „IP-Addresse“ ein. Geben Sie dann im „Eingang“-Menü den mit dem Rekorder verbundenen Eingang vor. Klicken Sie auf „Verbinden“. Jetzt ist Ihr HyperDeck bereit, gesteuert zu werden.

Über den einzelnen HyperDeck Icons erscheint ein Status-Symbol, das Sie über den jeweiligen Anschlusszustand aufklärt. Ein grüner Kreis mit Häkchen bedeutet, dass Ihr HyperDeck verbunden, in den Fernbedienungsmodus versetzt und einsatzbereit ist.

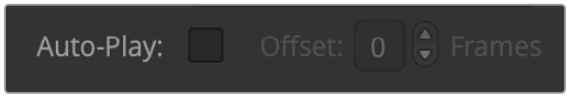
Wenn Ihr HyperDeck zwar erfolgreich verbunden und erkannt wurde, seine REMOTE-Taste aber nicht aktiviert ist, erscheint eine entsprechende Meldung.

Wenn Ihr HyperDeck nicht erkannt wurde, lautet die nun erscheinende Meldung „Verbindung fehlgeschlagen“. Vergewissern Sie sich in diesem Fall, dass der Ethernet-Port Ihres HyperDecks mit Ihrem Netzwerk verbunden und die eingegebene IP-Adresse korrekt ist.



Auto-Play

Sie können einem HyperDeck mit „Auto-Play“ vorgeben, Video automatisch wiederzugeben, sobald der Rekorder auf den Programmausgang geschaltet wird. Beispiel: Um Ihrem HyperDeck einen Cue-Punkt vorzugeben, von dem Ihre Quelle abgespielt werden soll, drücken Sie in der Misch-Effekte-Programmreihe die INPUT-Taste bzw. Schaltfläche für diesen Rekorder.



Da HyperDecks vor Einsatz der Wiedergabe einige Frames als Puffer brauchen, wird der tatsächliche Schnitt um eine vorgegebene Anzahl von Frames verzögert. Dies gewährleistet saubere Übergänge. Ganz so wie wenn man bei einem Videoband-Rekorder einen Vorlauf vorgibt. Justieren Sie die Länge dieser Verzögerung durch Ändern der Zahl im OFFSET-Feld. Unserer Erfahrung gemäß sorgen fünf Bilder in der Regel für einen sauberen Schnitt.

Alternativ lässt sich die „Auto-Play“-Funktion deaktivieren, um ein Standbild als Cue-Punkt vorzugeben oder um die Videowiedergabe von Ihrem HyperDeck manuell auszulösen.

HyperDecks mit ATEM Software Control steuern

Steuern Sie an Ihren Mischer gekoppelte HyperDeck Diskrekorder, indem Sie auf dem Software-Bedienpanel im „Media Player“-Tab auf die „HyperDecks“-Palette klicken.

Dort können Sie per Klick auf eine der Schaltflächen am oberen Rand des Bedienpanels zwischen an Ihr System angeschlossenen HyperDeck Rekordern auswählen. Die Namen der HyperDecks werden mit den in den ATEM Einstellungen vorgegebenen Labels angezeigt. Verfügbare HyperDecks sind an der weißen Textfarbe erkennbar, Ihr aktuell gesteuertes Gerät erscheint orangefarben.

Wählen Sie einen von bis zu zehn HyperDeck Rekordern aus, indem Sie in der „HyperDeck“-Menüpalette auf die entsprechenden Auswahlschaltflächen klicken

Zusätzlich zur Textfarbe verfügt der Auswahlbutton eines jeden HyperDecks über eine Tally-Anzeige.

Grüne Umrandung	Zeigt einen aktuell auf den Vorschauausgang geschalteten HyperDeck an.
Rote Umrandung	Zeigt einen aktuell auf den Programmausgang geschalteten HyperDeck an. Der Rekorder ist live und aktuell auf Sendung. Über den Auswahlbuttons für Ihre HyperDecks werden ggf. folgende weitere Statusmeldungen angezeigt:
Bereit	Der HyperDeck befindet sich im Fernsteuermodus und es ist ein Datenträger eingelegt. Bei verfügbarem Speicherplatz ist er bereit zur Wiedergabe und Aufzeichnung.
Aufzeichnen	Der HyperDeck zeichnet zurzeit auf.
Kein Datenträger	Es ist kein Datenträger im HyperDeck vorhanden.
Lokal	Der HyperDeck ist nicht auf den Remote-Betrieb eingestellt und somit nicht durch Ihren ATEM Mischer steuerbar.

Für Ihren ausgewählten HyperDeck werden folgende Informationen zu aktuell aktivierten Clips angezeigt: Name, Länge sowie die abgelaufene und verbleibende Abspieldauer. Darunter befinden sich die Steuerungs-Schaltflächen.

	**Aufzeichnen** Klicken Sie auf diese Schaltfläche, um die Aufzeichnung mit Ihrem HyperDeck zu starten. Klicken Sie erneut, um die Aufzeichnung zu stoppen.
	**Vorheriger Clip** Springt zum vorherigen Clip in Ihrer Medienliste.
	**Wiedergabe** Klicken Sie auf diese Schaltfläche, um die Wiedergabe zu beginnen. Klicken Sie erneut, um sie zu stoppen. Wenn Auto-Play in Ihren „HyperDeck“-Einstellungen aktiviert ist, erfolgt die Wiedergabe, sobald Ihr HyperDeck auf den Programmausgang geschaltet wird.
	**Nächster Clip** Springt zum nächsten Clip in Ihrer HyperDeck Medienliste.
	**Endlosschleife** Ein Klick auf Loop spielt den derzeitig gewählten Clip in Dauerschleife ab. Ein erneuter Klick spielt alle Clips in Ihrer HyperDeck Medienliste in Dauerschleife ab.

Anhand der Shuttle/Jog-Schieberegler unter den Steuerungs-Schaltflächen Ihrer HyperDecks navigieren Sie durch einen Clip. Dies gestattet flinke Bewegungen innerhalb von Clips, Sprünge per Shuttle zu einem ausgewählten Clip oder per Jog von Bild zu Bild zu gehen. Anhand der Schaltflächen neben dem Shuttle/Jog-Schieberegler wechseln Sie zwischen diesen Modi.

Die Auswahl zwischen der Shuttle- und Jog-Transportsteuerung erfolgt mit den Schaltflächen zur Linken des Transportreglers. Schieben Sie den Regler nach links bzw. rechts, um vorwärts bzw. rückwärts durch Ihren Clip zu gehen

In der Clipliste unter der Transportsteuerung sind alle auf dem ausgewählten HyperDeck verfügbaren Clips aufgeführt. Klicken Sie auf den Pfeil rechts neben der Clipliste, um diese aufzuklappen bzw. zusammenzufalten.

Wiedergabe

Auf Ihrem HyperDeck befindliche Medien lassen sich mühelos abspielen. Versetzen Sie Ihren HyperDeck in den Vorschauausgabe-Modus und wählen Sie den Clip für die Wiedergabe aus. Geben Sie den Cue-Punkt in Ihrem Clip anhand der Transportsteuerelemente vor. Sobald Sie Ihren HyperDeck auf Programmausgabe schalten, sorgt die „Auto-Play“-Funktion für eine automatische Wiedergabe beginnend von diesem Punkt.

Um die Wiedergabe manuell auszulösen, bspw. nach Halten eines Standbildes mit anschließendem Abspielen eines Clips, deaktivieren Sie das entsprechende „Auto-Play“-Kontrollkästchen in der „HyperDeck“-Registerkarte im „Einstellungen“-Menü der ATEM Bediensoftware.

Aufzeichnung

Um auf einen formatierten Datenträger im HyperDeck aufzuzeichnen, klicken Sie auf der „HyperDecks“-Menüpalette auf die „Aufzeichnen“-Transportsteuerelemente. Die Zeitanzeige auf der „HyperDecks“-Menüpalette gibt Ihnen Aufschluss über die ungefähre, auf dem Datenträger verbleibende Aufnahmedauer.

HyperDecks mit einem ATEM Television Studio steuern

Nach erfolgter Verbindung von HyperDeck Rekordern mit Ihrem Mischer wie im vorherigen Abschnitt „Anschließen von HyperDecks“ aufgeführt, können Sie jetzt einzelne HyperDeck Rekorder über die Systemsteuerungstasten und das LED-Menü des Bedienpanels einrichten und steuern.

HyperDecks mit einem ATEM Television Studio steuern

Die HyperDeck Bedienelemente befinden sich im Systemsteuerungsblock im Menü MEDIA PLAYER. Um auf dieses Menü zur Steuerung von HyperDecks zuzugreifen, drücken Sie im Systemsteuerungsblock die Taste MEDIA PLAYERS und dann die Multifunktionstaste über der LCD-Anzeige HYPERDECKS. Bei Mischern mit mehr als einem Media Player müssen Sie für den Zugriff auf die HyperDeck Bedienelemente ggf. zur nächsten Menüseite navigieren.

Jetzt können Sie die Drehregler unter den LCD-Anzeigen HYPERDECK, CLIP, JOG und SHUTTLE benutzen, um HyperDecks und Clips auszuwählen und in den Clips zu navigieren.

Der nun in der Mitte des HyperDeck Steuerungsmenüs eingeblendete Text gibt Aufschluss über Ihren ausgewählten HyperDeck.

Die Seiten 2 und 3 des LCD-Menüs MEDIA PLAYER enthalten weitere HyperDeck Bedienelemente, bspw. für Wiedergabe, Stopp, Wiedergabe in Schleife und zum Vor- und Zurückspringen zwischen Clips.

TIPP Um alle Clips abzuspielen, drücken Sie bei festgehaltener SHIFT-Taste die Wiedergabe-Multifunktionstaste

Drücken Sie auf der 3. Menüseite die Aufzeichnen-Multifunktionstaste, um die Programmausgabe Ihres Mischers auf Ihrem HyperDeck aufzunehmen. Erhöhen bzw. Reduzieren dieses Werts bewirkt, dass alle Farbtöne gemäß der auf dem Farbrad sichtbaren Farbtonverteilung gedreht werden.

Arbeiten mit Tally

Ausgeben von Tallysignalen mit einem GPI and Tally Interface

Ihr ATEM Mischer kann Tallysignale an Monitore und Kameras ausgeben, um anzuzeigen, welche Quelle aktuell auf den Programmausgang geschaltet und somit gegenwärtig auf Sendung ist.

Mit einem Tally wird normalerweise das Rotlicht auf einer Kamera oder einem Monitor aktiviert, damit die Darsteller wissen, dass sie on air sind. Über Tally lassen sich auch Umrandungen auf Monitoren einblenden, wie z. B. auf einem Blackmagic SmartView 4K. Eine Umrandung zeigt Produktionsmitarbeitern an, welche Kamera gegenwärtig auf Sendung ist.

Das GPI and Tally Interface von Blackmagic Design ist ein für Tallys verwendbares Ethernet-Gerät mit acht mechanischen Relais-Kontaktschließern zur Erde. Tallysignale werden über den Ethernet-Port Ihres ATEM Mischers an ein im selben Netzwerk befindliches GPI and Tally Interface übermittelt. Um Videoequipment anzuschließen, das Relais-Kontaktschließer für Tallysignale über eine Kabelpeitsche unterstützt, wie z. B. den Blackmagic SmartView Duo und SmartView HD, orientieren Sie sich am Verbindungsdiagramm auf der Rückseite des GPI and Tally Interface. Ein einziges GPI and Tally Interface unterstützt bis zu acht Tally-Empfangsgeräte. Für den Einsatz mit einem ATEM Television Studio reicht ein GPI and Tally Interface Gerät.

GPI and Tally Interface

Die GPI-Eingänge sind optische Isolatoren, die durch Erdung bei bis zu 5 V mit 14 mA ausgelöst werden.

Die Tally-Ausgänge sind mechanische Relais-Kontaktschließer zur Erde für maximal 30 V bei 1 A.

Ändern der Netzwerk- und Tallyeinstellungen

Damit das GPI and Tally Interface mit Ihrem ATEM Mischer kommuniziert, werden die Netzwerk- und Tallyeinstellungen dieses Anschlussgeräts mit dem Dienstprogramm ATEM Setup konfiguriert. Zur Konfiguration der Einstellungen mit ATEM Setup muss das GPI and Tally Interface via USB angeschlossen sein.

1. Binden Sie das GPI and Tally Interface in dasselbe Ethernet-Netzwerk wie Ihren ATEM Mischer ein.
2. Verbinden Sie das GPI and Tally Interface mit einem USB-Port Ihres Rechners und schließen Sie auch das mitgelieferte Netzteil an.
3. Starten Sie ATEM Setup.
4. Wenn Ihr ATEM Mischer eine direkte Verbindung zu Ihrem Rechner ohne Ethernet-Netzwerkschalter aufbaut, wählen Sie „Configure Address Using Static IP“ (Adresse mit statischer IP konfigurieren) aus. Standardmäßig verwendet das GPI and Tally Interface die werkseitig eingestellte, feste IP-Adresse 192.168.10.2. Wir raten, diese Nummer der Einfachheit halber beizubehalten.

Sie können auch eine beliebige andere statische IP-Adresse auswählen, sofern diese sich im gleichen Zahlenbereich wie die des ATEM Mischers befindet und nicht bereits von einem anderen Gerät in Ihrem Netzwerk verwendet wird. Aus diesem Grund sind folgende IP-Adressen für ATEM Produkte tunlichst zu vermeiden: 192.168.10.1, 192.168.10.2, 192.168.10.3, 192.168.10.10, 192.168.10.50, 192.168.10.60 und 192.168.10.240.

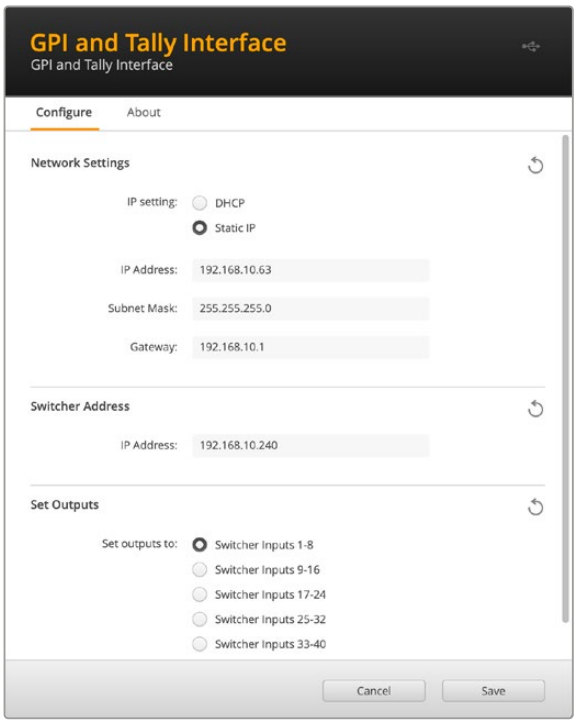
Baut Ihr ATEM Mischer eine Verbindung über einen vorhandenen Ethernet-Netzwerk-Switch auf, empfiehlt sich ggf. die Auswahl von „Configure Address Using DHCP“, da mit dieser Einstellung IP-Adresse, Subnetzmaske und Gateway-Informationen automatisch eingeholt werden.

5 Geben Sie die IP-Adresse Ihres ATEM Mischers in das Feld „Switcher Address“ ein. Ihr ATEM Mischer ist werksseitig auf die Standardeinstellung DHCP voreingestellt. Sie können auch eine beliebige statische IP-Adresse auswählen.

6 „Set Tally Outputs“ sollte auf „Switcher Inputs 1–8“ eingestellt sein.

7 Klicken Sie zum Anwenden auf „Apply“. Hat das Gerät den ATEM Mischer gefunden, sollte die weiße LED rechts neben dem USB-Port kontinuierlich leuchten statt zu blinken. Das GPI and Tally Interface ist jetzt einsatzbereit.

8 Beenden Sie ATEM Setup und entfernen Sie das USB-Kabel.



Netzwerk- und Ausgabeeinstellungen für das GPI and Tally Interface

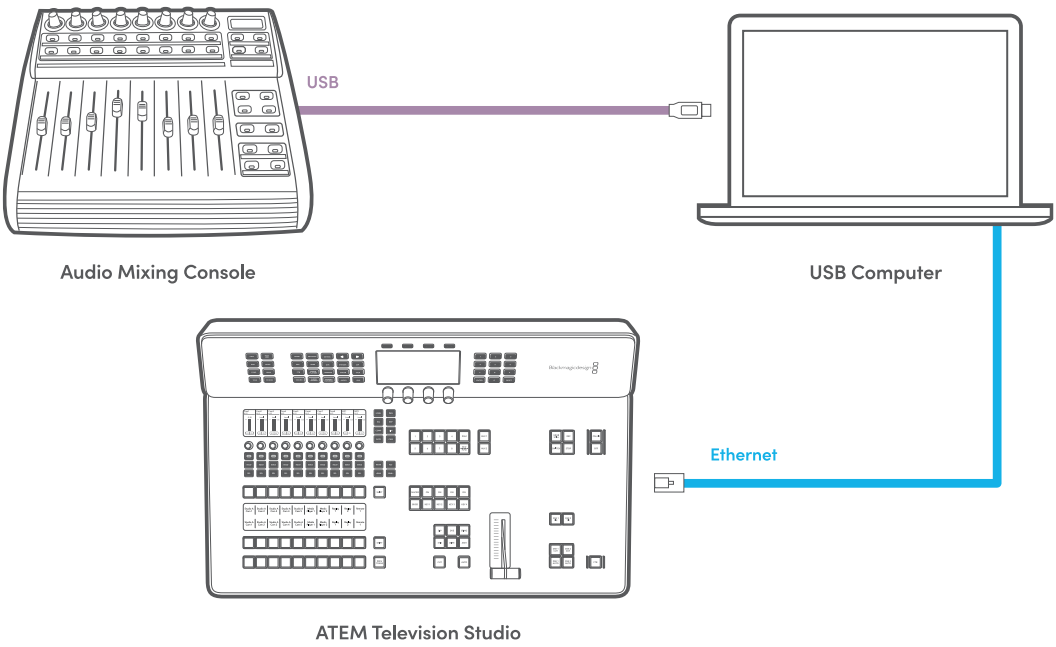
Arbeiten mit Tonmischpulten von Fremdherstellern

Arbeiten mit einem Tonmischpult

In der hektischen Welt der Liveproduktionen gehen Justierungen per Maus manchmal nicht schnell genug. Wenn Sie mit Ihrem ATEM Mischer mehrere Audioquellen gleichzeitig mixen müssen, haben wir eine Empfehlung für Sie: Schließen Sie ein hardwarebasiertes Tonmischpult an. Dann können Sie mit beiden Händen zupacken und mehrere Audiopegel gleichzeitig anpassen.

Für die Kommunikation mit dem ATEM Mischer kann ein Tonmischpult als MIDI-Gerät, das von Mackie-Control-Befehlen Gebrauch macht, an Ihren Mac oder PC angeschlossen werden.

Viele MIDI-Mischpulte von Fremdherstellern sind mit ATEM Mischern kompatibel. Lassen Sie sich dies im Zweifelsfall aber lieber vom Hersteller Ihres Pults bestätigen.



Sie können mehrere Audiopegel gleichzeitig anpassen, indem Sie einen hardwarebasierten Audiomixer an einen Computer mit ATEM Software Control anschließen

Anschließen Ihres Tonmischpults

1. Schließen Sie Ihr kompatibles MIDI-Tonmischpult an Ihren Mac oder PC an. Die meisten modernen Mischpulte verwenden USB.

2. Vergewissern Sie sich, dass Ihr Computer das Mischpult als MIDI-Gerät erkennt.

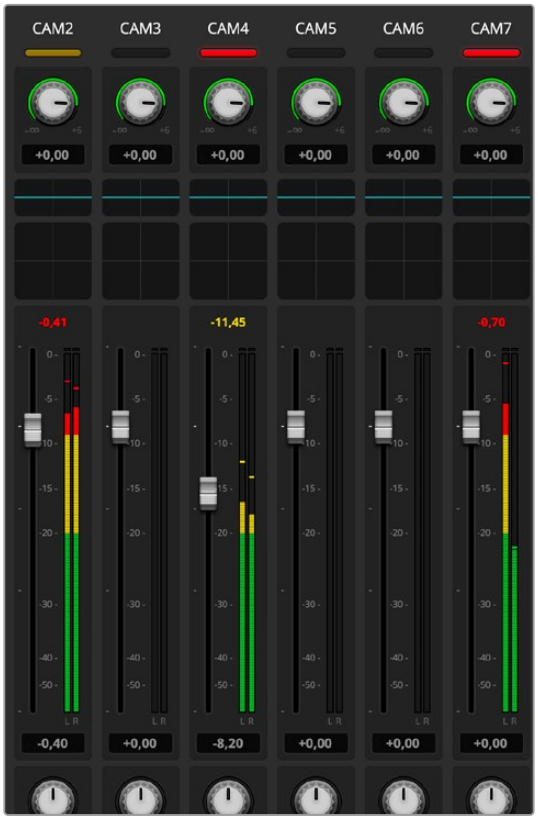
   Unter Mac: Gehen Sie zu „Programme“ > „Dienstprogramme“ > „Audio MIDI Setup“ und starten Sie die Anwendung. Gehen Sie zum Fenstermenü und wählen Sie „Show MIDI Window“ (MIDI Fenster anzeigen) aus. Vergewissern Sie sich, dass Ihr Mischpult in diesem Fenster als MIDI-Gerät erscheint.

   Unter Windows: Gehen Sie zu „Geräte-Manager“ > „Ton, Video und Gamecontrollers“ und vergewissern Sie sich, dass Ihr Mischpult in der Icon-Liste erscheint.

3. Da Ihr ATEM Audiomixer dazu konzipiert ist, über Mackie Control-Befehle mit Ihrem Mischpult zu kommunizieren, muss Ihr Mischpult Mackie Control unterstützen. Das Pult muss außerdem für den Einsatz von Mackie Control oder Mackie Control Emulation konfiguriert sein. Bitte sehen Sie die Einzelheiten für die Konfiguration im Handbuch Ihres Steuerpults nach.

   Da einige Tonmischpulte mehrere Arten von Mackie Steuerungssoftware bieten, sollten Sie die Version auswählen, die die meisten Features auf Ihrem Pult aktiviert. Beispiel: Beim Behringer BCF 2000 gibt die Auswahl von „Mackie Control Mapping for Cakewalk Sonar 3 [MCSo]“ die Funktionen Pegelfader, Bank-Wechsler, Balancesteuerung, AFV und ON/MUTE (Ein/Stumm) frei. Außerdem aktiviert diese Auswahl die LED-Anzeige, die die für Ihren Audiomix ausgewählte Fader-Bank anzeigt. Bei Auswahl einer anderen Mackie Control Emulation wird die LED-Anzeige nicht aktiviert.

4. Beim Start von ATEM Software Control sucht die Software Ihr Tonmischpult automatisch aus und benutzt den ersten Port des ersten aufgefundenen MIDI-Geräts. Klicken Sie in ATEM Software Control auf den „Audio“-Tab, wo Ihnen der ATEM Audiomixer angezeigt wird. Testen Sie durch Herauf- und Herabschieben der Verstärkungs-Fader Ihres Tonmischpults, ob die Software auf Ihrem Computerbildschirm einen entsprechenden Anstieg bzw. ein Senken der Audiomixer-Kanalfader anzeigt. Wenn ja, haben Sie Ihr Mischpult erfolgreich für den Einsatz mit dem ATEM Mischer konfiguriert.



Stummschaltung

Bei aktivierter EIN-Schaltfläche ist auf der Bedienoberfläche des ATEM Audiomixers immer Audio eingeschaltet oder im Mix vorhanden. Ist die EIN-Schaltfläche deaktiviert, wird kein Ton verwendet oder er ist stumm geschaltet. Die Stumm-Schaltfläche der Bedienoberfläche Ihres Audiomixers ist bei ständig aktiviertem oder im Mix vorhandenen Audio ständig erleuchtet. Die Stumm-Schaltfläche erlischt, wenn kein Audio verwendet wird oder es stumm geschaltet ist.

Dezibelskalen

Da alle Hardware-Tonmischpulte unterschiedlich ausgeführt sind, stimmen die auf Ihrem Tonmischpult aufgedruckten Skalen ggf. nicht mit der Bedienoberfläche Ihres ATEM Audiomixers überein. Richten Sie sich daher für die korrekten Dezibelskalen immer nach dem ATEM Audiomixer.

Arbeiten mit einem DaVinci Resolve Micro Panel

Der in jedes Kamerabedienfeld von ATEM Software Control integrierte DaVinci Primary Color Corrector lässt sich über ein DaVinci Resolve Micro Panel steuern. Über dieses Hardware-Steuerpult können Sie schnelle und präzise Farbjustagen vornehmen.

So richten Sie das Pult ein:

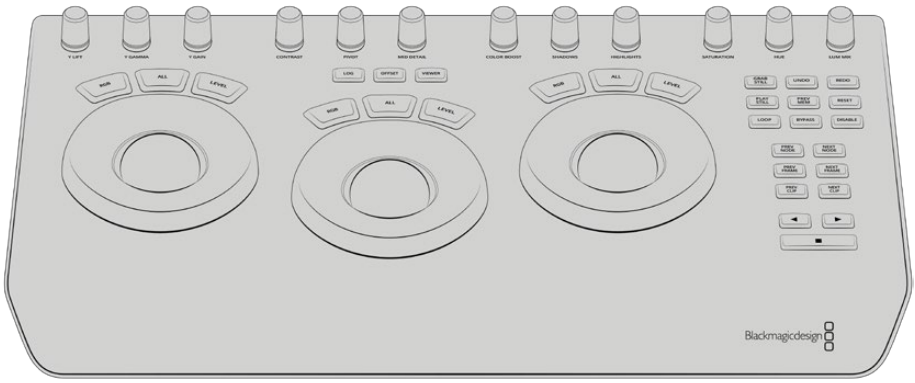
1. Verbinden Sie das DaVinci Resolve Micro Panel über ein USB-C-Kabel mit Ihrem Computer und starten Sie ATEM Software Control.
2. Klicken Sie auf den „Kamera“-Tab und wählen Sie eine Kamera aus, indem Sie irgendwo im gewünschten Kamerabedienfeld einen Klick ausführen.
3. Auf dem DaVinci Resolve Micro Panel justieren Sie die entsprechenden Steuerelemente des Tools für die primäre Farbkorrektur, indem Sie die Trackballs bewegen und die Regler drehen.

Vornehmen von Anpassungen an der Farbkorrektur

Das DaVinci Resolve Micro Panel ist vorrangig für den Einsatz mit der DaVinci Resolve Software konzipiert. Sie können mit diesem Gradingpult aber auch Anpassungen im Farbkorrektorfenster von ATEM Software Control vornehmen. Wie das geht, wird nachstehend beschrieben.

Die Trackballs

Anhand der drei Trackballs werden die im Farbkorrektorfeld befindlichen Farbräder für Schatten, Mitten und Lichter gesteuert. Alle Trackballs sind mit einem Ring versehen, der zum Justieren der dazugehörigen Masterräder unter den Farbrädern dient.



DaVinci Resolve Micro Panel

Die Steuerregler

Jede von Ihnen auf dem Hardware-Pult vorgenommene Einstellungsänderung bewirkt eine entsprechende Einstellungsänderung auf dem Software-Bedienpanel. Benutzen Sie die folgenden Regler, um Änderungen vorzunehmen.

Y Lift	Modifiziert den Bildkontrast allein durch Anpassen der Y-Koordinate für den Schwarzwert.
Y Gamma	Modifiziert den Bildkontrast allein durch Anpassen der Y-Koordinate für die Mitteltöne.
Y Gain	Modifiziert den Bildkontrast allein durch Anpassen der Y-Koordinate für die Lichter.
Kontrast	Drehen im Uhrzeigersinn erhöht den Kontrast, Drehen gegen den Uhrzeigersinn reduziert den Kontrast.
Lichter	Der Highlights-Regler steuert die Blende Ihrer ausgewählten Kamera. Drehen im Uhrzeigersinn öffnet die Blende, Drehen gegen den Uhrzeigersinn schließt sie.
Sättigung	Drehen im Uhrzeigersinn steigert die Farbsättigung, drehen gegen den Uhrzeigersinn reduziert sie.
Farbton	Passt die Farbtonverteilung durch Drehen des Hue-Reglers im oder gegen den Uhrzeigersinn wie bei einem Farbrad an.
Lum-Mix	Durch Drehen im oder gegen den Uhrzeigersinn stellen Sie die Ausgabemischung zwischen den RGB- und YRGB-Korrektoren ein.

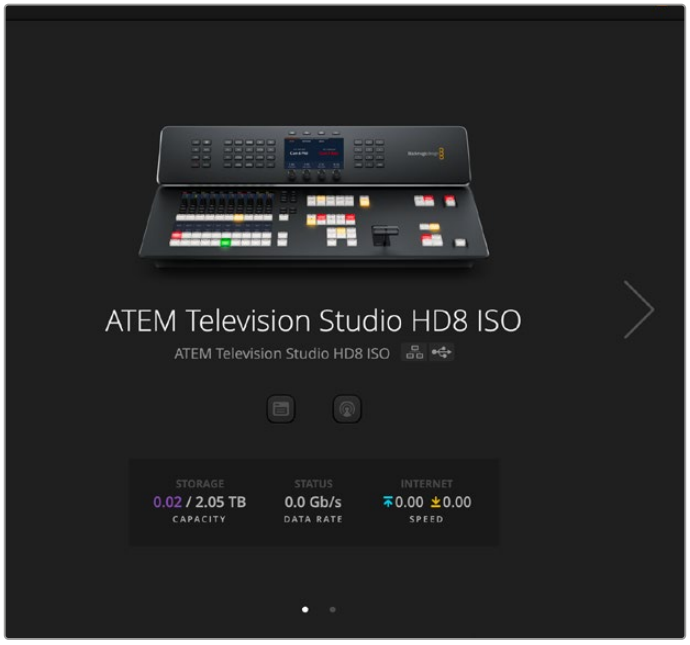
Bedientasten

Linkspfeil	Gibt die vorherige Kameranummer vor.
Rechtspfeil	Gibt die nächste Kameranummer vor.

Wie sich die einzelnen Regler auf das Bild auswirken, wird zu Beginn dieses Kapitels näher erklärt.

Verwenden von ATEM Setup

Zusammen mit ATEM Software Control wird auf Ihrem Computer auch das Dienstprogramm ATEM Setup installiert. Mit dem Setup-Dienstprogramm können Sie Ihren ATEM Television Studio aktualisieren, den Mischer benennen und seine Netzwerkeinstellungen ändern. ATEM Setup stellt auch Paneleinstellungen bereit, darunter die Mischmodi Programm/Vorschau und Cut-Bus sowie Keyer-bezogene Mischeinstellungen.



Wenn Sie ATEM Setup hochfahren, sehen Sie als erstes den Homescreen. Wenn Sie mehr als einen ATEM Mischer über USB angeschlossen oder in Ihr Netzwerk eingebunden haben, greifen Sie auf diese zu, indem Sie auf die linken oder rechten Pfeile klicken.

Wenn Sie einen internen Cloud-Speicher installiert haben, zeigen die Indikatoren am unteren Rand des Homescreens die gesamte Speicherkapazität, den belegten Speicherplatz, den Netzwerkstatus sowie die aktuelle maximale Datenrate an. Erscheint die Zahl für den belegten Speicherplatz violett, können Sie auf den Speicher zugreifen und Daten darauf schreiben. Ist die Zahl blau, ist der Speicherzugriff auf „Schreibgeschützt“ eingestellt.

Klicken Sie über den Speicherindikatoren auf das linke Icon, um die „Setup“-Seite zu öffnen. Klicken Sie zum Starten von ATEM Software Control auf das rechte Icon.

Setup-Tab

Name

Um Ihren Mischer umzubenennen, geben Sie den Namen in dieses Feld ein und klicken auf „Save“.

Software

Zeigt die derzeit auf Ihrem ATEM Television Studio installierte Softwareversion an.

Datum und Uhrzeit

Aktivieren Sie zur automatischen Eingabe von Datum und Uhrzeit für Ihren ATEM Television Studio die Dialogbox.

Für die automatische Datum- und Uhrzeiteingabe verwendet Ihr ATEM Mischer den im NTP-Feld eingestellten Network Time Protocol Server. Das NTP ist standardmäßig auf time.cloudflare.com eingestellt. Sie können ein NTP jedoch auch manuell eingeben und mit dem „Set“-Button bestätigen.

Verwenden Sie zur manuellen Eingabe die Datum-, Uhrzeit- und Zeitzonenfelder „Date and Time“ und „Time Zone“. Die korrekte Datum- und Uhrzeiteingabe stellt sicher, dass die Datum- und Zeitangaben Ihrer Aufzeichnung mit denen Ihres Netzwerks übereinstimmen. Dies verhindert auch eventuelle Netzwerkkonflikte, wie sie in manchen Systemen auftreten.

Network Settings

Über diese Optionen konfigurieren Sie die Netzwerkeinstellungen. Hier geben Sie bspw. vor, ob das Gerät über DHCP oder eine statische IP-Adresse mit einem Netzwerk verbunden wird. Einzelheiten zum Einbinden Ihres ATEM Mischers in ein Netzwerk finden im Abschnitt „Einbinden in ein Netzwerk“.

„Allow Utility Administration“

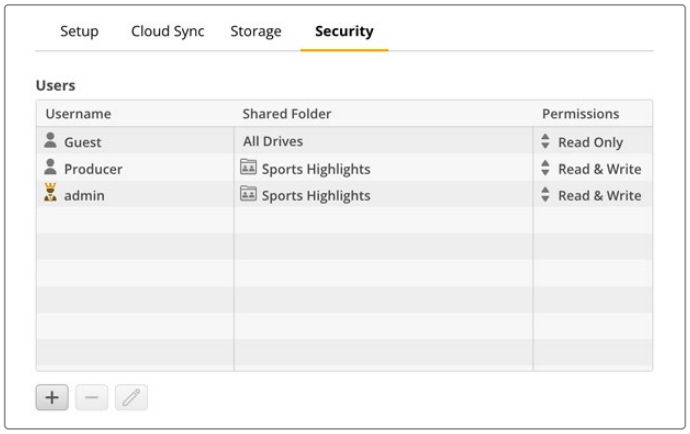
Zugriff auf ATEM Setup erfolgt über einen ins Netzwerk oder via USB eingebundenen ATEM Mischer. Um anderen Benutzern den Zugriff per Netzwerk zu verweigern und nur per USB zu erlauben, wählen Sie „via USB“.

„Connection Priority“

Wenn Ihr ATEM Television Studio über Ethernet und mit einem Mobiltelefon verbunden ist, wählen Sie mit dieser Einstellung, über welche Verbindung gestreamt wird. Näheres finden Sie im Abschnitt „Smartphone-Tethering“ in diesem Handbuch.

Security-Tab

Der „Security“-Tab enthält die Einstellungen für die Benutzerauthentifizierung sowie Optionen zum Anlegen von Benutzern, zum Zuweisen von freigegebenen Ordnern und zum Vergeben von Ordnerberechtigungen.

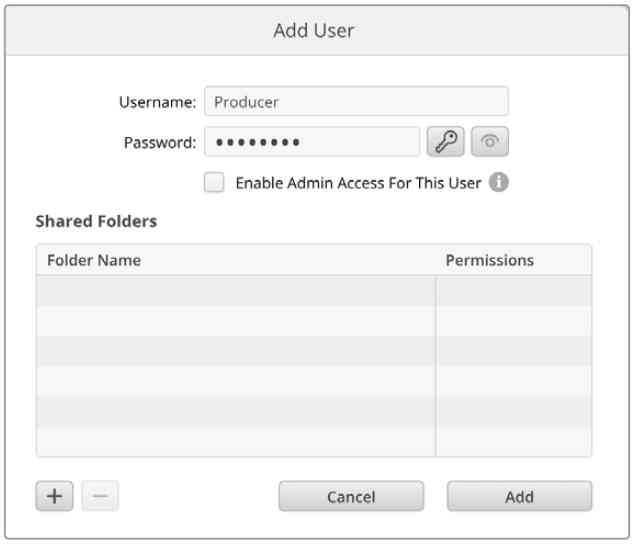


Add Users

Verwenden Sie diese Einstellungen, um Anwender hinzuzufügen, geteilte Ordner zuzuweisen und den Zugriff auf Ordner zu erlauben. Dies gilt, wenn sich Benutzer mit einem lokal gespeicherten Passwort anmelden. Beispiel: Sie können einem Projektleiter den Schreib- und Lesezugriff zu einem freigegebenen Ordner zuweisen, aber Benutzern, die den Ordner nur zur Dateiansicht brauchen, nur den Lesezugriff gewähren. Ein freigegebener Ordner kann ein beliebiger Ordner auf dem externen USB-Speicher oder dem optionalen internen Cloud-Speicher Ihres ATEM Mischers sein.

1 Öffnen Sie das „Add User“-Fenster, indem Sie unten links im „Security“-Tab auf den „+“-Button klicken.

2 Geben Sie im „Add User“-Fenster einen Benutzernamen für den neuen Benutzer ein. Wenn Sie einen Benutzer anlegen, der sich über SMB mit einem lokal gespeicherten Passwort anmeldet, geben Sie im Feld „Password“ ein Passwort ein. Um ein sicheres Passwort automatisch zu generieren, klicken Sie auf das Schlüssel-Icon.



Um dem neuen Benutzer administrativen Zugriff zu gewähren, aktivieren Sie das Kontrollkästchen „Enable Admin Access for this user“. Diese Option erlaubt es dem Benutzer, über das Ethernet auf ATEM Setup zuzugreifen und Einstellungen zu ändern.

3 Klicken Sie auf den „+“-Button, um das Fenster mit den freigegebenen Ordnern zu öffnen.

Es erscheint eine Liste mit allen auf der obersten Ebene des internen Speichers Ihres ATEM Television Studio Mischers befindlichen Ordnern. Doppelklicken Sie auf einen Ordner, um seine Unterorder zu sichten. Im Menü oben im Fenster wird der Name Ihres aktuell gesichteten Ordners angezeigt. Von dort können Sie durch die Ordnerebenen zurück navigieren. Wählen Sie den freigegebenen Ordner, zu dem Sie dem neuen Benutzer Zugriff gewähren wollen, und klicken Sie auf „Set“.

4 Der freigegebene Ordner erscheint im „Add Users“-Fenster in der Liste „Shared Folders“.

Um einen weiteren Ordner zuzuweisen, klicken Sie auf den „+“-Button. Um den Zugriff zu einem freigegebenen Ordner zu entfernen, klicken Sie auf den „-“-Button. Um das „Add User“-Fenster zu schließen und zum „Security“-Tab zurückzukehren, klicken Sie auf „Add“ und anschließend auf „Save“.

Der neue Benutzer kann sich nun auf dem ATEM Mischer anmelden und die ihnen zugewiesenen freigegebenen Ordner zugreifen.

So greifen Sie auf einem Mac-Computer auf freigegebene Ordner zu:

1 Öffnen Sie den Finder und klicken Sie im Seitenleistenmenü auf „Network“.

2 Klicken Sie in der Liste auf den Namen Ihres ATEM Mischers.

3 Klicken Sie auf „Verbinden als“, geben Sie Ihren Benutzernamen und Ihr Passwort ein und klicken Sie auf „Connect“.

Ihr ATEM Mischer erscheint nun im Seitenleistenmenü unter „Locations“. Nun können Sie die ihnen zugewiesenen freigegebenen Ordner sehen, indem Sie auf Ihren Mischer klicken.

So greifen Sie auf einem Windows-Computer auf freigegebene Ordner zu:

1 Klicken Sie im Datei-Explorer Seitenleistenmenü auf „Network“. Ihr ATEM Mischer erscheint nun in der Liste.

2 Ein Doppelklick auf Ihren ATEM Mischer öffnet ein Windows-Sicherheitsdialogfenster und fordert Sie auf, Ihre Zugangsdaten einzugeben.

3 Geben Sie Ihren Benutzernamen und Ihr Passwort ein.

4 Klicken Sie auf „OK“.

Ihr ATEM Mischer erscheint nun im Datei-Explorer-Fenster. Sie können auf sie wie auf jedes andere Netzwerklaufwerk zugreifen.

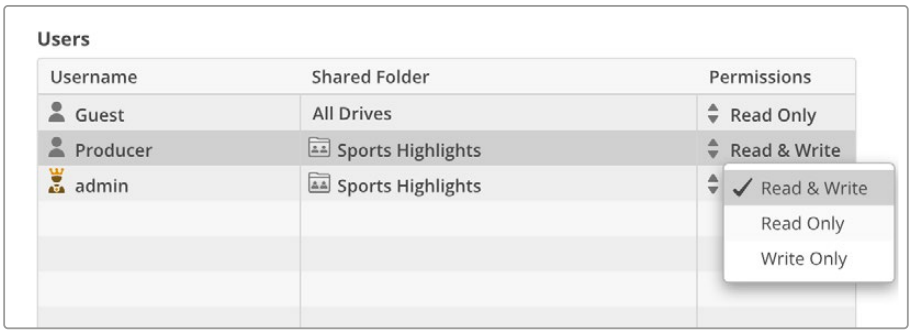
Berechtigungen

Über Berechtigungen können Sie bestimmen, wie weit die einem Benutzer für einen freigegebenen Ordner gewährten Zugriffsrechte reichen sollen. Wenn Sie einem Benutzer erstmals einen Ordner zuweisen, gewährt ihm das den Lese- und Schreibzugriff. Der Benutzer kann dem freigegebenen Ordner dann Inhalte hinzufügen, diese bewegen, ändern oder löschen. Sie können die Berechtigung zu freigegebenen Ordnern mit „Read only“ oder „Write Only“ auf jeweils nur den Lese- oder Schreibzugriff beschränken. Bei Vorgabe von „Read Only“ kann der Benutzer den Inhalt des Ordners zwar sehen, darin aber keine Dateien ändern oder löschen oder ihm weitere hinzufügen. Wurde die Berechtigung für „Write Only“ erteilt, darf der Benutzer zwar Dateien in den Ordner legen, aber nicht den Ordnerinhalt einsehen.

So ändern Sie die Berechtigungen:

1 Wählen Sie auf dem „Security“-Tab aus der „Users“-Liste einen Benutzer.

2 Klicken Sie in der Spalte „Permissions“ auf die aktuellen Berechtigungen des Benutzers und wählen Sie eine Option aus der Liste.



3 Klicken Sie auf „Save“, um Ihre Auswahl zu bestätigen.

TIPP Der Benutzer „Guest“ wird standardmäßig erstellt und hat automatisch Lese- und Schreibzugriff auf alle freigegebenen Ordner im Speicher Ihres ATEM Mischers. Sie können die Berechtigungen für Gastbenutzer auf dem „Security“-Tab in der Spalte „Permissions“ ändern und „Read & Write“ (Lesen und schreiben), „Write Only“ (Nur schreiben), „Read Only“ (Nur lesen) oder „No access“ (Kein Zugriff) vorgeben.

Manage User

Anhand der Optionen unter „Manage User“ können Sie die Ordnerzuweisungen eines Benutzers, seinen Benutzernamen oder sein Passwort ändern sowie seinen Verwaltungszugriff ein- oder ausschalten.

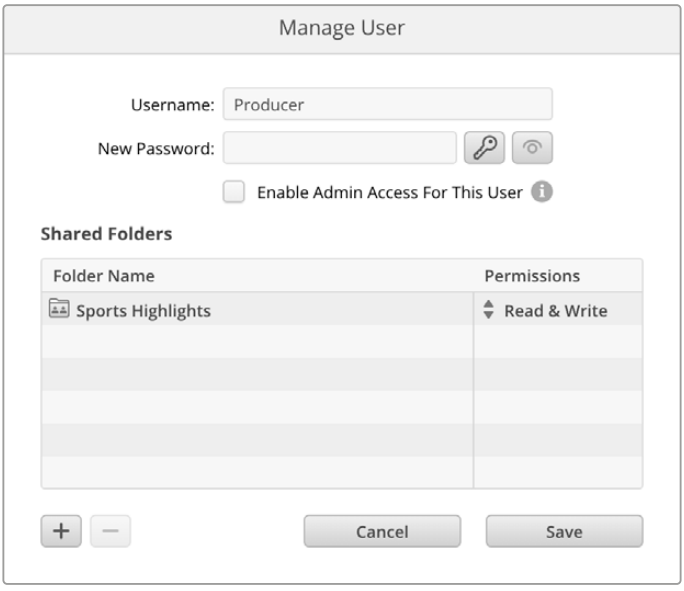
Settings

So verwalten Sie einen Benutzer:

1 Gehen Sie zum „Security“-Tab und wählen Sie den zu verwaltenden Benutzer aus der „Users“-Liste.

2 Klicken Sie auf das Stift-Icon.

3 Aktualisieren Sie die Benutzerdaten im „Manage User“-Fenster.



4 Klicken Sie auf „Save“, um Ihre Änderungen zu bestätigen.

Deleting Users

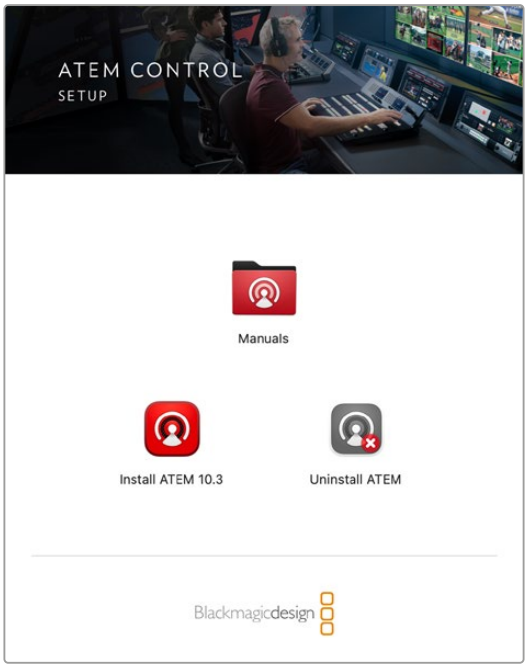
Um einen Benutzer zu löschen, wählen Sie auf dem „Security“-Tab den zu löschenden Benutzernamen aus der „Users“-Liste. Klicken Sie dann auf den „-“-Button. Klicken Sie auf „Delete“, um Ihre Auswahl zu bestätigen. Das Löschen eines Benutzers entfernt auch dessen Zugriff auf sämtliche freigegebene Ordner.

So aktualisieren Sie die ATEM Software

Von Zeit zu Zeit bringt Blackmagic Design neue Software für Ihren ATEM Mischer heraus, die neue Features, Bugfixes und erhöhte Kompatibilität mit den Softwareprodukten und Videogeräten von Fremdherstellern bietet.

Verwenden Sie zur Aktualisierung Ihres ATEM Mischers mit der neuen Software das ATEM Setup Dienstprogramm und schließen Sie den ATEM Mischer und Hardware-Bedienpulte an. ATEM Setup prüft nun die Mischerproduktsoftware und fordert Sie auf, diese zu aktualisieren, wenn auf Ihrem Computer eine neuere Version installiert ist.

Aktualisieren Sie alle Ihre Geräte zur gleichen Zeit, damit auf allen die gleiche Softwareversion läuft.



ATEM Software Installer

Schließen Sie Ihren ATEM Mischer für Aktualisierungen per USB direkt an einen Computer an.

Wenn Ihr Mischer und Computer schon per Ethernet verbunden sind, können Sie den Mischer auch über die Ethernet-Verbindung aktualisieren.

Laden Sie zunächst die neueste Blackmagic ATEM Switcher Software herunter und installieren Sie sie auf Ihrem Mac oder PC gemäß den Anweisungen im Kapitel „Erste Schritte“ dieser Bedienungsanleitung. Die neue Software für Ihren ATEM Mischer ist im ATEM Setup Dienstprogramm enthalten.

Aktualisieren der Mischersoftware

1. Schließen Sie den Mischer über seinen USB-Port an.

   Wenn Ihr Mischer und Computer schon per Ethernet verbunden sind, können Sie den Mischer auch über die Ethernet-Verbindung aktualisieren.

   Achten Sie beim Aktualisieren von Software per USB darauf, dass der Mischer das einzige ATEM Gerät ist, mit dem der Computer, auf dem das Setup-Dienstprogramm läuft, über USB verbunden ist. Sind mehrere ATEM Geräte angeschlossen, wird der Mischer ggf. nicht erkannt.

2. Starten Sie ATEM Setup.

3. Wenn eine Softwareaktualisierung des Mischers erforderlich ist, werden Sie durch ein Fenster zur Aktualisierung Ihrer Software aufgefordert. Klicken Sie auf „Update“, um die Aktualisierung zu starten. Dieser Vorgang kann einige Minuten dauern. Während des Softwareupdates darf die Stromversorgung des Mischers nicht unterbrochen werden.

4. Nach erfolgtem Softwareupdate erscheint ein Fenster, das Sie zum Aus- und Einschalten der Stromversorgung des Mischers auffordert. Schalten Sie Ihren Mischer aus und wieder ein. Schließen Sie das Dialogfenster.

Aktualisieren per Ethernet

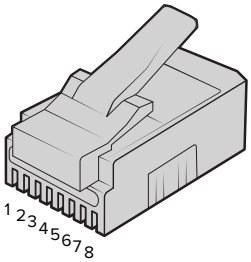
Am schnellsten und einfachsten aktualisieren Sie Ihren ATEM Mischer per Ethernet. Es gibt jedoch Situationen, wie die unten aufgeführten, wo dies nicht geht und die Aktualisierung per USB erforderlich ist:

- Die erstmalige Aktualisierung der Produktsoftware.
- Ihre ATEM Netzwerkeinstellungen sind vorkonfiguriert und gestatten den sofortigen Betrieb. Wenn Sie Ihr ATEM Gerät jedoch an ein Netzwerk mit anderen Videogeräten anschließen, führt dies ggf. zu Konflikten der IP-Adressen und zu Kommunikationsproblemen zwischen Ihrem Computer und dem Mischer. Netzwerkeinstellungen lassen sich nur per USB vorgeben.

Adapterkabel für Talkback und Kamerasteuerung

Pin-Anschlüsse für Talkback

Der Talkback-Anschluss hinten an ATEM Television Studio Mischern dient zur Signalverteilung von Techniker- und Produktions-Talkback. Mit einem RJ45-Verbinder können Sie sich anhand des folgenden Pinbelegungsdiagramms ein Adapterkabel bauen.



Eng TX+	Eng TX-	Prod TX+	Prod RX+	Prod RX-	Prod TX-	Eng RX+	Eng RX-
1	2	3	4	5	6	7	8

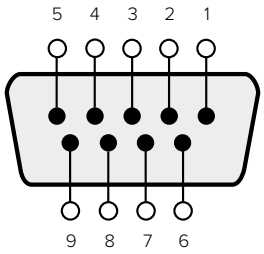
RJ45-Pinbelegung für den Talkback-Anschluss hinten am ATEM Television Studio

Pin-Anschlüsse des seriellen Ports für Steuerungskabel

RS-422-Pin-Anschlüsse für Steuerungskabel

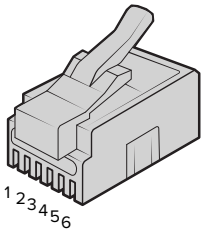
RS-422 ist ein Übertragungsstandard für Ports zum Gebrauch mit gängigen DB9- oder RJ12-Verbindern. Wer sich eine PTZ-Steuereinheit nach Maß bauen möchte, kann das mit solchen Verbindern durch Umverdrahten ohne großen Aufwand tun.

Nachstehend finden Sie ein Pinbelegungsdiagramm für RS-422 DB9- und RJ12-Verbinder.



Receive (Empfang) (–)	Receive (Empfang) (+)	Transmit (Übertragung) (–)	Transmit (Übertragung) (+)	Ground Pins (Erdungsstifte)
8	3	2	7	1, 4, 6, 9

RS-422 PTZ-Pinbelegung



TX+	TX-	GND	GND	RX-	RX+
1	2	3	4	5	6

RJ12-Pinbelegung für PTZ-Fernsteuerung mit dem ATEM Television Studio

Pinbelegungsdiagramm für den 5-poligen XLR-Headset-Anschluss für Talkback

Außenansicht	Pin	Signal	I/O	Beschreibung
 5-polige XLR-Headset-Buchse für Talkback	1	Gegensprech-Mikrofon (Y)	In -	Der Gegensprech-Mikrofoneingang unterstützt dynamische Mikrofone, sowohl symmetrischer als auch unsymmetrischer Art. Pin 1 ist für gebräuchliche Mikrofonsignale. Pin 2 dient als Mikrofonsignaleingang für beide Arten. Für Elektretmikrofone wird ein Adapter für externen DC-Ruhestrom benötigt, der den Einsatz von Luftfahrt-Headsets ermöglicht.
	2	Gegensprech-Mikrofon (X)	In +

Informationen für Entwickler (Englisch)

Blackmagic SDI Camera Control Protocol

Version 1.3

If you are a software developer you can use the SDI Camera Control Protocol to construct devices that integrate with our products. Here at Blackmagic Design our approach is to open up our protocols and we eagerly look forward to seeing what you come up with!

Overview

The Blackmagic SDI Camera Control Protocol is used by ATEM switchers, Blackmagic 3G-SDI Shield for Arduino and the Blackmagic Camera Control app to provide Camera Control functionality with supported Blackmagic Design cameras. Please refer to the 'Understanding Studio Camera Control' chapter section of this manual, or the ATEM Switchers Manual and SDK manual for more information. These can be downloaded at www.blackmagicdesign.com/support.

This document describes an extensible protocol for sending a uni directional stream of small control messages embedded in the non-active picture region of a digital video stream. The video stream containing the protocol stream may be broadcast to a number of devices. Device addressing is used to allow the sender to specify which device each message is directed to.

Assumptions

Alignment and padding constraints are explicitly described in the protocol document. Bit fields are packed from LSB first. Message groups, individual messages and command headers are defined as, and can be assumed to be, 32 bit aligned.

Blanking Encoding

A message group is encoded into a SMPTE 291M packet with DID/SDID x51/x53 in the active region of VANC line 16.

Message Grouping

Up to 32 messages may be concatenated and transmitted in one blanking packet up to a maximum of 255 bytes payload. Under most circumstances, this should allow all messages to be sent with a maximum of one frame latency.

If the transmitting device queues more bytes of message packets than can be sent in a single frame, it should use heuristics to determine which packets to prioritize and send immediately. Lower priority messages can be delayed to later frames, or dropped entirely as appropriate.

Abstract Message Packet Format

Every message packet consists of a three byte header followed by an optional variable length data block. The maximum packet size is 64 bytes.

Destination device (uint8)	Device addresses are represented as an 8 bit unsigned integer. Individual devices are numbered 0 through 254 with the value 255 reserved to indicate a broadcast message to all devices.
Command length (uint8)	The command length is an 8 bit unsigned integer which specifies the length of the included command data. The length does NOT include the length of the header or any trailing padding bytes.

Command id (uint8)	The command id is an 8 bit unsigned integer which indicates the message type being sent. Receiving devices should ignore any commands that they do not understand. Commands 0 through 127 are reserved for commands that apply to multiple types of devices. Commands 128 through 255 are device specific.
Reserved (uint8)	This byte is reserved for alignment and expansion purposes. It should be set to zero.
Command data (uint8[])	The command data may contain between 0 and 60 bytes of data. The format of the data section is defined by the command itself.
Padding (uint8[])	Messages must be padded up to a 32 bit boundary with 0x0 bytes. Any padding bytes are NOT included in the command length.

Receiving devices should use the destination device address and or the command identifier to determine which messages to process. The receiver should use the command length to skip irrelevant or unknown commands and should be careful to skip the implicit padding as well.

Defined Commands

Command 0 : change configuration

Category (uint8)	The category number specifies one of up to 256 configuration categories available on the device.
Parameter (uint8)	The parameter number specifies one of 256 potential configuration parameters available on the device. Parameters 0 through 127 are device specific parameters. Parameters 128 though 255 are reserved for parameters that apply to multiple types of devices.
Data type (uint8)	The data type specifies the type of the remaining data. The packet length is used to determine the number of elements in the message. Each message must contain an integral number of data elements.

Currently defined values are:

0: void / boolean	A void value is represented as a boolean array of length zero. The data field is a 8 bit value with 0 meaning false and all other values meaning true.
1: signed byte	Data elements are signed bytes
2: signed 16 bit integer	Data elements are signed 16 bit values
3: signed 32 bit integer	Data elements are signed 32 bit values
4: signed 64 bit integer	Data elements are signed 64 bit values
5: UTF-8 string	Data elements represent a UTF-8 string with no terminating character.

Data types 6 through 127 are reserved.

128: signed 5.11 fixed point	Data elements are signed 16 bit integers representing a real number with 5 bits for the integer component and 11 bits for the fractional component. The fixed point representation is equal to the real value multiplied by 2^11. The representable range is from -16.0 to 15.9995 (15 + 2047/2048).

Data types 129 through 255 are available for device specific purposes.

Operation type (uint8)	The operation type specifies what action to perform on the specified parameter. Currently defined values are:
0: assign value	The supplied values are assigned to the specified parameter. Each element will be clamped according to its valid range. A void parameter may only be 'assigned' an empty list of boolean type. This operation will trigger the action associated with that parameter. A boolean value may be assigned the value zero for false, and any other value for true.
1: offset / toggle value	Each value specifies signed offsets of the same type to be added to the current parameter values. The resulting parameter value will be clamped according to their valid range. It is not valid to apply an offset to a void value. Applying any offset other than zero to a boolean value will invert that value.
Operation types 2 through 127 are reserved.	
Operation types 128 through 255 are available for device specific purposes.	
Data (void)	The data field is 0 or more bytes as determined by the data type and number of elements.

The category, parameter, data type and operation type partition a 24 bit operation space.

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Lens	0.0	Focus	fixed16	–	0	1	0.0 = near, 1.0 = far
	0.1	Instantaneous autofocus	void	–	–	–	trigger instantaneous autofocus
	0.2	Aperture (f-stop)	fixed16	–	-1	16	Aperture Value (where fnumber = sqrt(2^AV))
	0.3	Aperture (normalised)	fixed16	–	0	1	0.0 = smallest, 1.0 = largest
	0.4	Aperture (ordinal)	int16	–	0	n	Steps through available aperture values from minimum (0) to maximum (n)
	0.5	Instantaneous auto aperture	void	–	–	–	trigger instantaneous auto aperture
	0.6	Optical image stabilisation	boolean	–	–	–	true = enabled, false = disabled
	0.7	Set absolute zoom (mm)	int16	–	0	max	Move to specified focal length in mm, from minimum (0) to maximum (max)
	0.8	Set absolute zoom (normalised)	fixed16	–	0	1	Move to specified focal length: 0.0 = wide, 1.0 = tele
	0.9	Set continuous zoom (speed)	fixed16	–	-1	+1.0	Start/stop zooming at specified rate: -1.0 = zoom wider fast, 0.0 = stop, +1 = zoom tele fast

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Video	1.0	Video mode	int8	[0] = frame rate	–	–	24, 25, 30, 50, 60
				[1] = M-rate	–	–	0 = regular, 1 = M-rate
				[2] = dimensions	–	–	0 = NTSC, 1 = PAL, 2 = 720, 3 = 1080, 4 = 2k, 5 = 2k DCI, 6 = UHD
				[3] = interlaced	–	–	0 = progressive, 1 = interlaced

Blackmagic Embedded Tally Control Protocol

Version 1.0 (30/04/14)

This section is for third party developers or users who may wish to add support for the Blackmagic Embedded Tally Control Protocol to their products or system. It describes the protocol for sending tally information embedded in the non-active picture region of a digital video stream.

Data Flow

A master device such as a broadcast switcher embeds tally information into its program feed which is broadcast to a number of slave devices such as cameras or camera controllers. The output from the slave devices is typically fed back to the master device, but may also be sent to a video monitor.

The primary flow of tally information is from the master device to the slaves. Each slave device may use its device id to extract and display the relevant tally information.

Slave devices pass through the tally packet on their output and update the monitor tally status, so that monitor devices connected to that individual output may display tally status without knowledge of the device id they are monitoring.

Assumptions

Any data alignment / padding is explicit in the protocol. Bit fields are packed from LSB first.

Blanking Encoding

One tally control packet may be sent per video frame. Packets are encoded as a SMPTE 291M packet with DID/SDID x51/x52 in the active region of VANC line 15. A tally control packet may contain up to 256 bytes of tally information.

Packet Format

Each tally status consists of 4 bits of information:

uint4

bit 0:	program tally status (0=off, 1=on)
bit 1:	preview tally status (0=off, 1=on)
bit 2-3:	reserved (0x0)

The first byte of the tally packet contains the monitor device tally status and a version number.

Subsequent bytes of the tally packet contain tally status for pairs of slave devices. The master device sends tally status for the number of devices configured/supported, up to a maximum of 510.

struct tally

uint8

bit 0: monitor device program tally status (0=off, 1=on)

bit 1: monitor device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4-7: protocol version (0b0000)

uint8[0]

bit 0: slave device 1 program tally status (0=off, 1=on)

bit 1: slave device 1 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 2 program tally status (0=off, 1=on)

bit 5: slave device 2 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

uint8[1]

bit 0: slave device 3 program tally status (0=off, 1=on)

bit 1: slave device 3 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 4 program tally status (0=off, 1=on)

bit 5: slave device 4 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

Hilfe

So erhalten Sie Hilfe

Am schnellsten erhalten Sie Hilfe über die Online-Support-Seiten auf der Blackmagic Design Website. Sehen Sie dort nach dem aktuellsten Support-Material für Ihren ATEM Mischer.

Blackmagic Design Online-Support-Seiten

Die aktuellsten Versionen der Bedienungsanleitung, Produktsoftware und der Support-Hinweise finden Sie im Blackmagic Support Center unter https://www.blackmagicdesign.com/de/support.

Kontaktaufnahme mit Blackmagic Design Support

Wenn unser Support-Material Ihnen nicht wie gewünscht hilft, gehen Sie bitte auf unsere Support-Seite, klicken Sie dort auf „Senden Sie uns eine E-Mail“ und schicken Sie uns Ihre Support-Anfrage. Oder klicken Sie auf „Finden Sie Ihr lokales Support-Team“ und rufen Sie Ihre nächstgelegene Blackmagic Design Support Stelle an.

Überprüfen der aktuell installierten Version

Öffnen Sie das Fenster „About ATEM Software Control“, um nachzusehen, welche Version der ATEM Software auf Ihrem Computer läuft.

- Öffnen Sie „ATEM Software Control“ unter Mac im Anwendungsordner. Wählen Sie im Anwendungsmenü „About ATEM Software Control“ aus, um sich die Versionsnummer anzeigen zu lassen.
- Öffnen Sie unter Windows „ATEM Software Control“ von Ihrem Startmenü aus. Klicken Sie auf „Hilfe“ und wählen Sie „About ATEM Software Control“ aus, um sich die Versionsnummer anzeigen zu lassen.

So holen Sie sich die aktuellsten Updates

Prüfen Sie zunächst die Versionsnummer der auf Ihrem Computer installierten ATEM Software. Besuchen Sie dann das Blackmagic Design Support Center unter www.blackmagicdesign.com/de/support und sehen Sie dort nach den neuesten Aktualisierungen. In der Regel empfiehlt es sich zwar, die aktuellsten Updates zu installieren. Nehmen Sie Ihre Softwareaktualisierungen aber vorsichtshalber nicht mitten in einem wichtigen Projekt vor.

Gesetzliche Vorschriften

Entsorgung von elektrischen und elektronischen Geräten innerhalb der Europäischen Union.

Das auf dem Produkt abgebildete Symbol weist darauf hin, dass dieses Gerät nicht zusammen mit anderen Abfallstoffen entsorgt werden darf. Altgeräte müssen daher zur Wiederverwertung an eine dafür vorgesehene Sammelstelle übergeben werden. Mülltrennung und Wiederverwertung von Altgeräten tragen zum nachhaltigen Umgang mit natürlichen Ressourcen bei. Gleichzeitig wird sichergestellt, dass die Wiederverwertung nicht zulasten der menschlichen Gesundheit und der Umwelt geht. Weitere Informationen zur Entsorgung von Altgeräten sowie zu den Standorten der zuständigen Sammelstellen erhalten Sie von Ihren örtlichen Müllentsorgungsbetrieben sowie vom Händler, bei dem Sie dieses Produkt erworben haben.

Dieses Gerät wurde geprüft und entspricht den Grenzwerten für Digitalgeräte der Klasse A gemäß Abschnitt 15 der FCC-Bestimmungen für Funkentstörung. Diese Grenzwerte dienen dem angemessenen Schutz gegen schädliche Störungen bei Betrieb des Geräts in einer gewerblichen Umgebung. Geräte dieser Art erzeugen und verwenden Hochfrequenzen und können diese auch ausstrahlen. Bei Nichteinhaltung der Installations- und Gebrauchsvorschriften können sie zu Störungen beim Rundfunkempfang führen. Der Betrieb solcher Geräte im Wohnbereich führt mit großer Wahrscheinlichkeit zu Funkstörungen. In diesem Fall kann vom Betreiber verlangt werden, selbst für die Beseitigung solcher Störungen aufzukommen.

Der Betrieb unterliegt den folgenden zwei Bedingungen:

1. Dieses Gerät darf keine schädigenden Störungen hervorrufen und
2. Dieses Gerät muss alle Störungen annehmen, einschließlich Störungen, die einen unerwünschten Betrieb zur Folge haben.

ISED-Zertifizierung für den kanadischen Markt

Dieses Gerät erfüllt die kanadischen Vorschriften für digitale Geräte der Klasse A.

Jedwede an diesem Produkt vorgenommene Änderung oder unsachgemäße Verwendung kann die Konformitätserklärung zum Erlöschen bringen.

Verbindungen zu HDMI-Schnittstellen müssen über abgeschirmte HDMI-Kabel hergestellt werden.

Die Ausstattung wurde unter Einhaltung der beabsichtigten Nutzung in einer gewerblichen Umgebung getestet. Bei Verwendung in häuslichen Umgebungen können Funkstörungen auftreten.

Sicherheitshinweise

Um Stromschläge zu verhindern, muss dieses Gerät an ein vorschriftsmäßig geerdetes Stromnetz angeschlossen werden. Kontaktieren Sie im Zweifelsfall eine Elektrofachkraft.

Um das Risiko eines elektrischen Schlages zu verringern, setzen Sie das Gerät weder Tropfen noch Spritzern aus.

Stellen Sie sicher, dass die an die Geräte angeschlossenen DC-Stromquellen über die auf dem DC-IN-Anschluss angegebene Eingangsspannung und -stärke verfügen.

Das Gerät eignet sich für den Einsatz in tropischen Gebieten mit einer Umgebungstemperatur von bis zu 40 °C.

Achten Sie auf eine ausreichende Luftzufuhr um das Gerät herum, sodass die Belüftung nicht eingeschränkt wird.

Im Inneren des Produkts befinden sich keine durch den Anwender zu wartenden Teile. Wenden Sie sich für die Wartung an ein Blackmagic Design Service-Center in Ihrer Nähe.

Nicht in Höhen von über 2000 m über dem Meeresspiegel einsetzen.

California Proposition 65

Plastikteile dieses Produkts können Spuren von polybromierten Biphenylen enthalten. Im US-amerikanischen Bundesstaat Kalifornien werden diese Chemikalien mit Krebs, Geburtsfehlern und anderen Schäden der Fortpflanzungsfähigkeit in Verbindung gebracht.

Weitere Informationen finden Sie unter www.P65Warnings.ca.gov.

Niederlassung in Europa:

Blackmagic Design Europe B.V.
Rijnlanderweg 766, Unit D
2132 NM Hoofddorp
NL

Warnhinweis für autorisiertes Wartungspersonal

Vergewissern Sie sich, dass die Verbindung zum Stromnetz vor Beginn der Wartung getrennt wurde.

Vorsicht – Doppelpol/Neutrale Sicherung

Die in diesem Gerät enthaltenen Außen- und Neutralleiter sind beide durch eine Sicherung geschützt. Daher ist das Gerät für den Anschluss an das IT-Energieverteilungssystem in Norwegen geeignet.

Garantie

12 Monate eingeschränkte Garantie

Für dieses Produkt gewährt die Firma Blackmagic Design eine Garantie auf Material- und Verarbeitungsfehler von 12 Monaten ab Kaufdatum. Sollte sich ein Produkt innerhalb dieser Garantiezeit als fehlerhaft erweisen, wird die Firma Blackmagic Design nach ihrem Ermessen das defekte Produkt entweder ohne Kostenerhebung für Teile und Arbeitszeit reparieren oder Ihnen das defekte Produkt ersetzen.

Zur Inanspruchnahme der Garantieleistungen müssen Sie als Kunde Blackmagic Design über den Defekt innerhalb der Garantiezeit in Kenntnis setzen und die entsprechenden Vorkehrungen für die Leistungserbringung treffen. Es obliegt dem Kunden, für die Verpackung und den bezahlten Versand des defekten Produkts an ein spezielles von Blackmagic Design benanntes Service Center zu sorgen und hierfür aufzukommen. Sämtliche Versandkosten, Versicherungen, Zölle, Steuern und sonstige Abgaben im Zusammenhang mit der Rücksendung von Waren an uns, ungeachtet des Grundes, sind vom Kunden zu tragen.

Diese Garantie gilt nicht für Mängel, Fehler oder Schäden, die durch unsachgemäße Handhabung oder unsachgemäße oder unzureichende Wartung und Pflege verursacht wurden. Blackmagic Design ist im Rahmen dieser Garantie nicht verpflichtet, die folgenden Serviceleistungen zu erbringen: a) Behebung von Schäden infolge von Versuchen Dritter, die Installation, Reparatur oder Wartung des Produkts vorzunehmen, b) Behebung von Schäden aufgrund von unsachgemäßer Handhabung oder Anschluss an nicht kompatible Geräte, c) Behebung von Schäden oder Störungen, die durch die Verwendung von nicht Blackmagic-Design-Ersatzteilen oder -Verbrauchsmaterialien entstanden sind, d) Service für ein Produkt, das verändert oder in andere Produkte integriert wurde, sofern eine solche Änderung oder Integration zu einer Erhöhung des Zeitaufwands oder zu Schwierigkeiten bei der Wartung des Produkts führt.

ÜBER DIE IN DIESER GARANTIEERKLÄRUNG AUSDRÜCKLICH AUFGEFÜHRTEN ANSPRÜCHE HINAUS ÜBERNIMMT BLACKMAGIC DESIGN KEINE WEITEREN GARANTIEN, WEDER AUSDRÜCKLICH NOCH STILLSCHWEIGEND. DIE FIRMA BLACKMAGIC DESIGN UND IHRE HÄNDLER LEHNEN JEGLICHE STILLSCHWEIGENDEN GARANTIEN IN BEZUG AUF AUSSAGEN ZUR MARKTGÄNGIGKEIT UND GEBRAUCHSTAUGLICHKEIT FÜR EINEN BESTIMMTEN ZWECK AB. DIE VERANTWORTUNG VON BLACKMAGIC DESIGN, FEHLERHAFTE PRODUKTE ZU REPARIEREN ODER ZU ERSETZEN, IST DIE EINZIGE UND AUSSCHLIESSLICHE ABHILFE, DIE GEGENÜBER DEM KUNDEN FÜR ALLE INDIREKTEN, SPEZIELLEN, NEBEN- ODER FOLGESCHÄDEN ZUR VERFÜGUNG GESTELLT WIRD, UNABHÄNGIG DAVON, OB BLACKMAGIC DESIGN ODER DER HÄNDLER VON DER MÖGLICHKEIT SOLCHER SCHÄDEN ZUVOR IN KENNTNIS GESETZT WURDE. BLACKMAGIC DESIGN IST NICHT HAFTBAR FÜR JEGLICHE WIDERRECHTLICHE VERWENDUNG DER GERÄTE DURCH DEN KUNDEN. BLACKMAGIC HAFTET NICHT FÜR SCHÄDEN, DIE SICH AUS DER VERWENDUNG DES PRODUKTS ERGEBEN. NUTZUNG DES PRODUKTS AUF EIGENE GEFAHR.

Mezcladores ATEM Television Studio

ATEM Television Studio HD8
ATEM Television Studio HD8 ISO
ATEM Television Studio 4K8

Bienvenido

Gracias por haber adquirido este producto.

Si no tienes experiencia en el uso de mezcladores durante las producciones en directo, estás a punto de adentrarte al sector más apasionante de la industria televisiva. Se trata de algo único, y es fácil tomarle el gusto a la descarga de adrenalina que se siente al editar en tiempo real mientras el evento acontece ante tus ojos. Esto es televisión de verdad, como debe ser.

Anteriormente, las producciones en directo eran demasiado costosas, y los equipos disponibles en el mercado carecían de la calidad y las funciones necesarias para la transmisión de contenidos. Los nuevos mezcladores ATEM Television Studio han cambiado esta realidad, dado que permiten obtener resultados extraordinarios durante la cobertura de espectáculos en directo. Esperamos que te diviertas creando tus producciones y los aproveches durante mucho tiempo.

Este manual de instrucciones contiene toda la información necesaria para instalar el dispositivo.

En la página de soporte técnico de nuestro sitio web encontrarás la versión más reciente del software para la línea de mezcladores ATEM. Basta con conectar un equipo informático al mezclador y al panel de control mediante un cable USB para actualizarlos y acceder a nuevas prestaciones. Por último, no olvides registrarte al descargar las actualizaciones, a fin de que podamos mantenerte informado sobre nuevos lanzamientos. Trabajamos continuamente para superarnos y desarrollar herramientas innovadoras, así que no dudes en hacernos saber tu opinión.

Grant Petty
Director ejecutivo de Blackmagic Design

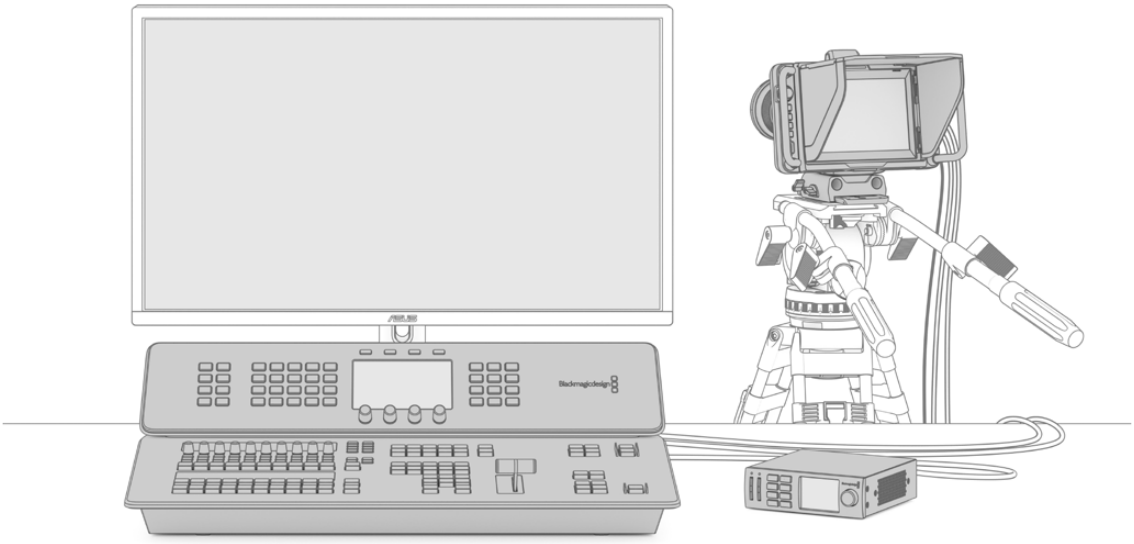
ATEM Television Studio

Los mezcladores ATEM Television Studio son equipos profesionales para producciones digitales que permiten procesar diversas fuentes y alternar entre ellas durante las transmisiones en directo. Presentan un diseño familiar con bancos de mezcla y efectos, y pueden controlarse tanto desde un panel como desde un equipo informático, brindando de este modo la posibilidad de conmutar señales con rapidez y facilidad. Cabe destacar que estos dispositivos también funcionan en modo A/B, lo cual facilita su manejo a aquellos usuarios acostumbrados a modelos más antiguos.

Para comenzar a utilizar este equipo, basta con ponerlo en funcionamiento, ya que cuenta con un panel de control integrado que permite alternar entre distintas señales presionando los botones correspondientes. No obstante, es posible emplear el programa ATEM Software Control o incluso conectar paneles adicionales para crear una solución más avanzada.



Para comenzar a utilizar el dispositivo, basta con conectar una cámara a una entrada, un grabador a la salida principal, y un monitor a la salida de visualización simultánea.

Mezcladores M/E

Es posible que los mezcladores económicos que haya empleado anteriormente no admitan el modo de funcionamiento generalmente conocido como M/E. Si está familiarizado con este modo, puede pasar por alto esta sección y proceder a la instalación del dispositivo.

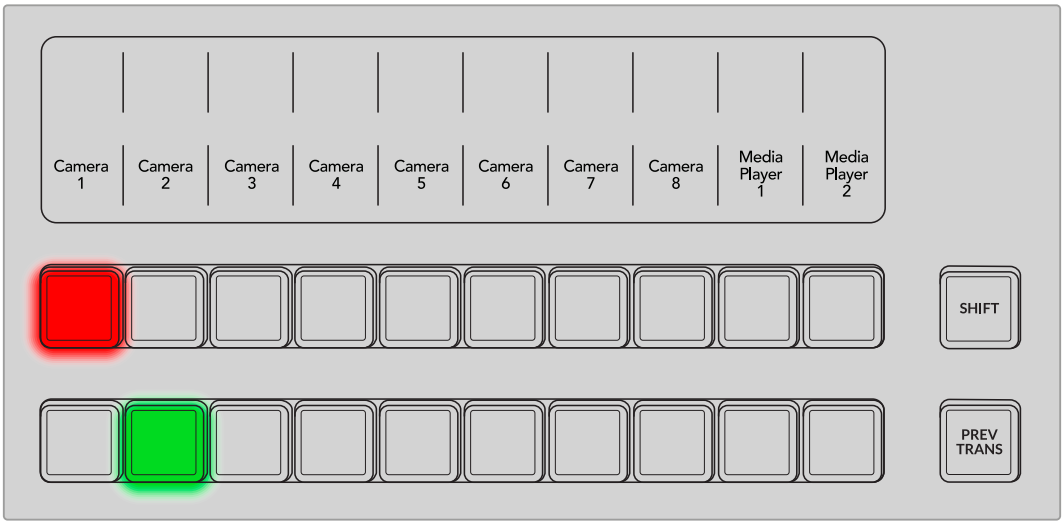
Por el contrario, si es la primera vez que se enfrenta a un mezclador ATEM, puede resultar un tanto abrumador debido a la cantidad de botones y mandos. Sin embargo, el equipo es muy fácil de usar, ya que la disposición de los controles sigue un orden lógico.

La línea de mezcladores ATEM incluye dispositivos de alta gama que funcionan según la dinámica M/E utilizada en la industria de la teledifusión. De esta forma, una vez familiarizado con su funcionamiento, podrá usar prácticamente cualquier otro tipo de mezclador empleado en la actualidad para transmitir contenidos.

El modo M/E ha sido desarrollado durante décadas para tratar de eliminar los errores cometidos al alternar señales durante la transmisión de eventos en directo. Permite ver con facilidad lo que acontece en todo momento, a fin de evitar confusiones que conducen a equivocaciones. Este tipo de funcionamiento brinda la posibilidad de verificar las fuentes que van a ser transmitidas y probar diferentes efectos antes de emitirlas al aire. Los botones del dispositivo para cada composición y transición indican al usuario lo que está sucediendo o va a suceder en forma inmediata.

La mejor forma de aprender a utilizar el mezclador es probar las diferentes funciones que ofrece y consultar el manual a modo de referencia. Si lo desea, puede instalar el dispositivo directamente antes de leer el resto de este apartado.

Las partes que más se destacan en un panel de control con bancos M/E son la palanca de transiciones y las filas de botones vinculados a las señales transmitidas y los anticipos.



Las filas de botones para el programa y los anticipos permiten ver una fuente y emitirla al aire.

Existen varias transiciones disponibles que pueden seleccionarse mediante los botones a la izquierda de la pantalla del dispositivo o presionando los correspondientes al tipo de transición específico en el panel. Es posible seleccionar una amplia variedad de cortinillas y efectos visuales, así como ajustar la duración de la transición y otros parámetros.

Otro concepto importante en este tipo de mezcladores es que las señales seleccionadas en los buses de programa y anticipos corresponden a la imagen de fondo. Esto se debe a que los distintos efectos y capas se superponen a dicha fuente. De esta forma, es posible vincular gráficos a una capa y verlos anticipadamente. Al encenderse el botón correspondiente, se verá la capa superpuesta sobre la imagen de fondo en la señal principal. Esto resulta de suma utilidad y permite realizar composiciones con múltiples capas.

Otra de las grandes ventajas de este modo de funcionamiento es que las capas pueden asociarse a las transiciones. Esto permite realizar disolvencias con elementos superpuestos que aparecen o desaparecen gradualmente en forma sincronizada. De esta manera, es posible crear una composición con diferentes superposiciones que se emiten al aire en forma conjunta. Esta es la función que cumplen los botones del módulo **Próxima transición** en la interfaz del programa informático. Por ejemplo, existen distintas opciones a fin de realizar transiciones comunes o seleccionar elementos para superponerlos a la imagen después de la transición.

Asimismo, se pueden vincular múltiples capas al fondo simultáneamente. Por otra parte, el mezclador dispone de botones especiales para asociar composiciones a una transición o realizar cortes directos y disolvencias con elementos superpuestos, lo cual brinda una mayor flexibilidad. Una composición posterior siempre se superpone a los restantes elementos, incluida la transición. Por tal motivo, resulta ideal para insertar logotipos y textos móviles.

Por último, al finalizar una producción en directo, es bueno poder contar con un botón para realizar un fundido a negro. Este se encuentra en la parte inferior derecha del mezclador y permite llevar a cabo este procedimiento sin pasar por alto ninguna capa. Este tipo de transición resulta útil para atenuar la imagen de todas las fuentes en forma simultánea.

Otra de las partes que se destacan en este tipo de mezcladores es el bus de selección. Este se encuentra arriba del bus del programa y permite seleccionar fuentes a fin de aplicar efectos y otras funciones. Asimismo, brinda la posibilidad de escoger fuentes para realizar una composición o ejecutar macros directamente desde el panel de control.

Como se explica en esta descripción general, los bancos M/E permiten realizar producciones en directo con seguridad y proporcionan información sobre el estado del mezclador para poder saber lo que está sucediendo en todo momento. Una vez familiarizado con esta dinámica de trabajo, podrá emplear diferentes modelos con suma facilidad, ya que todos funcionan de la misma manera.

Mezcladores A/B

Si hace algún tiempo que no utiliza un mezclador, es probable que esté familiarizado con los modelos A/B.

Estos mezcladores cuentan con un bus A y un bus B. Uno de ellos corresponde al bus del programa, que indica la fuente transmitida mediante un botón encendido de rojo. El otro es el bus de anticipos y dispone de un botón verde que permite ver las imágenes en forma anticipada. Al mover la palanca de transición, los botones permanecen encendidos y simplemente cambian de rojo a verde, y viceversa.

El modo A/B resulta un tanto más confuso cuando no se utiliza la palanca de transición para cambiar entre dos planos. Al emplear el botón de corte o transición automática para emitir el anticipo al aire, o si hay más de un panel de control conectado al mezclador, la palanca en el panel de control empleado no se moverá. La luz roja que indica la señal emitida a través de la salida principal siempre acompaña el movimiento de la palanca de transición, y dado que esta no se mueve, se enciende otro botón en la misma fila. Lo mismo sucede con la luz verde que indica el anticipo.

Esto puede resultar bastante confuso e induce a errores cuando la palanca no se utiliza en forma permanente, ya que los botones correspondientes al anticipo y la señal emitida a veces están en filas diferentes y otras veces permanecen en la misma.

Por esta razón, el modo M/E es preferible, ya que los botones para los anticipos (verde) siempre se encuentran situados en el bus de anticipos, mientras que los botones para seleccionar la señal emitida al aire (rojo) siempre se ubican en el bus del programa. Esto permite realizar transiciones de manera consistente y sin sorpresas.

Funcionamiento de los mezcladores ATEM

Los modelos ATEM Television Studio permiten procesar las imágenes y disponen de varias entradas y salidas.

Estos mezcladores cuentan con un panel de control integrado que incluye distintos mandos y botones. Por consiguiente, es posible alternar entre las fuentes desde el dispositivo mismo, o bien conectar un equipo informático mediante una red Ethernet y utilizar el programa ATEM Software Control, que simula los mismos controles en un panel virtual. Al usar el dispositivo junto con este programa, varios operadores pueden participar en la selección de señales. Por ejemplo, uno de ellos podría alternar entre las fuentes mediante el panel integrado en la unidad, mientras otros controlan la cámara y los niveles del audio desde el panel virtual. Las opciones son infinitas.

Los mezcladores ATEM Television Studio admiten señales a una resolución máxima de 1080p60 a través de las conexiones SDI 3G, o 2160p60 en el caso del modelo ATEM Television Studio 4K8. Todas las entradas permiten convertir el formato de las fuentes y sincronizarlas, de manera que, al conectar distintos equipos, la señal se ajustará al formato de transmisión configurado en el mezclador.

El mezclador incluye además compositores para superposiciones por crominancia, herramientas de audio Fairlight y ajustes para el control de las cámaras, además de brindar la oportunidad de guardar imágenes en el panel multimedia, entre otras prestaciones. Al conectarlo a una red, es posible transmitir las fuentes por Internet o grabarlas directamente en una unidad de almacenamiento en red.

Las salidas auxiliares de los mezcladores ATEM Television Studio pueden transmitir cualquier fuente interna o externa. Es posible emplearlas para la señal principal, en caso de necesitar salidas adicionales, o para señales limpias sin superposiciones posteriores, o incluso entradas específicas. El modelo ATEM Television Studio HD8 incluye dos salidas auxiliares, mientras que la versión ATEM Television Studio 4K8 cuenta con 10. Estas permiten conectar unidades HyperDeck a fin de grabar cada una de las fuentes por separado y editarlas posteriormente.

ATEM Television Studio HD8 ISO

ATEM Television Studio HD8

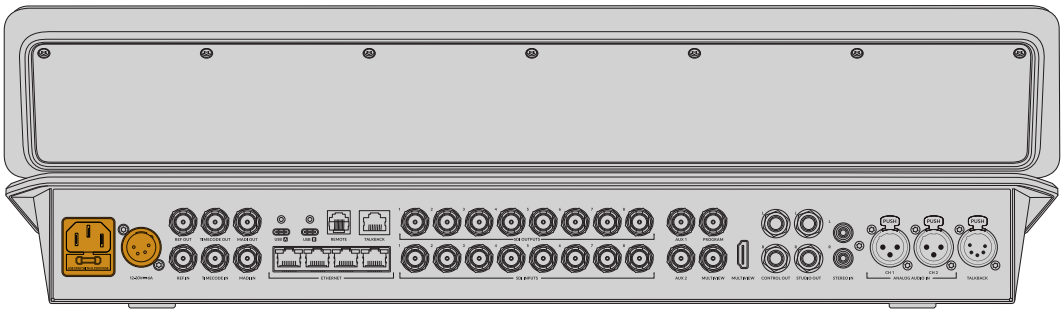
ATEM Television Studio 4K8

Primeros pasos

Para comenzar a utilizar un mezclador ATEM Television Studio, basta con conectar la alimentación, las fuentes SDI —que se pueden verificar mediante el panel frontal— y un monitor a fin de visualizar simultáneamente las distintas señales.

Conexión del cable de alimentación

Conecte un cable IEC convencional a la entrada de alimentación situada en el panel trasero del dispositivo. Los modelos ATEM Television Studio también incluyen una entrada para corriente continua que permite alimentarlos mediante baterías externas de 12 V. Una vez conectado el dispositivo, se encenderán la pantalla frontal y los botones correspondientes a las cámaras.



Conecte la fuente de alimentación mediante un cable IEC o la entrada para corriente continua en los modelos ATEM Television Studio.

Función de visualización simultánea

Para verificar las fuentes, conecte un monitor o televisor a las salidas SDI o HDMI denominadas **MULTIVIEW**.

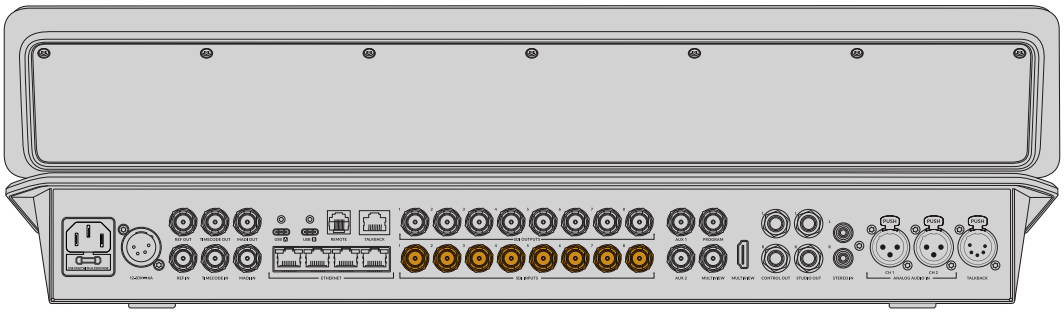
A continuación, se verán en la pantalla ocho ventanas pequeñas y otras dos de mayor tamaño. Cada una de ellas muestra una señal distinta y, al conectar fuentes adicionales, se verán en las respectivas ventanas. Esta función puede personalizarse a través del programa ATEM Software Control, a fin de ver 16 fuentes simultáneamente. Consulte el apartado *Uso de la función de visualización simultánea* para obtener más información al respecto.

Si las ventanas del modo de visualización simultánea aparecen en la pantalla, esto indica que el mezclador está encendido y funcionando correctamente, y ya es posible conectar fuentes.

Conecte el modelo ATEM Television Studio a un monitor externo para ver varias señales simultáneamente.

Conexión de fuentes

Conecte las cámaras SDI y otras fuentes a las entradas SDI del mezclador. Las conexiones SDI convierten formatos y sincronizan fotogramas, de modo que el formato de todas las fuentes coincida con el estipulado en el mezclador.



Entradas SDI del modelo ATEM Television Studio

Este modelo también permite conectar fuentes para transmitir por Internet, tales como unidades Blackmagic Studio Camera 6K Pro, mediante los puertos Ethernet. Consulte el apartado *Funciones adicionales de los modelos ISO* a fin de obtener más información al respecto.

Conexión de audio

Todos los modelos ATEM Television Studio permiten mezclar el audio integrado en las señales SDI provenientes de las cámaras, así como el recibido a través de las entradas XLR, RCA o MADI BNC. Asimismo, estas entradas adicionales brindan la posibilidad de emplear otras fuentes, tales como micrófonos o contenidos grabados en forma previa.

Entradas de audio en el modelo ATEM Television Studio

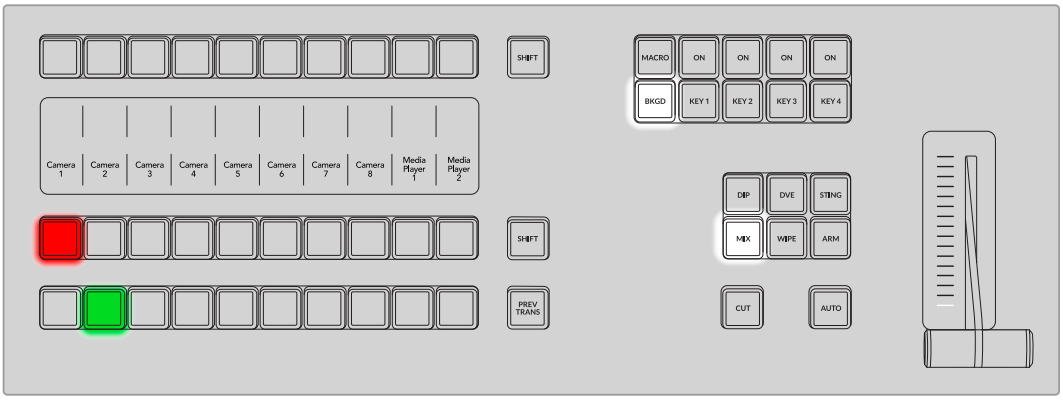
Una vez conectadas las fuentes de audio, confirme la presencia de la señal en cada canal verificando los niveles en el panel de control.

Verifique la intensidad del audio mediante los medidores.

Consulte el apartado referente a la mezcla de audio para obtener más información al respecto.

Cómo realizar una transición

Las partes que más se destacan en un panel de control con bancos M/E son la palanca de transiciones y las filas de botones vinculados a las señales transmitidas y los anticipos.

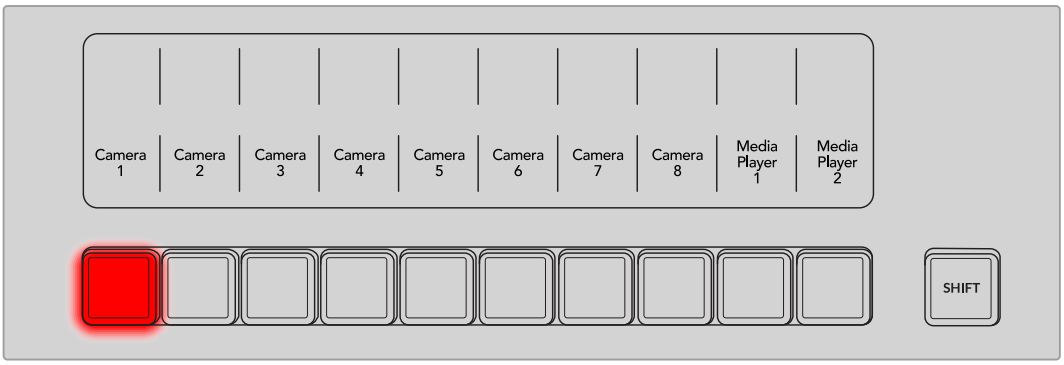


Al comprobar la configuración, el primer paso es intentar realizar una transición.

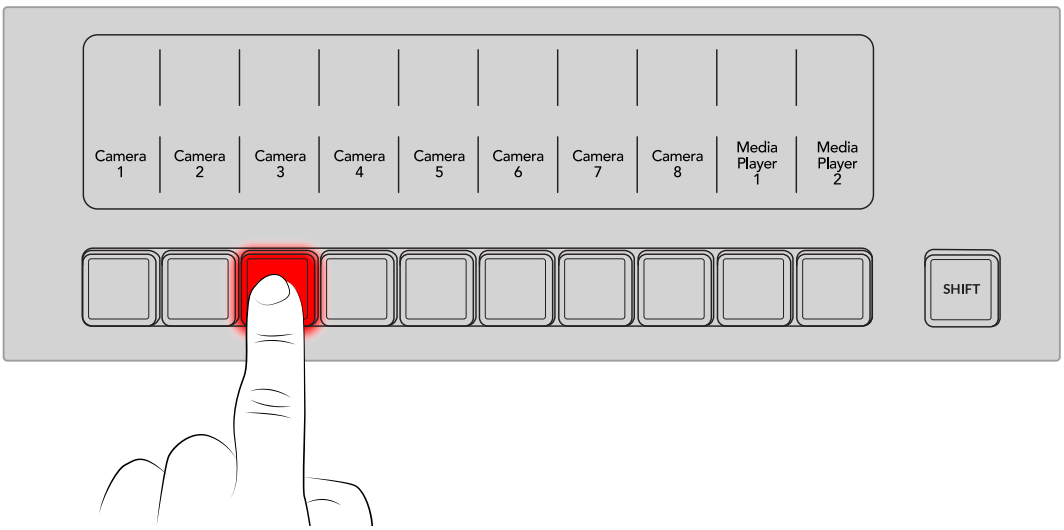
Los modelos ATEM Television Studio ofrecen dos modos para alternar imágenes. El modo programa/anticipo es el predeterminado y brinda la posibilidad de ver las imágenes antes de transmitirlas al aire. No obstante, los botones del bus de programa en la fila superior permiten alternar las señales transmitidas a través de la salida principal. Tenga cuidado al presionar uno de estos botones, ya que la fuente seleccionada se emitirá al aire inmediatamente.

Transición entre las entradas 1 y 3 mediante el bus del programa:

1 El botón correspondiente a la entrada 1 está encendido de rojo para indicar que la fuente recibida mediante la misma está al aire.



2 Presione el botón correspondiente a la entrada 3 en el bus del programa.



Como resultado, la imagen cambia inmediatamente, y el botón respectivo se enciende de rojo indicando que dicha señal está al aire. Esto se conoce como un *corte directo*.

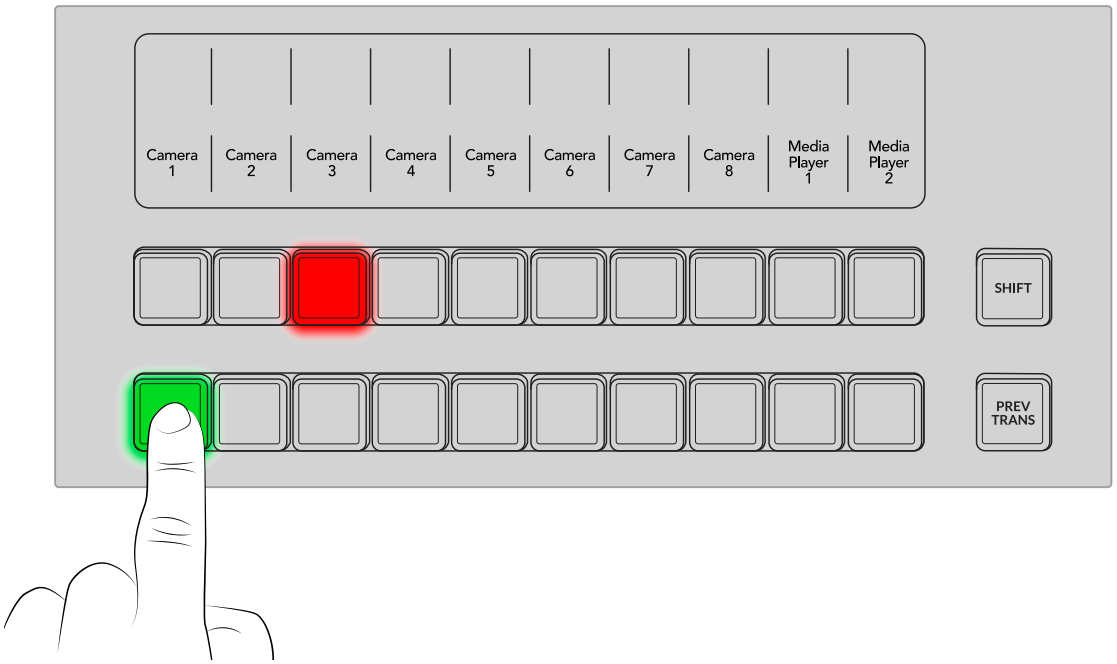
Una forma mejor y más organizada de llevar a cabo las transiciones es seleccionar la fuente en el bus de anticipos y luego escoger un tipo de transición.

Esta es una de las ventajas que ofrece el mezclador, ya que permite seleccionar la fuente en el bus de anticipos para comprobar si es la correcta antes de escoger un tipo de transición. De esta manera, es difícil cometer errores, dado que el usuario está al tanto de lo que sucede en todo momento. Solo el modo de funcionamiento M/E permite realizar un seguimiento constante.

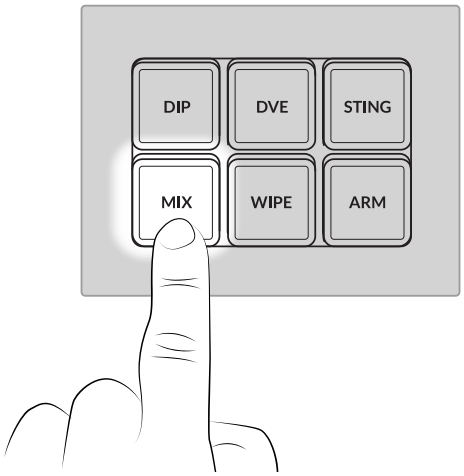
La fila inferior de botones corresponde al bus de anticipos. Aquí es donde pasará la mayor parte del tiempo, seleccionando la fuente que se emitirá al aire al realizar la siguiente transición. Esta puede llevarse a cabo mediante la palanca o presionando los botones **CUT** o **AUTO**. Es posible realizar una disolvencia, un fundido, una cortinilla o cualquier otra transición según la opción seleccionada en el módulo de control.

En el siguiente ejemplo, se realizará una disolvencia como transición de la fuente 3 a la 1.

1 Seleccione la fuente presionando el botón **1** en el bus de anticipos. Este se encenderá de color verde para indicar que dicha señal se ha seleccionado como un anticipo.

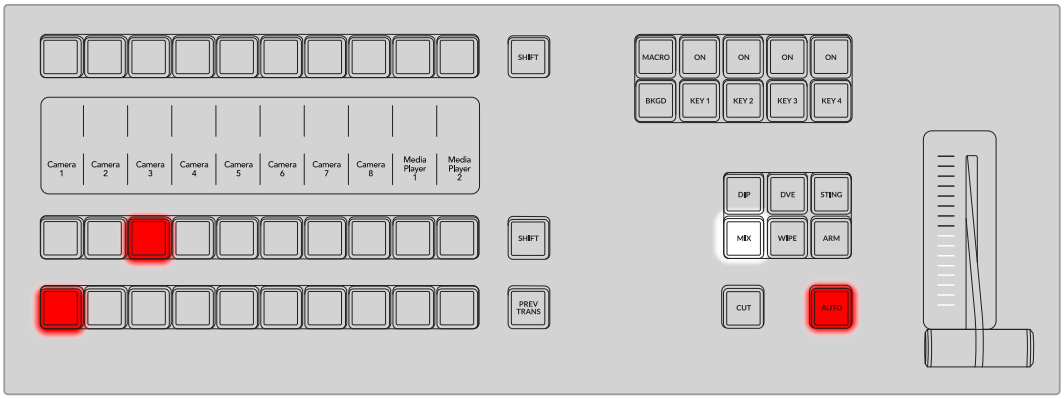


2 Oprima el botón **MIX** para seleccionar este tipo de transición.

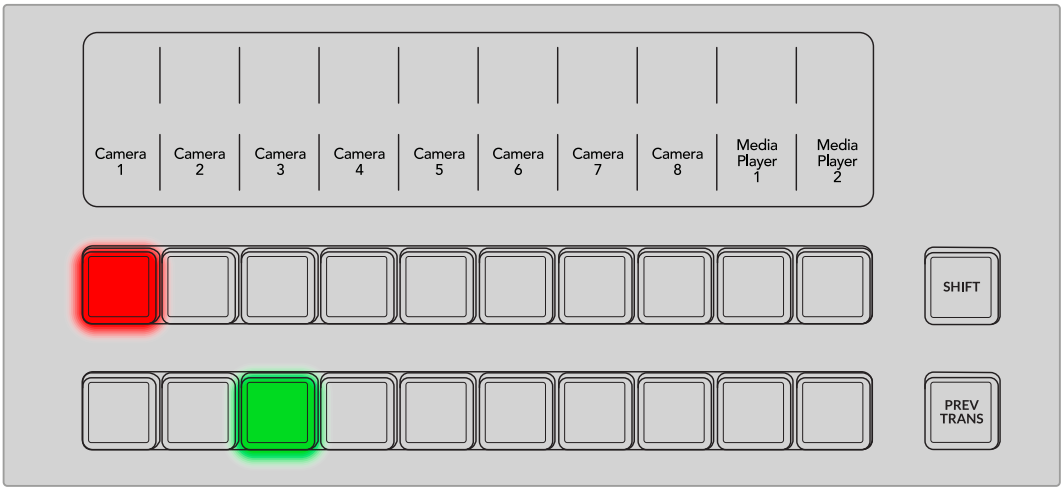


3 A continuación, presione el botón **AUTO** para llevar a cabo la disolvencia.

Durante la transición, los botones correspondientes a dichas fuentes se encenderán de rojo para reflejar que ambas están al aire, y los indicadores junto a la palanca de transiciones se iluminarán.



Nótese que, al completarse la transición, cambian los colores de los botones correspondientes a las fuentes seleccionadas en los buses de programa y anticipos. Esto se debe a que el anticipo es ahora la fuente emitida al aire, indicada mediante el botón que se enciende de color rojo en el bus del programa al finalizar la transición. Es importante recordar que dicho bus siempre indica la señal que está al aire.



Configuración de la red

La configuración por defecto del mezclador permite conectar un panel de control simplemente mediante un cable Ethernet. Sin embargo, todos los modelos ATEM son compatibles con protocolos IP para este tipo de redes, por lo cual es posible controlar ambos dispositivos desde cualquier sitio, a través de Internet. Esto brinda una variedad de opciones más amplia. Por ejemplo, al conectar un dispositivo ATEM Camera Control Panel a la misma red, puede haber una persona alternando fuentes y otra ajustando las cámaras simultáneamente. Asimismo, el programa de control instalado en el equipo informático permite que una tercera persona controle el audio u organice los archivos multimedia.

De manera predeterminada, los mezcladores de la línea ATEM Television Studio recurren al protocolo DHCP para obtener la información de la red automáticamente. Sin embargo, también es posible configurar una dirección IP fija.

1. Presione el botón **HOME** para acceder al menú inicial.
2. Presione el botón junto a la opción **RED** arriba de la pantalla LCD y luego la flecha derecha para acceder a la opción **Dirección IP**. Si el mezclador está conectado a la red, la dirección IP asignada aparecerá en la parte inferior de la pantalla.
3. Para configurar una dirección IP fija, presione el botón junto a la opción **DHCP SÍ** arriba de la pantalla LCD. Modifique la dirección mediante los mandos giratorios debajo de la pantalla. En este caso, los dispositivos deben compartir una misma subred para poder comunicarse entre sí, por lo que los primeros tres campos de la dirección IP deben ser iguales.

4. Una vez ingresada la dirección, presione el botón **GUARDAR** para confirmar los cambios.

Luego de conectar el mezclador a la red, es posible seleccionar una plataforma de transmisión mediante el programa ATEM Software Control y comenzar a emitir la señal presionado el botón **AL AIRE**.

Consulte el apartado referente a la transmisión de señales por Internet para obtener más información al respecto.

Esto es todo lo que es preciso saber para comenzar a utilizar el dispositivo. Continúe leyendo el manual a fin de obtener más información sobre el funcionamiento, las diferentes opciones y los ajustes del mezclador.

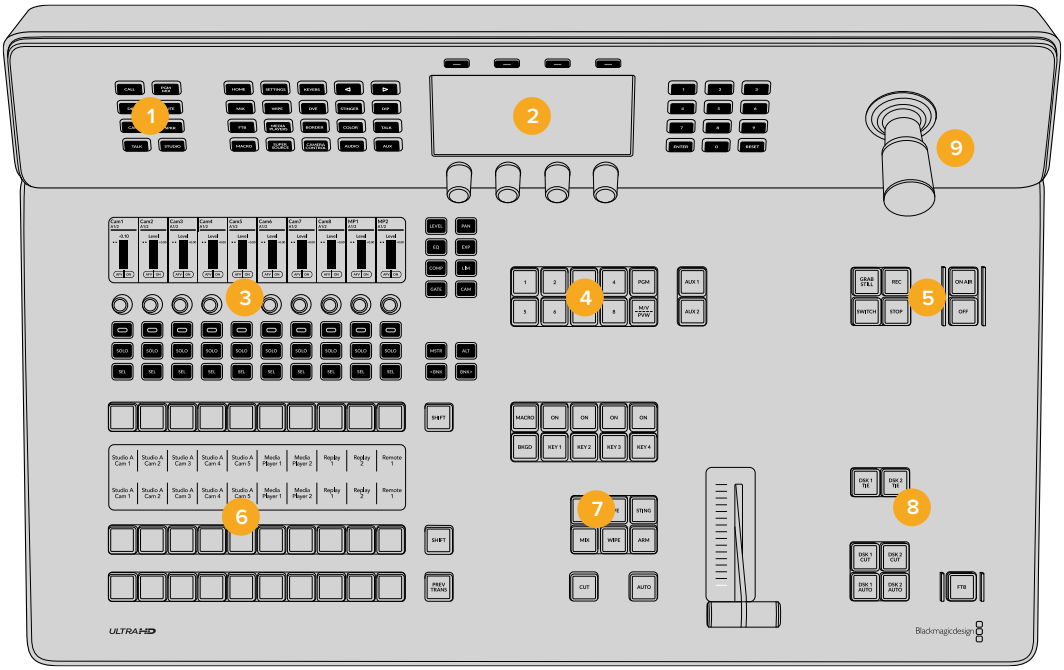
Uso del modelo ATEM Television Studio

El panel de control de los modelos ATEM Television Studio incluye buses para la señal principal y los anticipos, un banco de mezcla y efectos, mandos y botones para modificar los ajustes de las cámaras y comunicarse con los operadores, herramientas de audio Fairlight, una pantalla de cristal líquido y una palanca para realizar las transiciones con mayor precisión.

Al utilizarlo junto con el programa ATEM Software Control, cualquier cambio que se realice en uno se verá reflejado en el otro. Además, es posible conectar otros paneles, tales como dispositivos ATEM Camera Control Panel, en caso de que haya una persona específicamente asignada al control de las cámaras.

Descripción general del panel de control

Este apartado brinda información sobre las principales herramientas del panel control, por ejemplo, el sistema primario, los menús en pantalla, los botones para el programa, los anticipos y las transiciones, y las herramientas de audio Fairlight, entre otras.



ATEM Television Studio 4K8

1 Botones para la comunicación

2 Control del sistema

3 Mezcla de audio

4 Botones para salidas auxiliares

5 Botones de transmisión y grabación

6 Selección de la señal principal, los anticipos y las fuentes

7 Transiciones con efectos

8 Composiciones posteriores y fundido a negro

9 Palanca de mando del modelo ATEM Television Studio 4K8

Control del sistema

La sección superior del panel, que incluye la pantalla y los botones que la rodean, se denomina control del sistema y es uno de los principales componentes del dispositivo. Permite acceder a los menús para cambiar ajustes importantes y configurar el mezclador.

Control del sistema

Acceso a las opciones del menú

Al presionar uno de los botones de control del sistema, por ejemplo, el botón **HOME**, los ajustes relevantes se muestran en esta. Utilice estos botones y los mandos giratorios para acceder a los mismos y realizar cambios.

Cada menú puede incluir uno o más grupos de ajustes, indicados mediante puntos debajo del nombre. Para acceder a ellos, presione las flechas izquierda o derecha, o bien utilice el teclado numérico situado a la derecha de la pantalla.

Por ejemplo, para seleccionar el modo de funcionamiento del mezclador:

1 Presione el botón **SETTINGS**. Notara que los botones con las flechas se encienden, al igual que los numerados.

Los botones numerados a la derecha de la pantalla se encienden y permiten acceder rápidamente a cada grupo de ajustes.

2 Presione la flecha derecha reiteradamente hasta que aparezca la opción correspondiente al modo de funcionamiento o, de manera alternativa, el número 6 a fin de acceder a esta de inmediato.

Utilice el teclado numérico para acceder a los menús.

3 Seleccione una de las opciones que aparecen en la parte superior de la pantalla para configurar el modo de funcionamiento del mezclador.

Utilice los botones multifunción arriba de la pantalla para seleccionar el modo de funcionamiento del dispositivo.

4 Presione el botón **INICIO** para salir.

El teclado numérico también permite ingresar valores directamente. Por ejemplo, para cambiar la duración de las transiciones automáticas en la pantalla de inicio, presione el mando junto a la opción **TIEMPO PREDETERMINADO**. El teclado numérico se iluminará.

Ingrese la duración deseada y presione **ENTER**.

Presione **ENTER** para confirmar los cambios.

Modificación de ajustes

El menú principal es lo primero que aparece en la pantalla de inicio. Este incluye los ajustes de red y los perfiles de usuario. Para regresar a dicho menú en cualquier momento, basta con presionar el botón **HOME**.

Presione el botón arriba de la opción **ASIGNAR BOTONES** para acceder al menú correspondiente.

Inicio

El menú principal muestra las fuentes conectadas y la duración de las transiciones, así como la versión del software, y opciones para configurar la red y guardar perfiles de usuario.

Inicio	Pantalla principal
Red	Seleccione el protocolo DHCP o ingrese una dirección.
Información	Muestra la versión del sistema operativo instalado en el dispositivo.
Perfiles	Esta opción permite guardar macros y preferencias de configuración para volver a emplearlas posteriormente, lo cual resulta ideal cuando varias personas utilizan el mismo dispositivo.

Ajustes

Esta opción permite acceder a varios menús que brindan la posibilidad de configurar el dispositivo al seleccionar distintos ajustes mediante los botones multifunción, situados arriba de la pantalla.

Modificación de ajustes

Utilice los mandos giratorios, los botones multifunción y el teclado numérico para modificar los ajustes.

Formato de imagen	La opción **FORMATO** permite seleccionar el formato de funcionamiento del mezclador. Cada vez que este se modifica, se elimina el contenido del panel multimedia.
Visualización	Si la resolución del formato es 1080p25 o mayor, se puede reducir la frecuencia de imagen de la señal transmitida mediante salida de visualización simultánea, a fin de poder emplear monitores de menor definición.
Brillo	Ajuste el brillo de los botones, los rótulos y la pantalla mediante los mandos giratorios correspondientes. Esto puede resultar útil al trabajar en ambientes oscuros.

Código de tiempo	El generador de sincronismos comienza a generar automáticamente el código de tiempo según la hora del día a partir del momento en el que se enciende el mezclador. Sin embargo, es posible restablecerlo o ingresar un código de tiempo inicial distinto.
Modo de funcionamiento	Por defecto, los mezcladores ATEM funcionan en el modo Programa/Anticipo, dado que es más común en la actualidad. Sin embargo, puede modificarse para que el mezclador funcione en modo A/B directo, como se hacía previamente.
Fundido a negro	En el modelo ATEM Television Studio 4K8, esta función se puede activar o desactivar mediante los botones del sistema de control junto a la pantalla LCD.
Ajustes del puerto serial	Los modelos ATEM Television Studio incluyen una conexión RJ12 en la parte trasera que permite controlar otros dispositivos mediante el protocolo RS-422. En tal sentido, es posible seleccionar la forma en la cual se utiliza mediante el menú **Puerto serial**.
Ajustes para el control de cámaras	En el modelo ATEM Television Studio 4K8, es posible elegir la dirección de la palanca de mando mediante las opciones **Normal** e **Invertida**. Utilice el mando giratorio para seleccionar la salida SDI destinada al control de cámaras.
Formateo de unidades	El último grupo de ajustes del menú principal permite formatear la memoria interna opcional. Si el mezclador no tiene una instalada, este ajuste estará desactivado. Consulte el apartado *Unidades de almacenamiento* para obtener más información al respecto.
Selección del idioma	Es posible seleccionar una de las siguientes opciones para el idioma de la interfaz: inglés, español, alemán, chino, coreano, francés, italiano, japonés, polaco, portugués, ruso, turco y ucraniano.
Configuración inicial	Si se utilizan los mismos ajustes en todas las producciones, es posible guardar dicha configuración como predeterminada. Cada vez que se enciende el mezclador, se restablecen estos ajustes. Para eliminarlos, utilice la opción **Borrar estado inicial**.

Ajustes para grabadores HyperDeck

Es posible conectar hasta 10 grabadores HyperDeck Studio y controlarlos desde el mezclador. Los ajustes permiten seleccionar fuentes, iniciar la grabación automáticamente, cambiar el desfase y configurar la dirección IP. Consulte el apartado *Control de grabadores HyperDeck* para obtener más información al respecto.

Asignación de botones

Presione el botón **SETTINGS** para acceder al menú de ajustes del mezclador en la pantalla del dispositivo y luego seleccione la opción **ASIGNAR BOTONES**.

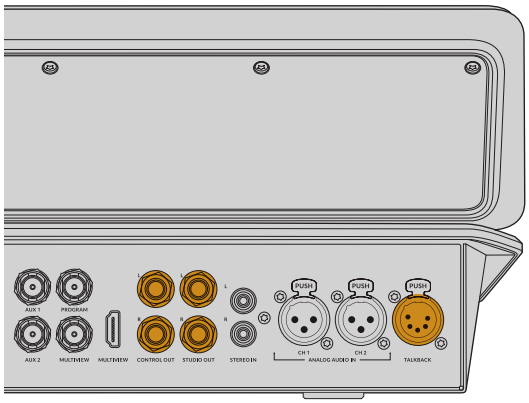
Utilice los mandos giratorios debajo de cada ajuste para asignar los botones a las entradas. También es posible cambiar el color del botón y de su nombre en el panel con el objetivo de destacar fuentes específicas. Por ejemplo, pueden resaltarse ciertas entradas con un color distinto para identificarlas fácilmente en el panel. El botón se iluminará en los dos buses hasta que la fuente se transmita al aire o se seleccione como un anticipo, en cuyo caso se encenderá de color rojo o verde, respectivamente.

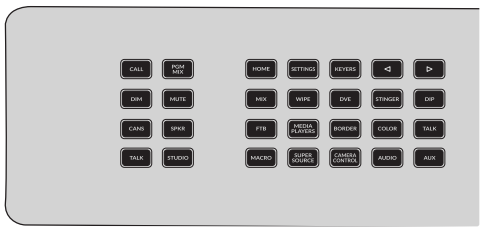
Cabe destacar que estos cambios se aplican de forma inmediata. Basta con presionar el botón **HOME** para regresar al menú inicial.

Para cambiar el brillo de los botones, presione el botón **SETTINGS** a fin de acceder al menú de opciones en la pantalla del dispositivo y luego utilice las flechas o presione el número 4 para acceder al cuarto grupo de ajustes. Gire el mando correspondiente para ajustar el brillo de los rótulos y los botones según la intensidad deseada. Al finalizar, presione el botón **HOME** para regresar al menú inicial. Consulte el apartado *Brillo* anteriormente en este manual para obtener más información al respecto.

Botones del sistema de comunicación

Estos botones ubicados en la parte superior izquierda del panel frontal brindan acceso a las funciones de comunicación sin necesidad de utilizar equipos adicionales. Enchufe un par de auriculares con micrófono en la conexión XLR de cinco pines situada en la parte trasera del mezclador.





Botón de llamada

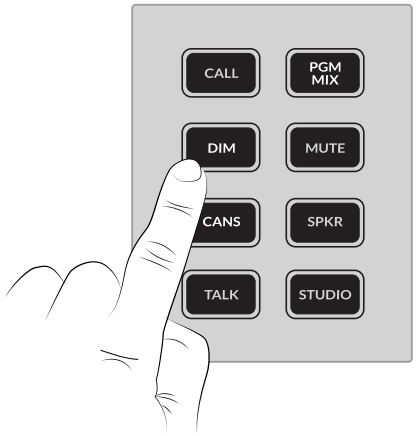
Al mantener presionado el botón **CALL**, las luces piloto de las cámaras conectadas se encenderán y apagarán de forma intermitente. Esta es una manera muy útil de llamar la atención de los camarógrafos o de indicarles que la señal va a ser emitida al aire.

Mezcla

Presione el botón **PGM MIX** para escuchar el audio del programa. Al presionar los botones **CANS** o **SPKR**, el sonido se transmite a través de la conexión XLR y los altavoces conectados al dispositivo.

Atenuar

Presione el botón **DIM** para reducir el volumen sin ajustar el atenuador. Presione este botón nuevamente a fin de restablecer el nivel previo.



Silenciar

Presione el botón **MUTE** para silenciar el audio temporalmente sin ajustar el atenuador.

Botón CANS

Presione este botón para escuchar el audio mediante la conexión XLR de cinco pines en la parte trasera del mezclador. A continuación, presione **PGM MIX** para escuchar el audio del programa.

Botón SPKR

Presione este botón para escuchar el audio mediante la conexión de control en la parte trasera del mezclador.

Comunicación

Presione el botón **TALK** para activar el micrófono de los auriculares y entablar una comunicación. Nótese que, a fin de que el receptor pueda escuchar la voz, es preciso mantener presionado el botón **STUDIO** u oprimirlo dos veces para que esta función permanezca activada.

En este último caso, el botón permanecerá encendido, al igual que el micrófono, hasta que se oprima nuevamente dos veces. Al presionar los botones **STUDIO** y **SPKR** simultáneamente, el micrófono permanecerá encendido para todos los canales de comunicación.

Estudio

El botón **STUDIO** permite activar la salida denominada **STUDIO OUT** en la parte trasera del dispositivo, la cual puede conectarse a un altavoz de referencia en el estudio. Al presionar **TALK**, oprima este botón y manténgalo presionado para hablar, o bien oprímalo dos veces.

Los botones del control del sistema permiten ajustar el volumen del audio escuchado mediante los auriculares o transmitido a través de las salidas en la parte trasera del dispositivo

1. Presione el botón **TALK**. Los dos grupos de ajustes para auriculares permiten modificar el volumen del audio transmitido mediante la conexión XLR de cinco pines en la parte trasera.
2. Gire los mandos correspondientes para ajustar el volumen.

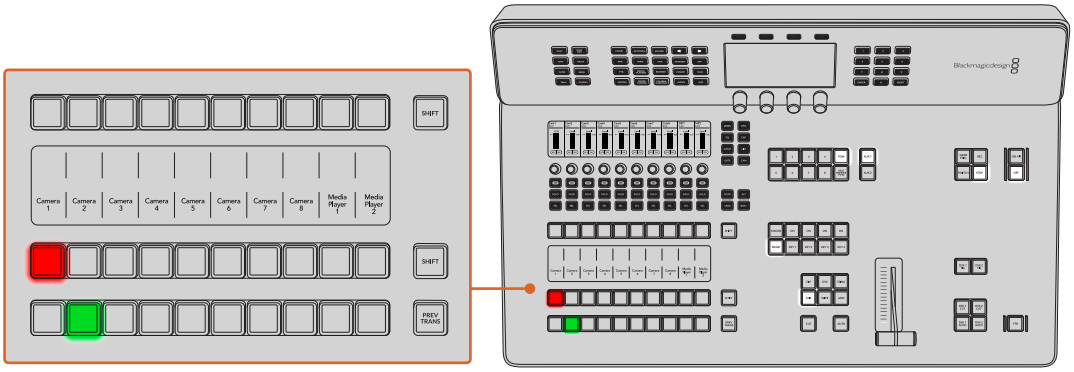
3 Ajuste el nivel del audio transmitido a través de las salidas **CONTROL OUT** y **STUDIO OUT** mediante el tercer y el cuarto grupo de ajustes.

Ajustes

Nivel	Permite ajustar el volumen general de los auriculares y las señales transmitidas mediante las salidas del dispositivo.
Mezcla	Permite determinar la intensidad del audio del programa.
Producción	Permite ajustar el volumen de la comunicación con otros integrantes de la producción.
Ingenieros	Permite ajustar el volumen de la comunicación con los ingenieros.
Efecto local (solo auriculares)	Este ajuste está solo disponible para auriculares con micrófono y permite integrar la voz captada por este en la señal supervisada. Resulta de utilidad al emplear auriculares con cancelación de ruido.
Ganancia (solo auriculares)	El nivel del micrófono de algunos auriculares es bajo y, por consiguiente, puede resultar difícil escuchar el audio. Modifique este ajuste para aumentar o disminuir el volumen.

Mezcla y efectos

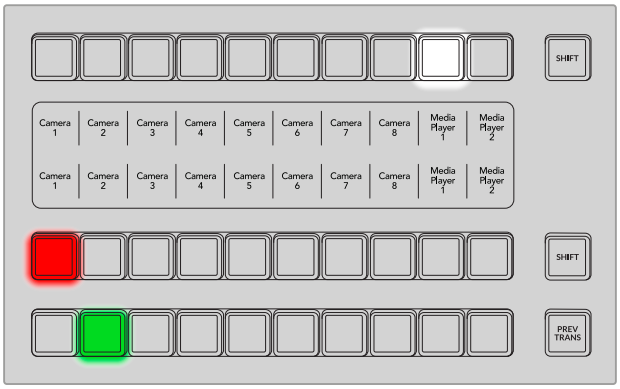
El bus del programa, el de anticipos y los indicadores del nombre de la fuente se emplean en forma conjunta al alternar entre distintas señales.



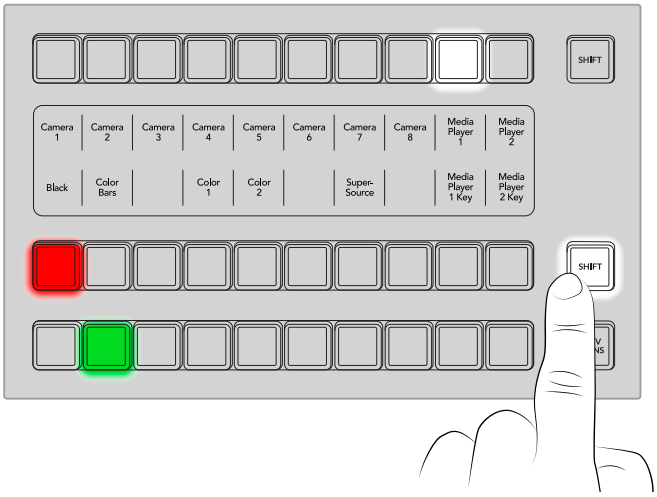
Visualización del nombre de la fuente

Los rótulos digitales debajo de cada botón identifican las fuentes externas o internas del mezclador por su nombre. Los nombres de las ocho entradas externas pueden modificarse en la pestaña de ajustes del programa ATEM Software Control. Los nombres de las fuentes internas son fijos y no es preciso cambiarlos.

Los rótulos digitales muestran el nombre de cada fuente en los buses del dispositivo.



Al presionar el botón **SHIFT**, es posible ver y seleccionar hasta 20 fuentes adicionales.



Al presionar ambos botones **SHIFT** simultáneamente, se muestran los nombres de las fuentes protegidas que se encuentran disponibles para ser asignadas a las distintas composiciones o a las salidas auxiliares. Las fuentes protegidas incluyen la señal transmitida al aire, el anticipo y las señales limpias 1 y 2.

Bus del programa

El bus del programa permite cambiar rápidamente las señales que se transmiten a través de la salida principal. El botón correspondiente a la fuente seleccionada se enciende de color rojo. Asimismo, parpadeará cuando se trate de una fuente adicional. Al presionar **SHIFT**, se muestra su nombre.

Bus de anticipos

El bus de anticipos permite seleccionar una señal para verla antes de emitirla al aire. La fuente seleccionada se transmitirá al realizar la siguiente transición. El botón correspondiente se enciende de color verde. Asimismo, parpadeará cuando se trate de una fuente adicional. Al presionar **SHIFT**, se muestra su nombre.

Botón SHIFT

Este botón permite seleccionar fuentes adicionales en los buses de programa y anticipos. Por otra parte, brinda la posibilidad de acceder a otros tipos de transiciones, así como a diferentes menús y funciones adicionales de la palanca de mando.

Otra forma de seleccionar fuentes o funciones adicionales es presionando dos veces los botones en los buses de programa y anticipos, o aquellos correspondientes a los distintos tipos de transiciones. Conviene subrayar que esta función no está disponible para el bus del programa, ya que provocaría que se transmitiera la fuente incorrecta momentáneamente a través de la salida principal.

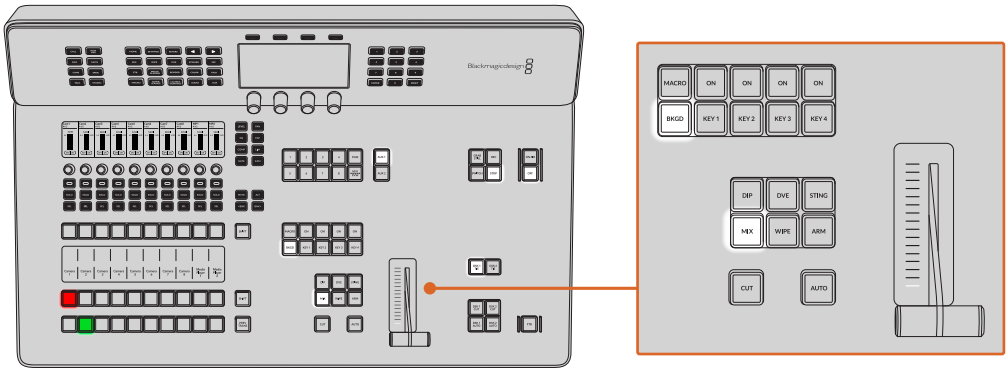
Bus de fuentes

Estos botones permiten asignar fuentes a composiciones y salidas auxiliares. Además, cuando el botón **MACRO** está encendido, brindan la posibilidad de cargar y ejecutar macros grabadas con anterioridad. En este caso, dichos botones se encenderán de color azul.

El indicador del nombre de la fuente y el bus de selección permiten identificar las distintas señales asignadas a composiciones y salidas auxiliares. El botón correspondiente a la fuente seleccionada se enciende de color verde. Este parpadeará cuando se trate de una fuente adicional. Asimismo, se encenderá de color verde para indicar que la señal es una fuente protegida.

Las fuentes protegidas incluyen la señal transmitida al aire, el anticipo y las señales limpias 1 y 2.

Control de transiciones y superposiciones previas



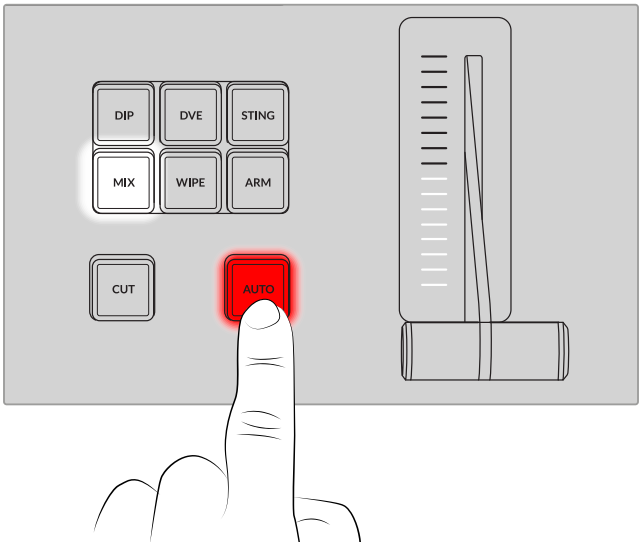
Cortes directos

El botón **CUT** permite realizar una transición inmediata entre la señal al aire y el anticipo, independientemente del tipo de transición seleccionado.

Transiciones automáticas

El botón **AUTO** permite llevar a cabo la transición seleccionada según la duración indicada. Esta puede ajustarse en el menú respectivo y se indica en la pantalla **Transition Rate**, situada en el módulo de control de transiciones, al presionar el botón correspondiente a la transición.

Durante la transición, el botón **AUTO** se enciende de color rojo, y el indicador junto a la palanca se ilumina para indicar su avance. Si el programa informático está en uso, la palanca de transición virtual también se desplazará para proporcionar una indicación visual del progreso de la transición.



La palanca de transición y su indicador

La palanca de transición se puede emplear como alternativa al botón **AUTO** y permite controlar la transición manualmente. Junto a esta, se proporciona una indicación visual del avance de la transición.

Durante la transición, el botón **AUTO** se enciende de color rojo, y el indicador junto a la palanca muestra su avance. Asimismo, si el programa informático está en uso, la palanca de transición virtual también se desplazará para proporcionar una indicación visual del progreso de la transición.

Botones de transiciones

Estos botones permiten seleccionar cinco tipos de transiciones diferentes: disolvencias, fundidos, cortinillas, transiciones con efectos visuales digitales y transiciones animadas. Las disolvencias y cortinillas se seleccionan presionando los botones **MIX** y **WIPE**. Estos se encenderán al oprimirlos.

Al seleccionar el tipo de transición, su duración se indica en la pantalla, y es posible modificar todos sus parámetros inmediatamente. Utilice los botones contextuales y mandos giratorios para acceder a los mismos y realizar cambios.

Preparar reproducción automática

El botón **ARM** permite iniciar automáticamente la reproducción desde un grabador HyperDeck conectado y seleccionado en el bus de anticipos tras una transición. De manera similar a la función de reproducción automática, la unidad seleccionada comenzará a reproducir el contenido al presionar los botones **CUT** o **AUTO** para iniciar la transición. Para emplear esta prestación, presione el botón **ARM**; la reproducción automática en el grabador seleccionado solo se llevará a cabo durante la siguiente transición. Si desea que la función permanezca activada, presione el botón dos veces. Este se encenderá de color verde para indicarlo.

Cabe destacar que cualquier ajuste del tiempo previo configurado mediante el grabador HyperDeck se ignorará al activar la función **ARM**.

Vista previa de transiciones

El botón **PREV TRANS** permite llevar a cabo la transición con la palanca para comprobarla antes de emitirla al aire. Una vez presionado, es posible ensayar la transición tantas veces como sea preciso. Esto brinda la posibilidad de comprobarla previamente a su transmisión y realizar las correcciones que sean necesarias. Cabe destacar que las transiciones animadas también pueden verse con anticipación. Una vez efectuados los ajustes necesarios, presione este botón nuevamente y estará listo para realizar la transición.

Próxima transición

Los botones **BKGD**, **KEY 1**, **KEY 2**, **KEY 3** y **KEY 4** se utilizan para seleccionar los elementos que formarán parte de la transición siguiente. Se pueden combinar diferentes fondos y composiciones presionando varios botones en forma simultánea. Al presionar **BKGD** dos veces, se seleccionan todas las composiciones que están al aire y se asignan a los botones del módulo **Next Transition**.

Los demás elementos superpuestos seleccionados se desactivarán al presionar cualquiera de dichos botones. Al seleccionar los elementos que formarán parte de la próxima transición, el operador debe mirar el anticipo, ya que esta señal proporciona una indicación de lo que se verá una vez que la transición finalice. Cuando se ha presionado el botón **BKGD**, se llevará a cabo una transición entre la señal al aire y la fuente seleccionada en el bus de anticipos.

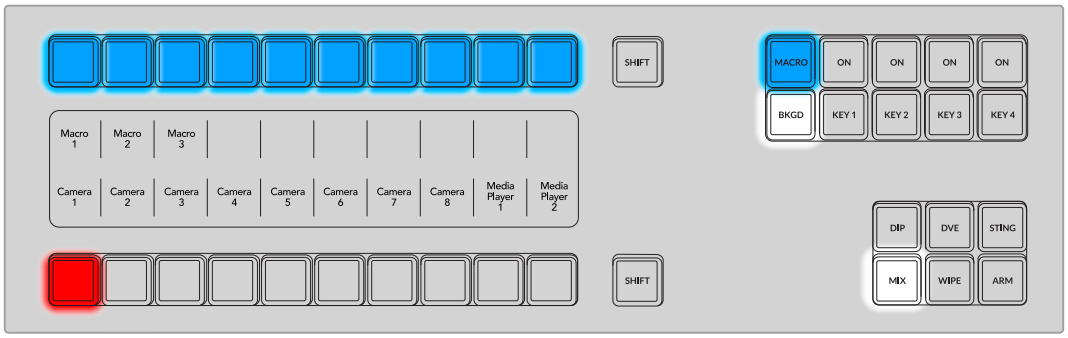
Al aire

Los botones **ON** situados arriba de cada compositor indican los elementos superpuestos que están al aire. Asimismo, permiten mostrarlos u ocultarlos de inmediato en la señal transmitida.

Macro

El botón **MACRO** permite seleccionar las funciones relativas a las macros.

Si se han grabado más de 10 macros, es posible acceder a las mismas a través del menú correspondiente en la pantalla del dispositivo.

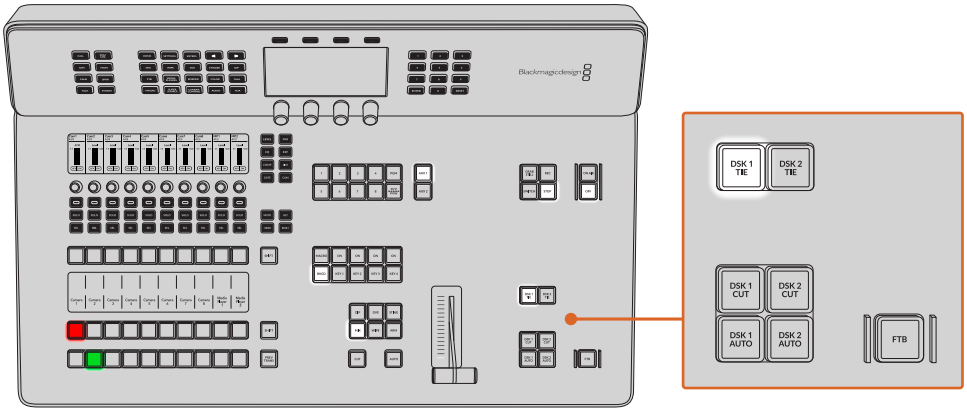


Consulte el apartado *Uso de macros* en este manual para obtener más información al respecto.

Superposiciones posteriores

Vinculación de superposiciones posteriores

El botón **DSK TIE** permite ver la composición en la imagen transmitida mediante la salida para anticipos, junto con los efectos de la siguiente transición, y la vincula al control principal, de forma que pueda emitirse al aire simultáneamente con dicha transición.



Al asociar los elementos superpuestos a la transición principal, esta se llevará a cabo a la velocidad indicada en los ajustes correspondientes. El direccionamiento de la señal no se verá afectado al vincular las capas adicionales a la transición.

Emisión de superposiciones posteriores

El botón **DSK CUT** permite mostrar u ocultar elementos superpuestos en la señal transmitida, e indica si estos se encuentran al aire. Además, se enciende cuando la composición es visible.

Transición de superposiciones posteriores

El botón **DSK AUTO** permite mostrar u ocultar gradualmente los elementos superpuestos en la señal emitida, según la duración indicada en el ajuste correspondiente.

Fundido a negro

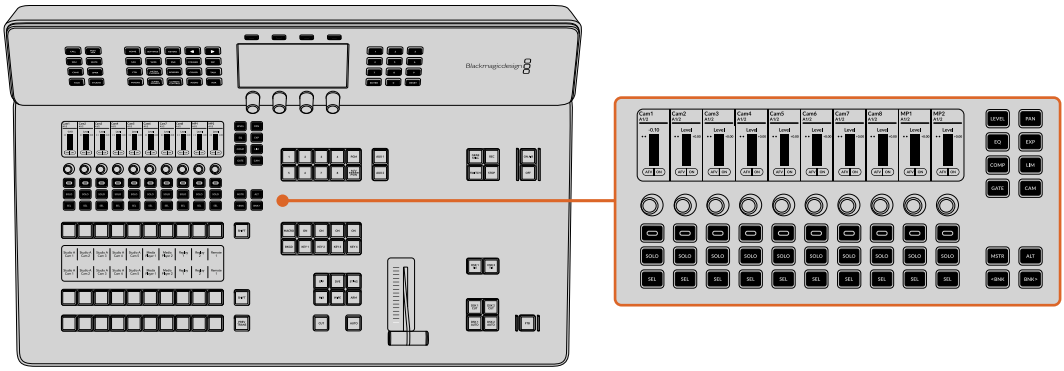
El botón **FTB** permite realizar un fundido a negro de la imagen transmitida según la duración indicada. Después de que la señal se desvanece gradualmente para dar paso al fondo negro, el botón parpadeará hasta que se presione otra vez. Al hacerlo, la imagen comenzará a mostrarse nuevamente a la misma velocidad. Cabe anotar que no es posible ver un fundido a negro de forma anticipada.

Por otro lado, la función AFV, o **Audio con imagen**, permite atenuar el audio junto con las imágenes. El volumen disminuirá paulatinamente según la duración indicada para el fundido a negro. Desactive esta función para que el audio continúe escuchándose después de realizar la transición.

Mezcla de audio

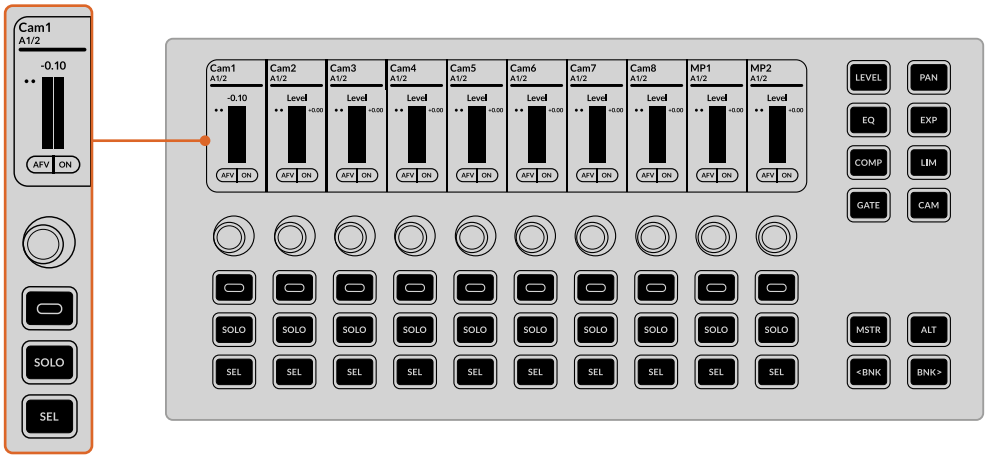
Los modelos ATEM Television Studio cuentan con controles de audio avanzados que permiten mejorar y perfeccionar la calidad del sonido de cada fuente y de la salida principal. Además, incluyen un ecualizador paramétrico de 6 bandas y ajustes de dinámica. Este apartado muestra las distintas herramientas que se pueden emplear a fin de personalizar y optimizar la mezcla de audio de la producción en directo. También es posible utilizar los mismos mandos y botones para controlar las cámaras y ajustar el volumen de las señales transmitidas a través de las salidas del mezclador.

Las herramientas de audio incluyen una amplia gama de controles que permiten supervisar el sonido y realizar mezclas. Algunos corresponden a una opción específica, mientras que otros brindan la posibilidad de llevar a cabo diversas funciones. En consecuencia, recomendamos familiarizarse con los distintos tipos de controles antes de intentar comprender el funcionamiento particular de cada botón o mando.



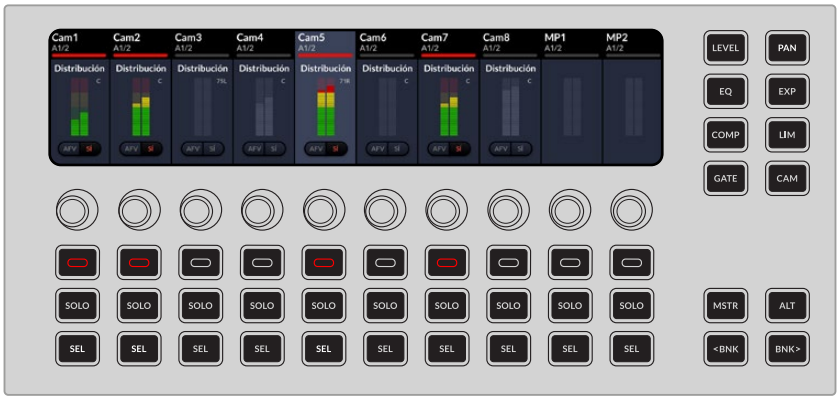
Columnas de canales

Las columnas correspondientes a cada canal ocupan una parte importante de la interfaz. El modo de funcionamiento predeterminado de la consola ofrece 10 columnas con diversos controles, mandos giratorios y una pantalla LCD que muestra información sobre el canal. Los cambios efectuados mediante estos controles se reflejarán en el programa ATEM Software Control.



Pantalla de cristal líquido

Al encender el mezclador por primera vez, la pantalla arriba de cada franja muestra el nombre de la fuente y un indicador del nivel del audio, así como distintos datos según el modo seleccionado mediante los botones a la derecha de la franja del canal. Por ejemplo, al presionar el botón **PAN**, se muestra el nivel del audio de las 10 fuentes. Si alguna de estas se divide en dos canales monoaurales, cada uno de ellos se representa de forma individual.

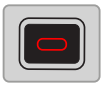


Las opciones en la pantalla cambian al seleccionar distintas funciones mediante los botones situados a la derecha de esta. Por ejemplo, al presionar el botón **EQ**, se muestran filtros para las distintas gamas de frecuencias, así como mandos y botones que permiten controlar parámetros específicos.

Mandos giratorios

Estos mandos versátiles permiten realizar cambios en distintos parámetros con rapidez y precisión. Para aumentar el volumen de una fuente, presione el botón **LEVEL** y gire el mando correspondiente en sentido horario.

Botones multifunción



Los botones debajo de cada mando giratorio permiten determinar los que se muestran en la pantalla. Por ejemplo, al presionar el botón **LEVEL**, brindan la posibilidad de activar el audio, silenciarlo o habilitar la función de seguimiento de imágenes (AFV). Al oprimir los botones **LEVEL** o **PAN**, estos se encenderán en rojo si la fuente correspondiente está al aire.

Botones de aislación

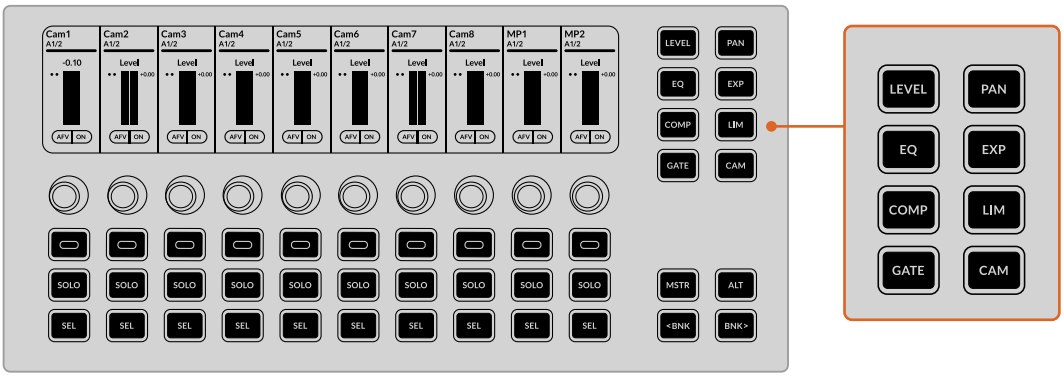
Presione uno de los botones **SOLO** para escuchar solamente el canal correspondiente. Esto facilita el ajuste del audio. Al oprimirlo, aparece un ícono de auriculares en la pantalla junto al canal respectivo.

Botones de selección

Los botones **SEL** permiten seleccionar un canal determinado.

Botones de configuración

Utilice los botones a la derecha de la pantalla a fin de activar distintas opciones de configuración para cada canal.



Presione el botón **EQ** dos veces para ver los controles correspondientes a filtros de paso alto y bajo.

Algunos ajustes incluyen grupos de controles adicionales. Para acceder a estos, presione el botón de configuración por segunda vez. Por ejemplo, a fin de ver los controles para filtros de paso alto y bajo, oprima el botón **EQ** dos veces.

Funciones

Las funciones de audio en el panel del mezclador corresponden a los ajustes disponibles en el programa ATEM Software Control. Además, la opción de control de cámaras facilita el manejo de diversas cámaras de Blackmagic desde el dispositivo, incluidos los modelos Studio Camera 6K Pro y URSA Broadcast G2.

Nivel	Ajuste el nivel de cada canal girando el mando correspondiente. Los botones debajo de cada mando permiten activar el audio, silenciarlo o habilitar la función de seguimiento de imágenes (AFV). Asimismo, es posible aumentar o disminuir la ganancia para modificar el volumen de la fuente respectiva.
Ecualizador	Este control incluye dos grupos de ajustes. Presione el botón **EQ** para acceder a los parámetros del primer grupo en todos los canales. Oprímalo nuevamente a fin de acceder al segundo grupo. Estas herramientas corresponden a los filtros de paso alto y bajo en las bandas 1 y 6. Por su parte, los botones multifunción permiten seleccionar los tipos de filtros, activarlos o desactivarlos. Presione el botón **EQ** para regresar al primer grupo de ajustes y repita este procedimiento según sea necesario a fin de alternar entre ambos grupos. Los controles de ecualización se corresponden con las funciones disponibles en la pestaña **Audio** del programa ATEM Software Control.
Compresor	Este conjunto de controles incluye todos los parámetros disponibles en la ventana para ajustar la dinámica. Al igual que en los demás casos, el interruptor asignado al botón multifunción se encuentra en el canal 1.
Puerta de ruido	Este grupo de controles corresponde a las funciones disponibles en la pestaña **Audio** del programa ATEM Software Control. Seleccione una pista determinada mediante el botón **SEL**. La puerta de ruido funciona como un expansor amplificado, reduciendo el volumen de los sonidos que están por debajo de cierto nivel, con el propósito de disminuir o eliminar el ruido en las partes más silenciosas de una grabación.
Distribución	Cada canal incluye un control de distribución estereofónica simple. Modifique la distribución del audio girando el mando del canal correspondiente. El botón **SEL** del canal seleccionado se encenderá.
Expansor	Este grupo de controles corresponde a las funciones disponibles en la pestaña **Audio** del programa ATEM Software Control. Utilice el botón **SEL** para seleccionar una pista determinada. Las siete columnas posteriores incluyen controles para el expansor, según el orden en el que aparecen en la ventana correspondiente a la dinámica.
Limitador	Al igual que en los demás casos, este grupo de controles incluye todos los parámetros asignados a los mandos giratorios, según el orden en el que aparecen en la ventana correspondiente a la dinámica.
Control de cámaras	Esta función permite controlar cámaras de Blackmagic mediante los mismos botones y mandos giratorios utilizados para ajustar el audio. Presione el botón **CAM** para ver las opciones disponibles. Estas se dividen en tres grupos a los cuales se accede oprimiendo dicho botón nuevamente. También es posible modificar los ajustes de control de la cámara mediante el botón **CAMERA CONTROL**. Consulte el apartado correspondiente al control de cámaras para obtener más información al respecto.

Botones para canales y modificadores

Estos se encuentran debajo de los botones de configuración.

Volumen general

El botón **MSTR** permite acceder a controles relativos a las salidas de audio en el parte trasera del mezclador. Además, brinda la posibilidad de ajustar el volumen general.

Opciones adicionales

Presione el botón **ALT** para acceder a funciones y parámetros adicionales. Por ejemplo, al ajustar el nivel de la señal, oprima este botón a fin de ver el control de ganancia.

Presione el botón **ALT** para acceder a los controles de ganancia.

Bancos

Presione los botones **<BNK** y **BNK>** para acceder a los grupos de las 10 fuentes anteriores o posteriores en la pantalla del dispositivo.

Dinámica de trabajo con los controles de audio

Este apartado describe una dinámica de trabajo básica que facilita el uso de las herramientas Fairlight para perfeccionar y mejorar la mezcla de audio.

1. En general, el primer paso para optimizar la mezcla de audio es normalizar todas las entradas, de modo que su volumen sea el mismo, sin que ocurra una distorsión. Para lograr este efecto, se suele aumentar o disminuir la ganancia de cada fuente, asegurándose de que los picos de la señal estén por debajo de 0 dB en el indicador correspondiente.
2. Si el objetivo es separar las fuentes monoaurales en dos canales estéreo, abra la pestaña **Audio** en los ajustes del mezclador. Seleccione las fuentes que desea dividir. Haga clic en **Listo**.

> **SUGERENCIA:** Si desea dividir las entradas monoaurales en dos canales, es preferible hacerlo antes de la normalización, tal y como se describe en el paso 1, de modo que sea posible normalizar ambos canales después de separarlos.

3. Presione el botón **EQ** y modifique la ecualización de cada fuente.

4 A continuación, acceda a los controles de dinámica mediante los botones **EXP** y **GATE**. Realice los ajustes necesarios para mejorar la mezcla de audio general.

5 Después de configurar la ecualización y los procesadores de dinámica, es posible abrir los controles respectivos para la salida principal en el programa ATEM Software Control y mejorar la mezcla final.

6 Abra el procesador de dinámica de la salida principal y realice los cambios necesarios para mejorar la mezcla final.

Una vez configurados todos los controles del audio, es posible ajustar los atenuadores en la consola de audio virtual para determinar el volumen más idóneo para la mezcla y llevar a cabo los cambios que sean necesarios durante la producción. Asimismo, aunque es posible volver a cualquiera de los ajustes para hacer más modificaciones, es recomendable seguir el mismo orden descrito anteriormente, a fin de obtener los mejores resultados. Por ejemplo, primero es fundamental determinar la ecualización antes de pasar a los procesadores de dinámica, ya que el mezclador aplica los cambios en este orden lógico.

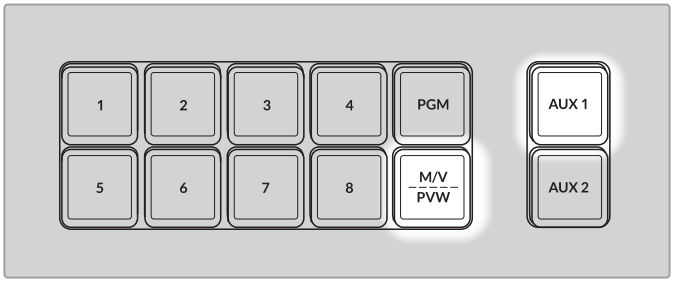
Es importante aplicar los efectos con suma atención para lograr que el audio suene lo más natural posible.

Consulte el apartado correspondiente a las herramientas de audio Fairlight en este manual para obtener más información al respecto.

NOTA: Cabe destacar que los controles para la mezcla de audio se desactivan automáticamente cuando se selecciona la opción **Audio digital USB** para la conexión USB y el mezclador detecta el retorno del audio a través del puerto USB, por ejemplo, desde Fairlight Live.

Botones de selección

Los mezcladores ATEM Television Studio incluyen varias salidas auxiliares a las cuales es posible asignar varias entradas y fuentes internas. Son muy similares a las salidas de una matriz de conmutación y permiten emplear las señales provenientes de todas las entradas, los generadores de color y los reproductores multimedia, además de la señal principal y los anticipos, e incluso barras de color. Los 10 botones del panel frontal brindan la oportunidad de seleccionar cualquiera de las ocho fuentes o el programa, así como alternar entre los anticipos y la función de visualización simultánea.



El botón **MV/PVW** se encenderá de blanco al activar la función de visualización simultánea o de verde si se trata de un anticipo.

Además, mediante el menú **AUXILIAR** en la pantalla de control del sistema, es posible asignar otras fuentes internas y reproductores multimedia, incluidas barras de color, a cualquiera de las salidas disponibles. Esto es ideal si es preciso obtener una señal limpia antes de realizar una superposición posterior. De esta forma, se obtiene una señal sin logotipos que se puede masterizar para editarla o emitirla posteriormente.

Para asignar una señal limpia a la salida auxiliar 1:

1. Presione el botón junto a la opción **AUXILIAR**.
2. Gire el mando correspondiente a la salida 1 hasta ver la opción **SEÑAL LIMPIA**.

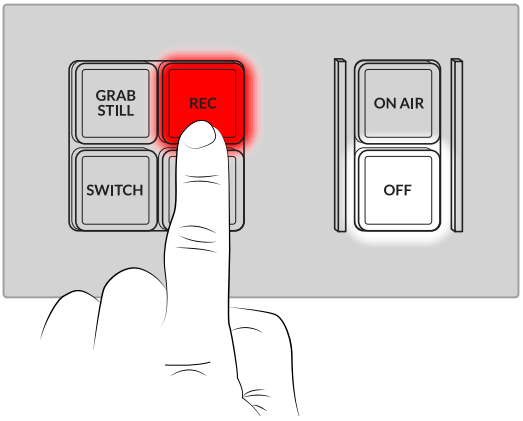
Asignación de las tres salidas auxiliares en el modelo ATEM Television Studio HD8

El mezclador realiza un corte directo cuando hay un cambio en la fuente de la salida auxiliar, por lo cual es posible pasar de una fuente a otra de forma precisa y sin saltos en la imagen.

Las salidas son sumamente útiles y también pueden configurarse desde el panel de control virtual. Los menús para las salidas se encuentran en la barra ubicada en la parte superior de la interfaz gráfica y están siempre disponibles, independientemente de la ventana activa. Consulte el apartado sobre salidas auxiliares en este manual para obtener más información al respecto.

Botones de transmisión y grabación

El modelo ATEM Television Studio permite transmitir y grabar la producción mediante botones específicos en el panel de la unidad.



Utilice los botones correspondientes para transmitir y grabar señales.

Capturar	Para capturar una imagen de la señal transmitida, presione el botón **GRAB STILL**. Las capturas se almacenan en el panel multimedia. Luego, es posible cargarlas de inmediato en el reproductor para usarlas en la transmisión o guardarlas en el equipo informático.
Grabar	La señal puede grabarse en una unidad externa conectada al puerto USB-C o en la memoria interna opcional al utilizar la versión ISO. Comience la grabación presionando el botón **REC**. Para finalizar, oprima el botón **STOP**.
Detener grabación	
Alternar	Al conectar dos unidades externas mediante el puerto USB, es posible alternar entre ellas para grabar en una u otra presionando el botón **SWITCH**.
Al aire	El mezclador permite transmitir directamente por Internet sin necesidad de usar programas informáticos adicionales. Después de conectar el dispositivo a una red y seleccionar la plataforma de difusión mediante el programa ATEM Software Control, presione el botón **ON AIR** para comenzar a transmitir de inmediato. Consulte el apartado sobre transmisiones más adelante en este manual para obtener información adicional al respecto.
Detener transmisión	

Antes de comenzar la transmisión, es necesario conectar el mezclador a una red. Además de poder acceder a plataformas tales como Blackmagic Cloud, YouTube y Twitch, esto permite utilizar otros paneles ATEM, por ejemplo, el modelo ATEM Camera Control, así como conectar fuentes remotas en el caso del modelo ATEM Television Studio HD8 ISO.

Nótese que no es posible grabar y transmitir simultáneamente señales en formato entrelazado, por ejemplo, 1080i60.

Consulte el apartado sobre transmisiones más adelante en este manual para obtener información adicional al respecto.

Soportes de almacenamiento

Los modelos ATEM Television Studio brindan la oportunidad de grabar el programa en soportes de almacenamiento externos conectados a cualquiera de los dos puertos USB-C en la parte trasera de la unidad. Asimismo, es posible conectar un adaptador con varios puertos USB-C o un dispositivo MultiDock 10G, a fin de emplear varias unidades SSD y aumentar la capacidad de almacenamiento.

Por otra parte, el mezclador también brinda la oportunidad de grabar en la memoria interna opcional. A continuación se explica cómo preparar los soportes de almacenamiento.

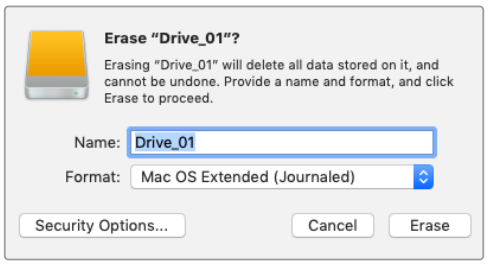
Preparación de unidades de almacenamiento en equipos informáticos

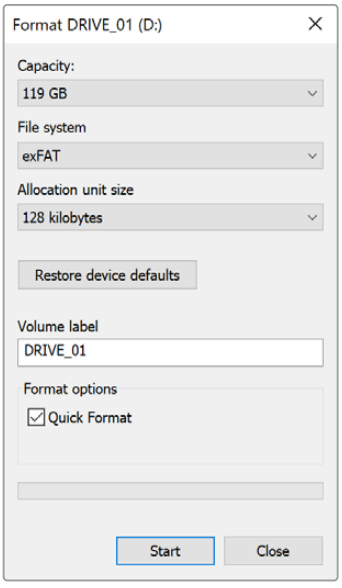
Las unidades de almacenamiento externas pueden formatearse en equipos informáticos Mac o Windows. El formato HFS+ (también conocido como Mac OS X Extended) es el más recomendado, ya que permite registrar la transferencia de los datos a medida que esta se lleva a cabo. De este modo, es más probable que la información pueda recuperarse en caso de un mal funcionamiento de la unidad. Por su parte, el formato exFAT puede emplearse en sistemas operativos macOS y Windows sin necesidad de adquirir programas adicionales, pero no brinda la posibilidad de registrar la transferencia de datos. Esta puede ser una buena opción si necesita leer y escribir datos en ambos sistemas.

Preparación de soportes en Mac

La aplicación **Utilidad de Discos**, incluida en el sistema operativo macOS, permite formatear unidades de almacenamiento mediante el sistema HFS+ o exFAT. Asegúrese de hacer una copia de seguridad de cualquier información importante que contenga el soporte de grabación, puesto que, al iniciar este procedimiento, se borrarán todos los datos.

1. Conecte la unidad al equipo informático mediante un cable o un adaptador e ignore cualquier mensaje relativo a su uso para copias de seguridad con Time Machine.
2. En el equipo informático, haga clic en **Aplicaciones** y luego seleccione **Utilidades**. A continuación, ejecute la aplicación **Utilidad de Discos**.
3. Haga clic en el ícono de la unidad y luego en la pestaña **Borrar**.
4. Seleccione la opción **Mac OS Extended (con registro)** o **exFAT**.
5. Escriba un nombre para la unidad y luego haga clic en **Borrar**. Se dará formato a la unidad rápidamente y esta quedará lista para usar.





El cuadro de diálogo **Formato** en el sistema operativo Windows permite formatear unidades externas mediante el sistema exFAT.

Preparación de soportes en Windows

El cuadro de diálogo **Formato** en el sistema operativo Windows permite formatear unidades de almacenamiento mediante el sistema exFAT. Asegúrese de hacer una copia de seguridad de cualquier información importante que contenga el soporte de grabación, puesto que, al iniciar este procedimiento, se borrarán todos los datos.

1. Conecte la unidad al equipo informático mediante un cable, un adaptador o un dispositivo externo.
2. Abra el menú **Inicio** o la pantalla de inicio y seleccione la opción **PC**. Haga clic con el botón derecho en el nombre de la unidad.
3. En el menú contextual, seleccione la opción **Formato**.
4. Elija la opción **exFAT** para el sistema de archivos y **128 kilobytes** para el tamaño de la unidad de asignación.
5. Escriba un nombre para la unidad, marque la casilla **Formato rápido** y haga clic en **Iniciar**.
6. Se dará formato a la unidad rápidamente y esta quedará lista para usar.

Preparación de unidades de almacenamiento en mezcladores ATEM Television Studio

Es posible formatear la memoria interna mediante el panel frontal o desde el programa utilitario ATEM Setup. Además, se brinda la oportunidad de formatear discos externos mediante los sistemas Mac Os Extended o exFAT desde el panel de control del mezclador.

Formateo de la unidad de almacenamiento

Para abrir el menú **Formatear**, presione el botón **SETTINGS** y utilice las flechas a fin de acceder al grupo de ajustes correspondiente.

Una vez que se abre el menú **Formatear**, es posible seleccionar entre la memoria interna o cualquier disco conectado mediante el puerto USB.

1. Para la memoria interna, gire el mando **UNIDAD** y seleccione la opción **Interna**.

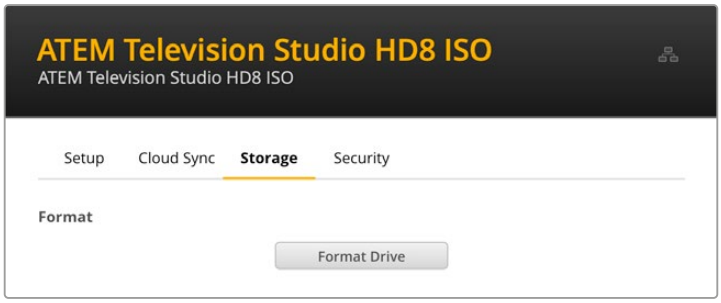
   Para formatear discos externos, gire el mando **UNIDAD** hasta encontrar la unidad seleccionada y luego el mando **Formatear** para optar entre el sistema **Mac OS Extended** o **exFAT**.

2. Presione el botón correspondiente a la opción **FORMATEAR** en la parte superior de la pantalla.
3. Siga las instrucciones que aparecen en la pantalla y mantenga presionado el botón **FORMATEAR** durante tres segundos hasta que finalice la cuenta regresiva. A continuación, el procedimiento comenzará.
4. Una vez finalizado este procedimiento, la memoria interna estará lista. Presione el botón **OK** en la parte superior de la pantalla para regresar al menú **Formatear unidad**.

Cómo formatear la memoria interna mediante el programa ATEM Setup

También es posible formatear la memoria interna mediante el programa utilitario del mezclador. Para ello, es preciso conectar el dispositivo mediante el puerto USB.

1. Ejecute el programa ATEM Setup. En equipos Mac, este se encuentra en la carpeta Blackmagic ATEM Switchers, ubicada junto a las demás aplicaciones. En equipos Windows, haga clic en **Inicio**, luego en la opción **Programas** y a continuación seleccione **Blackmagic Design**.
2. Una vez abierto el programa, haga clic en la opción **Storage** y luego en el botón **Format Drive**.



3 Aparecerá una advertencia indicando que se eliminará el contenido de la unidad de almacenamiento. Si es la primera vez que formatea el soporte, haga clic en el botón **Format** para continuar.

4 Aparecerá un aviso de advertencia para confirmar el procedimiento. Esto evita que el contenido de la unidad se borre accidentalmente. Haga clic en el botón **Erase**.

5 Aparecerá una barra que indica el progreso del procedimiento. Una vez finalizado, la memoria interna estará lista.

Acceso al contenido del soporte de almacenamiento

Al grabar en unidades externas, una forma simple de acceder a los clips y proyectos de DaVinci Resolve almacenados en estas es desconectarlas del panel trasero del mezclador y conectarlas a un equipo informático, aunque también es posible hacerlo a través de una red.

Para acceder al contenido del soporte de almacenamiento en equipos Mac:

1 Abra la aplicación Finder y haga clic en la opción **Red** de la barra lateral.

2 Haga doble clic en el modelo ATEM Television Studio que aparece en la lista.

3 Haga doble clic la opción **Almacenamiento interno**.

A continuación, el mezclador aparecerá en la barra lateral de ubicaciones. Para acceder a la unidad de almacenamiento en equipos Windows:

1 Haga clic en la opción **Red** en la barra lateral del Explorador de Windows. El mezclador aparecerá en la lista.

2 Haga doble clic en la unidad. Aparecerá un cuadro de diálogo solicitando las credenciales de red.

3 Escriba su nombre de usuario y contraseña.

> **NOTA:** Windows 11 ya no admite cuentas de invitados que no requieran un nombre de usuario y una contraseña para conectarse al soporte de almacenamiento de red. Antes de acceder al contenido almacenado en el mezclador ATEM a través de una red, deberá crear un usuario nuevo y establecer una contraseña mediante el programa ATEM Setup. Consulte el apartado *Seguridad* en la sección referente a dicho programa para obtener más información al respecto.

4 Haga clic en **OK**.

A continuación, verá el mezclador en la ventana del Explorador y podrá acceder al contenido.

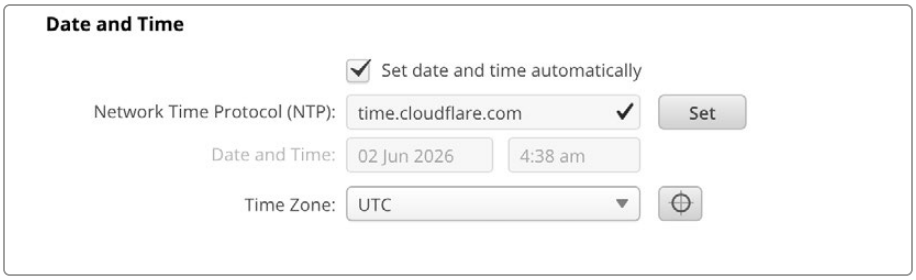
De manera alternativa, es posible acceder a la unidad de almacenamiento desde el programa utilitario. En equipos Mac, haga clic en el botón **Show in Finder**. En equipos Windows, este botón se denomina **Show in File Explorer**.

Sincronización

Otra manera de acceder al contenido de los soportes de almacenamiento internos o externos es sincronizando los archivos mediante servicios en la nube, tales como Dropbox.

Ajuste de la fecha y la hora

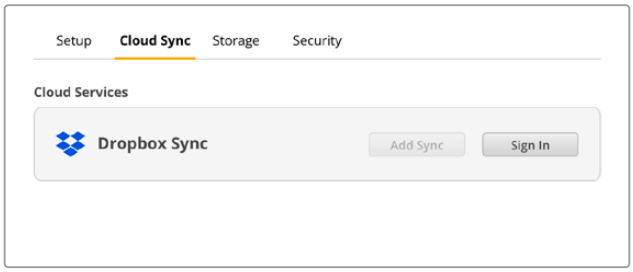
Es preciso configurar correctamente la fecha y la hora para que la sincronización pueda llevarse a cabo entre el mezclador y Dropbox. Por defecto, el dispositivo utilizará el servidor NTP de Cloudflare para configurar automáticamente dichos parámetros.



Acceda a su cuenta en línea, seleccione la carpeta que desea sincronizar y la dirección de la sincronización.

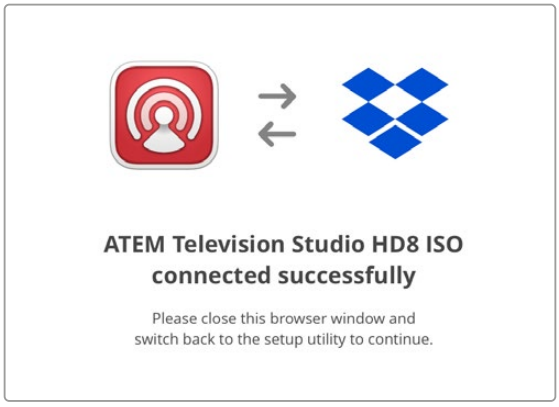
Inicio de sesión en Dropbox

1. Haga clic en el botón **Sign in** para la cuenta de Dropbox. Aparecerá una ventana para iniciar la sesión.
2. Inicio de sesión en Dropbox



Haga clic en el botón **Allow** a fin de confirmar que concede permisos al dispositivo Blackmagic Cloud Store para ver y modificar el contenido.

Aparecerá un mensaje de confirmación indicando que la conexión se ha establecido satisfactoriamente. De lo contrario, compruebe que el equipo informático esté conectado a Internet.

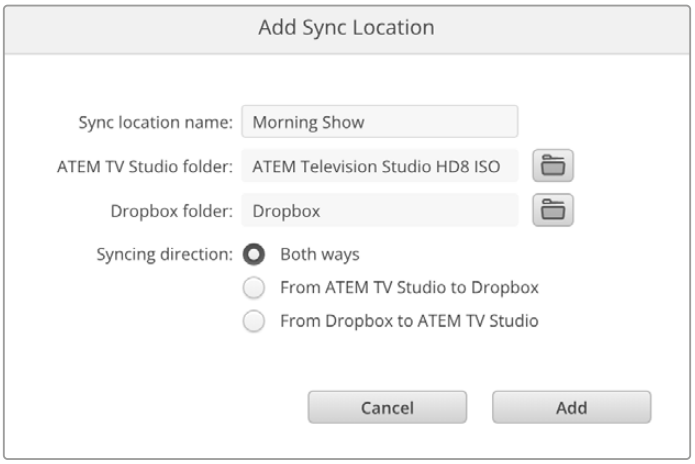


3. Haga clic en el botón **Close**.

Carpeta y dirección de sincronización

1 Haga clic en el botón **Add Sync** para elegir la carpeta cuyo contenido se sincronizará y el sentido de la sincronización.

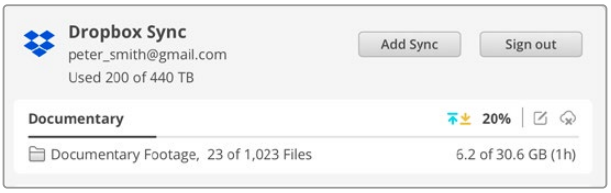
2 Asigne un nombre a la ubicación y haga clic en los íconos de las carpetas para elegir las que desea sincronizar. Por lo general, estas tendrán el mismo nombre.



3 Seleccione el sentido de la sincronización. Por ejemplo, para copiar los archivos del mezclador a Dropbox, pero no a la inversa, elija la opción **From ATEM TV Studio to Dropbox**.

4 Haga clic en **Add**.

El contenido se sincronizará con la plataforma seleccionada.



Los indicadores proporcionan información sobre el proceso de sincronización.

La flecha azul indica la transmisión de datos desde el dispositivo, mientras que la amarilla denota la recepción de datos desde la nube. Si ambos procesos ocurren simultáneamente, aparecerán las dos flechas. La flecha gris indica que no se transmiten datos en dicha dirección.

El porcentaje a la derecha de las flechas muestra el progreso de la sincronización.

Haga clic en este indicador para cambiar la carpeta sincronizada y su ubicación.

Haga clic en este indicador para borrar la carpeta de sincronización. En el cuadro de diálogo que aparece a continuación, haga clic en **Continue** a fin de confirmar, o en **Cancel** para cancelar.

También es posible añadir dispositivos Blackmagic Cloud Store o Blackmagic Cloud Pod mediante el programa Blackmagic Cloud Setup y crear una copia de resguardo al grabar.

Modo de visualización simultánea

Esta función es muy útil, ya que permite ver todas las fuentes SDI, el programa y el anticipo en una sola pantalla. Asimismo, ofrece información relativa al reproductor multimedia y al estado de la transmisión, de la grabación y del disco, así como medidores de audio e indicadores para la ecualización y la dinámica.

Gracias a esta función, estará siempre al tanto de lo que está pasando durante la transmisión del programa.

El modo de visualización simultánea es muy útil para supervisar todas las fuentes y salidas al mismo tiempo.

A continuación, se describe cada una de las ventanas.

Anticipo

Esta ventana muestra la fuente asignada al anticipo. Es muy útil no solo si desea alternar entre fuentes a modo de práctica, sino también para ver transiciones en forma previa o realizar composiciones posteriores, ya que permite comprobarlas antes de emitirlas al aire. Si desea utilizar la función de visualización simultánea, será necesario que cambie el funcionamiento del mezclador al modo programa/anticipo. Consulte el apartado correspondiente para obtener más información al respecto.

Programa

Esta muestra la fuente asignada a la salida principal, por lo que permite ver exactamente lo que se está transmitiendo.

Fuentes

En estas ventanas se muestran las ocho fuentes conectadas a las entradas SDI. Esto brinda la posibilidad de supervisar las imágenes captadas por cada cámara, a fin de poder tomar decisiones rápidamente. Cabe destacar que también podría haber otros dispositivos conectados al mezclador, tales como equipos informáticos o grabadores HyperDeck.

Cuando una fuente se asigna a la salida principal o a un anticipo, el borde de la ventana correspondiente se destacará en rojo o verde, al igual que una luz piloto. El primero indica que se trata de un anticipo, mientras que el segundo significa que la imagen está al aire.

Reproductor multimedia

Esta ventana muestra el gráfico cargado en el reproductor multimedia. Para cargar un gráfico, basta con acceder al mismo en el panel multimedia en el programa ATEM Software Control y arrastrarlo al reproductor. Consulte el apartado *Panel multimedia* para obtener más información al respecto.

Transmisión

Esta ventana muestra parámetros relativos a la transmisión, inclusive la velocidad de transferencia y el estado de la memoria caché. Asimismo, en la parte inferior de la ventana, se indica la plataforma empleada.

- **Indicador AL AIRE** Antes de comenzar la grabación, el indicador del estado señal se encuentra apagado, lo cual significa que el mezclador está listo para comenzar la transmisión. Al iniciarse, aparecerá **AL AIRE** en rojo hasta que se detenga.

  Si la transmisión se interrumpe, por ejemplo, porque la velocidad de la conexión a Internet es muy lenta o no hay más espacio en la memoria caché, el indicador parpadeará.

- **Velocidad de transmisión** La velocidad de transmisión se mide en megabits por segundo (Mb/s). En los mezcladores ATEM Television Studio, es necesaria una velocidad de 5 a 7 Mb/s para transmitir en formato 1080p60 sin que se omitan fotogramas.

- **Estado de la memoria caché** Este indicador muestra el estado de la memoria caché del mezclador, que permite grabar y reproducir la señal transmitida de manera continua. Funciona como una medida de seguridad en caso de que la velocidad de transmisión disminuya. La naturaleza variable de Internet se debe mayoritariamente a la actividad de la red o a la potencia de la señal inalámbrica. De este modo, si la velocidad de transmisión disminuye, se almacenarán más datos en la memoria caché. Si la velocidad no es suficiente para realizar la transmisión, los fotogramas comenzarán a almacenarse en la memoria caché. Sin embargo, cuando esta no tenga más capacidad, la transmisión se verá comprometida, por lo que es recomendable evitar que se llene siempre que sea posible. Para ello, compruebe la velocidad de la conexión al preparar la transmisión. Durante la misma, es posible ver el estado de la memoria caché en las ventanas del modo de visualización simultánea. Si esta se llena con frecuencia, seleccione una calidad inferior en los ajustes para la transmisión.
- **Anclaje** Aparece el ícono de un teléfono móvil cuando el mezclador se encuentran conectado a uno de estos dispositivos. El ícono se destacará en rojo cuando la transmisión está al aire.

Grabación

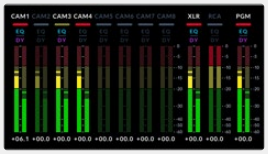
Esta ventana muestra el estado de la grabación en unidades USB-C externas o en la memoria interna.

- **Indicador de grabación** Antes de comenzar la grabación, o si no hay unidades externas conectadas, este indicador dirá **STOP**. Cuando hay soportes de almacenamiento conectados, aparecerán los íconos correspondientes.

  Cuando la grabación está en curso, el indicador mostrará **REC** y se destacará en rojo.

- **Contador de duración** Se encuentra situado debajo del indicador de grabación. Al presionar el botón de grabación, el contador se activará.
- **Indicadores del estado de la grabación** Proporcionan información acerca de cada unidad de almacenamiento y el estado de la grabación en ellas. Por ejemplo, si se emplean dos soportes de almacenamiento, se mostrará su nombre, el espacio disponible y el tiempo de grabación restante. Asimismo, el indicador correspondiente a la unidad en la que se está grabando se destacará en rojo y mostrará cuanto espacio libre queda.

  Los íconos se organizan según la capacidad de almacenamiento de las unidades. Por ejemplo, si dispone de cuatro unidades SSD en un equipo Blackmagic MultiDock 10G, aquella con mayor cantidad de espacio disponible aparecerá primera, y así sucesivamente. Cuando las unidades 1 y 2 están llenas, la 3 pasará al primer lugar, y la 4 al segundo. Por otro lado, siempre es posible saber qué unidad ha sido asignada a cada indicador comprobando los nombres debajo de estos.



Audio

Durante la transmisión, es posible ver el nivel de audio de cada fuente y del programa en las ventanas correspondientes.

- **Intensdad del audio** Las entradas y la salida principal disponen de medidores de audio individuales. Si el nivel sobrepasa los -10 dB, el vúmetro se encenderá de rojo, advirtiendo que está cercano al máximo de 0 dB. Si el nivel alcanza los 0 dB, el audio se distorsionará, y por lo tanto será necesario disminuir el volumen mediante los botones correspondientes en el panel frontal del mezclador o en la pestaña **Audio** del programa ATEM Software Control. En el siguiente apartado se brinda más información acerca de este programa.

  Estos medidores son una herramienta importante que brinda la posibilidad de supervisar el audio de manera que su calidad sea óptima.
- **Íconos Fairlight** Estos íconos permiten comprobar si el ecualizador o los procesadores de dinámica están activados en el panel de audio del programa ATEM Software Control.

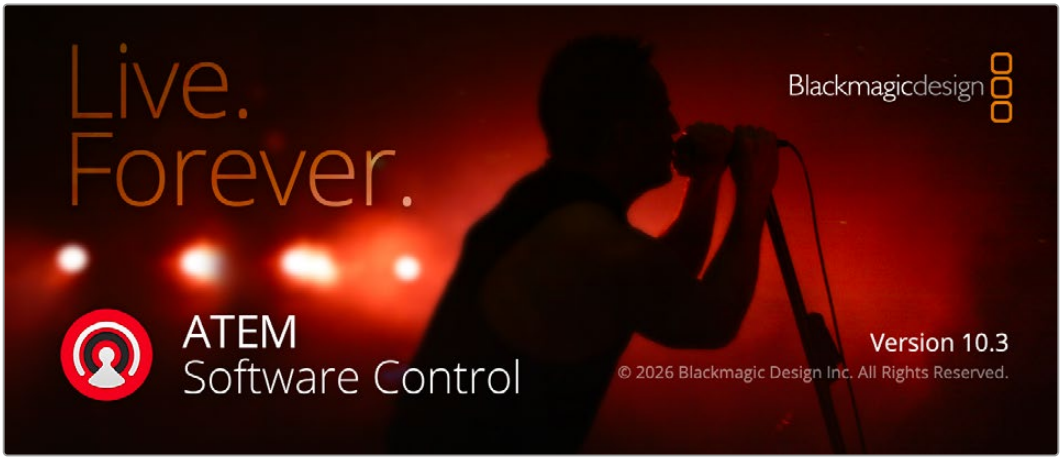
EQ DY	Si el ecualizador y los procesadores de dinámica están activados y la señal está al aire, los íconos correspondientes se encenderán de distintos colores.
EQ DY	Si los íconos no están encendidos, significa que las herramientas están activadas, pero la señal no está al aire.
EQ DY	Si los íconos no tienen color ni están encendidos, significa que las herramientas no están activadas o se han deshabilitado desde la pestaña **Audio** del programa ATEM Software Control.

La función de visualización simultánea es excepcional, puesto que permite supervisar todos los detalles al instante. Por ejemplo, brinda la oportunidad de ver la transmisión en la ventana correspondiente al anticipo antes de emitirla al aire. Es muy útil no solo si desea alternar entre fuentes SDI a modo de práctica, sino también para ver transiciones en forma previa o realizar composiciones por crominancia, ya que permite comprobarlas antes de emitirlas al aire.

ATEM Software Control

El programa ATEM Software Control es una aplicación informática incluida con los mezcladores ATEM que permite manejarlos al igual que el panel integrado en los dispositivos. En este caso, en lugar de botones, cuenta con varias secciones sobre el margen derecho que permiten acceder a las distintas funciones de procesamiento del dispositivo y modificar los ajustes con facilidad. De este modo, es posible controlar el mezclador a distancia, por ejemplo, en los casos en que la unidad está instalada en un bastidor y el operador se encuentra en una sala distinta.

Para poder utilizarlo, es preciso instalar el programa.

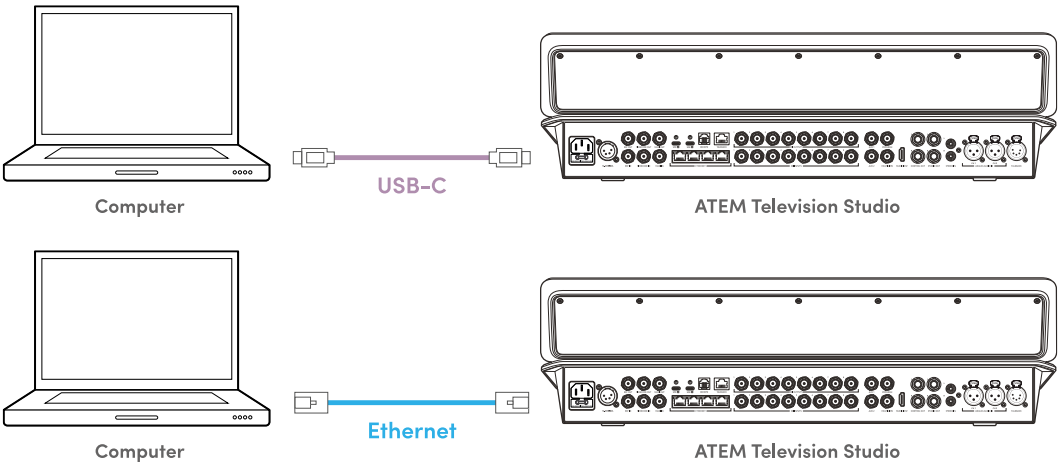


Instalación del programa ATEM Software Control:

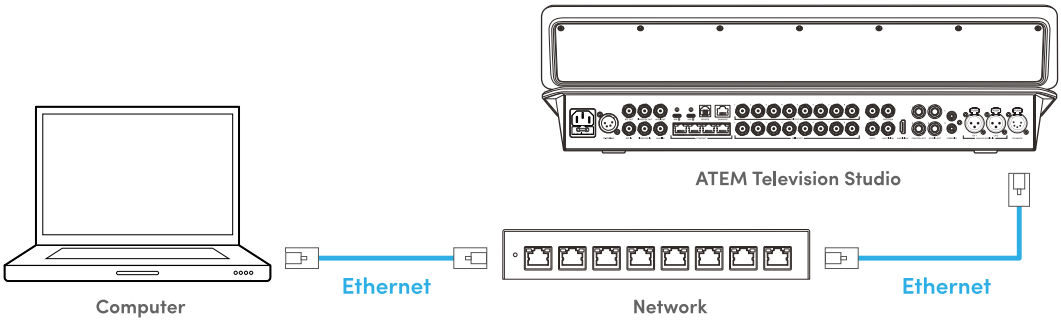
1. Descargue la versión más reciente de los controladores desde nuestra página de soporte técnico.
2. Al finalizar la descarga, haga doble clic en el ícono **Install ATEM** para dar inicio a la instalación. Siga las instrucciones que aparecen en la pantalla y haga clic **Install**.
3. Cuando el proceso haya terminado, busque la carpeta **Blackmagic ATEM Switchers** en el directorio de aplicaciones o programas y haga doble clic en **ATEM Software Control**.

A continuación, conecte el mezclador al equipo informático, ya sea mediante un puerto USB o una red Ethernet.

Conexión directa



Conexión mediante redes



Por último, es preciso asegurarse de que el equipo informático se encuentre conectado a la red y funcionando correctamente. Al abrir el programa ATEM Software Control, deberá seleccionar un mezclador. En caso de que no aparezca en la red, es posible seleccionarlo a partir de la lista o ingresar la dirección IP correspondiente en forma manual. A tal fin, utilice la dirección recién ingresada para el mezclador. De esta forma, la aplicación podrá detectarlo y establecer la comunicación.

Panel de control virtual

El programa está compuesto por cuatro pestañas principales: Mezclador, Audio, Multimedia y Cámara. Es posible acceder a ellas haciendo clic sobre las mismas o presionando la tecla **Shift** y la flecha izquierda o derecha en el teclado. El ícono del engranaje que se encuentra en la parte inferior izquierda de la interfaz permite abrir la ventana de ajustes generales. Todas las ventanas incluyen distintos parámetros del mezclador que solo pueden modificarse mediante el programa de control.

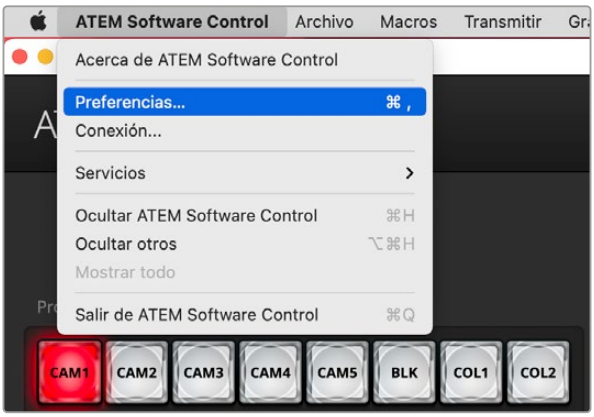
Mezclador

Al ejecutar el programa por primera vez, se muestra la pestaña **Mezclador**. Cabe destacar que para que los controles funcionen correctamente, el equipo informático debe estar conectado al dispositivo.

ATEM Software Control

Preferencias

El panel de preferencias incluye las opciones **General** y **Asignación**. La primera de ellas permite modificar los ajustes de control de transiciones, cambiar el idioma de la interfaz y activar o desactivar la conexión MIDI. La pestaña **Asignación** permite asignar entradas a botones específicos en los buses de programa y anticipos. En la barra de menús situada en la parte superior de la ventana, seleccione **ATEM Software Control** y haga clic en la opción **Preferencias**.



Seleccione la opción **Preferencias** en el menú **ATEM Software Control**.

Preferencias generales

Por defecto, los mezcladores ATEM funcionan en el modo Programa/Anticipo, dado que es lo más habitual en la actualidad. Sin embargo, puede modificarse para que el mezclador funcione en modo A/B directo, como se hacía previamente.

Es posible seleccionar una de las siguientes opciones para el idioma de la interfaz: inglés, español, alemán, chino, coreano, francés, italiano, japonés, polaco, portugués, ruso, turco y ucraniano.

Al ejecutar el programa por primera vez después de su instalación, aparecerá un cuadro de diálogo donde podrá elegir el idioma de la interfaz. No obstante, es posible seleccionar otro diferente en cualquier momento.

En el menú de idiomas, seleccione el de su preferencia. Aparecerá un aviso de advertencia para confirmar el cambio. Haga clic en **Cambiar**.

Al reiniciar el programa, verá la interfaz en el idioma seleccionado.

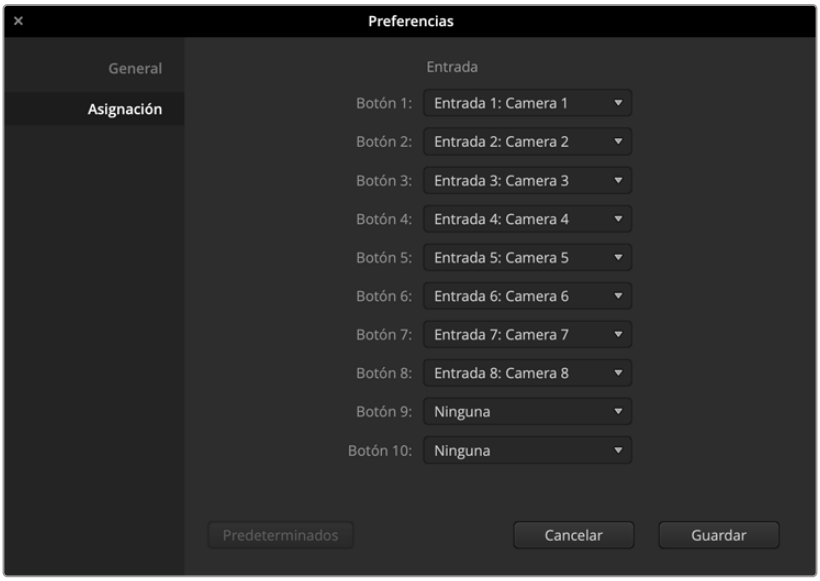
Para manejar el mezclador mediante un controlador MIDI, marque la casilla correspondiente.

Ajustes de preferencias generales

Asignación de botones

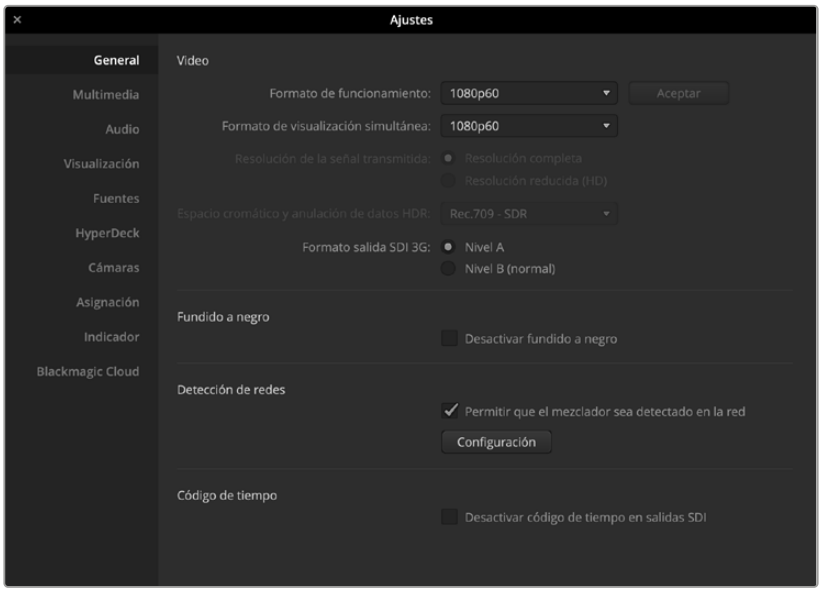
La pestaña **Asignación** permite asignar entradas a botones específicos en los buses de programa y anticipos.

Tanto el programa informático como el panel control físico permiten asignar las principales fuentes a los botones más accesibles en los buses de programa y anticipos. Las fuentes que se emplean con menor frecuencia pueden asignarse a otros botones menos destacados. La asignación de botones se realiza de forma independiente en el programa informático y el panel, de manera que el modo en el cual los botones se asignaron a determinadas fuentes en el primero no afectará la forma en que fueron asignados en este último.



Modificación de ajustes del mezclador

Al hacer clic en el ícono del engranaje situado en la esquina inferior izquierda, es posible acceder a la ventana de ajustes para cambiar la configuración del mezclador, el audio o los grabadores HyperDeck conectados, seleccionar el modo de visualización simultánea, activar la función de control de cámaras o personalizar los distintos rótulos. Estos ajustes se encuentran agrupados en distintas pestañas.



Ajustes generales del modelo ATEM Television Studio HD8 ISO

Ajustes generales

La pestaña **General** contiene opciones correspondientes al formato, los ajustes del panel multimedia y de la salida para supervisar las imágenes.

Video

Selección del formato de imagen

La opción **Formato general** permite seleccionar el formato de funcionamiento del mezclador. Es posible elegir distintos formatos de imagen, por ejemplo, 1080i59.94, 720p59.94 o 525i59.94 NTSC, según la región donde se emitan los contenidos. Para países que siguen la norma PAL, se incluyen opciones tales como 1080i50 o 720p50. Una buena manera de determinar la opción más adecuada es comprobar las cámaras y luego configurar el mezclador para que el formato coincida.

Formato de imagen

Los mezcladores ATEM Television Studio son compatibles con los siguientes formatos:

Formatos HD	720p50, 720p59.94, 720p60 1080p23.98, 1080p24, 1080p25, 1080p29.97, 1080p30, 1080p50, 1080p59.94, 1080p60 1080i50, 1080i59.94, 1080i60

Los modelos ATEM Television Studio 4K8 también son compatibles con los siguientes formatos:

Formatos UHD	2160p23.98, 2160p24, 2160p25, 2160p29.97, 2160p30, 2160p50, 2160p59.94, 2160p60

Para establecer un formato, seleccione la opción deseada y haga clic en el botón **SET**. Cada vez que este se modifica, se elimina el contenido del panel multimedia.

Selección del formato de visualización simultánea

Si la resolución del formato es 1080p25 o mayor, se puede reducir la frecuencia de imagen de la señal transmitida mediante salida de visualización simultánea, a fin de poder emplear monitores de menor definición. Por ejemplo, si el formato seleccionado es 1080p60, es posible elegir la opción 1080i60 para la señal transmitida a través de dicha salida.

Nivel de la señal SDI 3G transmitida

Si se desean transmitir contenidos con resolución 1080p50 o en un formato de mayor definición a dispositivos con tecnología SDI 3G, puede que sea necesario alternar el formato de la señal saliente entre los niveles A y B, de modo de no perder compatibilidad con los equipos que solo admiten uno de ellos. La opción predeterminada es nivel B, dado que funciona con la mayoría de los dispositivos. No obstante, es cambiarla marcando la opción **Nivel A**.

Fundido a negro

Para desactivar el botón **FTB** en el panel frontal del mezclador y en el programa ATEM Software Control, marque la casilla **Desactivar fundido a negro**.

Composiciones posteriores

Al seleccionar un valor de 100 % de opacidad para las composiciones posteriores, es posible anular el indicador de señal al aire, por ejemplo, al realizar repeticiones de competencias deportivas con el dispositivo DaVinci Resolve Replay Editor. Esto ayuda a notificar al operador de cámara de que las imágenes no están al aire cuando se está emitiendo una repetición. Sin embargo, si la opacidad no está al máximo, el indicador permanecerá activo.

Detección de redes

De manera predeterminada, los mezcladores ATEM Television Studio pueden ser detectados en una red inmediatamente, a fin de facilitar la transmisión a través de Internet mediante los modelos Blackmagic Studio Camera 6K Pro o URSA Broadcast G2. Para desactivar esta función, desmarque la opción que permite que el dispositivo sea detectado en la red.

Ajustes multimedia

Panel multimedia

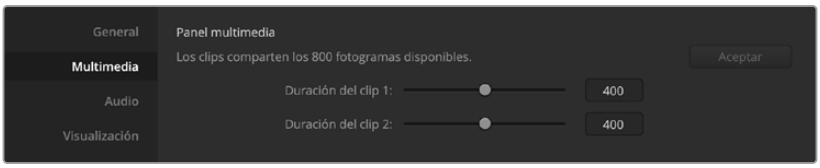
Ajuste de la duración de un clip en el panel multimedia

El panel multimedia de los mezcladores ATEM permite guardar imágenes con sus respectivos canales alfa, al igual que clips, que luego pueden asignarse a un reproductor para usarlos durante la producción.

Modelo ATEM	Imágenes	Clips	Formato	Duración
ATEM Television Studio HD8	20	2	720p	400 fotogramas
			1080p	200 fotogramas
ATEM Television Studio HD8 ISO	20	2	720p	400 fotogramas
			1080p	200 fotogramas
ATEM Television Studio 4K8	20	2	720p	1600 fotogramas
			1080p	400 fotogramas
			2160p	200 fotogramas

Capacidad del panel multimedia

La memoria disponible se reparte equitativamente entre cada secuencia en forma predeterminada, lo cual determina la cantidad máxima de fotogramas. Si necesita aumentar la duración de un clip, mueva el control correspondiente para ajustarla. Cabe recordar que, al aumentar la duración de uno, se reducirá la del otro.



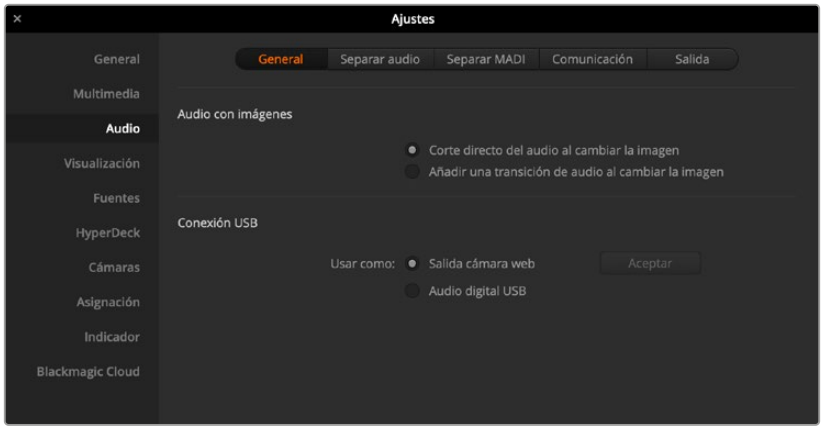
Asignación de la capacidad disponible del panel multimedia

Ajustes de audio

La pestaña **Audio** incluye todos los ajustes divididos en cinco categorías: **General**, **Separar audio**, **Separar MADI**, **Comunicación**, **Salida** y **Mezcla N-1**.

General

Esta pestaña permite configurar la opción **Audio con imágenes** (AFV).



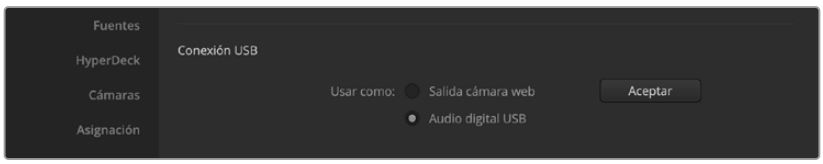
Audio con imágenes

Esta función (AFV) permite seleccionar el comportamiento del audio durante las transiciones mediante los botones de opción. Para realizar un fundido cuando las fuentes cambian, marque el botón a fin de agregar una transición. Este solo se transmitirá a través de la salida principal cuando la señal proveniente de la entrada seleccionada esté al aire.

Conexión USB

Las conexiones USB en la parte trasera de los mezcladores ATEM Television Studio se utilizan para actualizarlos y detectarlos como una cámara web al transmitir. También puede configurar el puerto USB para que funcione como una interfaz de audio digital con Fairlight Live. Fairlight Live es una extraordinaria mesa de mezclas virtual que permite procesar cientos de canales. El programa admite tanto formatos convencionales (desde sonido estéreo hasta envolvente) como audio inmersivo y ámbisónico.

A fin de utilizar Fairlight Live, seleccione la opción **Audio digital USB** para la conexión USB y haga clic en el botón **Aceptar**.



Al seleccionar dicha opción para la conexión USB, los controles para la mezcla de audio en el programa ATEM Software Control y en el mezclador se desactivan automáticamente cuando este detecta el retorno del audio desde el puerto USB.

Al utilizar una plantilla de programa de Fairlight Live para mezcladores ATEM, esto ocurre en cuanto el programa comienza. Con una plantilla de programa personalizada u otra interfaz de mezcla de audio USB, esto sucede después de asignar la salida de audio de vuelta al mezclador.

En el caso de Fairlight Live, el direccionamiento de la señal transmitida se configura en la ventana de la matriz de asignación.

Separar audio

Los modelos ATEM Television Studio permiten dividir una señal estereofónica en dos canales monoaurales independientes. Esto resulta útil al mezclar una fuente monoaural en los dos canales de la salida estéreo principal. Asimismo, es posible separar todas las fuentes de audio en canales distintos o seleccionar cada una individualmente.

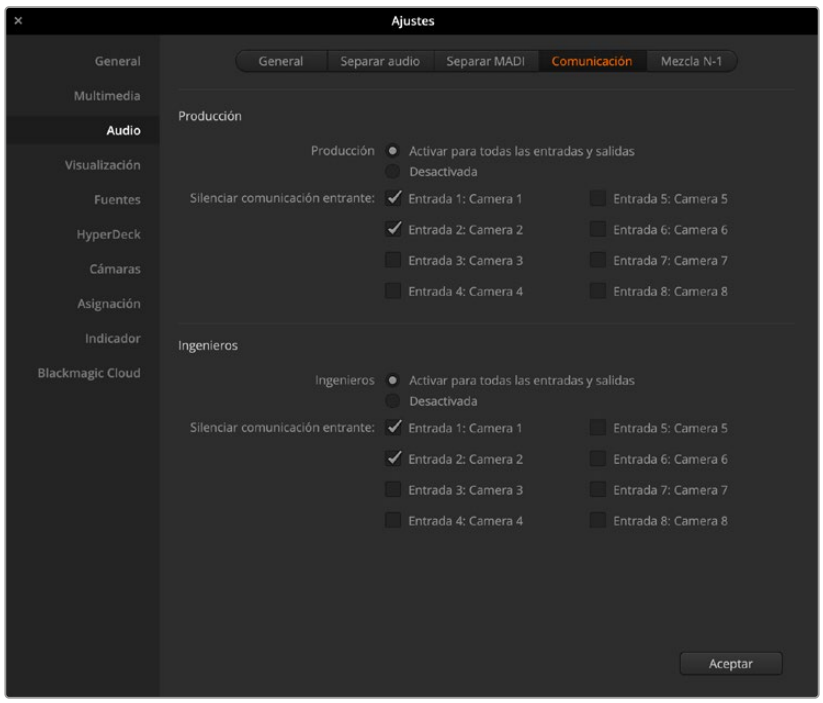
A su vez, se pueden obtener canales monoaurales a partir de una señal en formato MADI.

Marque las casillas correspondientes para obtener canales monoaurales.

Comunicación

Configure los ajustes de la comunicación en la pestaña **Comunicación**. La comunicación con la producción se establece mediante los canales SDI 15 y 16, mientras que los canales 13 y 14 están reservados para los ingenieros. Esta función puede activarse o desactivarse.

Es posible que se quiera conectar la salida derivada del mezclador a otra conexión de entrada para lograr un efecto en particular. En algunos casos, esto podría generar un sonido de retorno en los canales de comunicación. Para evitarlo, marque la casilla **Silenciar** en cada una de las entradas SDI correspondientes. Si no desea silenciar la comunicación, asegúrese de marcar las casillas correspondientes a la producción y los ingenieros.



Marque las casillas para silenciar la comunicación con la producción.

Salida

Modifique la señal de retorno de audio SDI, la fuente remota y las salidas auxiliares mediante el menú de asignación de salidas en mezcladores ATEM Television Studio HD8.

Audio SDI

Seleccione una de las opciones de retorno de audio en el menú. Estas incluyen: mezcla, supervisión, producción, ingenieros y mezcla N-1. Al seleccionar esta última, elija la fuente de audio en el menú a fin de eliminar la fuente seleccionada de la señal de retorno.

Audio salidas auxiliares

Al asignar una fuente de una cámara a una salida auxiliar, es posible activar la opción mezcla N-1 para transmitir el audio de la mezcla principal, excluyendo dicha fuente particular.

Audio fuente remota

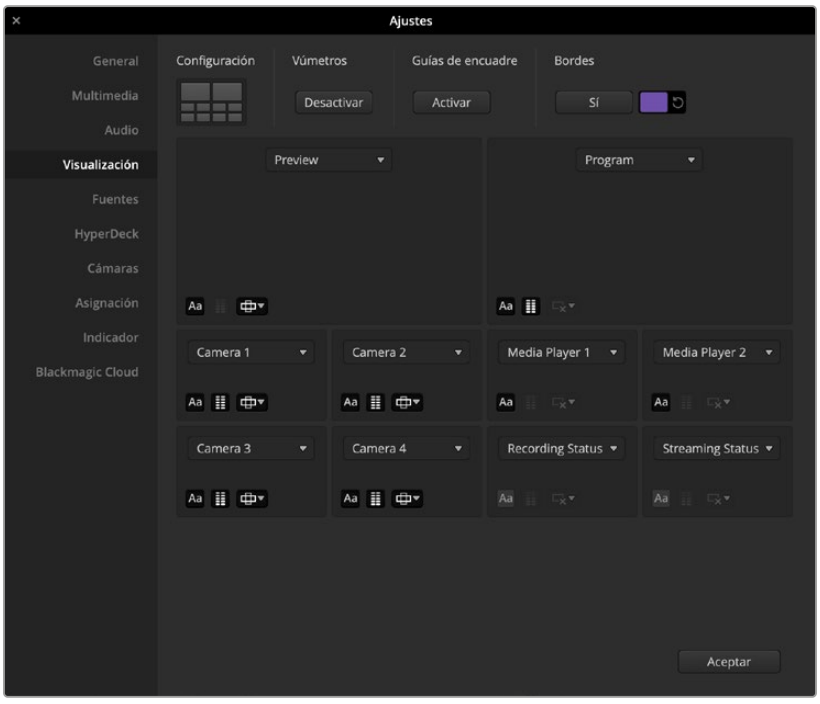
Al usar fuentes remotas con modelos ATEM Television Studio HD8 ISO, es posible especificar la señal de retorno de audio desde el menú **Fuente retorno**. Al seleccionar la opción **Mezcla N-1**, elija la fuente de audio en el menú a fin de eliminar la fuente seleccionada de la señal de retorno.

Mezcla N-1

En el modelo ATEM Television Studio 4K8, es posible seleccionar la opción **Mezcla N-1** a los efectos de silenciar el audio de una entrada específica en la señal de retorno. Por ejemplo, al realizar coberturas en directo, la demora en el audio de retorno podría provocar que el presentador se distraiga al escuchar su voz con retraso. En tal sentido, este modo brinda la posibilidad de excluir una fuente particular de la mezcla de audio.

Ajustes para modo de visualización simultánea

Estos ajustes brindan la posibilidad seleccionar la disposición de las ventanas del modo de visualización simultánea. La configuración predeterminada consiste en dos ventanas grandes en la parte superior y ocho más pequeñas en la inferior. Sin embargo, cada cuadrante de este modo configurarse como una ventana o dividirse para ver 4, 7, 10, 13 o 16 señales. Haga clic en cada cuadrante en la opción **Configuración** para alternar entre una y cuatro ventanas.



Distribución de las ventanas en el modo de visualización simultánea

La opción **Activados** permite ver los vúmetros de todas las fuentes. De manera alternativa, es posible activarlos en forma individual mediante el ícono situado en la parte inferior derecha de cada ventana.

Las ventanas de vista previa disponen de marcadores que indican el área de seguridad en la imagen y permiten asegurarse de que esta se verá correctamente en cualquier monitor. Las opciones para las guías de encuadre son 16:9 (horizontal) o 9:16 (vertical). Seleccione **Todas** a fin de activar ambas.

Además, se muestra un borde rojo o verde alrededor de cada ventana para diferenciar la señal al aire de los anticipos. El rojo indica que la fuente está siendo transmitida como señal principal, mientras que el verde corresponde a un anticipo. Es posible ocultar estos bordes o seleccionar un color distinto mediante los ajustes respectivos. A su vez, los rótulos en cada ventana se destacan en rojo o verde según se trate de un anticipo o de la señal emitida, respectivamente. Estos también pueden desactivarse haciendo clic en la opción **Aa**.

Además, es posible ver el estado de la transmisión, la grabación y el audio para controlar el espacio disponible en las unidades de almacenamiento o la velocidad de transferencia de datos. Consulte el apartado *Uso de la función de visualización simultánea* para obtener más información al respecto.

Fuentes

La pestaña **Fuentes** permite asignar nombres a las entradas, las salidas y los reproductores multimedia. Cada entrada y salida tiene un nombre largo y otro corto.

Los nombres largos admiten hasta veinte caracteres y aparecen en los menús desplegables para seleccionar las fuentes en el programa de control, así como en las ventanas del modo de visualización simultánea y en las pantallas LCD del mezclador. Para identificar la fuente en el panel, se utiliza una denominación corta de cuatro caracteres.

Para cambiar el nombre de una entrada, haga clic en el campo de texto correspondiente, ingrese el texto y luego haga clic en **Cambiar**. La nueva denominación podrá verse en la interfaz del programa, en el panel del mezclador y en las ventanas del modo de visualización simultánea.Se recomienda modificar ambos nombres al mismo tiempo, de forma que coincidan. Por ejemplo, Cámara 1 corresponde a la denominación por extenso, y CAM1 al nombre abreviado.

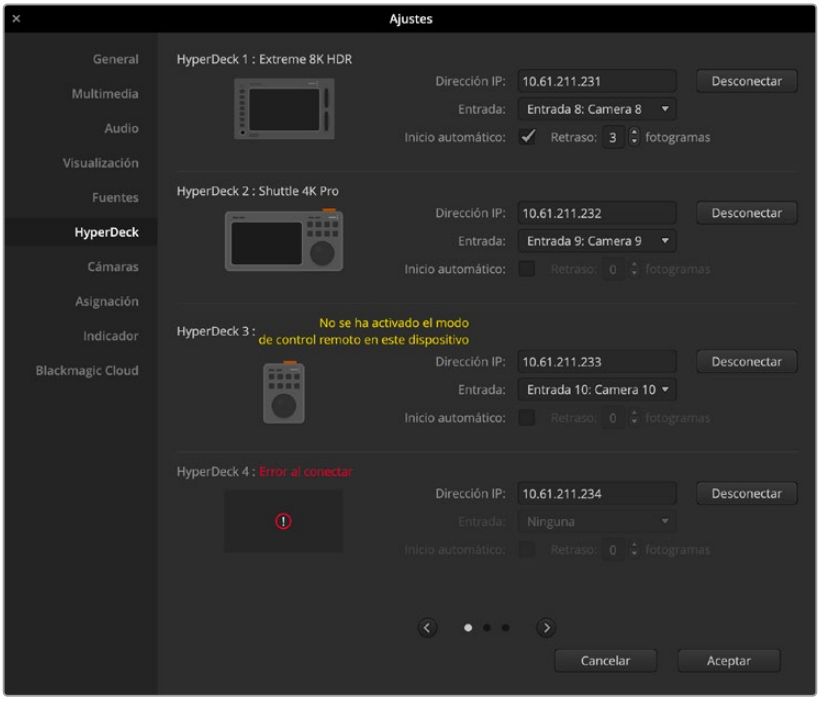
Ingrese los nombres largos y cortos de las entradas y salidas.

El modelo ATEM Television Studio HD8 brinda la posibilidad de controlar cámaras conectadas de forma remota a través de Internet o una red local Ethernet. Consulte el apartado *Funciones adicionales de los modelos ISO* a fin de obtener más información al respecto.

Ajustes para grabadores HyperDeck

Es posible conectar hasta 10 grabadores HyperDeck Studio y controlarlos mediante el programa ATEM Software Control. En este sentido, la pestaña **HyperDeck** permite configurar direcciones IP, seleccionar fuentes, activar o desactivar la función de inicio automático de la grabación o cambiar el tiempo de retraso.

Los indicadores situados arriba de cada unidad y el mensaje que aparece debajo brindan la posibilidad de identificar con facilidad si está conectada o si el modo de control remoto se encuentra habilitado.



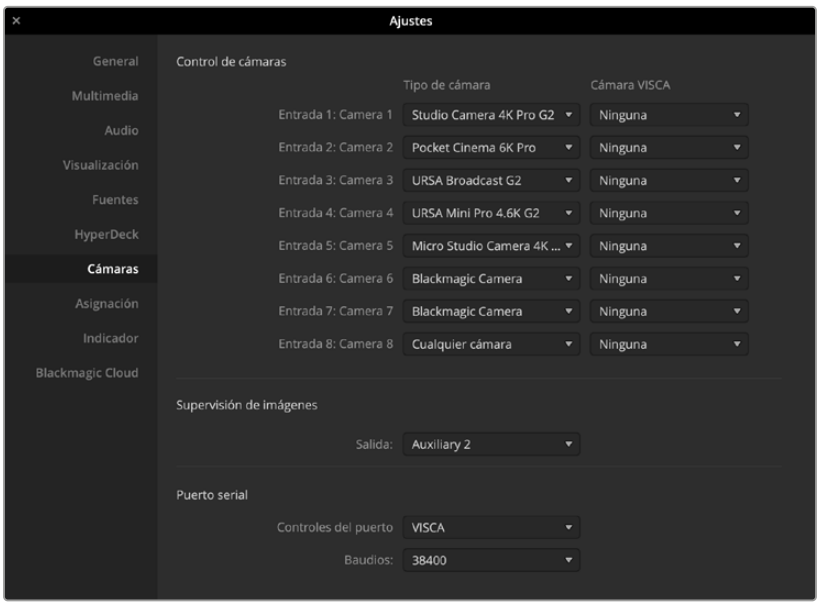
Agregue hasta 10 grabadores HyperDeck.

Al cambiar el nombre de las entradas conectadas a los grabadores HyperDeck, es más fácil seleccionarlas en la lista.

Consulte las especificaciones de cada modelo para obtener más información al respecto.

Ajustes para el control de cámaras

La pestaña **Cámaras** incluye ajustes para asignar cámaras a las entradas y seleccionar la salida destinada a la supervisión de imágenes.



Control de cámaras

Este menú permite asignar a cada entrada una cámara de Blackmagic o de otros fabricantes. En este último caso, elija la opción **Cualquier cámara**. Al seleccionar la cámara correcta para cada entrada, se garantiza que todos los parámetros pertinentes sean correctos.

Siga los pasos descritos a continuación para agregar cámaras PTZ y cabezales motorizados cuyo control se efectúa mediante el protocolo VISCA a través de una red IP.

1. En la opción **Tipo de cámara**, seleccione **Cualquier cámara**.
2. Haga clic en el menú de cámaras VISCA. Si ya ha agregado una unidad, esta aparecerá en la lista. De lo contrario, seleccione la opción **Agregar cámara VISCA IP**.
3. En el menú para agregar cámaras VISCA IP, introduzca la dirección IP de la unidad o del cabezal motorizado. También es posible añadir un nombre para la cámara. Haga clic en **Agregar**.

Supervisión de imágenes

Es posible seleccionar cualquier salida SDI o la utilizada para reconocer el dispositivo como una cámara web a fin de supervisar imágenes. Al controlar las cámaras mediante el panel de control, los ajustes de la señal transmitida pueden comprobarse mediante la salida de supervisión. Haga clic en el menú para elegir la conexión que desea utilizar.

Ajustes del puerto serial

Es posible seleccionar la forma en la cual se utiliza mediante el menú **Puerto serial**. Las opciones disponibles son **Ninguna**, **VISCA** y **GVG**. Esta última brinda la posibilidad de utilizar el protocolo GVG100, un sistema heredado común que facilita la comunicación con ciertos dispositivos, tales como equipos de edición lineal. Al seleccionar la opción **VISCA**, deberá determinar asimismo la tasa de baudios (9600 o 38 400).

Para detectar cámaras VISCA conectadas de manera remota, haga clic en el botón **Configurar cámara VISCA**.

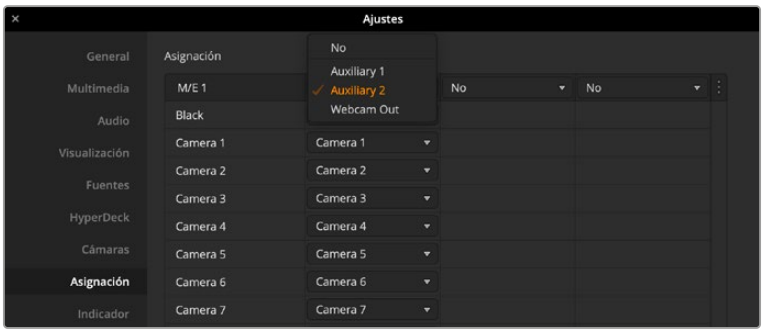
Se abrirá una ventana que muestra todas las unidades disponibles. También es posible agregar una cámara haciendo clic en el botón + (más). Una vez que estas se detectan, pueden seleccionarse en el menú desplegable junto a cada entrada. Haga clic en el botón - (menos) para quitar una cámara.

Asignación de buses

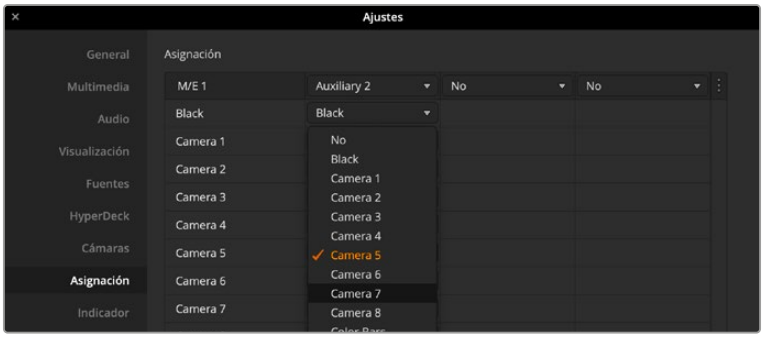
En los mezcladores ATEM Television Studio, es posible vincular las salidas auxiliares para que funcionen a la par del banco principal. Esto permite transmitir varias señales de un mismo programa, controladas desde dicho banco.

Mediante la pestaña **Asignación** en los ajustes, es posible sustituir fuentes en las señales transmitidas mediante dichas salidas, a fin de ignorar las entradas seleccionadas. Una vez configurada esta función, dichos buses realizarán los mismos cortes y transiciones que se efectúen en el bus principal, pero pueden transmitir distintas fuentes, si es necesario. No obstante, cabe destacar que las imágenes transmitidas a través de estas salidas no incluyen las transiciones que se efectúen durante la emisión del programa. Esto facilita, por ejemplo, la creación de versiones locales de un programa, sustituyendo los gráficos de los títulos en cada señal transmitida con un idioma diferente. El bus subordinado llevará a cabo las transiciones en sincronía con el principal y mostrará los gráficos asignados, lo cual permite emitir hasta cuatro señales distintas del programa. Para configurar la sustitución de fuentes:

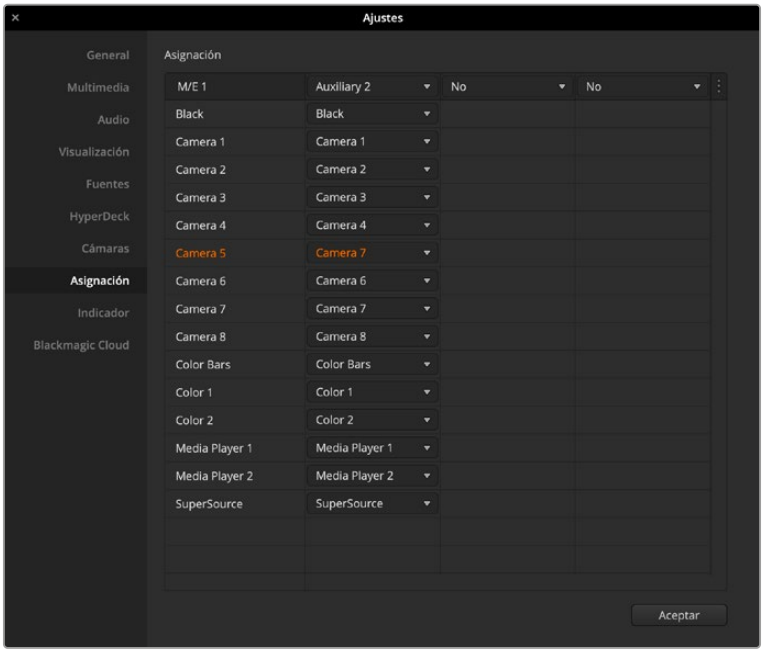
1. Seleccione una salida auxiliar en el menú situado en la parte superior de la segunda columna para utilizarla como subordinada, por ejemplo, la salida auxiliar 2. Los modelos ATEM Television Studio HD8 incluyen 2 salidas auxiliares, mientras que la versión ATEM Television Studio 4K8 cuenta con 10.



2 En este ejemplo, se sustituirá la cámara 5. Acceda a la lista de fuentes correspondientes debajo de la salida auxiliar 2 para la cámara 5 y haga clic en el menú desplegable.



3 Seleccione la cámara 7. La cámara 5 en el banco de mezcla y efectos 1 se destacará de color naranja para indicar que se ha efectuado una sustitución.



Ahora, al realizar una transición a la cámara 5 en el banco principal, se llevará a cabo otra transición a la cámara 7 de forma paralela en la señal transmitida mediante la salida auxiliar 2. Una manera rápida de comprobar el funcionamiento de esta configuración es asignar ambas señales a la salida de visualización simultánea.

No obstante, cabe destacar que las imágenes transmitidas a través de estas salidas no incluyen las transiciones que se efectúen durante la emisión del programa.

Indicadores

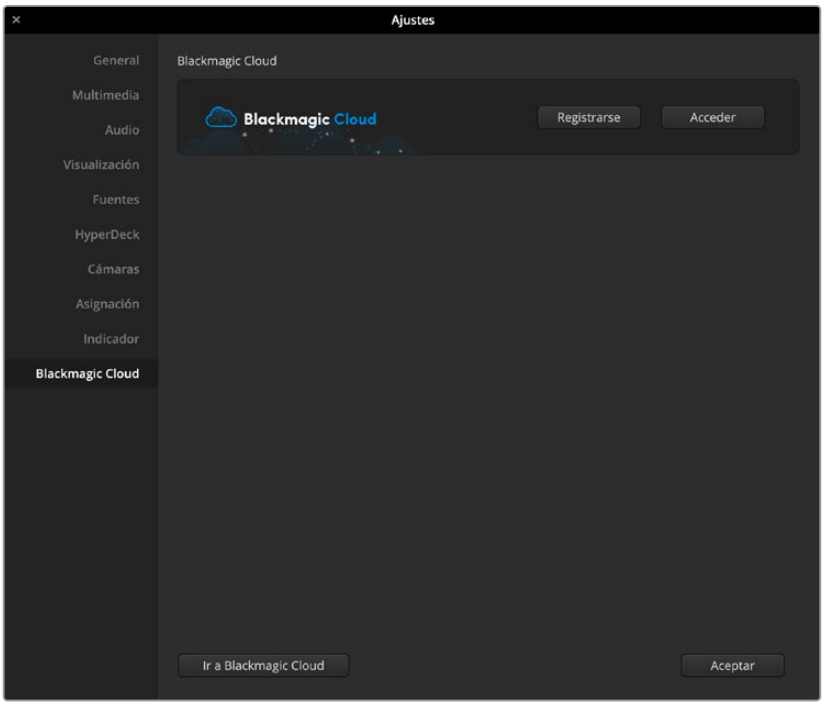
Esta pestaña incluye ajustes para activar los indicadores en cada banco de manera independiente.

Para desactivar un indicador mientras una superposición posterior se encuentra al aire, marque la casilla **Ignorar indicador de señal al aire**.

Blackmagic Cloud

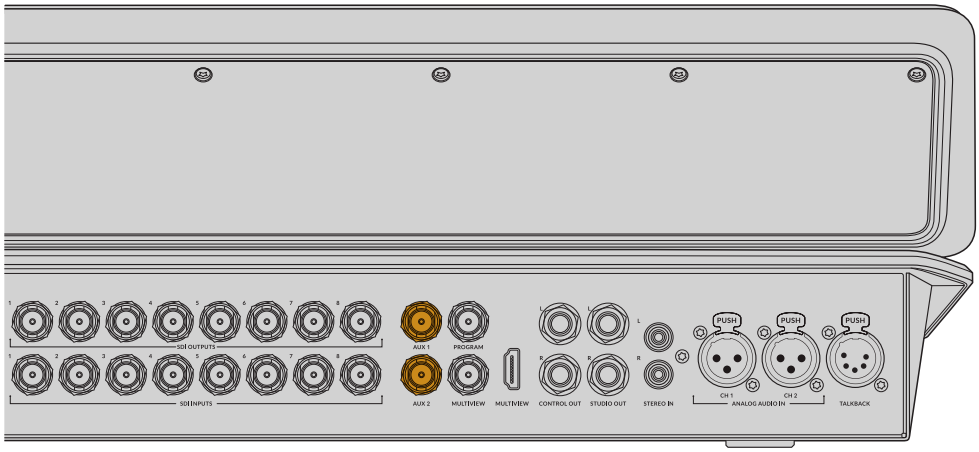
Al transmitir a la aplicación Stream Router o sincronizar proyectos con Blackmagic Cloud, deberá iniciar sesión en la plataforma.

Esto se puede hacer a través del menú de Blackmagic Cloud en la ventana de configuración o mediante el panel de transmisión en directo.

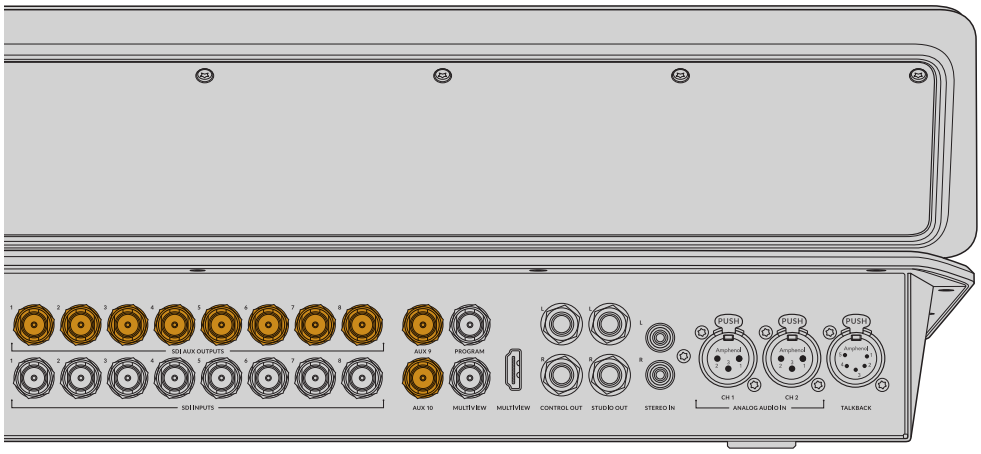


Salidas auxiliares

Es posible asignar distintas señales y fuentes internas a las salidas auxiliares SDI del mezclador y a la que permite detectar el dispositivo como una cámara web. Son muy similares a las salidas de una matriz de conmutación y permiten emplear las señales provenientes de todas las entradas, los generadores de color y los reproductores multimedia, además de la señal principal y los anticipos, e incluso barras de color. El modelo ATEM Television Studio HD8 ofrece tres salidas auxiliares, mientras que la versión ATEM Television Studio 4K8 cuenta con 11.



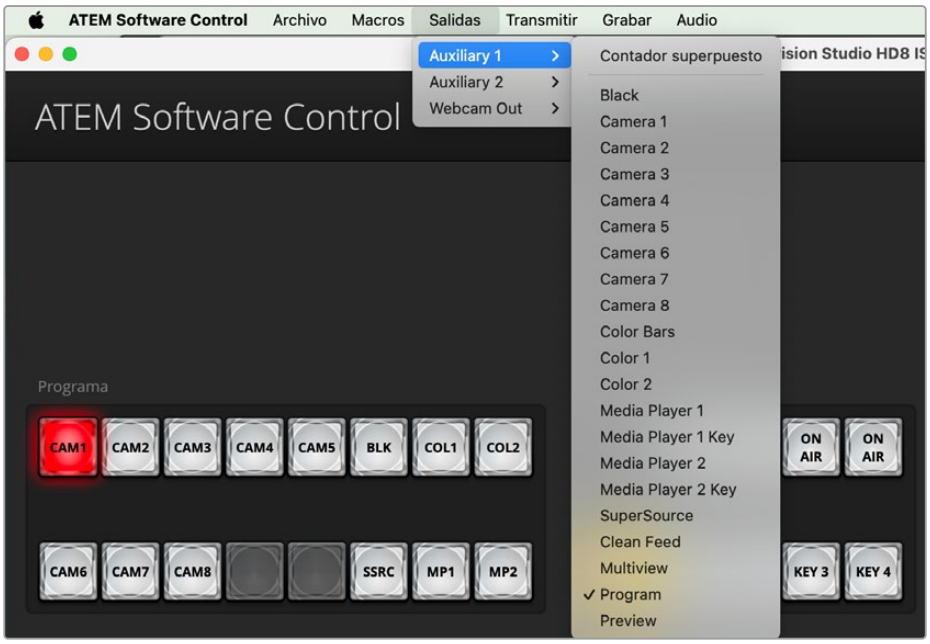
Salidas auxiliares en el modelo ATEM Television Studio HD8



Salidas auxiliares en el modelo ATEM Television Studio 4K8

Distribución de señales

Para asignar una señal a una salida auxiliar, basta con hacer clic en el menú **Salidas** en la barra superior y buscar la opción deseada. Al seleccionarla, la señal transmitida por dicha salida cambiará inmediatamente. La fuente seleccionada se indica con un visto. Existe una amplia variedad de fuentes que pueden seleccionarse, inclusive colores sólidos, fondos e imágenes superpuestas, programas y anticipos o señales limpias.



Menú para salidas SDI en el modelo ATEM Television Studio HD8

Las salidas auxiliares son sumamente útiles y ofrecen varias posibilidades. Incluso pueden utilizarse con proyectores y pantallas gigantes en escenarios durante conciertos y actuaciones en vivo. La mayoría de los espectáculos en directo hoy en día son complejos en cuanto a la diversidad de medios empleados. Las salidas auxiliares han sido diseñadas para permitir controlar los diferentes dispositivos que forman parte de la transmisión desde el mezclador.

Asignación de canales de audio

El mezclador brinda la oportunidad de integrar diversas fuentes de audio en canales que se asignan a la salida SDI, a fin de grabarlas mediante unidades HyperDeck.

Por ejemplo, es posible conectar un micrófono a una cámara y luego asignar esta fuente a los canales de audio 3 y 4 integrados en la señal principal transmitida. Al grabar cuatro o más canales de audio seleccionando la opción respectiva en los ajustes para dichas unidades, la grabación incluirá el sonido captado por los micrófonos de la cámara independientemente de la mezcla de audio, y cualquier ingeniero de sonido tendrá acceso a estas fuentes específicas al procesar el audio durante la posproducción.

Esta extraordinaria función brinda un control absoluto sobre todos los canales de audio integrados en la señal transmitida a través de la salida SDI.

El mezclador brinda la posibilidad de asignar dichos canales individualmente.

Opciones de asignación del audio en el programa ATEM Software Control para los modelos ATEM Television Studio

El audio del programa siempre se asigna a los canales 1 y 2, mientras que la comunicación se establece mediante los canales 13 y 14 (ingenieros) o 15 y 16 (producción). No obstante, todos los

demás canales pueden asignarse como resulte más conveniente mediante cualquiera de las entradas SDI, MADI, XLR, RCA o para micrófonos.

Asignación del audio mediante el programa ATEM Software Control

1. Haga clic en el menú **Audio** en la barra de herramientas superior.
2. Seleccione un par de canales entre las opciones disponibles a la derecha y luego la entrada SDI que desee asignar. Por ejemplo, para asignar los canales 3 y 4 de las entradas SDI 2 a los canales 3 y 4 de la salida principal, seleccione la opción **Audio Out 3/4** en la lista del primer menú y a continuación la opción **SDI Input 2 Audio 3/4** en la segunda lista.

Uso de la función SuperSource

Los modelos ATEM Television Studio disponen de una función denominada **SuperSource** (también conocida como PIP o imágenes simultáneas) que permite visualizar varias fuentes en un monitor al mismo tiempo. Por ejemplo, al transmitir una entrevista con cuatro participantes, es posible superponer las imágenes de cada uno al fondo. Los mezcladores de esta línea procesan las imágenes de la función SuperSource como una señal.

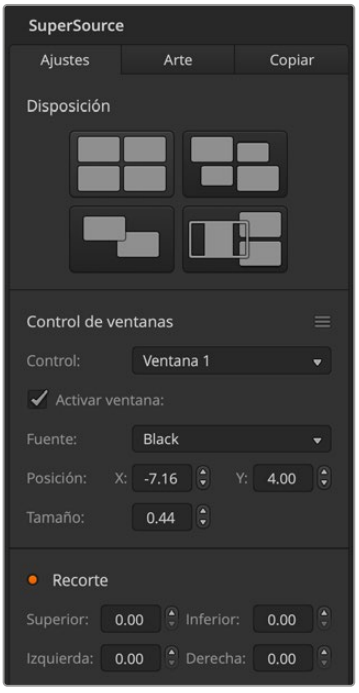
Ajustes de la función SuperSource

Esta función se puede configurar mediante los ajustes en las pestañas laterales del programa ATEM Software Control o presionando el botón respectivo a la izquierda de la pantalla LCD.

Visualización

Para configurar la función **SuperSource**, primero es necesario visualizar la imagen en el monitor. A tal fin, asigne un canal SuperSource a una de las salidas SDI mediante el menú respectivo, o bien a una de las ventanas del modo de visualización simultánea.

Posición de las fuentes



Ajustes de la función **SuperSource**

En el panel **SuperSource** del programa informático, elija uno de los cuatro formatos predeterminados, según el que mejor se ajuste a sus necesidades, para situar las ventanas de acuerdo con las posiciones indicadas en la interfaz. Mediante el menú de control, seleccione la ventana que desea ajustar. A continuación, es posible cambiar la posición (X/Y) y el tamaño de la ventana. Desmarque la opción **Activar ventana** para eliminarla. Los ajustes de recorte permiten modificar los bordes de las ventanas. Marque la casilla de verificación respectiva y ajuste los valores para el borde superior, inferior, izquierdo o derecho. Para restablecer todos los parámetros, haga clic en el ícono situado a la derecha del menú de control.

En los modelos ATEM Television Studio, al emplear un dispositivo ATEM Advanced Panel, presione el botón **SUPER SOURCE** y utilice las flechas del sistema de control para acceder a los ajustes de configuración respectivos. En el segundo grupo de ajustes, gire el mando correspondiente a las configuraciones predeterminadas para elegir la disposición preferida y luego presione al botón junto a la opción **APLICAR AJUSTE** en la parte superior de la pantalla. Una vez seleccionada la ventana, los ajustes adicionales se aplicarán a esta junto con la palanca de mando.

También es posible ajustar el tamaño y la posición de la ventana mediante los mandos giratorios situados debajo de la pantalla, en el tercer grupo de ajustes, aunque es mucho más fácil con la palanca. Empújela hacia arriba y abajo, o hacia los costados para cambiar la posición, y gírela en sentido horario o antihorario para aumentar o disminuir el tamaño, respectivamente.

Imágenes de fondo y en primer plano

Haga clic en la pestaña **Arte** para acceder a la configuración correspondiente. Seleccione la imagen en primer plano desde el menú. Al utilizar el panel del mezclador, es posible elegir la fuente mediante el bus de selección respectivo. Coloque la fuente en el fondo o en primer plano. Después de seleccionar el primer plano, elija el canal alfa desde el menú o el bus de selección en el panel del mezclador.

Opciones para ajustar la imagen en segundo plano

Al marcar el botón de opción correspondiente al primer plano, es necesario determinar si el gráfico es un elemento premultiplicado. En caso afirmativo, marque la casilla de verificación respectiva. La imagen se colocará sobre las ventanas activas. Si el elemento gráfico no incluye un canal premultiplicado, utilice los controles **Recorte** y **Ganancia** según se describe en el apartado *Composición de imágenes* para obtener el resultado deseado. Asimismo, es posible invertir la superposición.

En el panel del mezclador, presione las flechas para acceder a los ajustes correspondientes. Seleccione el gráfico mediante el mando giratorio correspondiente y asígnelo al primer plano o al fondo oprimiendo los botones respectivos encima de la pantalla. Si la imagen incluye un canal premultiplicado, acceda al siguiente grupo de ajustes y compruebe que la opción **COMPOSICIÓN PRECOMPUESTA SÍ** esté activada. La imagen se colocará sobre las ventanas activas. Si el elemento gráfico no incluye un canal premultiplicado, utilice los controles **Recorte** y **Ganancia** según se describe en el apartado *Composición de imágenes* para obtener el resultado deseado. Podría ser necesario invertir la composición.

Copiar ajustes

Copia de ajustes de la ventana 1 a la ventana 2

Para usar la función de copia en el programa ATEM Software Control, haga clic en la pestaña **Copiar** a fin de acceder a las distintas opciones. Los ajustes de la ventana seleccionada se pueden aplicar fácilmente a cualquiera de las demás ventanas con solo un clic. Dichas ventanas aparecerán detrás de la ventana principal y compartirán la misma fuente.

Al emplear un mezclador ATEM Television Studio, acceda al último grupo de ajustes del menú **SuperSource** y seleccione la ventana desde la cual desea copiar, así como la ventana de destino, mediante los mandos giratorios situados debajo de la pantalla. También es posible elegir todas las ventanas como destino.

Transmisión de la señal al aire

Los mezcladores ATEM procesan las imágenes de la función **SuperSource** como una señal. Simplemente selecciónela en el bus de programa mediante el software o el panel del dispositivo para usar la composición.

Guardar y restablecer los ajustes del mezclador

Una vez configurado el mezclador, es posible guardar los ajustes de dos maneras.

Guardar estado inicial

Si se utilizan los mismos ajustes en todas las producciones, es posible guardar dicha configuración como predeterminada. Cada vez que se abre el programa ATEM Software Control, se restauran estos ajustes. Para eliminarlos, utilice la opción **Borrar estado inicial**.

Guardar ajustes en un archivo XML

La opción **Guardar como** es ideal para dinámicas de trabajo que incluyen diversas producciones con ajustes particulares. Esta función es de gran utilidad y permite ahorrar tiempo durante las producciones en directo en las que se emplean ciertos parámetros con regularidad. Por ejemplo, es posible restaurar los ajustes de una cámara o gráficos y composiciones complejas desde un equipo informático portátil o una unidad USB.

Para guardar ajustes

1. En la barra superior del programa ATEM Software Control, seleccione el menú **Archivo** y luego la opción **Guardar como**.
2. Se abrirá una nueva ventana donde podrá ingresar el nombre del archivo y elegir la carpeta de destino. A continuación, haga clic en **Continuar**.
3. Se abrirá una ventana con casillas para seleccionar los distintos ajustes disponibles. La casilla **Seleccionar todos** se encuentra marcada por defecto. En este caso, el programa guardará la configuración general del mezclador. Para guardar ajustes específicos, desmarque en forma individual aquellos que no desea utilizar, o bien todos juntos haciendo clic en el botón **Cancelar selección**. Ahora podrá seleccionar los ajustes determinados.
4. Haga clic en **Guardar**. En la parte inferior derecha del panel se indica el avance del proceso.

El programa guarda la configuración en un archivo XML junto con una carpeta para el contenido del panel multimedia.

Para guardar la configuración del dispositivo en cualquier momento, haga clic en el menú **Archivo** y seleccione la opción **Guardar** o presione las teclas **Command +S** en Mac o **Ctrl** + **S** en Windows. Cabe destacar que los ajustes previos no se reemplazan, sino que se agrega un nuevo archivo XML a la carpeta de destino claramente identificado con la fecha y hora de su creación. De este modo, siempre es posible restaurar una configuración anterior.

El programa ATEM Software Control permite guardar y restaurar todos los ajustes del mezclador, inclusive las composiciones, los estilos de transición y el contenido del panel multimedia, entre otros.

Al guardar el archivo que contiene la configuración en un equipo informático portátil, es posible acceder a él desde cualquier lugar. Conecte el equipo a un mezclador ATEM para restablecer los ajustes rápidamente.

Las producciones en directo son exigentes y apasionantes a la vez, por lo que es fácil olvidarse de hacer copias de seguridad de los archivos guardados al finalizar.

Para conservar determinados ajustes, guárdelos en un equipo informático o soporte externo, tal como una unidad USB. Esto permite acceder a ellos con facilidad y disponer de un respaldo en caso de que se eliminen accidentalmente.

Para restaurar ajustes:

1. En la barra superior del programa ATEM Software Control, seleccione el menú **Archivo** y luego la opción **Restaurar**.
2. Se abrirá una ventana para seleccionar el archivo que desea abrir. Selecciónelo y haga clic en **Abrir**.
3. A continuación, se abrirá una ventana con casillas marcadas para los ajustes guardados. Marque la opción **Seleccionar todos** para restablecer todos los ajustes o seleccione solamente algunos específicos.
4. Haga clic en **Restaurar**.

Restablecer ajustes originales

Para restablecer los ajustes originales del mezclador, abra el programa ATEM Setup y haga clic en la opción **Factory Reset**. Se conservarán aquellos ajustes almacenados antes de restablecer el dispositivo.

Alternar fuentes con el programa ATEM Software Control

La primera pestaña del programa informático corresponde a la interfaz de control del mezclador. Durante una producción en directo, permite seleccionar distintas fuentes y transmitirlas al aire.

Asimismo, es posible seleccionar diferentes transiciones, realizar superposiciones y activar o desactivar la función de fundido a negro. Los paneles situados a la derecha permiten ajustar las transiciones y las composiciones, configurar los generadores de color, controlar los reproductores multimedia y cambiar la duración del fundido a negro.

Control mediante el ratón o el panel táctil

Los botones virtuales, los controles deslizantes y la palanca de transición en la interfaz gráfica del mezclador se controlan mediante el ratón del equipo informático o el panel táctil en caso de utilizar un equipo portátil.

Para presionar un botón, haga clic sobre el mismo una vez con el botón izquierdo. Para mover un control deslizante, haga clic sobre él con el botón izquierdo y manténgalo presionado mientras lo desplaza. De igual forma, para controlar la palanca de transición, haga clic sobre ella con el botón izquierdo y arrástrela hacia arriba o abajo.

Teclas de acceso rápido

Las teclas de acceso rápido permiten controlar algunas de las funciones del mezclador usando un teclado QWERTY convencional, tal como se indica a continuación:

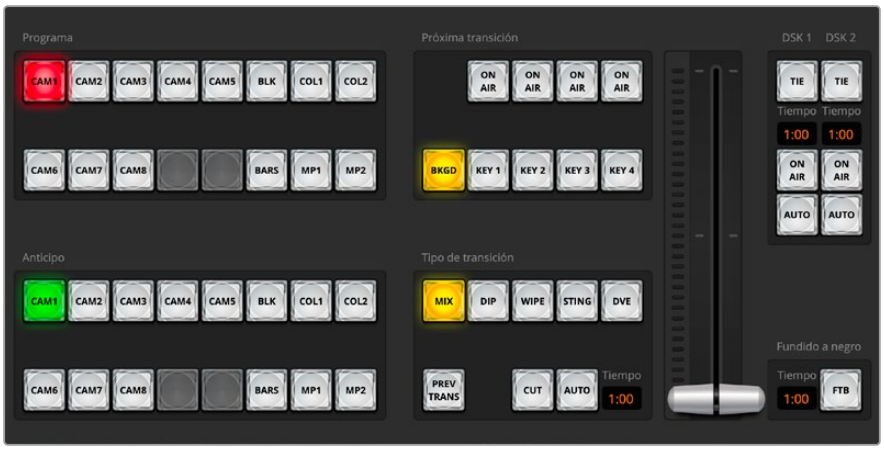
Teclas de acceso rápido	Función
<1> – <0>	Permite ver las señales correspondientes a las entradas 1-10.
<Shift> <1> – <0>	Permite ver las señales correspondientes a las entradas 11-20. Shift 0 = entrada 20.
<Control> <1> – <0>	Permite alternar rápidamente entre las entradas 1-10 y la salida principal.
Presione <Control>, suelte la tecla y luego oprima <1> – <0>	Permite alternar rápidamente entre las entradas 1-10 y la salida principal. La función permanece activada y el botón CUT se enciende de color rojo.

<Control> <Shift> <1> – <0>	Permite alternar rápidamente entre las entradas 11-20 y la salida principal.
Presione <Control>, suelte la tecla y luego oprima <Shift> <1> – <0>	Permite alternar rápidamente entre las entradas 11-20 y la salida principal. La función permanece activada y el botón CUT se enciende de color rojo.
<Control>	Desactiva las funciones anteriores si están activadas. El botón CUT se enciende de color blanco.
<Espacio>	CUT
<Enter>	AUTO

En los siguientes apartados se brinda más información sobre el uso del programa de control.

Mezclas y efectos

Los bancos M/E en la pestaña **Mezclador** incluyen botones para seleccionar fuentes en los buses de programa y anticipos, permitiendo de este modo elegir señales externas o internas para ver la próxima transición antes de emitir las imágenes al aire.



Panel de mezcla y efectos en los modelos ATEM Television Studio

Botones del bus del programa

Estos botones permiten alternar la señal transmitida a través de la salida principal. El botón correspondiente a la fuente seleccionada se enciende de color rojo.

Botones del bus de anticipos

Estos botones permiten seleccionar una fuente para verla antes de que salga al aire al realizar la siguiente transición. El botón correspondiente a la fuente seleccionada se enciende de color verde.

Los botones de selección de fuentes en el bus del programa coinciden con los del bus de anticipos.

ENTRADAS	La cantidad de botones coincide con el número de entradas del mezclador.
BLK	Fuente en negro generada internamente por el mezclador.
SUPERSOURCE	Esta función permite ver varias fuentes de manera simultánea en un monitor. Presione el botón SHIFT para seleccionar las barras de color.
BARS	Barras de color generadas internamente por el mezclador. Presione los botones SHIFT y SSCR para seleccionar las barras de color.
COL1 y COL2	Fuentes de color generadas internamente por el mezclador.
MP1 y MP2	Reproductores multimedia internos que muestran imágenes o secuencias almacenadas en el mezclador.

Control de transiciones y superposiciones previas

Control de transiciones

CUT

Este botón permite realizar una transición inmediata entre la señal principal y el anticipo, independientemente del tipo de transición seleccionado.

AUTO

Este botón permite llevar a cabo la transición seleccionada según la duración indicada en el campo **Tiempo**, la cual se ajusta en el panel correspondiente a cada tipo de transición y se indica en dicho campo al seleccionarla.

El botón **AUTO** se enciende de color rojo, y el valor de la duración se actualiza para indicar el número de fotogramas restante a medida que transcurre la transición. En los modelos ATEM Television Studio, el indicador junto a la palanca proporcionará una indicación visual del avance de la transición.

Palanca de transición

La palanca de transición se emplea como alternativa al botón **AUTO** y permite al operador controlar la transición de forma manual. El botón **AUTO** se enciende de color rojo, y el valor de la duración se actualiza para indicar el número de fotogramas restante a medida que transcurre la transición. Junto a la palanca, se proporciona una indicación visual del avance de la transición.

Tipo de transición

Estos botones permiten elegir entre cinco tipos de transiciones diferentes: disolvencias, fundidos, cortinillas, transiciones con efectos visuales digitales y transiciones animadas. El tipo de transición seleccionado se indica mediante un botón que se enciende de color amarillo. Asimismo, esto se ve reflejado en la pestaña correspondiente del panel **Transiciones**. Por ejemplo, al abrir el panel de transiciones y hacer clic en la opción **Cortinilla**, se muestra automáticamente la pestaña correspondiente para poder ajustar diversos parámetros de la transición, tales como la duración o el estilo.

Preparar la reproducción automática

El botón **ARM** permite iniciar automáticamente la reproducción desde un grabador HyperDeck conectado y seleccionado en el bus de anticipos tras una transición. De manera similar a la función de reproducción automática, la unidad seleccionada comenzará a reproducir el contenido al presionar los botones **CUT** o **AUTO** para iniciar la transición. Para utilizar la función de preparación, mantenga presionada la tecla de mayúsculas y haga clic en el botón **ARM**, el cual aparecerá en lugar del botón **STING**. Al presionarlo una vez, la reproducción automática desde el grabador HyperDeck seleccionado solo se llevará a cabo durante la siguiente transición. Si desea que la función permanezca activada, presione la tecla de mayúsculas en el teclado y oprima el botón **ARM** dos veces.

Cabe destacar que cualquier ajuste del tiempo previo configurado mediante la pestaña **HyperDeck** se ignorará al activar la función **ARM**.

PREV TRANS

Este botón permite al operador comprobar la transición antes de emitirla al aire, llevándola a cabo con la palanca. Al seleccionar esta opción, el anticipo coincide con la señal principal. A continuación, es posible practicar la transición seleccionada para comprobar si se logra el efecto deseado. Esta función resulta de suma utilidad a fin de no cometer errores al aire.

Próxima transición

Los botones **BKGD**, **KEY 1**, **KEY 2**, **KEY 3** y **KEY 4** se utilizan para seleccionar los elementos que formarán parte de la transición siguiente. La cantidad de capas disponibles depende del modelo de mezclador. Los elementos superpuestos pueden visualizarse o desaparecer en forma gradual a medida que transcurre la transición principal. También es posible seleccionar elementos en forma individual, de manera que el módulo de control principal se puede emplear para hacer aparecer o desaparecer dichos elementos paulatinamente.

Al escoger los elementos de la transición siguiente, el operador debe mirar el anticipo, ya que este brinda un adelanto de las imágenes que se transmitirán a través de la salida principal una vez que la transición finalice. El botón **BKGD** permite llevar a cabo una transición entre la señal al aire y la fuente seleccionada en el bus de anticipos sin elementos superpuestos. También es posible realizar transiciones de los elementos superpuestos solamente, sin alterar la imagen de fondo.

ON AIR

Estos botones indican las composiciones que están al aire y permiten mostrarlas u ocultarlas inmediatamente.

Canales para superposiciones posteriores

TIE

Este botón permite vincular elementos superpuestos en el anticipo con la transición siguiente, de manera que puedan emitirse al aire simultáneamente.

La duración se indica en el campo **Tiempo**. Cabe destacar que, si los elementos superpuestos están vinculados a la transición, el direccionamiento de la señal limpia no se verá afectado.

ON AIR

Estos botones permiten mostrar u ocultar elementos superpuestos a la señal emitida e indica si estos se encuentran al aire. Además, se encienden cuando la composición es visible.

AUTO

Este botón permite mostrar u ocultar los elementos superpuestos a la señal emitida según la duración indicada en el campo **Tiempo**. Funciona de forma similar al botón del mismo nombre en el módulo de control, pero solo afecta las capas que se superponen posteriormente. Es de gran utilidad para lograr que elementos tales como logotipos, textos móviles o repeticiones en directo aparezcan o desaparezcan gradualmente, sin interferir con las transiciones del programa.

Composiciones posteriores y fundido a negro

Fundido a negro

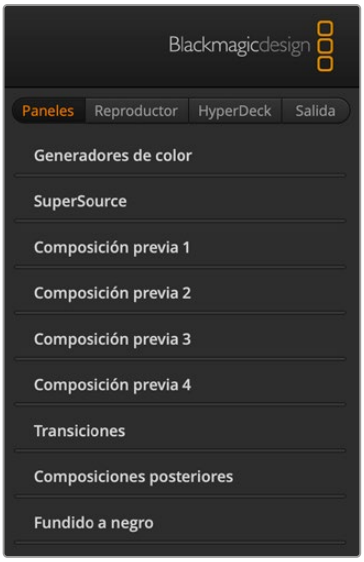
El botón **FTB** permite realizar un fundido a negro de la imagen transmitida según la duración indicada en el campo **Tiempo**. Una vez que la señal se desvanece gradualmente para dar paso al fondo negro, el botón parpadeará hasta que se presione nuevamente. Al presionarlo, la imagen comenzará a mostrarse gradualmente a partir de la pantalla en negro a la misma velocidad, a menos que se ingrese una nueva duración. El fundido a negro se emplea habitualmente al principio y al final de una producción, o antes de una pausa publicitaria, y resulta útil para asegurarse de que todas las capas superpuestas se atenúen al mismo tiempo. Cabe anotar que no es posible ver un fundido a negro de forma anticipada. También puede disminuirse la intensidad del volumen gradualmente al realizar un fundido a negro seleccionando la opción **AFV** para la salida de audio principal.

Paneles de opciones

El programa informático cuenta con distintas opciones para las transiciones, los reproductores multimedia y la transmisión de imágenes. El orden de procesamiento es el mismo que en el mezclador. A su vez, los paneles pueden expandirse o contraerse para ahorrar espacio, así como desplazarse para acceder a los distintos ajustes.

Paneles

Los paneles incluyen los siguientes controles:



Generadores de color 1 y 2

Los mezcladores ATEM cuentan con dos generadores de color que pueden configurarse desde el panel correspondiente, mediante un selector de color o ajustando el tono, la saturación y la luminancia.

SuperSource

Los modelos ATEM Television Studio disponen de una función denominada **SuperSource** (también conocida como PIP o imágenes simultáneas) que permite visualizar varias fuentes en un monitor al mismo tiempo. Consulte el apartado correspondiente en este manual para obtener más información al respecto.

Composiciones previas

Los mezcladores ATEM permiten utilizar hasta cuatro composiciones de imágenes que pueden configurarse mediante los paneles **Composición previa**. Cada composición cuenta con su propio panel. En cada uno de ellos, puede seleccionarse el tipo de composición (por luminancia, crominancia, geométrica o con efectos visuales digitales).

Al seleccionar un panel, se mostrarán los parámetros configurables. Más adelante se proporcionan detalles adicionales sobre la composición de imágenes.

Transiciones

El panel de transiciones permite ajustar distintos parámetros para cada tipo de transición. Por ejemplo, en el caso de un fundido, se incluye un menú desplegable mediante el cual se puede seleccionar la fuente, mientras que para una cortinilla se muestran todas las formas disponibles. Existe un sinfín de variaciones, y es posible realizar una gran cantidad de transiciones combinando los ajustes y las funciones.

NOTA: Cabe destacar que, al seleccionar un tipo de transición en el panel de transiciones, solo se modificarán los parámetros relativos a esa transición en particular. Aún es necesario escoger la transición específica que se desea realizar en el módulo de control de transiciones del programa o del mezclador. Para mayor facilidad, algunas personas prefieren utilizar el panel de control físico a fin de alternar señales, y el programa informático para ajustar los parámetros de la transición. El panel de control y el programa ATEM Software Control funcionan en forma conjunta, y los parámetros de uno se ven reflejados en el otro.

Composiciones posteriores

Los mezcladores ATEM disponen de dos capas adicionales para superponer elementos a la señal transmitida. Este panel incluye menús desplegables para seleccionar el canal alfa y la señal superpuesta que forman la composición, así como controles para ajustar distintos parámetros. Los modelos ATEM Television Studio incluyen dos compositores para superposiciones posteriores.

Fundido a negro

Este panel permite ajustar la duración del fundido a negro. Incluye una casilla a modo de atajo para seleccionar la opción **Audio con imagen**, a fin de que el volumen disminuya gradualmente a medida que la imagen se desvanece.

Reproductor

Esta pestaña permite acceder a las distintas opciones de control para los reproductores multimedia del mezclador y de los grabadores que se encuentren conectados.

Reproductores multimedia

Estos reproductores ofrecen la posibilidad de visualizar los clips y las imágenes almacenadas en el panel multimedia. El contenido que se desea reproducir se selecciona a partir de la lista desplegable. Los controles integrados permiten reproducir los clips solo una vez o en forma continua, así como pausarlos. Además, es posible adelantar o retroceder cuadros en cada secuencia. Los modelos ATEM Television Studio cuentan con dos reproductores multimedia.

HyperDeck

Esta pestaña permite controlar hasta 10 grabadores HyperDeck.

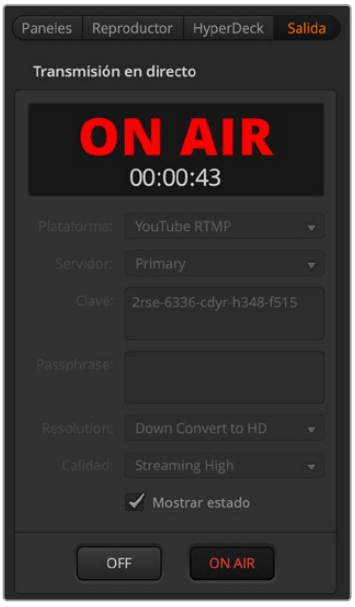
Grabadores HyperDeck

Es posible conectar hasta 10 grabadores HyperDeck y controlarlos mediante el programa ATEM Software Control. Para cambiar la cantidad de unidades mostradas, haga clic en el ícono del engranaje y seleccione el número deseado en la lista. Consulte el apartado *Control de grabadores HyperDeck* para obtener más información al respecto.

Salida

Esta pestaña permite configurar la grabación y las transmisiones en directo por Internet, ajustar el código de tiempo o el contador y capturar una imagen fija.

Transmisión en directo



Esta opción brinda la posibilidad de configurar la transmisión en directo ingresando los datos de la plataforma empleada al utilizar el mezclador. A continuación, basta con hacer clic sobre los botones **AL AIRE** o **DETENER** para comenzar o finalizar la transmisión, respectivamente.

Gracias al tamaño y al color de los indicadores de estado, se puede ver con claridad qué está sucediendo, además de emplear las opciones correspondientes para generar un código de tiempo.

Plataforma	Haga clic en este menú y seleccione la plataforma de transmisión por Internet que desea emplear. Las opciones disponibles incluyen Facebook Live, YouTube Live y Twitch.
Servidor	Seleccione el servidor más cercano haciendo clic en el menú de la ventana de ajustes.
Canal alfa	En este campo se debe ingresar la clave que la plataforma de transmisión en directo ha asignado a su cuenta. Consulte la sección *Cómo obtener una clave de transmisión* en el apartado *Conexión a redes* para obtener más información al respecto.
Frase de contraseña	Al utilizar un servicio de transmisión con el protocolo SRT, ingrese la frase de contraseña asignada por la plataforma.
Resolución	Cuando el modelo ATEM Television Studio 4K8 funciona en resolución 2160p, esta opción permite mantener dicho valor o reducir la definición de la señal transmitida.

Calidad	Este ajuste permite seleccionar la calidad de la transmisión y la grabación. Se incluyen las siguientes opciones: ▪ HyperDeck High (45-70 Mb/s) ▪ HyperDeck Medium (25-45 Mb/s) ▪ HyperDeck Low (12-20 Mb/s) ▪ Streaming High (6-9 Mb/s) ▪ Streaming Medium (4.5-7 Mb/s) ▪ Streaming Low (3-4.5 Mb/s) En el presente apartado se brinda información adicional sobre estos ajustes de calidad.

Consulte el apartado *Transmisiones por Internet* a fin de obtener más información al respecto.

A pesar de que los ajustes son sencillos y solo es necesario seleccionar el servidor y otras opciones mínimas, se incluye también un archivo XML con información adicional que los usuarios más experimentados pueden emplear a fin de añadir otras plataformas de transmisión y personalizar los menús. Consulte el apartado correspondiente para obtener más información al respecto.

Ajustes de calidad

La velocidad de transferencia de datos en los ajustes de calidad variará dependiendo del formato elegido para la transmisión mediante el mezclador. Por ejemplo, al seleccionar una calidad alta para transmitir una señal en formato 1080p24, la velocidad de transmisión será de 6 Mb/s.

Las velocidades de las opciones **HyperDeck High**, **HyperDeck Medium** y **HyperDeck Low** son de 45-70 Mb/s, 25-45 Mb/s y 12-20 Mb/s, respectivamente. Por su parte, las velocidades de las opciones **Streaming High** (6-9 Mb/s), **Streaming Medium** (4.5-7 Mb/s) y **Streaming Low** (3-4.5 Mb/s) son menores, a fin de permitir la transmisión de datos por Internet.

Nótese que para cada ajuste se mencionan dos velocidades. La inferior se emplea con frecuencias de imagen de 24p, 25p y 30p, mientras que la superior corresponde a valores de 50p y 60p. Asimismo, cabe mencionar que la opción predeterminada para la transmisión es **Streaming High** (6-9 Mb/s), ya que brinda la mejor calidad a tales efectos y resultados aceptables al grabar.

Si no es necesario transmitir, es posible elegir cualquiera de las opciones HyperDeck. Estos ajustes son iguales a los del grabador HyperDeck Studio Mini y ofrecen una buena velocidad de transferencia cuando es preciso obtener grabaciones de calidad profesional. Sin embargo, con la última versión del sistema operativo interno para estos dispositivos, también admite las opciones de menor calidad.

Grabación

Al grabar la transmisión, es posible gestionar los soportes de almacenamiento, comenzar o detener la grabación, ingresar un nombre de archivo o iniciar la grabación en todas las unidades Blackmagic Pocket Cinema Camera conectadas al mezclador. Consulte el apartado *Preparación de soportes para la grabación*a fin de obtener más información al respecto.

Nombre	Antes de comenzar la grabación, escriba el nombre del archivo en este campo. Haga clic en cualquier lugar fuera de la ventana para confirmar. Al comenzar y detener la grabación, se asignará automáticamente un número de versión consecutivo al nombre del archivo.
Unidades	Las unidades de almacenamiento formateadas y conectadas al mezclador aparecerán en la lista correspondiente en la ventana de grabación, y es posible seleccionarlas desde el menú desplegable. Asimismo, se mostrará información relativa a la capacidad y el tiempo de grabación restante. La grabación siempre comenzará en la unidad con más espacio disponible y continuará en la siguiente con mayor capacidad. No obstante, es posible seleccionar manualmente la unidad deseada haciendo clic en el botón **Cambiar**. Esta opción es de gran utilidad si quedan menos de 5 minutos disponibles en la unidad actual y desea cambiar a la siguiente en un momento concreto de la transmisión.
Cambiar	Este botón permite cambiar el soporte de almacenamiento durante la grabación.

SUGERENCIA: También es posible cambiar la unidad de almacenamiento presionando el botón **SWITCH** en el panel de control de los modelos ATEM Television Studio.

Grabar	Haga clic en este botón para comenzar la grabación.
Detener	Haga clic en este botón para detener la grabación.
Mostrar estado	Haga clic en la casilla correspondiente para activar o desactivar esta opción. La información en pantalla aparecerá en la parte inferior derecha de la interfaz del programa ATEM Software Control e incluye datos relevantes al estado de la grabación. Durante la grabación, el indicador **REC** se destaca en rojo y muestra información acerca de la unidad de almacenamiento y el tiempo restante.
Grabar en todas las cámaras	Seleccione esta opción para comenzar la grabación en todas las cámaras Blackmagic conectadas al presionar el botón correspondiente. Es muy útil si se requiere grabar la señal de cada cámara por separado para su posterior edición. Las cámaras se configuran de manera automática para grabar en formato Blackmagic RAW según los últimos ajustes de calidad empleados.

Sincronización con Blackmagic Cloud

Blackmagic Cloud es una plataforma de colaboración que permite trabajar en equipo y compartir proyectos de DaVinci Resolve.

Al acceder a su cuenta de Blackmagic Cloud desde el mezclador, es posible determinar si se desea subir la grabación aislada y los clips desde la memoria o el disco externo directamente a un proyecto de DaVinci Resolve. De manera alternativa, la grabación puede subirse directamente a un dispositivo de almacenamiento Blackmagic Cloud privado sin sincronizarlo con un proyecto de DaVinci Resolve en la nube.

Acceso a Blackmagic Cloud

Antes de acceder a su cuenta de Blackmagic Cloud, será preciso conectar el puerto Ethernet del mezclador a un conmutador de red mediante el cable correspondiente.

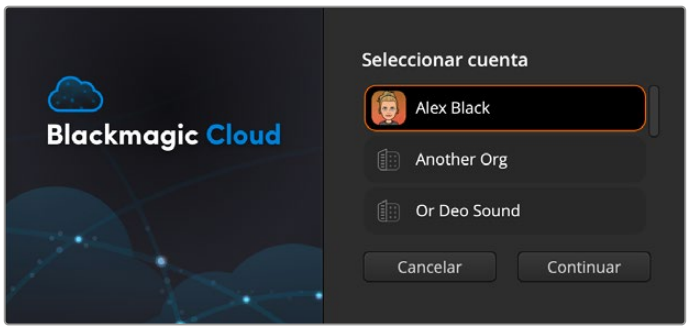
Para acceder a una cuenta de Blackmagic Cloud desde los modelos ATEM Television Studio:

1 Haga clic en la pestaña **Salida** y seleccione menú **Grabar**.

2 Marque la casilla de sincronización con Blackmagic Cloud y haga clic en el botón **Acceder** para abrir la ventana de acceso a Blackmagic Cloud.

3 Escriba su dirección de correo electrónico y la contraseña asociada a la cuenta en los campos correspondientes y haga clic en el botón **Acceder**. De manera alternativa, haga clic en la opción **Acceder desde el navegador**, en la esquina superior derecha.

4 Aparecerá una ventana donde se podrá seleccionar un perfil de Blackmagic Cloud personal o el de una organización. Haga clic en el perfil deseado y luego en el botón **Continuar**.



Una vez que haya accedido a su cuenta, desde el menú de proyectos, seleccione aquel con el que desea sincronizar los archivos. El menú mostrará los proyectos de DaVinci Resolve existentes en Blackmagic Cloud.

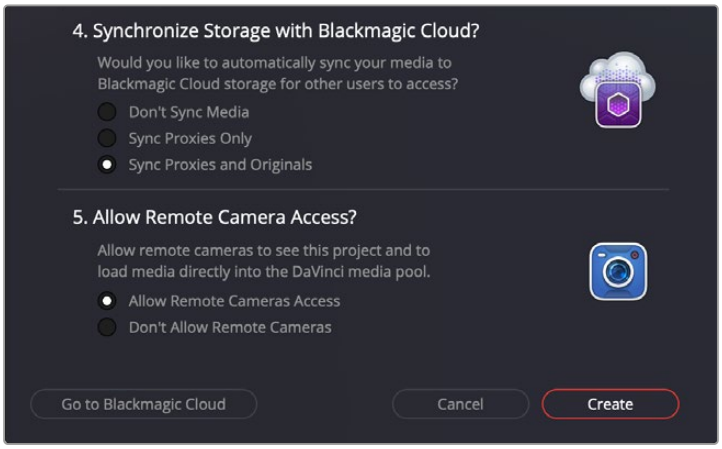
En caso de no encontrar el proyecto, será preciso modificar la configuración o crear uno nuevo desde DaVinci Resolve.

Acceso a DaVinci Resolve.

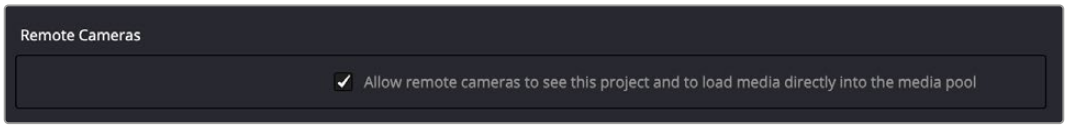
Es posible subir archivos a proyectos nuevos o existentes en Blackmagic Cloud desde el mezclador permitiendo el acceso remoto en los ajustes del programa. Una vez activada esta opción para un proyecto específico, este aparecerá en la pestaña **Grabar**.

Para permitir el acceso a un proyecto nuevo:

1. Ejecute DaVinci Resolve. En la ventana del organizador de proyectos, haga clic en la pestaña **Blackmagic Cloud** e introduzca los datos necesarios para acceder a la plataforma.
2. Seleccione una biblioteca de proyectos de Blackmagic Cloud y haga clic en la opción **Crear proyecto**.
3. Introduzca la información del proyecto. Active la opción **Sincronizar archivos proxy y originales** y permita el acceso de una cámara remota en la venta del nuevo proyecto. A continuación, haga clic en el botón **Crear**.



Para añadir clips a un proyecto existente, acceda a las opciones de dicho proyecto y seleccione **Blackmagic Cloud**. En los ajustes de las cámaras conectadas remotamente, active la opción que permite ver el proyecto en la cámara para cargar archivos directamente en el panel multimedia.



El proyecto aparecerá en la pestaña de grabación cuando el mezclador esté conectado a Internet y se haya accedido a la plataforma Blackmagic Cloud.

Consulte el manual de DaVinci Resolve para obtener más información al respecto. Este se encuentra disponible en nuestra página de soporte técnico.

Capturar imagen

Para capturar una imagen de la señal transmitida, presione el botón **Capturar**. Las capturas se almacenan en el panel multimedia. Luego, es posible cargarlas de inmediato en el reproductor para usarlas en la transmisión o guardarlas en el equipo informático.

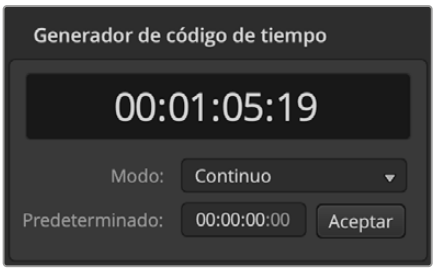
Para guardar las capturas del panel multimedia:

1. Haga clic en el menú **Archivo** en la barra superior y seleccione la opción **Guardar como**.
2. Seleccione la carpeta donde desea almacenar las capturas.
3. Haga clic en el botón **Guardar**.

A continuación, es posible acceder a las imágenes y utilizarlas en cualquier programa de procesamiento gráfico.

Generador de código de tiempo

Empieza a contar automáticamente a partir del momento del día en el que se ejecuta el programa ATEM Software Control, aunque es posible reiniciarlo o ingresar manualmente un código de tiempo de inicio.



Es posible configurar el generador de código de tiempo de acuerdo con la hora del día o ingresando un valor determinado.

Para configurar un código de tiempo manualmente:

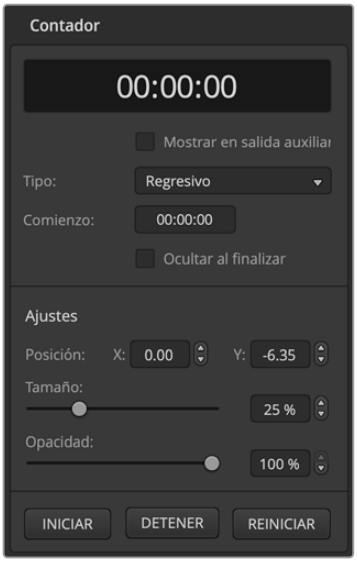
1. Haga clic en **Modo** y seleccione **Continuo** entre las opciones del menú.
2. En el contador del código de tiempo, ingrese el valor deseado. El nuevo código de tiempo se iluminará de verde.
3. Para aceptar el cambio, haga clic en el botón **Aceptar**.

Hora

Cuando el mezclador se encuentra conectado a un equipo informático, el código de tiempo se sincroniza con la hora del día en él. El dispositivo cuenta con un reloj que funciona durante unos seis días, por lo que, al desconectarlo del equipo informático, el código de tiempo seguirá corriendo hasta que la batería se agote. Esta se cargará nuevamente cuando el mezclador vuelva a conectarse al equipo informático mediante el puerto USB.

Contador

En el modelo ATEM Television Studio HD8, esta opción permite superponer un contador a la imagen transmitida mediante la salida 1. Esto puede resultar de utilidad en el monitor de un presentador, por ejemplo, a fin de ver una cuenta regresiva en caso de que la presentación tenga una duración determinada, o para saber durante cuánto tiempo ha hablado.

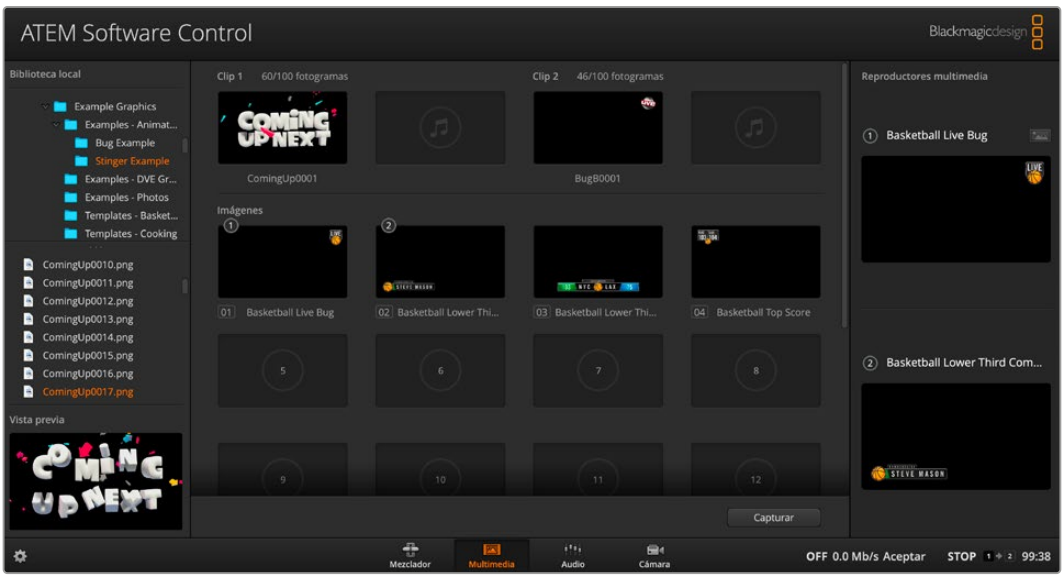


Para configurar el contador:

1. Seleccione el modo progresivo o regresivo.
2. Ingrese el tiempo inicial para la cuenta regresiva.
3. Mediante el menú de ajustes, es posible superponer el contador sobre la imagen y configurar sus dimensiones y su opacidad.
4. Una vez efectuados todos los ajustes, puede iniciar el contador. Compruebe que la superposición del contador esté activada en el menú correspondiente a las salidas, situado en la barra superior. Verifique la salida 1 esté seleccionada en la opción **Contador superpuesto**.

Panel multimedia

Haga clic en la pestaña **Mutimedia** en la parte inferior de la interfaz para acceder al panel multimedia. Este permite utilizar imágenes y clips o asignarlos a cualquiera de los reproductores multimedia. A la izquierda se muestran las carpetas, en el centro el contenido del panel multimedia, y a la derecha los reproductores multimedia.



Haga clic en la pestaña Multimedia en la parte inferior de la interfaz para acceder al panel multimedia.

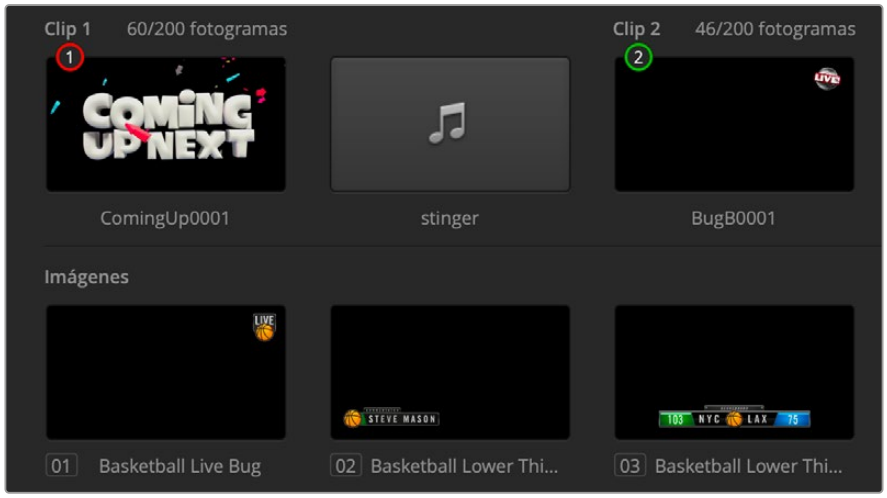
Explorador de archivos

Esta ventana es un organizador de archivos simplificado que permite buscar imágenes en el equipo informático. Muestra todas las unidades conectadas al equipo y brinda la posibilidad de seleccionar distintas carpetas. Asimismo, su contenido puede verse haciendo clic en las flechas situadas a cada costado. La ventana de vista previa en la esquina inferior izquierda muestra los archivos seleccionados. El panel multimedia admite imágenes en formato PNG, TGA, BMP, GIF, JPEG o TIFF. En lo que respecta al audio, es compatible con archivos WAV, MP3 o AIFF. Cualquiera de ellos puede agregarse al panel.

Panel multimedia

Este panel muestra vistas en miniatura de las secuencias e imágenes fijas asignadas a cada espacio. En el caso de un clip, se muestra el fotograma correspondiente a la mitad de la secuencia. Encima de cada clip se brinda información sobre la cantidad de fotogramas que contiene y el máximo permitido según el formato de imagen seleccionado. Las imágenes se marcan con un número que facilita su identificación cuando al asignarlas. El nombre del archivo correspondiente a cada imagen o clip se muestra debajo de la miniatura para simplificar su organización. La lista de las imágenes y los clips añadidos al panel multimedia así como su número identificatorio aparecerán en el panel **Reproductores multimedia** de la pestaña **Mezclador**, en la pantalla de los dispositivos ATEM Panel al seleccionar la opción **Reproductores** y en el complemento Photoshop. En el panel frontal del mezclador, solo se muestra el nombre de la imagen, a menos que el espacio esté vacío.

En la esquina superior izquierda de la miniatura se muestra el número para identificar claramente los espacios asignados al respectivo reproductor multimedia. Cuando se emite al aire el contenido de un reproductor, el círculo que rodea al número se destaca en rojo. Por el contrario, cuando se destaca en verde, significa que la imagen es un anticipo.



Búsqueda y selección de archivos

Para seleccionar una imagen, basta con arrastrarla desde el explorador hacia uno de los espacios vacíos en el panel multimedia. En el caso de las animaciones, es necesario seleccionar una secuencia de imágenes. Si la secuencia se encuentra en una carpeta, haga clic sobre esta y arrástrela del explorador a unos de los dos espacios disponibles para clips. En caso contrario, haga clic en el archivo que contiene la primera imagen y luego, manteniendo presionada la tecla de mayúsculas, haga clic en el que corresponde a la última imagen. Una vez que toda la serie esté resaltada, podrá arrastrarla hacia uno de los dos espacios provistos para clips en el panel multimedia. Si desea incorporar archivos de audio en un clip, como en el caso de una transición animada, arrástrelos desde el explorador hacia el espacio designado junto al clip correspondiente. Este se identifica mediante una nota musical.

Cada vez que mueva una imagen, un clip o un archivo de audio hacia uno de los espacios disponibles, aparecerá un indicador del progreso de carga. Cabe destacar que es posible arrastrar archivos al panel multimedia aun cuando la transferencia no haya finalizado, ya que el procedimiento continuará de forma automática. Por otro lado, si se arrastra una imagen o un clip hacia una ventana en la cual se han cargado otros contenidos, estos serán remplazados.

Se puede cambiar el reproductor asignado en el módulo **Mezclador** seleccionando la imagen o el clip deseado en la lista desplegable denominada **Medios** dentro del panel **Reproductores multimedia**. Para ello, haga clic en la flecha que se encuentra junto a dicha opción, a fin de seleccionar el elemento deseado.

Asimismo, es posible cambiar la asignación mediante el menú **Reproductores** en el control del sistema o incluso al exportar mediante la opción **ATEM Switcher Media Pool** en Photoshop. Consulte el apartado correspondiente más adelante en este manual para obtener información adicional al respecto.

Capturar imagen

Haga clic en el botón **Capturar** para guardar una imagen fija de la secuencia.

También es posible hacerlo mediante el botón situado en la esquina inferior derecha del panel multimedia. La imagen se guardará en el siguiente espacio disponible del panel multimedia.

Mezcla de audio

La pestaña **Audio** permite mezclar el sonido proveniente de los reproductores multimedia y de las distintas fuentes conectadas al dispositivo.

En la parte superior se muestran las cámaras, los reproductores y las fuentes MADI o externas disponibles, así como la salida principal.

Debajo de cada fuente hay un vúmetro, un control para limitar el volumen y un mando giratorio para modificar el balance entre el canal izquierdo y el derecho. El control general situado a la derecha cuenta con un vúmetro independiente y se emplea con el objetivo de ajustar la ganancia de la señal transmitida a través de la salida principal. El control de monitorización y los demás botones se encuentran debajo del atenuador principal y permiten ajustar la intensidad del volumen en forma independiente, además de supervisar las salidas.

Los botones debajo de cada vúmetro determinan si el audio está disponible para mezclas en todo momento o solo cuando la fuente se emite al aire. El botón con el ícono de los auriculares permite escuchar el audio de manera independiente.

Los indicadores muestran las fuentes de audio transmitidas al aire y se encienden al seleccionar la opción **AFV**. Asimismo, es posible ver el volumen de los distintos canales de audio o modificar su balance. La interfaz también cuenta con botones para seleccionar diferentes fuentes.

Luz indicadora

Cualquier fuente de audio transmitida al aire se indica mediante una luz roja. Generalmente, el audio externo siempre se emite al aire de forma predeterminada, por lo que el indicador **EXT** permanecerá encendido. En el ejemplo proporcionado en esta página, los indicadores correspondientes a las cámaras 4 y 7 están encendidos, ya que el audio captado por las mismas se transmite en todo momento. Al seleccionar la opción **AFV**, el indicador se encenderá de color amarillo si la cámara vinculada a dicho canal de audio no está al aire. Lo mismo sucede con el indicador del atenuador principal. Una vez activada la función **FTB**, dicho indicador se enciende y se apaga en forma intermitente.

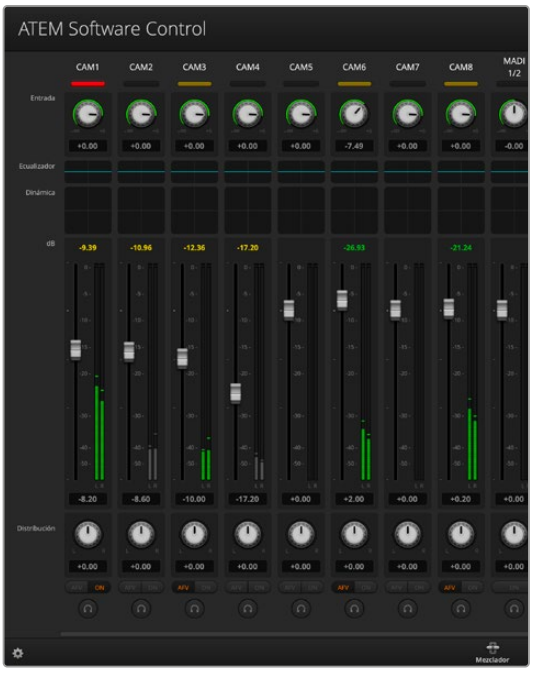
Intensidad del volumen

Mueva el control a fin de ajustar la ganancia para cada cámara o fuente de audio. El número naranja debajo de cada vúmetro indica la intensidad máxima del volumen según el atenuador.

El número encima del medidor indica el pico máximo alcanzado por cada fuente de audio. Un número verde representa una intensidad baja o media. Si tanto el vúmetro como el número encima de él permanecen en rojo, disminuya el volumen para evitar una distorsión. Después de modificar la intensidad del volumen, puede restablecer dicho parámetro haciendo clic sobre él. Observe el nuevo valor para comprobar que no aumente repentinamente y evitar que el número permanezca en rojo. Si esto sucede, deberá reducir aún más el volumen.

Balance de audio

El mezclador de audio admite señales en estéreo. Para modificar el balance entre los canales izquierdo y derecho de una cámara u otra fuente de audio, gire el mando hasta el punto deseado.



El vúmetro de la cámara 1 aparece atenuado, por lo cual no se utiliza dicha señal de audio, puesto que las opciones **ON** o **AFV** no están activadas. Se ha seleccionado la función **AFV** en la cámara 2, pero el audio proveniente de la misma no está siendo utilizado porque la cámara no se encuentra al aire, según lo indica la luz amarilla. En las cámaras 4 y 7 se ha habilitado la opción ON, por lo cual la señal de audio proveniente de las mismas siempre se transmite y las luces piloto permanecen encendidas aun cuando dichas cámaras no estén al aire. Los indicadores en las cámaras 3, 5, 6 y 8 muestran que no hay ninguna señal de audio presente.

Selección de fuentes de audio

Las opciones **ON** y **AFV** debajo de cada vúmetro permiten seleccionar las fuentes de audio transmitidas mediante la salida principal del mezclador.

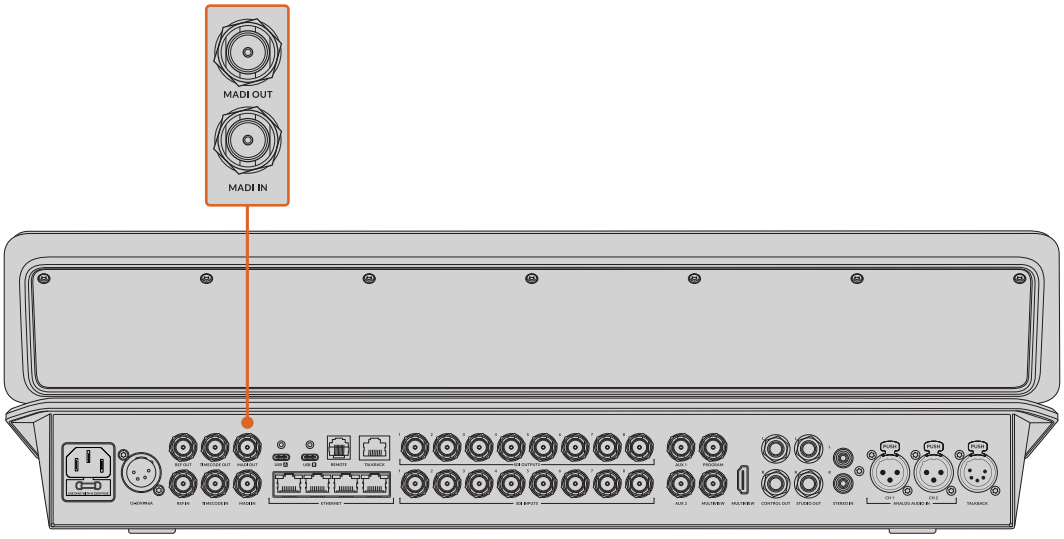
ON	Al seleccionar esta casilla, la señal de audio entrante se mezclará con la señal transmitida a través de la salida de programa, aun cuando la fuente asociada no esté al aire. La luz indicadora permanecerá encendida en rojo, dado que el audio está transmitiéndose. Al activar esta función, la opción AFV quedará inhabilitada.
AFV	AFV La función de seguimiento de imágenes (AFV) permite que el audio disminuya y aumente nuevamente en forma gradual al cambiar la señal de entrada. Este solo se transmitirá a través de la salida principal cuando la señal proveniente de la entrada seleccionada esté al aire, según lo indica la luz roja. Cuando la cámara no está al aire, dicha luz se enciende en amarillo. Al seleccionar esta función, la opción ON quedará inhabilitada.

Volumen general

El control general situado a la derecha cuenta con un vúmetro independiente y se emplea con el objetivo de ajustar la ganancia de la señal transmitida a través de la salida principal. Seleccione la opción **AFV** para que el volumen disminuya gradualmente junto con la imagen al realizar un fundido a negro. Esto brinda la posibilidad de atenuar la intensidad del volumen al realizar este tipo de fundido.

MADI

Los mezcladores ATEM son compatibles con el protocolo de audio digital MADI (Multichannel Audio Digital Interface). Este es muy utilizado por fabricantes de equipos de audio profesionales, difusoras y estudios de grabación de alta gama. Los puertos MADI del mezclador incluyen conectores BNC y transmiten datos de audio mediante cables coaxiales de 75 ohm con una longitud de hasta 100 metros.



Conectores BNC para audio MADI, y entradas y salidas TRS para audio analógico

Entrada MADI

Los canales MADI 1 a 32 reciben señales de audio digitales con una profundidad de bits de 24 y una frecuencia de muestreo de 48 kHz. Estos se encuentran conectados a otros 16 canales estéreo, que se pueden integrar a la señal principal con los mismos ecualizadores y procesadores de dinámica que los demás canales. Estas 16 entradas adicionales facilitan la realización de mezclas de audio complejas en el mezclador.

Salida MADI 1

Esta salida permite transmitir las siguientes fuentes:

Canales 1-16	Canales 1 y 2 de las entradas SDI 1-8
Canales 17/18	Audio del reproductor multimedia 1
Canales 19/20	Audio del reproductor multimedia 2
Canales 20/21	Micrófono externo
Canales 22/23	XLR (señal externa)
Canales 23/24	RCA (señal externa)
Canales 25/26	Mezcla del programa
Canales 27/28	Mezcla de supervisión
Canales 29/30	Mezcla auxiliar 1
Canales 31/32	Mezcla auxiliar 2
Canales 33-48	Canales 3 y 4 de las entradas SDI 1-8
Canales 49-64	Sin uso

Ajustes de los auriculares

La configuración de los auriculares se emplea para ajustar la mezcla de audio en la salida correspondiente. Se pueden emplear auriculares con micrófono para comunicarse con los camarógrafos mediante el conector XLR de 5 pines situado en el panel trasero. Además, los auriculares permiten superponer comentarios al audio o supervisar la calidad del sonido.

Los ajustes de auriculares brindan la posibilidad de mezclar los niveles de cada una de las salidas empleadas a tales efectos. Por ejemplo, aumentar o disminuir la intensidad del volumen de la comunicación frente al de la señal principal.

General

Este control permite determinar el volumen de la mezcla que se escucha a través de los auriculares.

Comunicación

Este control permite determinar el volumen de la voz de la comunicación con los camarógrafos. Ajuste estos controles para lograr un equilibrio adecuado entre ambos.

Efecto local

Este control permite integrar la voz captada por el micrófono de los auriculares en la señal supervisada. Resulta de utilidad al emplear modelos con reducción de ruido.

Controles Fairlight avanzados

Los modelos ATEM Television Studio cuentan con controles de audio Fairlight avanzados que permiten mejorar y perfeccionar la calidad del sonido de cada fuente y de la salida principal. Además, incluyen un ecualizador paramétrico de 6 bandas y ajustes de dinámica. Este apartado muestra los distintos controles de audio Fairlight que se pueden emplear a fin de personalizar y optimizar la mezcla de audio de la producción en directo.

Volumen de las fuentes

Generalmente, al configurar la mezcla de audio, el primer paso es normalizar todas las fuentes. Esto implica utilizar el mando giratorio de cada entrada para optimizar el volumen en su punto máximo sin que ocurra una distorsión de la señal.

Este control se encuentra en la parte superior de cada pista, debajo de la luz indicadora. Haga clic sobre el mando y arrastre el puntero hacia la derecha o la izquierda para aumentar o disminuir el volumen, respectivamente. Esta función permite unificar el volumen de todas las fuentes sin perder información en las señales. Luego, es posible comenzar a llevar a cabo cambios y mejoras.

Una vez que se normaliza el volumen de todas las fuentes, es posible comenzar a optimizar y configurar cada una de ellas mediante el ecualizador paramétrico de seis bandas y los procesadores de dinámica.

Ecualizador paramétrico de seis bandas

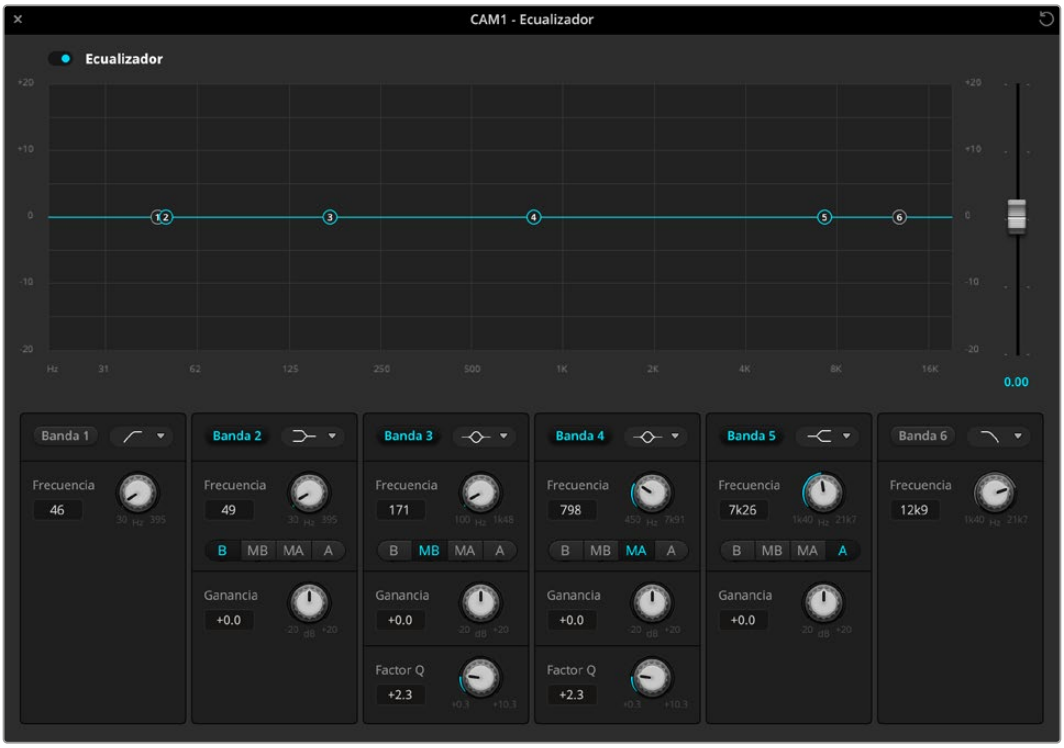
Cada una de las entradas y la salida principal cuentan con un ecualizador paramétrico de seis bandas que permite controlar frecuencias específicas. Esto permite reducir zumbidos o el ruido de un micrófono, reforzar las frecuencias bajas o incluso darle un toque único a cada fuente, a fin de lograr una mezcla final distintiva. Existe una amplia variedad de opciones creativas.

Para abrir el ecualizador paramétrico de una entrada o de la salida principal, haga clic en el indicador correspondiente.

Haga clic en el indicador del ecualizador paramétrico de una entrada para abrir la ventana correspondiente.

El primer elemento que se observa es la gráfica con los números 1 a 6, situada en la parte superior de la ventana. Los diferentes indicadores corresponden a las distintas bandas y pueden ser ajustados según sea necesario.

Cada una de las seis bandas presenta una columna con diferentes parámetros, los cuales varían según la banda que se esté controlando y el tipo de filtro empleado.



Cada entrada de audio cuenta con un ecualizador paramétrico de seis bandas.

Para realizar cambios en un ajuste, primero es necesario comprobar que la banda esté activada. Haga clic en el número de la banda para activarla. Cuando el botón está encendido, la composición está al aire. A continuación, es posible ajustar sus distintos parámetros o arrastrar uno de los puntos de control según sea preciso.

SUGERENCIA: Más adelante en este apartado se brinda información adicional al respecto.

Puntos de control

Estos puntos de control correspondientes a una banda están situados sobre una línea curva superpuesta a la gráfica. Es posible hacer clic sobre ellos y arrastrarlos para seleccionar la frecuencia y la ganancia deseadas. Ambos parámetros se modifican de manera simultánea, lo que ofrece una forma rápida y sencilla de lograr un resultado determinado en toda la gama de frecuencias.

NOTA: Para hacer cambios empleando los puntos de control, asegúrese de que la banda esté activada. A tal fin, basta con hacer clic sobre la banda que se desea ajustar. Esta se destaca en azul para indicar que está activada.

A medida que se arrastran los controladores hacia la izquierda o la derecha, observará que la frecuencia y los decibelios se actualizan en los ajustes situados en la parte inferior, así como en los indicadores de frecuencia baja, media baja, media alta y alta.

Controles de frecuencia

De manera alternativa, es posible emplear los mandos giratorios para seleccionar un valor específico de la frecuencia en cada banda.

Ajustes predeterminados para el rango de frecuencias

El rango de frecuencia para cada banda se define mediante los botones predeterminados. Por ejemplo, el indicador **B** corresponde a una frecuencia baja que cubre de 30 a 395 Hz.

A modo de ejemplo, seleccione un filtro de rechazo en el menú y luego haga clic en cada uno de los indicadores del rango. Podrá observar cómo se mueve el controlador a una posición diferente en la gráfica, representando cada opción seleccionada. Esto permite definir rápidamente un rango específico de frecuencias al que se aplicará el filtro.

A continuación, se incluye una tabla con los rangos de frecuencia para cada uno de los indicadores predeterminados.

Ajuste predeterminado	Intervalo de frecuencias
Bajo	30 Hz a 395 Hz
Medias bajas – **MB**	100 Hz a 1.48 kHz
Medias altas – **MA**	450 a 7.91 kHz
Máximas	1.4 kHz a 21.7 kHz

Controles de ganancia

Haga clic sobre el mando giratorio de la ganancia y arrastre el puntero hacia la derecha o la izquierda para aumentar o disminuir el volumen de la frecuencia seleccionada, respectivamente.

Factor Q

El control del factor Q está disponible cuando se aplica el filtro resonante a las bandas 2, 3, 4 y 5. Este permite establecer el rango de frecuencias que será afectado. Por ejemplo, el valor mínimo permite aplicar el filtro a un mayor rango de frecuencias cercanas, mientras que el máximo reduce el efecto a un punto más específico. Esto es fundamental para incluir o excluir sonidos presentes en frecuencias cercanas.

A medida que se ajusta el factor Q, observe cómo cambia la forma del efecto en la línea, de una curva amplia y redondeada a un pico pronunciado. Esta representación visual muestra la forma en que se ven afectadas las regiones cercanas a la frecuencia modificada.

SUGERENCIA: Es posible comparar el audio modificado con el original haciendo clic en el interruptor situado en la parte superior de la ventana del mezclador. Este permite activar y desactivar el ecualizador.

Filtros de banda

Es posible elegir entre seis tipos distintos de filtros de banda, por ejemplo, paramétrico, de realce de graves o agudos, de paso alto o bajo y de rechazo. Estos permiten controlar áreas específicas dentro de un rango de frecuencias particular. Por ejemplo, un filtro de realce de graves permite aumentar o disminuir el volumen para las frecuencias bajas en la gráfica, mientras que un realce de agudos facilita el control de las frecuencias altas.

A modo de ejemplo, seleccione un filtro de realce de graves en la banda 3 y ajuste la ganancia. Dichos cambios se ven reflejados en las frecuencias más bajas de la gráfica.

A continuación, se brinda una descripción de cada filtro.

Paramétrico

Este filtro, también conocido como *bell* o campana, permite aumentar o disminuir un rango de frecuencias en torno a una frecuencia definida.

Realce de agudos

Este filtro, también conocido como *high shelf*, permite aumentar o disminuir el volumen de las frecuencias altas.

Realce de graves

Este filtro, también conocido como *low shelf*, permite aumentar o disminuir el volumen de las frecuencias bajas.

Rechazo

Este filtro, también conocido como *notch*, permite eliminar o recortar una frecuencia definida.

Paso alto

Este filtro, también conocido como *high pass*, permite eliminar las frecuencias extremadamente bajas, sin afectar las altas.

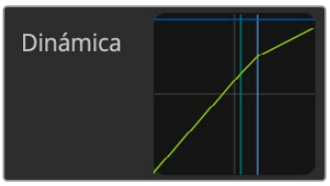
Paso bajo

Este filtro, también conocido como *low pass*, permite eliminar las frecuencias extremadamente altas, sin afectar las bajas.

SUGERENCIA: Es común contar con distintos filtros en cada banda, cuyas curvas se superponen en la gráfica. Por ejemplo, puede haberse aplicado un filtro de realce de graves a la banda 4 y uno de rechazo a la 5 con el propósito de reducir una frecuencia determinada en el mismo intervalo.

Procesadores de dinámica

También es posible mejorar y perfeccionar el audio mediante los controles de dinámica. Estos brindan la oportunidad de determinar el comportamiento de los distintos niveles, a diferencia del ecualizador paramétrico que permite modificar las frecuencias dentro de una misma señal. Los niveles de una señal pueden ajustarse, por ejemplo, ampliando el rango dinámico entre el nivel más alto y el más bajo, aplicando una puerta de ruido a fin de seleccionar la intensidad de una señal o utilizando el compresor y el limitador para mejorar el audio sin que ocurra una distorsión.



Es posible abrir el procesador de dinámica para cada fuente y para la salida principal simplemente haciendo clic en el indicador correspondiente.

Junto con los parámetros de ecualización, estas herramientas son sumamente útiles y no solo ofrecen la oportunidad de personalizar y definir el audio, sino también de optimizar el sonido de la salida principal.

Este apartado brinda información sobre los controles correspondientes al expansor, la puerta de ruido, el compresor y el limitador.

Ajustes de dinámica frecuentes

El expansor o la puerta de ruido, el compresor y el limitador comparten parámetros que permiten ajustar la forma en que cada uno de ellos afecta al audio, por ejemplo, su nivel al inicio, su duración o su intensidad. Los ajustes disponibles varían según la opción seleccionada.

Umbral	Determina el volumen del audio al cual se activa una función. Por ejemplo, al ajustar este valor a -20 dB para el compresor, este se activará cuando la señal supere dicho nivel. De manera alternativa, si se ajusta el expansor a -40 dB, este se activará cuando el nivel de la señal disminuya por debajo de dicho valor.
Intervalo	Define el intervalo de decibelios afectados.
Proporción	Define la fuerza máxima de la función una vez iniciada.
Ataque	Ajusta la atenuación de la función al inicio. Por ejemplo, un tiempo de ataque mayor permitirá que la función se mezcle mejor con la señal, sin llamar demasiado la atención, mientras que un ataque corto es más adecuado para sonidos complejos con variaciones rápidas, donde la primera opción puede generar artefactos.
Mantener	Sostiene la función de dinámica durante un tiempo ajustable.
Relajación	Es similar al ataque, pero ocurre al final. Por ejemplo, permite que las funciones de dinámica se atenúen de forma gradual o disminuyan rápidamente, una vez que el nivel se traslada fuera del umbral.

Expansor y puerta de ruido

En el primer conjunto de parámetros, es posible alternar entre el expansor y la puerta de ruido.

El expansor destaca las diferencias en términos de volumen, disminuyendo la intensidad de las partes más bajas de la señal con relación a aquellas más altas. En consecuencia, puede emplearse para enfatizar las desigualdades entre el volumen más alto y el más bajo de una pista, o para aumentar el rango dinámico de una señal y minimizar el ruido indeseado.

Por otro lado, la puerta de ruido funciona como un expansor amplificado, reduciendo el volumen de los sonidos que están por debajo de cierto nivel, con el propósito de disminuir o eliminar el ruido en las partes más silenciosas de una grabación. Por ejemplo, un intervalo de 15 a 20 dB permite atenuar el sonido de la respiración en una pista de voces lo suficiente como para que suene natural.

La puerta de ruido es sumamente efectiva, aunque hay que prestarle especial atención. Si se define un límite demasiado alto, es posible que se originen artefactos, por ejemplo, que se corte el inicio de una sílaba o el final silencioso de una palabra. Igualmente, puede compensarse su efecto reduciendo el límite apenas o aumentando el ataque o el tiempo de relajación.

Compresor

El compresor permite reducir los picos de una señal de audio, acotando su rango dinámico con el propósito de aumentar el volumen general sin que ocurra una distorsión. Esto resulta útil cuando es necesario asegurarse de que los elementos más fuertes no disminuyan la intensidad de aquellos más suaves, o para igualar los cambios en el volumen dentro de una señal.

SUGERENCIA: Es recomendable aplicar el compresor después de ajustar los controles del ecualizador.

Comp.

Este ajuste permite aumentar el volumen de la señal en general junto con los parámetros de compresión. Debido a que el compresor reduce las partes más fuertes del audio, es posible usar este parámetro para potenciar el sonido sin que ocurra una distorsión.

Limitador

El limitador evita que los picos de la señal superen un nivel máximo determinado, lo cual es útil para impedir distorsiones abruptas. Por ejemplo, si fijamos este parámetro en -8 dB, la señal entrante nunca superará dicho nivel. Por otro lado, los ajustes de ataque, mantenimiento y relajación permiten controlar el grado en el que se afecta la señal.

Características de los controles de dinámica

Control	Mínimo	Predeterminado	Máximo
Expansor y puerta de ruido Expansor			
Umbral	-50 dB	–45 dB**	0 dB
Intervalo	0 dB	18 dB	60 dB
Proporción	1.0:1	1.1:1	10:1
Ataque	0.5 ms	1.4 ms	30 ms
Mantener	0.0 ms	0.0 ms	4 s
Relajación	50 ms	93 ms	4 s
Puerta de ruido*			
Umbral	-50 dB	–45 dB**	0 dB
Intervalo	0 dB	18 dB	60 dB
Ataque	0.5 ms	1.4 ms	30 ms
Mantener	0.0 ms	0.0 ms	4 s
Relajación	50 ms	93 ms	4 s
Compresor Controles del compresor			
Umbral	-50 dB	–35 dB	0 dB
Proporción	1.0:1	2.0:1	10:1
Ataque	0.7 ms	1.4 ms	30 ms
Mantener	0.0 ms	0.0 ms	4 s
Relajación	50 ms	93 ms	4 s
Limitador Controles del limitador			
Umbral	-50 dB	–12 dB	0 dB
Ataque	0.7 ms	0.7 ms	30 ms
Mantener	0.0 ms	0.0 ms	4 s
Relajación	50 ms	93 ms	4 s

* Los controles del expansor y la puerta de ruido están desactivados en el procesador de dinámica del canal principal.

** El umbral predeterminado para el expansor y la puerta de ruido del canal principal es -35 dB, mientras que para el micrófono y las entradas XLR es -45 dB.

Uso de la función de control de cámaras

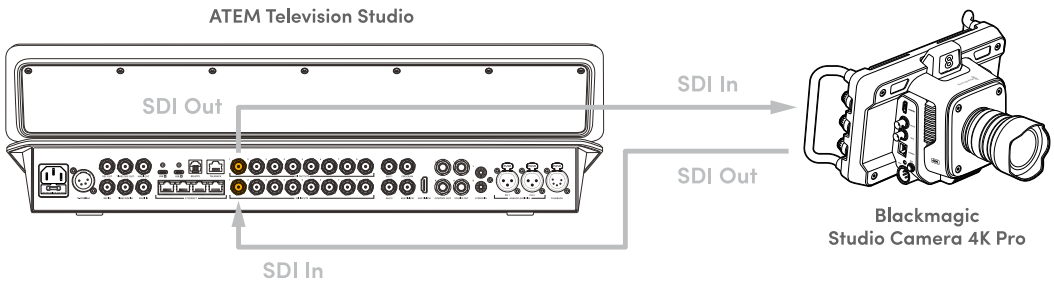
La pestaña **Cámara** situada en la parte inferior de la interfaz permite acceder al módulo de control de cámaras. Esta es una herramienta de gran utilidad que facilita el manejo de las diversas cámaras de Blackmagic, incluidos los modelos Studio Camera 6K Pro y URSA Broadcast G2. Asimismo, esta prestación permite modificar con facilidad diferentes parámetros, tales como la apertura del diafragma, la ganancia y la distancia focal, al emplear objetivos compatibles, así como ajustar el color y crear imágenes extraordinarias con las herramientas para correcciones primarias de DaVinci Resolve.

El módulo de control envía paquetes de instrucciones a la cámara mediante cualquiera de las salidas SDI del mezclador, excepto aquellas correspondientes a señales cuya definición se ha reducido. Al conectar una de ellas a la entrada correspondiente en la cámara, esta detecta las instrucciones integradas en la señal, permitiendo de este modo controlar los diferentes parámetros.

Módulo de control de cámaras

Para conectar cámaras:

1. Conecte la salida SDI 12G de la cámara a cualquier entrada SDI del mezclador.
2. Conecte cualquiera de las salidas SDI del mezclador (excepto aquellas destinadas al modo de visualización simultánea) a la entrada SDI del modelo Studio Camera. Nótese que no es posible transmitir dicha señal mediante la salida destinada a la visualización simultánea de contenidos.
3. En los ajustes de la cámara, cambie su número identificatorio de forma que coincida con el de la entrada del mezclador. Por ejemplo, si **Studio Camera 1** corresponde a **Cam 1** en el mezclador, el valor para **Camera Number** también deberá ser 1. De este modo, es posible asegurarse de establecer una comunicación con la cámara correcta.



Panel de control de cámaras

Ejecute el programa ATEM Software Control y haga clic en la pestaña **Cámara**, situada en la parte inferior de la ventana. Verá una serie de controladores con herramientas para ajustar y mejorar la imagen de cada cámara. Estos son muy fáciles de usar. Basta con hacer clic en los botones correspondientes o mantener presionado el botón del ratón y moverlo para realizar ajustes.

Selección de cámaras

La fila de botones situada en la parte superior de la ventana permite seleccionar la cámara que se desea controlar. Estos botones se emplean asimismo en la ventana de ajustes cromáticos con el mismo fin. Al usar una salida para supervisar imágenes, la señal de la cámara seleccionada también se transmitirá a través de esta, según las preferencias configuradas en el mezclador.

Estado de la cámara

En la parte superior de cada controlador se identifica cada unidad y se indica si la misma está al aire. Además, hay un botón que permite bloquear todos los controles de la cámara. Cuando su señal está al aire, la barra superior de la ventana se enciende de rojo e indica **Al aire**.

Ajustes de la cámara

El botón para modificar los ajustes de la cámara, situado en la esquina superior izquierda del controlador, permite activar las barras de color en los modelos Blackmagic Studio Camera, URSA Mini y URSA Broadcast. Asimismo, ofrece la posibilidad de ajustar detalles de la señal de cada cámara.

En la parte superior de cada controlador, se indica si la cámara está al aire. Utilice los controles generales debajo de cada círculo cromático para ajustar las luces, los tonos intermedios y las sombras en cada canal YRGB.

Mostrar/ocultar barras de color

Las barras de color en las cámaras Blackmagic se pueden activar o desactivar mediante las opciones **Mostrar** y **Ocultar**. Esto resulta de suma utilidad para identificar las unidades de forma visual durante la preparación de una producción en directo. Asimismo, dicha señal incluye un tono auditivo que brinda la posibilidad de comprobar o modificar la intensidad del volumen en cada cámara.

Detalles

Este ajuste permite dar mayor nitidez a las imágenes captadas por las cámaras en directo. Las opciones disponibles son **Desactivados**, **Predeterminado**, **Medio** y **Alto**.

Círculo cromático

El círculo cromático es una herramienta de DaVinci Resolve que permite ajustar el color en las luces, los tonos intermedios y las sombras de cada canal YRGB. Para seleccionar el parámetro que desea modificar, haga clic en una de las tres pestañas situadas en la parte superior del controlador.

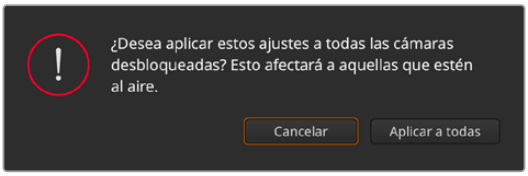
Control general

El control general situado debajo del círculo cromático permite ajustar el contraste en todos los canales YRGB al mismo tiempo, o la luminancia de las luces, los tonos intermedios y las sombras en forma independiente.

Botón de reajuste

Este botón, situado cerca de la parte superior derecha de cada controlador, permite seleccionar los ajustes que se desean copiar, aplicar o restablecer. A su vez, cada círculo cromático también cuenta con uno de estos botones. Haga clic sobre este para copiar, aplicar o restablecer los parámetros a sus valores predeterminados. Cabe destacar que los ajustes de los controladores bloqueados no se modifican.

El botón situado en la esquina inferior derecha del controlador permite restablecer los valores predeterminados de los círculos cromáticos y los ajustes de contraste, saturación, matiz y luminancia. Es posible aplicar parámetros a todas las cámaras en general o a cada una en forma individual, con el objetivo de lograr una apariencia uniforme en las imágenes. Los valores correspondientes a la apertura del diafragma, el enfoque, el control primario y el pedestal no se alteran al copiar y aplicar otros ajustes. Al aplicar parámetros a todas las cámaras simultáneamente, el programa solicitará una confirmación previa por parte del usuario. De esta forma, es posible evitar que se realicen cambios en las cámaras no bloqueadas cuya señal está al aire.



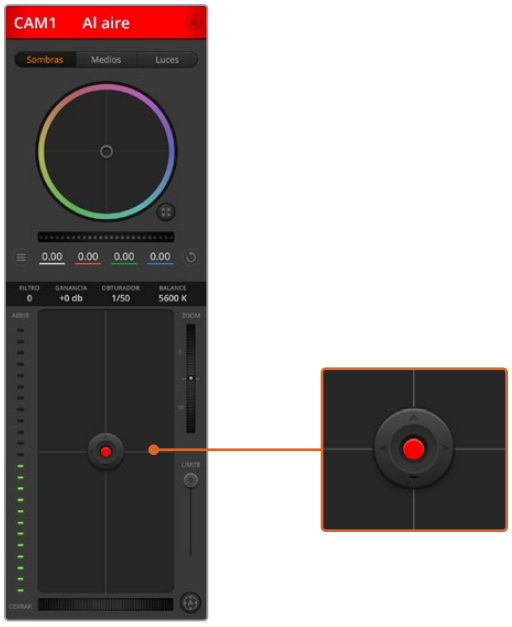
Al aplicar parámetros a todas las cámaras simultáneamente, el programa solicitará una confirmación previa por parte del usuario. De esta forma, es posible evitar que se realicen cambios en las cámaras no bloqueadas cuya señal está al aire.

Control del diafragma/pedestal

Este control se encuentra en el retículo central de cada controlador y se enciende de rojo cuando la cámara está al aire.

Para abrir o cerrar el diafragma, arrastre el círculo hacia arriba o abajo. Al mantener presionada la tecla de mayúsculas simultáneamente, solo cambia la apertura del diafragma.

Para oscurecer o incrementar el pedestal, arrastre el círculo hacia la izquierda o la derecha. Manteniendo presionada la tecla **Command** en Mac o **Control** en Windows mientras se mueve el círculo, solo cambia el pedestal.



El control del diafragma/pedestal se enciende de rojo cuando la cámara está al aire.

Control de la distancia focal

Este control brinda la posibilidad de acercar o alejar la imagen al usar objetivos compatibles con servomecanismos integrados. Funciona de la misma manera que el interruptor físico de la cámara, que permite aumentar o disminuir la distancia focal. Haga clic sobre el control y arrástrelo hacia arriba para acercar la imagen, o hacia abajo para alejarla.

Control primario

Se encuentra a la izquierda del control del diafragma/pedestal y permite limitar la apertura máxima del diafragma. Es de suma utilidad para evitar que salgan al aire imágenes sobrexpuestas.

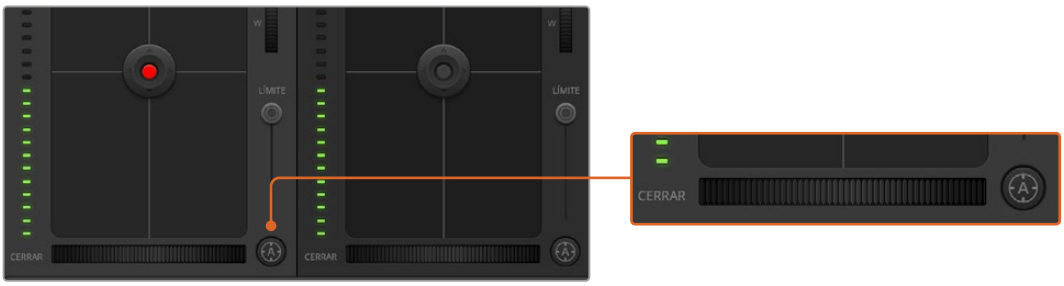
Para limitar la apertura del diafragma, ábralo completamente usando el control circular y luego utilice el control primario a fin de ajustar la exposición. Esto impedirá que se exceda el valor máximo para dicho parámetro.

Indicador del diafragma

Este indicador se encuentra a la izquierda del control circular y brinda una rápida referencia visual de la apertura del diafragma. Conviene subrayar que depende del ajuste establecido mediante el control primario.

Botón de enfoque automático

Este botón se encuentra en la esquina inferior derecha del controlador. Presiónelo para ajustar el enfoque en forma automática si cuenta con un objetivo que admita dicha función. Cabe destacar que, aunque la mayoría de los modelos brindan la posibilidad de ajustar el enfoque electrónicamente, algunos incluyen además un modo de ajuste manual. Por consiguiente, es importante comprobar que se haya seleccionado el modo automático. En algunos casos, esto se logra moviendo el anillo de enfoque del objetivo hacia adelante o atrás.



Haga clic sobre el botón de enfoque automático o deslice el control de enfoque hacia la izquierda o la derecha para enfocar la imagen.

Enfoque manual

Utilice el dial situado en la parte inferior de cada controlador para enfocar la imagen manualmente. Deslice la rueda hacia la izquierda o la derecha para ajustar el enfoque y obtener imágenes nítidas.

Ganancia de la cámara

Este control permite aumentar aún más la ganancia de la cámara, lo cual resulta de suma importancia al filmar en condiciones de luz escasa, a fin de evitar una subexposición de las imágenes. Haga clic sobre las flechas correspondientes para aumentar o disminuir la ganancia.

Este valor se puede aumentar siempre que sea necesario, por ejemplo, al rodar en exteriores durante el atardecer, cuando la intensidad de la luz disminuye y es preciso aumentar el brillo en la imagen. Conviene subrayar que, al incrementar la ganancia, el ruido también aumentará.

Control de la velocidad de obturación

Se encuentra situado entre el círculo cromático y el control del diafragma/pedestal. Mueva el puntero del ratón sobre el indicador y haga clic en las flechas para aumentar o disminuir la velocidad de obturación.

Si la imagen parpadea, disminuya el valor a fin de solucionar este problema. Una buena forma de lograr más brillo en las imágenes sin modificar la ganancia es disminuyendo la velocidad de obturación, ya que de este modo se incrementa el tiempo de exposición del sensor. Al aumentar la

velocidad de obturación, se reduce el rastro dejado por los objetos en movimiento, y por consiguiente este parámetro puede emplearse asimismo para lograr una mayor nitidez en tomas de acción.

Balance de blancos

Este parámetro se encuentra junto al control de la velocidad de obturación y puede modificarse haciendo clic en las flechas ubicadas a ambos lados del indicador de la temperatura cromática. Resulta de gran utilidad para compensar los colores cálidos o fríos emitidos por diferentes fuentes de luz. Esto permite conservar la pureza de los blancos en la imagen.

Herramientas de DaVinci Resolve para correcciones primarias

La ventana del módulo de control de cámaras puede configurarse para que se asemeje a la interfaz de correcciones primarias en un programa de etalonaje y edición.

Estas herramientas integradas en la cámara son idénticas a las del programa DaVinci Resolve. En consecuencia, si el usuario está familiarizado con ellas, podrá valerse de su experiencia en materia de etalonaje al llevar a cabo producciones en directo. El panel de corrección cromática se puede expandir desde el controlador para acceder a la interfaz completa.

Si desea acceder a las herramientas para correcciones primarias de DaVinci Resolve, haga clic sobre el botón situado en la parte inferior, a la derecha del círculo cromático.

Esta incluye ajustes adicionales, tales como círculos cromáticos y otros controles, que brindan la posibilidad de evaluar simultáneamente las luces, los tonos intermedios y las sombras en la imagen. Para cambiar de cámara, utilice los botones en la parte superior de la ventana.

Círculos cromáticos para luces, tonos intermedios y sombras en el panel de etalonaje.

Círculos cromáticos

Haga clic dentro del círculo y arrastre el ratón:
Nótese que no es preciso modificar el indicador de balance cromático. Los valores debajo del círculo cambian, reflejando de este modo los ajustes realizados en cada canal.

Mantenga presionada la tecla de mayúsculas y haga clic dentro del círculo:
Esto permite situar el indicador en la posición indicada por el puntero del ratón para realizar ajustes importantes con rapidez.

Haga clic dos veces dentro del círculo:
Se restablecen los valores originales sin reajustar el control general.

Haga clic en el botón de reajuste, situado en la esquina superior derecha:
Se restablecen todos los ajustes.

Controles generales

Los controles generales situados debajo de cada círculo cromático permiten ajustar las sombras, los tonos intermedios y las luces en cada canal YRGB.

Esto permite oscurecer o aclarar el parámetro seleccionado, respectivamente. Al ajustar un valor, el cambio se verá reflejado en los campos correspondientes a cada canal, situados debajo del círculo cromático. Para ajustar solo la luminancia, mantenga presionada la tecla **Alt** o **Command** y mueva el control hacia la izquierda o la derecha. Dado que el color y la luminancia se procesan individualmente, es posible lograr efectos interesantes modificando solo el canal Y. Este ajuste funciona mejor si el control **Mezcla de luminancia** se mueve hacia la derecha. De lo contrario, el programa procesará los canales de color de forma normal. Por lo general, la mayoría de los coloristas utilizan el método YRGB, ya que permite obtener un mayor control del balance de color sin afectar la luminancia general para lograr la apariencia deseada más rápido.

Contraste

Este control permite ajustar el intervalo entre los valores más claros y oscuros de una imagen. El efecto es similar al que se obtiene realizando ajustes opuestos mediante los controles generales situados debajo de las opciones **Luces** y **Sombras**. El valor predeterminado es 50 %.

Pivote

Una vez ajustado el contraste, el pivote permite cambiar el punto medio de dicho parámetro, estableciendo un equilibrio al colocar mayor énfasis a un lado u otro de la escala de luminancia. Al aumentar este control, se incrementará el brillo general de la imagen, pero se reducirá la nitidez en las zonas más oscuras.

Saturación

Este control permite aumentar o disminuir la cantidad de color en la imagen. El valor predeterminado es 50 %.

Mezcla de luminancia

Las funciones de etalonaje de las cámaras Blackmagic están basadas en las herramientas para correcciones primarias de DaVinci Resolve. Este programa fue desarrollado a principio de los 80 y es el más utilizado en la producción de largometrajes en Hollywood.

El corrector cromático de la cámara incluye prestaciones sumamente útiles y creativas. Una de ellas es el método de procesamiento YRGB.

Al etalonar, es posible seleccionar cualquiera de los dos métodos de procesamiento disponibles. Aquellos coloristas con más experiencia recurren al modo YRGB, dado que ofrece un control más preciso sobre el color y permite ajustar los canales en forma independiente, logrando de esta manera una amplia variedad de opciones creativas.

Cuando el control **Mezcla de luminancia** se mueve totalmente a la derecha, el programa emplea el modo YRGB. Por el contrario, si se mueve totalmente a la izquierda, se utilizará el modo RGB. También es posible seleccionar cualquier punto intermedio para obtener una mezcla de ambos.

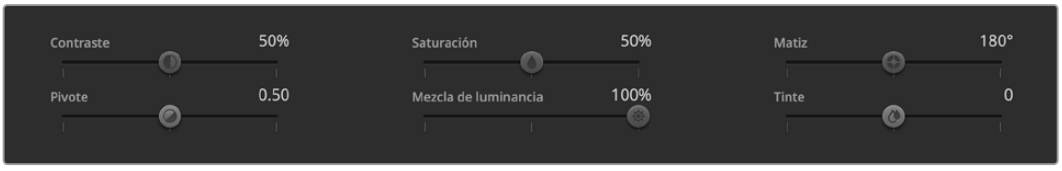
¿Cuál es el mejor ajuste? Esto depende del usuario, ya que el proceso de etalonaje es totalmente creativo, y no hay estilos correctos o incorrectos. El mejor ajuste es el que más se adapte a su estilo.

Matiz

Este control permite modificar los matices de la imagen recorriendo el perímetro del círculo cromático. El valor predeterminado de 180 grados muestra la distribución original de este parámetro. Al incrementar o disminuir dicho valor, los matices rotarán en sentido horario o antihorario.

Tinte

Al ajustar esta opción, se añaden tonos verdes o magentas a la imagen, a fin de lograr un mejor balance cromático. Esto facilita la filmación con fuentes de luz artificiales, tales como lámparas fluorescentes o de vapor de sodio.



Arrastre los controles hacia la izquierda o la derecha para ajustar el contraste, la saturación, el matiz y la mezcla de luminancia.

Sincronización de ajustes

El mezclador transmite la señal de control a la cámara cuando ambos dispositivos están conectados. Si se modifica un ajuste por error en la cámara, la unidad de control del mezclador restablecerá automáticamente los valores para mantener la sincronización entre los equipos.

Funcionamiento del mezclador

Fuentes internas

Además de las entradas SDI, el mezclador dispone de ocho fuentes internas que pueden utilizarse en una producción. Dichas fuentes son identificadas por su nombre en el programa ATEM Software Control. En los mezcladores ATEM, se emplean denominaciones más largas para identificar las fuentes internas fácilmente.

Negro

El color negro generado internamente es una de las fuentes disponibles y puede utilizarse como fondo en cualquier producción.

Barras de color

Otra de las fuentes disponibles son las barras de color generadas internamente. Son útiles para comprobar las señales transmitidas desde el mezclador o realizar una composición por crominancia con un vectorscopio.

Generadores de color

Los mezcladores ATEM tienen dos fuentes de color que pueden personalizarse para generar cualquier máscara y utilizarla en las producciones. Estas permiten agregar bordes de color al realizar una cortinilla o escoger un color intermedio, por ejemplo, blanco, para un fundido entre dos planos.

Para ajustar una fuente de color en el programa informático, simplemente haga clic en el panel correspondiente al generador de color y luego sobre el cuadrado coloreado para abrir el selector de colores y realizar la elección. En el mezclador, seleccione la opción **Color** en el módulo de control del sistema y ajuste el matiz, la saturación y la luminancia.

Es importante recordar que la luminancia de los colores más profundos es de 50%.

Los mezcladores ATEM tienen dos fuentes de color que pueden personalizarse para generar cualquier máscara y utilizarla en las producciones

Reproductores multimedia

El canal alfa y la señal principal de cada fuente disponen de salidas independientes. Las fuentes que pueden superponerse se denominan **Media Player** (1 o 2), mientras que aquellas correspondientes a canales alfa reciben el nombre de **Media Player 1 Key**, **Media Player 2 Key**, y así sucesivamente.

Los reproductores multimedia permiten reproducir contenidos del panel multimedia. Las fuentes para la señal superpuesta muestran los canales de color de la imagen o secuencia seleccionada, mientras que las fuentes para determinar las partes visibles de dicha imagen o secuencia en la composición final muestran el canal alfa (blanco y negro). Los reproductores multimedia pueden utilizarse en varias partes de la producción.

Para controlar los reproductores multimedia en los modelos ATEM Television Studio:

1. Presione el botón **MEDIA PLAYERS** para acceder a los reproductores multimedia.
2. Seleccione el reproductor que desea utilizar mediante los botones situados junto a la parte superior de la pantalla.
3. Seleccione el clip o la imagen que desea emplear mediante el mando giratorio.
4. Si ha seleccionado una secuencia, presione la flecha derecha. Se activarán los controles de reproducción.

Para controlar los reproductores multimedia desde el programa informático:

1. En la pestaña **Mezclador**, seleccione el panel **Reproductores**.
2. Seleccione un clip o una imagen del panel multimedia en el menú desplegable.
3. Si ha seleccionado un clip, los controles de transporte se habilitarán para permitir reproducirlo. Si desea reproducir un clip en forma continua, haga clic primero en el botón con la flecha situado en el extremo derecho y luego sobre el botón de reproducción. El clip comenzará a reproducirse nuevamente cada vez que finalice hasta que el usuario detenga la reproducción.

En la imagen, los reproductores multimedia contienen un clip

Tipos de transiciones

Una de las funciones principales de un mezclador es realizar transiciones entre dos fuentes. La combinación de diferentes efectos y estilos proporciona un sinfín de opciones creativas para mejorar la calidad de la producción.

Para tal fin, es posible utilizar el programa ATEM Software Control o el mezclador. En este apartado se explica cómo realizar los distintos tipos de transiciones disponibles.

Corte directo

El corte directo es la transición más simple que puede realizarse con el mezclador. En este tipo de transición, la señal transmitida a través de la salida principal cambia inmediatamente de una fuente a otra.

Secuencia de imágenes en la señal transmitida al realizar un corte directo

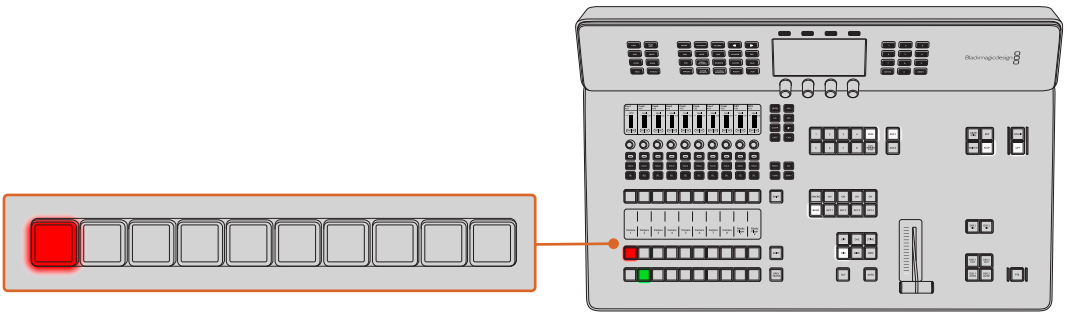
Un corte puede llevarse a cabo directamente desde el bus del programa o mediante el botón **CUT** en el módulo de control de transiciones.

Bus del programa

Cuando se realiza un corte directo desde el bus del programa, la imagen cambia, pero se mantienen los elementos superpuestos.

Para realizar un corte directo desde el bus de programa en los modelos ATEM Television Studio:

En el bus del programa, seleccione la fuente que desea transmitir a través de la salida principal. Esta comenzará a transmitirse de forma inmediata.



Presione cualquier botón asociado a una fuente para realizar un corte directo.

Para realizar un corte directo desde el programa informático:

En el bus del programa de la pestaña **Mezclador**, seleccione la fuente que desea emitir al aire. Esta comenzará a transmitirse de forma inmediata.

Para realizar un corte directo desde el programa informático mediante el teclado numérico:

1. Oprima la tecla de bloqueo de mayúsculas o mantenga presionada la tecla de mayúsculas.
2. En el teclado, presione el número correspondiente a la fuente que desea emitir al aire. Esta comenzará a transmitirse de forma inmediata.

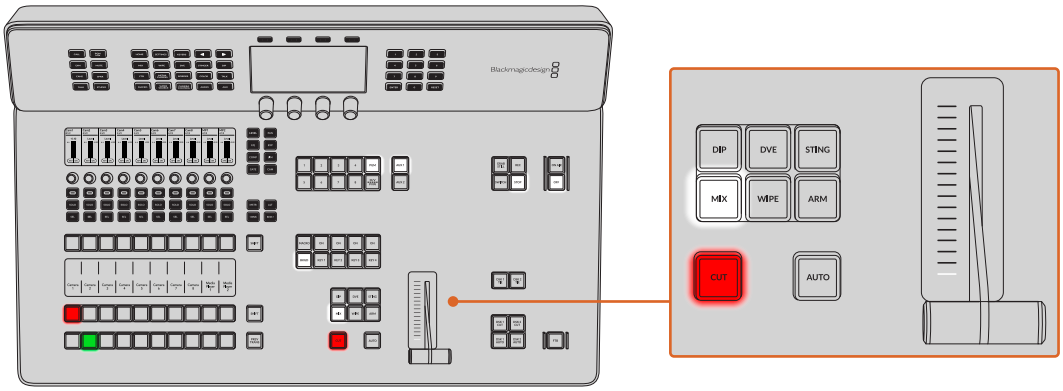
Botón CUT

Al realizar un corte directo mediante el botón **CUT**, se verán afectados todos los elementos superpuestos seleccionados para formar parte de la siguiente transición, así como las capas adicionales vinculadas a esta. Por ejemplo, una capa adicional asociada a la transición será visible si no estaba al aire, o viceversa. De manera similar, todos los elementos superpuestos seleccionados en el módulo **Próxima transición** serán visibles si no estaban al aire o desaparecerán si formaban parte de la señal principal.

Para realizar un corte directo mediante el botón **CUT** en los modelos ATEM Television Studio:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire. La imagen transmitida no cambiará.
2. En el módulo de control de transiciones, presione el botón **CUT**. Las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

Se recomienda usar los botones en el módulo de control de transiciones para efectuar una transición, ya que de esta forma es posible comprobar las imágenes en la salida para anticipos antes de emitirlas al aire, por ejemplo, para asegurarse de que una cámara está enfocada correctamente.



Para realizar un corte directo desde el programa informático mediante el botón CUT:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire. La imagen transmitida no cambiará.
2. En el módulo de control de transiciones, presione el botón **CUT**. Las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

El botón **CUT** forma parte del módulo de transiciones.

Para realizar un corte directo desde el programa informático mediante el teclado numérico:

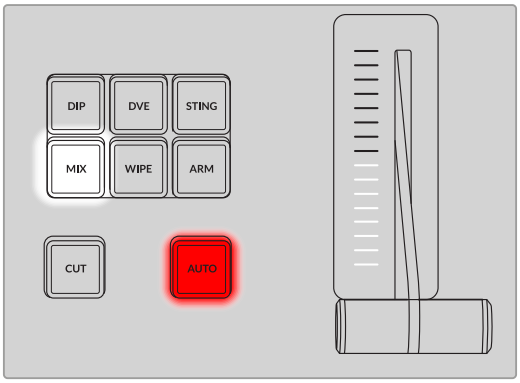
1. Compruebe que la tecla de bloqueo de mayúsculas no esté activada.
2. En el teclado, presione el número correspondiente a la fuente que desea emitir al aire. La fuente quedará seleccionada en el bus de anticipos sin que se modifique la señal transmitida.
3. Presione la barra espaciadora. Las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

Transiciones automáticas

Una transición automática permite realizar un cambio entre la imagen transmitida y la fuente seleccionada en el bus de anticipos con una duración predeterminada. Cabe destacar que se verán afectados todos los elementos superpuestos seleccionados para formar parte de la siguiente transición, así como las capas adicionales vinculadas a esta. Las transiciones automáticas se llevan a cabo mediante el botón **AUTO** en el módulo de control de transiciones. Las disolvencias, fundidos, cortinillas y transiciones animadas o con efectos visuales digitales pueden realizarse en forma automática.

Para realizar una transición automática en los modelos ATEM Television Studio:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Seleccione el tipo de transición mediante el botón respectivo en el módulo de control de transiciones.
3. Ajuste la duración de la transición y cualquier otro parámetro en la pantalla del dispositivo, según sea necesario.
4. Haga clic en el botón **AUTO** para comenzar la transición.



Los modelos ATEM Advanced Panel cuentan con botones independientes para cada tipo de transición

Los botones de las fuentes seleccionadas en los buses de programa y anticipos se encenderán de color rojo para indicar que la misma está en curso. El indicador junto a la palanca de transición muestra el progreso de la misma y el visor indica la cantidad de fotogramas restantes a medida que esta transcurre.

Al finalizar la transición, las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

Cada transición tiene una duración independiente, lo cual permite aumentar la velocidad simplemente eligiendo el tipo de transición y presionando el botón **AUTO**. Este valor se almacena en la memoria del dispositivo hasta que el usuario lo modifique nuevamente.

Un mezclador ofrece varias maneras para pasar de un plano a otro. Por lo general, se realiza un corte directo al alternar entre las fuentes.Las disolvencias, los fundidos, las cortinillas y los efectos visuales digitales permiten realizar una transición entre dos imágenes en forma gradual. Las transiciones animadas y cortinillas con gráficos son dos tipos de transiciones especiales que se describen más adelante. Las disolvencias, fusiones, cortinillas y demás transiciones con efectos visuales digitales pueden llevarse a cabo de forma automática o manual, mediante el módulo de control de transiciones.

El botón **AUTO** forma parte del módulo de transiciones.

Para realizar una transición automática desde el programa informático:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.
3. Seleccione el mismo tipo de transición en el panel lateral de la interfaz.
4. Ajuste la duración de la transición y cualquier otro parámetro, según sea necesario.
5. Haga clic en el botón **AUTO** para comenzar la transición.
6. Los botones de las fuentes seleccionadas en los buses de programa y anticipos se encenderán de color rojo para indicar que la misma está en curso. La palanca virtual acompaña automáticamente el avance de la transición, y el indicador de la duración muestra la cantidad de cuadros o fotogramas restantes a medida que esta transcurre.
7. Al finalizar la transición, las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

Para realizar una transición automática desde el programa informático mediante el teclado numérico:

1. Compruebe que la tecla de bloqueo de mayúsculas no esté activada.
2. En el teclado, presione el número correspondiente a la fuente que desea emitir al aire. La fuente quedará seleccionada en el bus de anticipos sin que se modifique la señal transmitida.
3. Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.
4. Seleccione el mismo tipo de transición en el panel lateral de la interfaz.
5. Ajuste la duración de la transición y cualquier otro parámetro, según sea necesario.
6. Presione la tecla **Return** o **Enter** para comenzar la transición.

Los botones de las fuentes seleccionadas en los buses de programa y anticipos se encenderán de color rojo para indicar que la misma está en curso. La palanca virtual acompaña automáticamente el avance de la transición, y el indicador de la duración muestra la cantidad de cuadros o fotogramas restantes a medida que esta transcurre.

Al finalizar la transición, las fuentes seleccionadas en ambos buses cambian para indicar que el anticipo ha pasado a transmitirse a través de la salida principal.

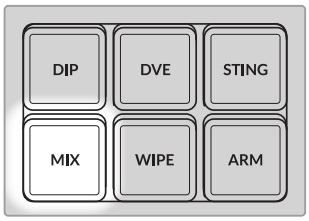
Disolvencias

Una disolvencia consiste en una transición gradual de un plano a otro que se realiza interpolando ambas fuentes y superponiéndolas durante el tiempo determinado para la duración del efecto, que puede ajustarse según las preferencias del usuario.

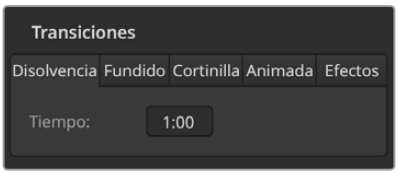
Secuencia de imágenes en la señal transmitida al realizar una disolvencia

Para realizar una disolvencia en el modelo ATEM Television Studio:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Oprima el botón **DIP/MIX** o **MIX** para seleccionar el tipo de transición. El módulo de control del sistema mostrará el menú de transiciones.
3. Utilice el mando giratorio junto a la pantalla para ajustar la duración de la disolvencia. Este valor se indica en la pantalla en el módulo de control de transiciones. También es posible ingresar un valor específico mediante el teclado numérico.
4. Realice la transición de forma manual o automática.



Presione el botón **MIX** y determine la duración de la transición mediante el menú y el mando giratorio junto a la pantalla del dispositivo.



Ajuste de parámetros para disolvencias

Para realizar una disolvencia desde el programa informático:

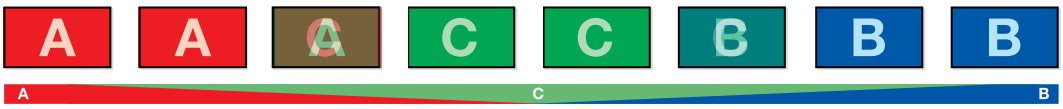
1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.
3. Abra el panel de composiciones y seleccione la opción **Disolvencia** en la barra superior.
4. Ajuste la duración de la transición ingresando el valor deseado en el campo **Tiempo**. Este valor se indica en la pantalla del módulo de control de transiciones.
5. Realice la transición de forma manual o automática.

Opciones para disolvencias

Tiempo	Duración de la transición en segundos y fotogramas.

Fundidos

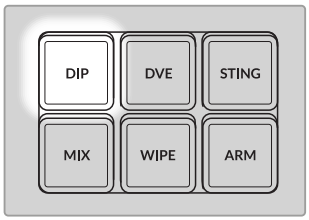
Al igual que la disolvencia, el fundido consiste en una transición gradual de una fuente a otra. Sin embargo, el plano saliente da paso a una fuente intermedia que permanece en la pantalla durante unos instantes hasta fundirse gradualmente con el plano siguiente. Este tipo de transición puede utilizarse para lograr un efecto, por ejemplo, mediante un fundido en blanco, o mostrar rápidamente el logotipo de un patrocinador. Cabe señalar que es posible ajustar tanto la duración de la transición como el tiempo que la fuente intermedia permanece en pantalla.



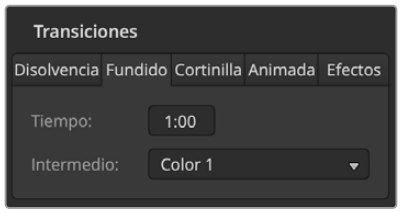
Secuencia de imágenes en la señal transmitida al realizar un fundido

Para realizar un fundido en los modelos ATEM Television Studio:

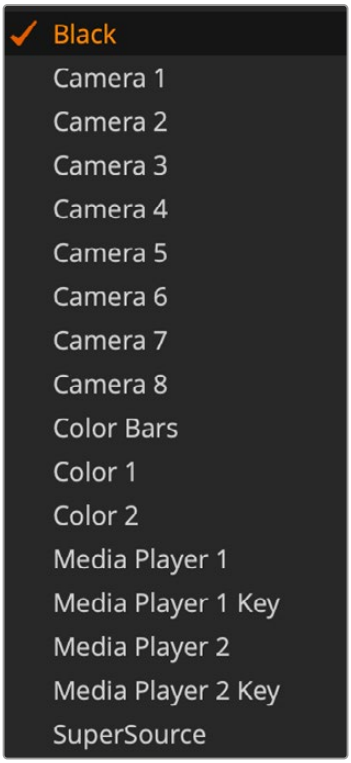
1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Presione el botón **DIP** para seleccionar el tipo de transición. La pantalla del dispositivo mostrará los ajustes disponibles.
3. Utilice el mando giratorio debajo de la pantalla para ajustar la duración del fundido. También es posible ingresar un valor específico mediante el teclado numérico.
4. Utilice el mando correspondiente para seleccionar la fuente intermedia. De manera alternativa, presione uno de los botones en el bus de selección.
5. Realice la transición de forma manual o automática.



Presione el botón **DIP** y luego seleccione la fuente intermedia y la duración de la transición mediante el menú y los mandos giratorios junto a la pantalla del dispositivo.



Ajuste de parámetros para fundidos



Menú para seleccionar la fuente intermedia

Para realizar un fundido desde el programa informático:

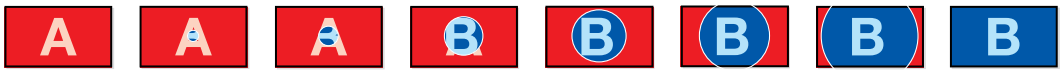
1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.
3. Abra el panel de composiciones y seleccione la opción **Fundido** en la barra superior.
4. Ajuste la duración de la transición ingresando el valor deseado en el campo **Tiempo**. Este valor se indica en la pantalla del módulo de control de transiciones.
5. Seleccione la fuente intermedia.
6. Realice la transición de forma manual o automática.

Opciones para fundidos

Tiempo	Duración de la transición en segundos y fotogramas.
Intermedio	Fuente intermedia que puede ser cualquier señal. Generalmente proviene de los generadores de color o los reproductores multimedia y se utiliza en la transición de un plano a otro.

Cortinillas

Es un tipo de transición entre dos planos que consiste en reemplazar una fuente mediante un patrón o una forma geométrica, por ejemplo, un rombo o un círculo en expansión.



Secuencia de imágenes en la señal transmitida al realizar una cortinilla

Para realizar una cortinilla en los modelos ATEM Television Studio:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Presione el botón **WIPE** para seleccionar el tipo de transición. La pantalla del dispositivo mostrará los ajustes disponibles.
3. Seleccione una figura y la velocidad mediante el mando giratorio. Los botones permiten seleccionar la dirección de la cortinilla.
4. Presione las flechas a la izquierda de la pantalla a fin de acceder a todos los parámetros disponibles, tales como la posición, la simetría y la fuente para el borde.

5 Realice la transición de forma manual o automática.

Ajuste de parámetros para cortinillas

Para realizar una cortinilla desde el programa informático:

1 En el bus de anticipos, seleccione la fuente que desea emitir al aire.

2 Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.

3 Abra el panel de composiciones y seleccione la opción **Cortinilla** en la barra superior.

4 Modifique los parámetros para personalizar la transición.

5 Realice la transición de forma manual o automática.

Opciones para fundidos

Tiempo	Duración de la transición en segundos y fotogramas.
Simetría	Se utiliza para controlar la relación de aspecto de la figura geométrica. Por ejemplo, ajustando este valor, es posible transformar un círculo en una elipse. En los mezcladores ATEM, la simetría puede modificarse mediante el mando giratorio.
Posición	La ubicación del centro de la figura geométrica en la pantalla puede modificarse, si la figura lo permite, mediante los mandos giratorios en el mezclador o los campos correspondientes en el panel de transiciones del programa informático.
Invertir dirección	Al invertirla, la transición comienza desde los bordes de la pantalla hacia el centro. Al seleccionar esta opción, el texto se destaca de color naranja.
Alternar	Cuando esta función se encuentra activada, la dirección de la transición alterna entre normal e inversa cada vez que se ejecuta. Al seleccionar esta opción, el texto se destaca de color naranja.
Atenuación	Permite ajustar la definición de los bordes de la figura empleada en la cortinilla.
Borde	Permite ajustar el ancho del borde.
Relleno del borde	Es posible emplear cualquier fuente del mezclador. Por ejemplo, se puede utilizar una imagen del reproductor multimedia en un borde ancho para destacar una marca o un patrocinador.

Ajuste de parámetros para transiciones animadas

Las transiciones animadas se realizan a partir de un clip del reproductor de medios. Dicha secuencia normalmente consiste en una animación gráfica que se superpone a la imagen de fondo. Cuando se reproduce la animación en pantalla completa, se realiza un corte directo o disolvencia de la imagen de fondo. Por ejemplo, este tipo de transición se utiliza con frecuencia en producciones de eventos deportivos para mostrar repeticiones instantáneas. Las transiciones animadas emplean una capa especial, por lo cual las demás capas estarán disponibles para superponerlas a la señal de salida. A continuación, se explica cómo realizar una transición animada.

Cómo realizar una transición animada

Para realizar una transición con efectos en los modelos ATEM Television Studio:

1. Seleccione el tipo de transición mediante el botón **STING**.
2. Gire el mando situado junto a la opción **Fuente** para seleccionar el reproductor multimedia. Utilice las flechas para ajustar los diferentes parámetros de la transición según sea necesario.
3. A continuación, presione el botón **MEDIA PLAYERS** situado junto a la pantalla para configurar el reproductor.
4. En el menú respectivo, seleccione el clip o la imagen que desea utilizar girando el mando junto a la opción **MULTIMEDIA**. Si es necesario, indique el fotograma en el cual desea comenzar girando el mando correspondiente.
5. Realice la transición de forma automática desde el módulo de control de transiciones.

Ajuste de parámetros para transiciones animadas

Para realizar una transición animada desde el programa informático:

1. Haga clic sobre el botón **STING** en el módulo de control de transiciones.
2. En el menú de fuentes, elija el reproductor multimedia que empleará para la transición. Compruebe que la fuente del reproductor multimedia incluye el clip que desea utilizar.
3. Ajuste la duración y demás parámetros según sea necesario.
4. Realice la transición de forma automática desde el módulo de control de transiciones.

   Nótese que no es posible llevar a cabo una transición animada en forma manual mediante la palanca de transición.

Opciones para transiciones animadas

Fuente	Reproductor multimedia utilizado para reproducir el clip que se utilizará en la transición.
Duración del clip	Se refiere a la duración de la animación. Generalmente la duración total debe coincidir con la de la animación. También puede utilizarse para ajustar el final del clip.
Punto de inicio	Es el punto en el cual el mezclador comienza la disolvencia entre los planos de fondo detrás de la animación. Generalmente coincide con el momento en el cual la animación se ve en pantalla completa.
Duración de la mezcla	Indica la duración de la disolvencia entre un plano y otro detrás de la animación. Para realizar un corte directo en vez de una disolvencia, simplemente ajuste la duración a 1.
Tiempo previo	Valor que permite recortar el principio de la secuencia. El tiempo máximo es de 3:00 segundos.
Composición precompuesta	Identifica el canal alfa del clip en el reproductor multimedia como un canal premultiplicado.
Nivel	Permite ajustar el valor al cual la señal realiza el corte en el clip reproducido. Al disminuir este valor, la imagen de fondo se verá con mayor nitidez. Aumente este parámetro si el fondo se ve completamente negro.
Ganancia	Permite modificar electrónicamente el valor para atenuar los bordes de la secuencia superpuesta. Ajuste este parámetro hasta obtener el efecto deseado sin afectar la luminancia del fondo.
Invertir composición	Cambia la imagen superpuesta por la imagen de fondo.

Es importante recordar que las diferentes duraciones en estos parámetros son interdependientes. Por ejemplo, la suma de los valores en las opciones **trigger** y **mix** no puede superar al de la duración. Asimismo, nótese que el tiempo visualizado en la pantalla es igual a la suma de los valores en las opciones **duration** y **preroll**.

Transiciones con efectos

El mezclador incluye un extraordinario procesador de efectos visuales digitales. Este tipo de transición brinda la posibilidad de desplazar la imagen de diferentes maneras para pasar de un plano a otro. Por ejemplo, se puede emplear un efecto para empujar la imagen hacia afuera de la pantalla, dando lugar a un nuevo plano.

Para realizar una transición con efectos en los modelos ATEM Television Studio:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Presione el botón **DVE** para seleccionar el tipo de transición. La pantalla del dispositivo mostrará los ajustes disponibles.

> **NOTA:** Cuando los efectos visuales están siendo utilizados en otra composición previa, no será posible elegir un tipo de transición con efectos si dicha composición está al aire o ha sido vinculada a la próxima transición. Consulte el apartado *Cómo compartir recursos al trabajar con efectos visuales digitales* para obtener más información al respecto.

3. Utilice los botones y mandos giratorios para configurar los diferentes parámetros. Estos permiten ajustar la forma, dirección y duración de la transición. Utilice las flechas a ambos lados de la pantalla LCD para acceder a las opciones adicionales.

4 Realice la transición de forma manual o automática moviendo la palanca o presionando el botón **AUTO**.

Opciones de la pestaña **DVE**.

Para realizar una transición con efectos desde el programa informático:

1 En el bus de anticipos, seleccione la fuente que desea emitir al aire.

2 Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.

3 Abra el panel de composiciones y seleccione la opción **DVE** en la barra superior.

Cuando los efectos visuales están siendo utilizados en otra composición previa, el botón no estará disponible si dicha composición está al aire o ha sido vinculada a la próxima transición. Consulte el siguiente apartado para obtener más información al respecto.

Modifique los parámetros para personalizar la transición.

4 Realice la transición de forma manual o automática.

Opciones para transiciones con efectos

Forma	Seleccione la forma del efecto.
Movimiento	Permite seleccionar la dirección de la transición.
Tiempo	Duración de la transición en segundos y fotogramas. En los modelos ATEM Television Studio, gire el mando correspondiente para modificar este parámetro. El valor se indicará en el módulo de control de transiciones.
Dirección	Aplica el efecto visual a la imagen que está al aire y da paso al anticipo.
Invertir dirección	Invierte la dirección en la cual los efectos visuales digitales se aplican a la señal en la salida de vista previa. En este caso, el efecto reemplaza la imagen que está al aire con el anticipo.
Alternar	Cuando esta opción está activada, la dirección de la transición alterna entre normal e inversa cada vez que se lleva a cabo.

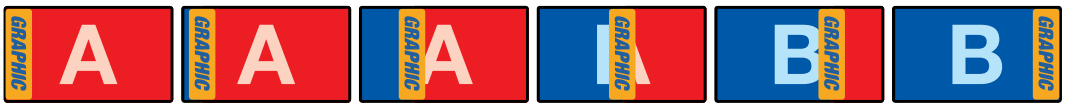
Parámetros de la composición

Activar composición	Permite superponer u ocultar una composición con efectos visuales. Cuando el botón está encendido, la composición está al aire.
Composición precompuesta	Selecciona el efecto como un canal premultiplicado.
Nivel	Permite ajustar el valor a partir del cual la imagen de fondo es visible a través de la máscara. Al disminuir este valor, la imagen de fondo se verá con mayor nitidez. Aumente este parámetro si el fondo se ve completamente negro.
Ganancia	Permite modificar electrónicamente el valor de visibilidad de la imagen superpuesta atenuando su borde. Ajuste este parámetro hasta obtener el efecto deseado sin afectar la luminancia del fondo.
Invertir composición	Invierte la señal auxiliar cuando el canal alfa no está premultiplicado.

Cómo compartir recursos al trabajar con efectos visuales digitales

Los mezcladores ATEM disponen de canales para efectos visuales digitales que permiten realizar transiciones con dichos efectos o utilizarlos en una composición de imágenes. No es posible seleccionar una transición con efectos visuales digitales si están siendo utilizados en otras funciones del sistema. En el mezclador, el botón respectivo estará desactivado si este tipo de transición no se encuentra disponible. Para usar los efectos visuales digitales, es necesario que estén disponibles. Compruebe que los elementos superpuestos sobre las señales emitidas y los anticipos no contengan efectos, y que no formen parte de una composición animada. Seleccione otro tipo de composición si es necesario, a fin de poder utilizar dichos recursos. De esta forma, quedarán disponibles para emplearlos en una transición.

Las transiciones con gráficos son muy utilizadas e incluyen efectos visuales digitales. El elemento gráfico se mueve a través de la pantalla sobre una transición de fondo. Por ejemplo, en una cortinilla con un gráfico, este se mueve horizontalmente a través de la pantalla remplazando el borde de la transición. En el caso de una disolvencia, el elemento atraviesa la pantalla girando al mismo tiempo que la transición se lleva a cabo. Este tipo de transición es ideal para mostrar el logotipo del canal a través de la pantalla o un balón de fútbol que da paso a una nueva imagen. Las transiciones gráficas utilizan una capa independiente, por lo cual las demás estarán disponibles para ser empleadas en otras composiciones. A continuación, se explica cómo realizar una transición gráfica.



Secuencia de imágenes en la señal transmitida al realizar una transición con logotipos

Transiciones con gráficos

Para realizar una transición con gráficos en los modelos ATEM Television Studio:

1. Seleccione el tipo de transición mediante el botón respectivo. La pantalla del dispositivo mostrará los ajustes disponibles.

   Cuando los efectos visuales están siendo utilizados en otra composición previa, no será posible seleccionar un tipo de transición con efectos si dicha composición está al aire o ha sido vinculada a la próxima transición. Consulte el apartado *Cómo compartir recursos al trabajar con efectos visuales digitales* para obtener más información al respecto.

2. Presione el botón correspondiente a la opción **EFECTO** en la pantalla para acceder a los ajustes correspondientes.

La dirección predeterminada es de izquierda a derecha, aunque puede modificarse mediante la opción **INVERTIR DIRECCIÓN**. Por otra parte, la opción **ALTERNAR** brinda la posibilidad de alternar entre ambas direcciones cada vez que se realiza una transición.

3 Presione la flecha derecha para ajustar los parámetros de la composición. Active la composición y seleccione las fuentes para el canal alfa y la imagen en primer plano. Presione la flecha derecha nuevamente para acceder a otros ajustes adicionales.

SUGERENCIA: En una transición con gráficos, por lo general la fuente es el reproductor multimedia. En este caso, la opción **Composición precompuesta** se selecciona automáticamente. Por consiguiente, el mezclador utilizará un gráfico que incluye una máscara en el canal alfa. No obstante, es posible deshabilitar esta función y cambiar la fuente si se desea usar un archivo diferente de otro reproductor o una entrada distinta.

4 Realice la transición de forma manual o automática moviendo la palanca o presionando el botón **AUTO**.

Para realizar una transición con gráficos desde el programa informático:

1 Seleccione el tipo de transición mediante el botón respectivo en el módulo **Tipo de transición**.

Cuando los efectos visuales están siendo utilizados en otra composición previa, el botón no estará disponible si dicha composición está al aire o ha sido vinculada a la próxima transición. Consulte el apartado *Cómo compartir recursos al trabajar con efectos visuales digitales* para obtener más información al respecto.

2 Abra el panel de composiciones y seleccione la opción **DVE**. Utilice las flechas para elegir el tipo de efecto deseado.

3 Seleccione una cortinilla gráfica como transición en las opciones para efectos.

4 En los menús desplegables, seleccione la imagen correspondiente al primer plano y al canal alfa.

5 Ajuste los parámetros de la composición, según sea necesario.

6 Realice la transición de forma manual o automática.

Opciones para cortinillas con gráficos

Tiempo	Duración de la transición en segundos y fotogramas. Para ajustarla, gire el mando correspondiente o ingrese un valor y presione el botón **ENTER**.
Normal	El elemento gráfico se desplaza de izquierda a derecha. En el control del sistema del mezclador, aparece la opción **Invertir dirección**.
Invertir dirección	Invierte la dirección, de forma que el elemento gráfico se desplaza de derecha a izquierda. En el mezclador, esta opción se destaca en naranja para indicar que se encuentra activada.
Alternar	Cuando esta opción está activada, la dirección de la transición alterna entre normal e inversa cada vez que se lleva a cabo. El ajuste indica la dirección de la transición siguiente.
Primer plano	Permite seleccionar el gráfico que se desplaza sobre la transición.
Canal alfa	Este es una imagen en escala de grises que define el área del gráfico que deberá eliminarse para que la imagen en primer plano se aplique correctamente sobre la transición.

Imágenes para cortinillas con gráficos

Para realizar una cortinilla con gráficos, es necesario disponer de un elemento fijo que se usa como borde y se desplaza en forma horizontal a través de la pantalla. Este debería ser una especie de pancarta vertical cuyo ancho no supere el 16 % del ancho total de la pantalla.

Requisitos para el ancho del gráfico

2160p	Cuando el mezclador funciona en esta resolución, el ancho del elemento gráfico no debe superar los 230 pixeles.
1080i	Cuando el mezclador funciona en esta resolución, el ancho del elemento gráfico no debe superar los 116 pixeles.
720p	Cuando el mezclador funciona en esta resolución, el ancho del elemento gráfico no debe superar los 77 pixeles.

Transiciones manuales

Las transiciones manuales permiten realizar un cambio de fuentes mediante la palanca. Las disolvencias, fundidos, cortinillas y transiciones con efectos visuales digitales pueden realizarse de forma manual.

Para realizar una transición manual desde el programa informático o el mezclador:

1. En el bus de anticipos, seleccione la fuente que desea emitir al aire.
2. Seleccione el tipo de transición mediante el botón respectivo en el módulo de control de transiciones.
3. Mueva la palanca de un extremo a otro para llevar a cabo la transición.Al mover la palanca nuevamente, se iniciará otra transición.

4 Los botones de las fuentes seleccionadas en los buses de programa y anticipos se encenderán de color rojo para indicar que la misma está en curso. Asimismo, el indicador de ledes junto a la palanca muestra el avance de la transición. En el programa informático, la palanca virtual muestra la posición y el avance de la transición.

5 Al finalizar la transición, se intercambian las fuentes seleccionadas en los buses de programa y anticipo, lo que indica que ahora el anticipo corresponde a la imagen emitida y viceversa.

Vista previa de transiciones

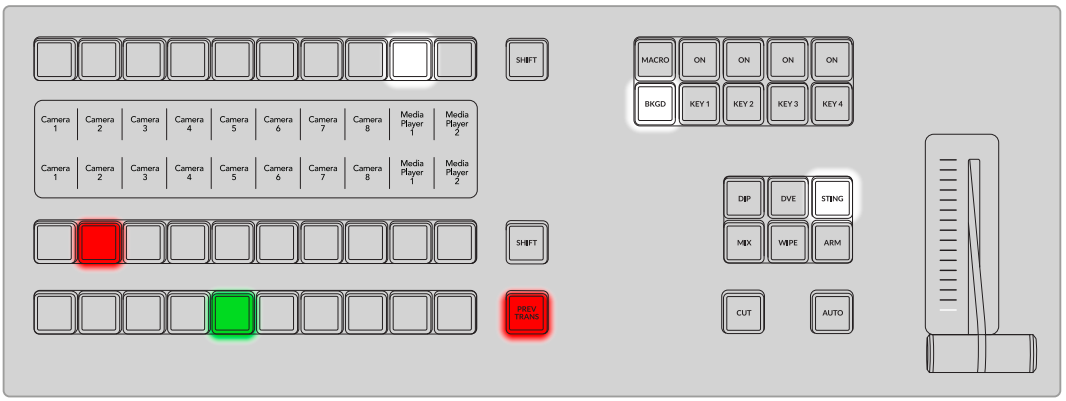
Los mezcladores ATEM cuentan con una función que permite comprobar y ajustar una transición antes de que salga al aire. Esto brinda la posibilidad de verificar que se logre el efecto deseado.

Para ver una transición de forma anticipada mediante el programa informático o el mezclador:

1 En el bus de anticipos, seleccione la fuente que desea emitir al aire.

2 Seleccione el tipo de transición mediante el botón respectivo en el módulo de control de transiciones.

3 Presione el botón **PREV TRANS** o haga clic en el mismo para activar el modo de vista previa. Este se encenderá de color rojo, y las imágenes correspondientes al anticipo y la señal emitida coincidirán.



4 Mueva la palanca de un extremo a otro para llevar a cabo la transición. La imagen transmitida no cambiará.

5 Presione el botón **PREV TRANS** para desactivar el modo de vista previa.

Composición de imágenes

La composición de imágenes es una herramienta muy útil que permite superponer elementos visuales de diferentes fuentes sobre una misma imagen.

Para llevar a cabo esta función, se superponen múltiples capas o elementos gráficos sobre una imagen de fondo. Esta será visible en mayor o menor medida, según cómo se ajuste la transparencia de las capas superpuestas. Este proceso se denomina composición. Para crear los distintos grados de transparencia, se utilizan varias técnicas que corresponden a los distintos tipos de composiciones disponibles en el mezclador.

En el siguiente apartado, se explican las composiciones lineales y por luminancia que es posible realizar antes o después de emitir la señal al aire, y las composiciones por crominancia, con formas geométricas o con efectos visuales digitales que pueden llevarse a cabo solamente de manera previa a la transmisión.

¿Qué es una composición?

Una composición requiere dos elementos: la señal principal y el canal alfa. La señal principal contiene la imagen que se superpone sobre el fondo, mientras que el canal alfa se usa para determinar la transparencia de la señal principal. Ambas pueden seleccionarse a partir de cualquier entrada externa o fuente interna del mezclador y pueden consistir en imágenes fijas o clips.

En el programa informático, el canal alfa y la señal principal se seleccionan en las listas desplegables, situadas en los paneles **Composición previa** y **Composición posterior**. En el mezclador, dichas señales se determinan desde el bus de selección.

El mezclador utiliza dos tipos de capas: previas (Upstream Keyer) y adicionales (Downstream Keyer). El módulo M/E del panel de control dispone de cuatro botones para superponer efectos. Cada uno de ellos puede asignarse a una composición lineal, precompuesta, geométrica, por crominancia, por luminancia o con efectos visuales digitales. Por su parte, el módulo **DSK** cuenta con dos botones para composiciones previas. Cada uno de ellos puede asignarse a una composición lineal o por luminancia.

Composición por luminancia

Una composición por luminancia consiste en una sola fuente con la imagen principal que se superpone al fondo. Todas las áreas negras definidas según la luminancia de la señal se tornarán transparentes para que se visualice el fondo. En este tipo de composición, se utiliza solo una imagen para definir las zonas no deseadas, y por consiguiente el canal alfa coincide con la imagen en primer plano. A continuación, se muestran los elementos necesarios para crear una composición por luminancia y la imagen final resultante.

Combinación del fondo y el primer plano en una composición por luminancia

Fondo

Imagen en pantalla completa, por lo general proveniente de una cámara.

Primer plano

Gráfico que se colocará sobre la imagen de fondo. Nótese que la composición final no contiene las partes negras del elemento gráfico, ya que estas han sido eliminadas de la imagen.

Composición lineal

Una composición lineal contiene dos elementos: el canal alfa y la señal principal. La señal principal incluye la imagen que se superpone al fondo, mientras que el canal alfa contiene una máscara en escala de grises que permite definir la transparencia. Ambas señales son fuentes audiovisuales. A continuación, se muestran los elementos necesarios para crear una composición lineal y la imagen final resultante.

Combinación del fondo y el primer plano en una composición lineal

Fondo

Imagen en pantalla completa, por lo general proveniente de una cámara.

Primer plano

Gráfico que se colocará sobre la imagen de fondo. Nótese que las partes blancas del elemento gráfico permanecen intactas, ya que el canal alfa se utiliza para crear un espacio vacío que luego se rellena con la señal principal. Por lo general, esta proviene de un sistema gráfico.

Canal alfa

Imagen en escala de grises que define las áreas que deberán eliminarse para que la señal principal se aplique correctamente sobre el fondo. Por lo general, esta proviene de un sistema gráfico.

Composición precompuesta

Los generadores de caracteres o sistemas gráficos modernos que proporcionan canales alfa y señales principales generalmente permiten realizar composiciones precompuestas. Estas consisten en una combinación especial del canal alfa y la señal principal en la cual esta última ha sido premultiplicada mediante el canal alfa sobre un fondo negro. Las imágenes generadas mediante Photoshop que contienen un canal alfa son imágenes precompuestas.

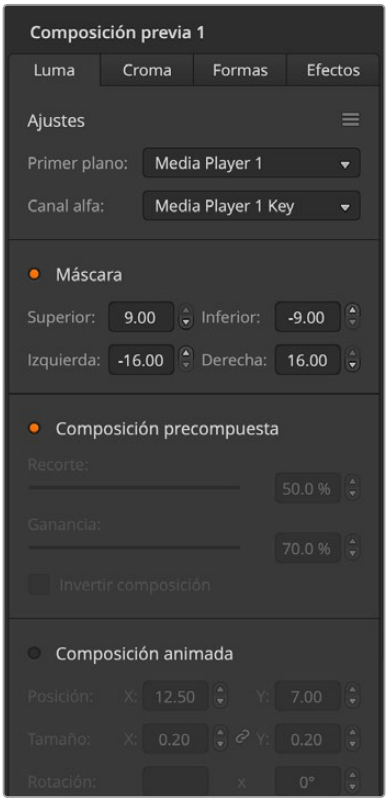
Los mezcladores ATEM cuentan con una función para composiciones precompuestas que, al estar activada, ajusta automáticamente los valores correspondientes a los parámetros **Recorte** y **Ganancia**.

Al usar una imagen generada en Photoshop, es preciso crear elementos gráficos sobre un fondo negro y colocar todo el contenido en las capas superiores. Es necesario crear un canal alfa en Photoshop que se pueda emplear para superponer dicho gráfico sobre las imágenes en directo. Luego, al guardarlo como un archivo Targa o exportarlo directamente al **Panel multimedia**, seleccione la opción **Composición precompuesta** para lograr un resultado de buena calidad.

Es necesario utilizar esta opción cuando se trabaja con imágenes generadas con Photoshop, ya que estas siempre son precompuestas.

Cómo realizar una composición previa lineal o por luminancia

Las composiciones lineales y por luminancia comparten los mismos parámetros y, por lo tanto, se ajustan usando el mismo menú, tanto en el programa informático como en el mezclador. La selección del canal alfa y la señal principal determinará si se trata de una composición lineal o por luminancia. En una composición por luminancia, ambas fuentes provienen de la misma señal. En el caso de una composición lineal, las fuentes son diferentes.



El panel **Composición previa** dispone de un menú para restablecer los parámetros en la parte superior de cada pestaña. En el menú, seleccione los elementos que desea restablecer.

Para realizar una composición previa lineal o por luminancia en los modelos ATEM Television Studio:

1. Presione el botón **KEY 1** a fin de poder ver la composición en el monitor de anticipos. La pantalla del dispositivo mostrará el menú de ajustes correspondientes. Para acceder al mismo directamente, presione el botón **KEYERS**.
2. Gire el mando junto al indicador **COMPOSICIÓN** y seleccione la opción **Luminancia**.
3. Gire los mandos junto a las opciones **PRIMER PLANO** y **CANAL ALFA** para seleccionar las fuentes correspondientes.

> **SUGERENCIA:** De manera alternativa, presione los respectivos botones en el bus de selección.

4. Una vez seleccionadas las fuentes, presione la flecha derecha para acceder a los ajustes adicionales y gire los mandos correspondientes para modificar otros parámetros.

Para realizar una composición previa lineal o por luminancia desde el programa informático:

1. Abra el panel **Composición previa 1** y haga clic en la pestaña **Luma**.
2. Seleccione la imagen correspondiente para el primer plano y el canal alfa.

A efectos de realizar una composición por luminancia, seleccione la misma fuente para la imagen principal y el canal alfa.

Ajuste los demás parámetros de la composición, según sea necesario. Consulte la tabla que figura a continuación para ver una descripción detallada de los mismos.

Opciones para composiciones lineales y por luminancia:

Máscara	Permite crear una máscara rectangular que puede ajustarse modificando los campos **Superior**, **Inferior**, **Izquierda** y **Derecha**.
Composición precompuesta	Indica que el canal alfa está premultiplicado.
Nivel	Permite ajustar el valor a partir del cual la imagen de fondo es visible a través de la máscara. Al disminuir este valor, la imagen de fondo se verá con mayor nitidez. Aumente este parámetro si el fondo se ve completamente negro.

Ganancia	Permite modificar electrónicamente el valor de visibilidad de la imagen superpuesta atenuando su borde. Ajuste este parámetro hasta obtener el efecto deseado sin afectar la luminancia del fondo.
Invertir composición	Permite invertir el canal alfa.
Composición animada	Permite activar o desactivar los efectos visuales digitales.

Cómo realizar una composición posterior lineal o por luminancia

Para realizar una composición posterior lineal o por luminancia en los modelos ATEM Television Studio:

1. Presione el botón **DSK 1 TIE** para ver la composición en el monitor de anticipos. La pantalla del dispositivo mostrará el menú de ajustes correspondientes. Para acceder al mismo directamente, presione el botón **KEYERS** y luego la flecha derecha.
2. Presione el botón junto a la opción **COMPOSICIÓN 1** o **COMPOSICIÓN 2**.

> **SUGERENCIA:** Cabe destacar que no es necesario seleccionar el tipo de composición, ya que en este caso siempre se trata de una superposición por luminancia.

3. Gire los mandos debajo de la pantalla para seleccionar el canal alfa y la imagen en primer plano. De manera alternativa, presione los respectivos botones en el bus de selección.
4. Una vez seleccionadas las fuentes, presione la flecha derecha o izquierda para acceder a otros ajustes adicionales.

Para realizar una composición posterior lineal o por luminancia desde el programa informático:

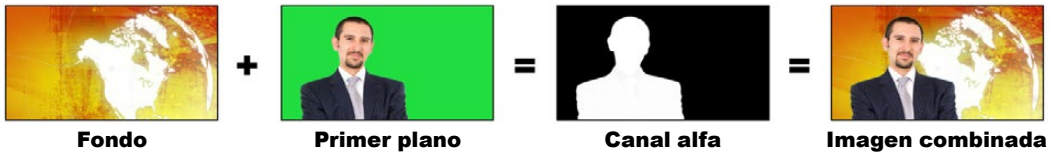
1. Seleccione el panel **Composición posterior 1**.
2. Seleccione el canal alfa y la imagen en primer plano desde los respectivos menús desplegables. A efectos de realizar una composición por luminancia, seleccione la misma fuente para la imagen principal y el canal alfa.
3. Ajuste los demás parámetros de la composición, según sea necesario.

Opciones para composiciones posteriores

Composición por crominancia

Este tipo de composición se utiliza principalmente para pronósticos del tiempo en los cuales el meteorólogo aparece delante de un gran mapa. En realidad, en el estudio, el presentador está parado frente a un fondo azul o verde. En una composición por crominancia se combinan dos imágenes usando una técnica especial que permite eliminar un color de la imagen en primer plano para dejar ver la imagen de fondo. Esta técnica también es conocida como inserción cromática, superposición por separación de colores, o simplemente pantalla azul o verde.

En una composición por crominancia generalmente se emplean elementos gráficos generados mediante un equipo informático. Este puede conectarse fácilmente al mezclador ATEM a través de la salida HDMI o mediante una tarjeta DeckLink o Intensity de Blackmagic Design, con el objetivo de usar los clips en el mezclador. El fondo verde utilizado se puede sustituir con facilidad para crear animaciones de cualquier duración. El color verde generado por el equipo informático es uniforme y, por lo tanto, muy fácil de reemplazar.



Combinación del fondo con la imagen en primer plano y el canal alfa

Fondo

Imagen en pantalla completa. En el caso de una composición por crominancia, generalmente es un mapa meteorológico.

Primer plano

Imagen que se colocará sobre el fondo. En el caso de una composición por crominancia, sería la imagen del meteorólogo frente al fondo verde.

Canal alfa

En el caso de una composición por crominancia, el canal alfa se genera a partir de la imagen que se colocará en primer plano.

Cómo realizar una composición por crominancia avanzada

Los mezcladores ATEM disponen de controles avanzados para composiciones por crominancia con opciones y ajustes adicionales. Estos permiten lograr superposiciones perfectas, mejorando la combinación del fondo con la imagen en primer plano para crear efectos visuales convincentes.

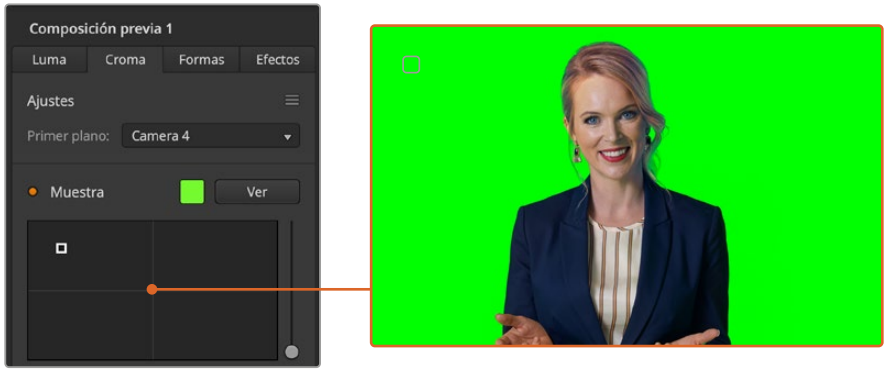
Para realizar una composición previa por crominancia en los modelos ATEM Television Studio:

1. Presione el botón **KEY 1** a fin de poder ver la composición en el monitor de anticipos. La pantalla del dispositivo mostrará el menú de ajustes correspondientes. Para acceder al mismo directamente, presione el botón **KEYERS**.
2. Gire el mando junto al indicador **COMPOSICIÓN** y seleccione la opción **Crominancia**.
3. Seleccione el canal alfa y la imagen en primer plano girando los mandos correspondientes. Por lo general, es la cámara que graba al presentador parado delante de un fondo verde, o un gráfico del reproductor multimedia. De manera alternativa, presione los respectivos botones en el bus de selección.
4. Presione la flecha derecha a fin de acceder a la pantalla de ajustes para la composición.
5. Haga clic en la opción **Muestra**.

Para realizar una composición por crominancia desde el programa informático:

1. Abra el panel **Composición previa 1** y haga clic en la pestaña **Croma**.
2. Seleccione la fuente para la imagen en primer plano. Por lo general, es la cámara que graba al presentador parado delante de un fondo verde, o un gráfico del reproductor multimedia.
3. Haga clic en la opción **Muestra**.

   Aparecerá un nuevo panel con un recuadro que se también se ve en la imagen transmitida a través de la salida para anticipos del banco M/E 1.



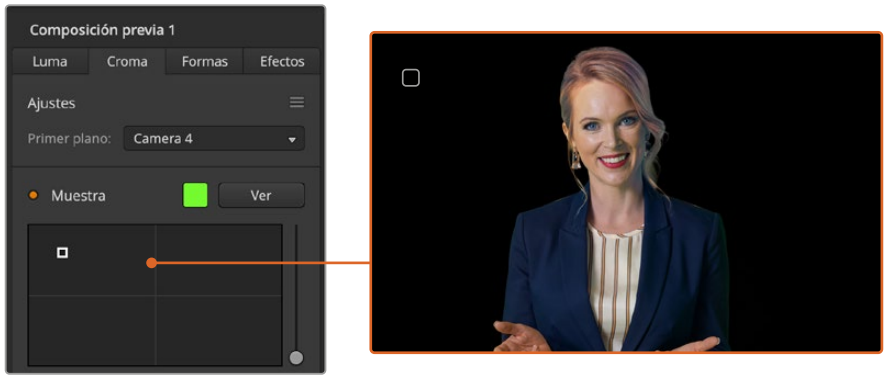
La función **Muestra** permite colocar un recuadro sobre una parte de la imagen para tomar una muestra cromática.

4. Haga clic sobre el recuadro y arrástrelo para moverlo hasta la posición deseada.

Seleccione un área representativa del fondo verde que abarque el mayor rango de luminancia posible. El tamaño predeterminado del recuadro resultará adecuado en la mayoría de los casos, cuando el fondo está bien iluminado. No obstante, si existen variaciones en el fondo, es posible ajustar las dimensiones del recuadro haciendo clic en el control situado a la derecha de la ventana y desplazándolo hacia arriba o abajo. En el mezclador, use los mandos giratorios correspondientes para cambiar la posición del recuadro, o el eje Z para modificar su tamaño.

SUGERENCIA: Al tomar muestras de fondos verdes irregulares, recomendamos seleccionar el área más oscura en primer lugar antes de aumentar el tamaño del recuadro. Esto permite lograr una composición más precisa.

Es posible ver la composición en cualquier momento haciendo clic en el botón **Ver**, situado junto a la muestra en la interfaz del programa, o presionando el botón para la opción **VISTA PREVIA** en la parte superior de la pantalla del mezclador.



Haga clic en el botón **Ver** para observar la composición.

Ajustes adicionales

Una vez obtenida una muestra que permite eliminar la mayor parte del fondo verde y retener al mismo tiempo los elementos en primer plano, es posible realizar ajustes adicionales para mejorar la composición. En el modelo ATEM Television Studio, presione la flecha derecha a fin de acceder al menú de configuración de la composición.

Primer plano

Utilice este control o el mando giratorio para ajustar la opacidad de la máscara en primer plano. Esto permite determinar la intensidad de la imagen en primer plano sobre el fondo. Al aumentar este valor, es posible rellenar pequeñas áreas de transparencia en la imagen en primer plano. Sugerimos mover el control y detenerse tan pronto como se logra dicho objetivo.

Fondo

Este control y el mando giratorio respectivo permiten ajustar la opacidad de la superposición. Utilícelo para eliminar artefactos menores en el área de la imagen que desea eliminar. Se recomienda mover el control hasta que el área superpuesta se torne opaca.

Borde

Este control y el mando giratorio respectivo permiten mover el borde de la superposición para eliminar elementos del fondo cercanos a la imagen en primer plano, o extenderla si la composición es demasiado notoria. Esto resulta de suma utilidad con ciertos detalles, tales como el cabello. Sugerimos mover el control hasta eliminar los artefactos visibles en el borde de la composición.

Mediante estos controles, los elementos en primer plano deberían quedar claramente separados del fondo.

Rebase cromático y supresión de reflejos

La luz que rebota en una superficie verde puede provocar la aparición de un contorno del mismo color en los elementos en primer plano, así como de un cierto matiz en toda la imagen principal. Esto se denomina rebase o reflejo cromático. Los ajustes disponibles permiten mejorar las partes de la imagen en primer plano afectadas por dicho problema. Esto es posible mediante la opción **Corrección**.

Rebase

Ajuste este control para eliminar el tinte cromático en el contorno de los elementos en primer plano, por ejemplo, causados por el reflejo de la luz en un fondo verde.

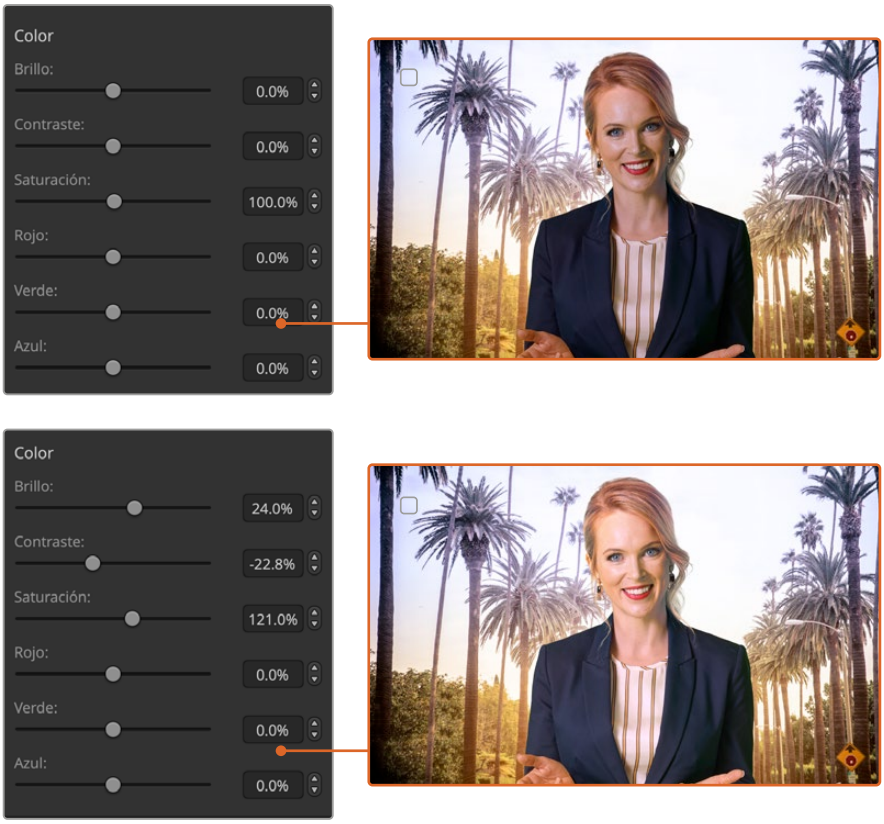
Reflejo

Permite eliminar una cierta tonalidad general en todos los elementos en primer plano.

Combinación del fondo y la imagen en primer plano

Una vez efectuados todos los ajustes necesarios para distinguir la imagen en primer plano del fondo, utilice la opción **Ajustes cromáticos** para que lograr que la apariencia de ambos coincida.

Ajuste el brillo, el contraste y la saturación de la imagen en primer plano para conseguir que se combine adecuadamente con el fondo, a fin de que la superposición sea más convincente.



Utilice los ajustes cromáticos para lograr una combinación adecuada de la imagen en primer plano con el fondo.

Composiciones con figuras geométricas

Este tipo de composición permite superponer sobre el fondo una imagen recortada según una cierta figura geométrica. En este caso, el canal alfa es generado por el mezclador. Este brinda la posibilidad de crear 18 formas diferentes que pueden ajustarse y colocarse en distintos lugares para obtener el efecto deseado.

Combinación del fondo con la imagen en primer plano y el canal alfa

Fondo

Imagen en pantalla completa.

Primer plano

Imagen en pantalla completa que se superpone al fondo.

Canal alfa

En este caso, el canal alfa es generado por el mezclador.

Cómo realizar una composición previa geométrica

Para realizar una composición previa geométrica mediante el compositor 1 en los modelos ATEM Television Studio:

1. Presione el botón **KEY 1** a fin de poder ver la composición en el monitor de anticipos. La pantalla del dispositivo mostrará el menú de ajustes correspondiente. Al oprimir este botón, la composición se emitirá al aire al llevar a cabo la siguiente transición.
2. Seleccione el tipo de composición geométrica girando el mando correspondiente.
3. Seleccione la fuente para la imagen en primer plano girando el mando respectivo o presionando el botón correspondiente.
4. Seleccione la forma de la composición girando el mando correspondiente y ajuste su tamaño.
5. Presione la flecha izquierda o derecha para acceder a otros parámetros y realice los ajustes que sean necesarios. Observe la imagen en el monitor al efectuar los cambios.

SUGERENCIA: Es posible cambiar la posición de algunas formas mediante los mandos giratorios correspondientes. Para restablecer la posición original, cambie el tipo de forma y luego vuelva a seleccionar la forma deseada.

Opciones para composiciones geométricas

Para realizar una composición geométrica desde el programa informático:

1. Abra el panel **Composición previa 1** y haga clic en la pestaña **Formas**.
2. Seleccione la fuente para la imagen en primer plano.
3. Seleccione la figura deseada.
4. Ajuste los demás parámetros de la composición, según sea necesario. Consulte la tabla que figura a continuación para ver una descripción detallada de los mismos.

Tamaño	Permite ajustar el tamaño de la figura seleccionada.
Simetría	Permite ajustar la simetría o relación de aspecto de algunas formas. Por ejemplo, los círculos pueden convertirse en elipses horizontales o verticales.
Atenuación	Permite ajustar la atenuación de los bordes en la figura geométrica.
Invertir patrón	Se utiliza para invertir la parte de la composición que ocupará el primer plano. Por ejemplo, la señal principal se verá en el área fuera del círculo y el fondo, en el interior. Seleccione la posición del círculo y luego active esta opción.
Composición animada	Permite activar o desactivar los efectos visuales digitales

Posición de la figura geométrica

Es posible reubicar el centro de algunas figuras. Para cambiar la posición de la figura geométrica, acceda al menú de selección que contiene los diferentes patrones. Utilice los mandos giratorios para moverla en sentido vertical y horizontal. Para centrarla nuevamente, seleccione dicha forma en el menú. La posición y la simetría de la figura geométrica se restablecerán.

Composiciones con efectos visuales

Los efectos visuales digitales (DVE) se usan para mostrar una imagen más pequeña en un recuadro con bordes sobre la imagen de fondo. La mayoría de los modelos cuentan con un canal para efectos visuales 2D que brinda la posibilidad de ajustar el tamaño de las ventanas, así como utilizar bordes o sombras paralelas.

Combinación del fondo con la imagen en primer plano y el canal alfa

Fondo

Imagen en pantalla completa.

Primer plano

Otra imagen en pantalla completa que se ha ajustado o a la que se han añadido bordes y que se superpondrá al fondo. Puede incluir bordes.

Canal alfa

En este caso, el canal alfa es generado por el mezclador.

Cómo realizar una composición previa con efectos

Para realizar una composición previa con efectos mediante el compositor 1 en los modelos ATEM Television Studio:

1. Presione el botón **KEY 1** a fin de poder ver la composición en el monitor de anticipos.
2. Seleccione el tipo de composición con efectos en el menú que aparece en la pantalla del dispositivo girando el mando correspondiente.
3. Seleccione la fuente para la imagen en primer plano girando el mando respectivo o presionando el botón correspondiente.
4. Presione las flechas para acceder a los distintos parámetros y utilice los mandos giratorios para ajustar los valores.

SUGERENCIA: Al utilizar el teclado numérico, mantenga presionado el botón **RESET** durante varios segundos para ingresar valores negativos. Repita el mismo procedimiento para regresar a la opción original.

Para realizar una composición con efectos visuales digitales desde el programa informático:

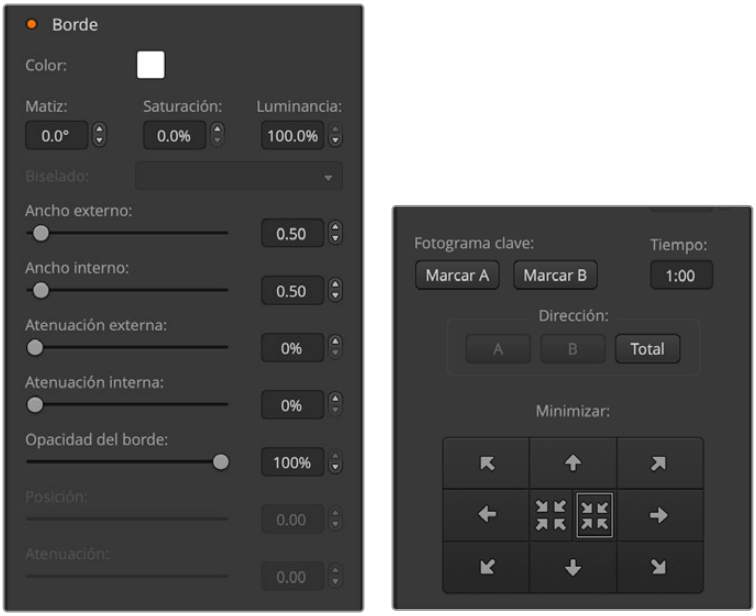
1. Abra el panel **Composición previa 1** y seleccione la pestaña **DVE** en la barra superior.
2. Seleccione la fuente para la imagen en primer plano.
3. Ajuste los demás parámetros de la composición, según sea necesario. Consulte la tabla más adelante para ver una descripción detallada.

Opciones para composiciones con efectos

Opciones para composiciones con efectos

Primer plano	Fuente para el efecto visual digital.
Tamaño	Valores X e Y para ajustar las dimensiones de la ventana.
Máscara	Permite crear una máscara rectangular que puede ajustarse modificando los campos **Superior**, **Inferior**, **Izquierda** y **Derecha**.
Sombras	Permite ajustar la dirección de la fuente de luz sobre el efecto visual o la imagen superpuesta. Al modificar este valor, se verán afectados los parámetros del borde y la sombra paralela.

Añadir bordes con efectos



Opciones para bordes en efectos

Los mandos giratorios y botones de función variable en el módulo de control del sistema se usan para modificar los parámetros de los bordes. Los botones **Soft/Color** y **SHIFT** permiten conmutar los parámetros que se ajustan mediante dichos controles.

Borde	Permite activar o desactivar el borde.
Color	Permite ajustar el color del borde.
Matiz	Permite cambiar el color del borde. Es un valor del círculo cromático.
Saturación	Permite cambiar la intensidad del color del borde.
Luminancia	Permite cambiar el brillo del color del borde.
Ancho externo	Permite ajustar el ancho exterior del borde.
Ancho interno	Permite ajustar el ancho exterior del borde.
Atenuación externa	Permite ajustar el contorno exterior del borde, que lo separa de la imagen de fondo.
Atenuación interna	Este parámetro permite ajustar el contorno interior del borde, que lo separa de la imagen superpuesta.
Opacidad del borde	Permite ajustar la transparencia del borde. Es posible utilizarlo para crear bordes vítreos de color.

Máscaras

Las diferentes funciones para combinar imágenes cuentan con una máscara rectangular ajustable que puede utilizarse para eliminar bordes ásperos y otros artefactos de la señal. Al modificar el largo o el ancho de dicho rectángulo, es posible cubrir diversas partes de la imagen. Asimismo, es posible emplearla como una herramienta creativa para ocultar diversos elementos.

En el panel de control, las máscaras se ajustan desde el menú correspondiente en el módulo de control del sistema, al cual se accede desde los menús **EFFECTS KEYS** o **DSK KEYS**.

En el programa informático, se ajustan desde los paneles correspondientes a las composiciones.

Composición animada

Las composiciones por luminancia, crominancia y formas geométricas incluyen ajustes para realizar composiciones animadas. Dichos parámetros permiten aplicar efectos visuales a la imagen si existe un canal para este tipo de efectos.

Cómo realizar transiciones con composiciones previas

Las composiciones previas se pueden realizar desde el módulo de control de transiciones o del sistema. Los elementos superpuestos se pueden ver u ocultar en la señal mediante los botones **ON** o **KEY** en el módulo **Próxima transición**.

Botones ON

Siga los pasos descritos a continuación para ver u ocultar los distintos elementos superpuestos en la señal mediante los botones **ON**:

1. Presione el botón **ON** situado sobre el botón **KEY** correspondiente para ver u ocultar la composición previa en las imágenes emitidas.
2. El botón **ON** también indica si la capa es visible en la señal.

Botones del módulo *Next Transition*

Siga los pasos descritos a continuación para mostrar u ocultar los distintos elementos superpuestos en la señal mediante los botones de este módulo:

1. Seleccione los elementos que desea vincular a la transición mediante los botones **BKGD**, **KEY 1**, **KEY 2**, **KEY 3** o **KEY 4**.
2. Compruebe la imagen en el monitor de anticipos para saber exactamente cómo se verá una vez realizada la transición.
3. Oprima los botones **CUT** o **AUTO**, o utilice la palanca manual para realizar la transición.

A continuación, proporcionamos algunos ejemplos para ilustrar las diferentes formas de mostrar u ocultar varios elementos superpuestos en la señal principal. En estos ejemplos, el botón **KEY 1** está asociado al logotipo LIVE, situado en la parte superior izquierda de la pantalla, y el botón **KEY 2** a otro logotipo en la parte inferior derecha.

Ejemplo 1:

En este ejemplo, ninguno de los logotipos superpuestos se encuentra al aire. En el módulo **Next Transition** se ha oprimido el botón **KEY 1**, por lo cual el logotipo asociado a este será visible (ON) en la señal principal al realizar la siguiente transición.

Botones del panel antes de la transición | Imagen antes de la transición | Imagen después de la transición

Ejemplo 2:

En este ejemplo, el elemento superpuesto asociado al botón KEY 1 está al aire. En el módulo **Next Transition**, se ha oprimido el botón **KEY 1**, por lo cual el logotipo asociado a este desaparecerá (OFF) en la señal principal al realizar la siguiente transición.

Botones del panel antes de la transición | Imagen antes de la transición | Imagen después de la transición

Ejemplo 3:

En este ejemplo, los elementos asociados a los botones **KEY 1** y **KEY 2** están al aire. El botón **BKGD** está encendido, lo cual indica que se ha seleccionado la imagen de fondo para la transición siguiente. Al realizarla, dicha imagen cambiará, mientras que los elementos permanecerán en pantalla.

Botones del panel antes de la transición | Imagen antes de la transición | Imagen después de la transición

Ejemplo 4:

En este ejemplo, ambos elementos asociados a los botones **KEY 1** y **KEY 2** están al aire. Los botones BKGD y KEY 2 están encendidos, lo cual indica que al realizar la próxima transición la imagen de fondo cambiará y el elemento superpuesto vinculado al botón KEY 2 desaparecerá (OFF) en la señal principal.

Botones del panel antes de la transición | Imagen antes de la transición | Imagen después de la transición

Existen varias maneras de realizar transiciones con imágenes superpuestas. Al realizar la transición de fondo, la imagen superpuesta se puede mostrar, ocultar o mezclar gradualmente. Las composiciones previas pueden emitirse al aire mediante los botones del módulo **Next Transition**. Las composiciones posteriores pueden realizarse mediante botones independientes, o vincularse a la transición de la imagen de fondo mediante los botones **DSK TIE**.

Cómo realizar transiciones con composiciones posteriores

La transición de los elementos superpuestos a las imágenes emitidas puede realizarse mediante botones independientes, y el panel cuenta con una pantalla separada para indicar su duración. Una vez que los parámetros de la composición se han configurado, es posible mostrar u ocultar el elemento superpuesto en la señal mediante cualquiera de los siguientes métodos:

1. Oprima el botón **DSK CUT** para mostrar u ocultar inmediatamente el elemento superpuesto en la señal.
2. Oprima el botón **DSK AUTO** para mostrar u ocultar gradualmente el elemento superpuesto en la imagen emitida, según la duración indicada en la pantalla **DSK rate**.
3. Utilice el botón **DSK TIE** para asociar la composición posterior al módulo de control de transiciones. Una vez vinculado, el elemento estará asociado al tipo de transición seleccionado en dicho módulo y se mostrará u ocultará según la duración indicada en el módulo.

   Al presionar el botón **DSK TIE**, es posible ver la composición en el monitor para anticipos.

   No es posible ver en forma anticipada una transición que incluye un elemento de una superposición posterior cuando esta se vincula al módulo de control de transiciones. Si el botón **DSK TIE** está encendido al seleccionar el modo de previsualización de transiciones, la función para vincular el elemento superpuesto al módulo de control de transiciones no estará disponible hasta que dicho modo sea desactivado.

Opciones para composiciones posteriores

Nivel	Permite ajustar el valor a partir del cual la imagen de fondo es visible a través de la máscara. Al disminuir este valor, la imagen de fondo se verá con mayor nitidez. Si la imagen se ve completamente negra, dicho valor es demasiado alto.
Ganancia	Permite modificar electrónicamente el valor de visibilidad de la imagen superpuesta atenuando su borde. Ajuste este parámetro hasta obtener el efecto deseado sin afectar la luminancia del fondo.
Tiempo	Duración de la transición de la composición al tornarse visible o invisible en la imagen transmitida al aire.
Invertir composición	Permite invertir el canal alfa.
Composición precompuesta	Indica que el canal alfa está premultiplicado.

Transmisiones por Internet

Los mezcladores ATEM permiten transmitir directamente a través de plataformas como YouTube y Twitch mediante botones especiales en el panel de control. Para comenzar la transmisión, primero es necesario configurar la clave correspondiente en el programa ATEM Software Control.

Obtención de la clave de transmisión

Esto permite seleccionar la plataforma que se desea emplear y modificar todos los ajustes relevantes. Por ejemplo, al configurar una transmisión en un canal que usará con regularidad, estos parámetros se guardarán en la memoria del mezclador, lo que brinda la oportunidad de conectarlo a Internet en cualquier momento y comenzar a transmitir directamente desde el dispositivo.

Este apartado brinda información acerca de cómo configurar los ajustes para las plataformas YouTube Studio y Twitch.

SUGERENCIA: Al configurar los ajustes de la transmisión, se recomienda cargar un gráfico al reproductor multimedia del programa ATEM Software Control y asignarlo a la salida principal, a fin de comprobar cómo se verá en la emisión en directo.

Configuración de ajustes para Blackmagic Cloud

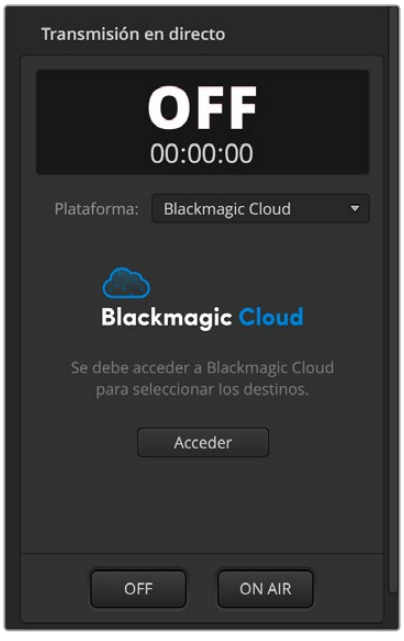
La aplicación Stream Router es una matriz de conmutación virtual que permite conectar y direccionar señales SRT y RTMP en directo a través de la plataforma Blackmagic Cloud.

Antes de comenzar la transmisión, deberá tener asignada una fuente en la matriz virtual de Blackmagic Cloud. Esto puede realizarse utilizando un perfil personal o de una organización en su cuenta de Blackmagic Cloud, o mediante una asignación otorgada por otro usuario.

Una vez configurada la fuente, podrá comenzar la transmisión.

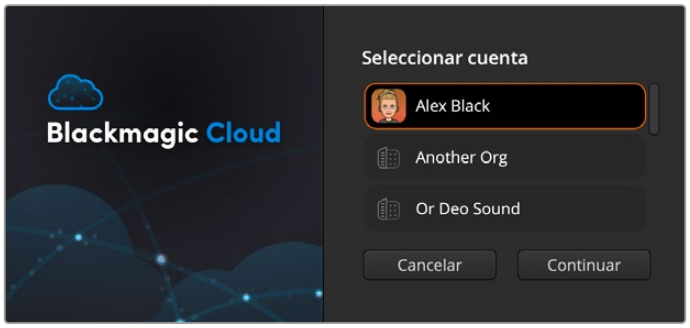
Para transmitir a Blackmagic Cloud:

1. Abra el panel de transmisión y haga clic en el menú **Plataforma**.
2. Seleccione **Blackmagic Cloud** en la lista. Si no ha iniciado sesión en Blackmagic Cloud anteriormente, haga clic en el botón **Acceder**.



3 En la ventana de acceso, escriba su dirección de correo electrónico y su contraseña en los campos correspondientes y haga clic en el botón **Acceder**. De manera alternativa, haga clic en la opción **Acceder desde el navegador**, situada en la esquina superior derecha.

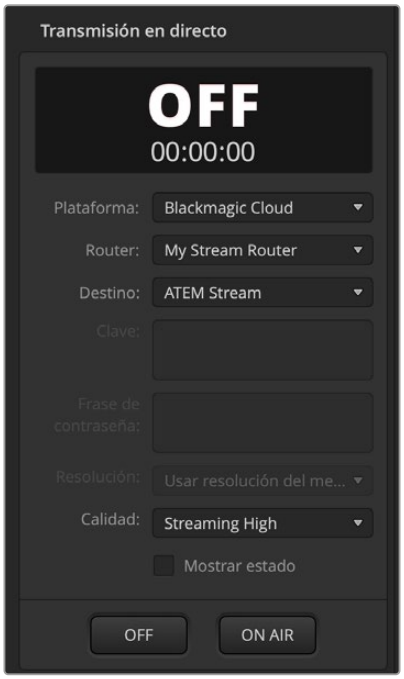
4 Seleccione el perfil de cuenta de Blackmagic que desea usar para la transmisión (personal u organización).



5 Haga clic en **Continuar** para cerrar la ventana de configuración y volver al panel de transmisión.

Una vez que haya iniciado la sesión, los destinos disponibles en la matriz de transmisión aparecerán en la lista.

6 Seleccione la matriz y el destino de transmisión en los menús correspondientes.Si solo se ha asignado un destino, el menú lo seleccionará automáticamente.



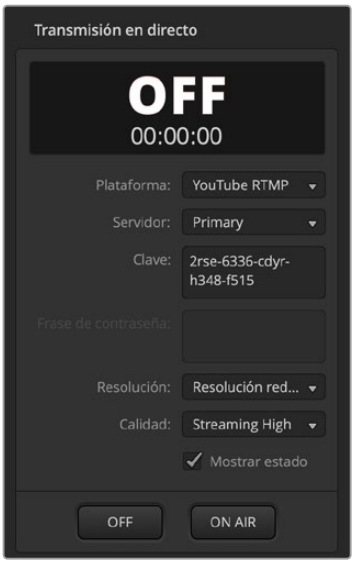
Para comenzar la transmisión, haga clic en el botón **ON AIR** en el programa o presione el botón físico en el mezclador. Al finalizar el programa, presione el botón **OFF** en el mezclador (o haga clic en el mismo en el programa informático) para detener la transmisión. Una vez seleccionada la fuente, la conexión permanecerá activa incluso si la transmisión se detiene. Si desea liberar la entrada de la matriz al finalizar la producción, seleccione **No** en la lista de matrices o destinos.

SUGERENCIA: Al configurar los ajustes de la transmisión, se recomienda cargar un gráfico al reproductor multimedia del programa ATEM Software Control y asignarlo a la salida principal, a fin de comprobar cómo se verá en la emisión en directo.

Configuración de ajustes para YouTube Studio

1. Inicie sesión en su cuenta de YouTube. En el menú **Crear**, elija la opción para transmitir en directo.
2. Elija la opción deseada para comenzar la transmisión de inmediato o posteriormente y seleccione el programa que utilizará en el menú de opciones.
3. Haga clic en **Editar** junto al título de la transmisión para modificar los datos, incluyendo el nombre, la descripción y la configuración de audiencia.
4. Configure de manera apropiada la audiencia y guarde los ajustes.
5. Aparecerá una clave de transmisión generada automáticamente en la esquina superior derecha de la ventana de vista previa; haga clic en el icono para copiarla.

A continuación, deberá pegarla en el campo correspondiente en el programa ATEM Software Control.



1. En el programa ATEM Software Control, haga clic en la pestaña **Salida**. A continuación, acceda a la opción **Transmisión en directo**.
2. En el menú desplegable, seleccione **YouTube**. Seleccione **Primario** en las opciones para el servidor.
3. En el campo **Clave**, pegue la clave generada por YouTube.
4. Seleccione la calidad de la transmisión (**Alta**, **Media** o **Baja**). La opción escogida también aplicará a la señal grabada mediante el puerto USB-C.
5. Una vez configurados todos los ajustes, recomendamos realizar una transmisión de prueba a fin de comprobar que todo funcione correctamente. Presione el botón **ON AIR** en el mezclador o haga clic en el botón **AL AIRE** en el panel de opciones para transmisiones en directo.

Está todo listo para comenzar la transmisión por YouTube Studio. Es posible que la memoria intermedia demore un tanto en iniciarse. Una vez que el proceso ha finalizado, bastará con hacer clic en el botón **Emitir en directo** en YouTube Studio para comenzar la transmisión del programa.

Con el propósito de asegurarse de que todo esté funcionando correctamente, haga clic en el ícono **Compartir**, copie el vínculo y péguelo en una pestaña o ventana nueva en su buscador. A continuación, podrá ver su transmisión como si fuera un espectador.

Al finalizar el programa, presione el botón **OFF** en el mezclador para detener la transmisión.

Configuración de ajustes para Twitch

1. Inicie sesión en su cuenta de Twitch. Haga clic en el ícono correspondiente a su usuario, en la esquina superior derecha.
2. Haga clic en la opción **Creator Dashboard**.
3. Seleccione **Stream** en las opciones de ajustes.
4. Se generará una clave primaria de manera automática. Haga clic en **Copy**.

A continuación, deberá pegarla en el campo correspondiente en el programa ATEM Software Control.

1. En el programa ATEM Software Control, haga clic en la pestaña **Salida**. A continuación, acceda a la opción **Transmisión en directo**.
2. En el menú desplegable, seleccione **Twitch**.
3. En el menú desplegable del campo **Servidor**, seleccione el más cercano.
4. En el campo **Clave**, pegue la clave generada por YouTube.
5. Seleccione la calidad de la transmisión (**Alta**, **Media** o **Baja**). La opción escogida también aplicará a la señal grabada mediante el puerto USB-C.
6. Una vez configurados todos los ajustes, recomendamos realizar una transmisión de prueba a fin de comprobar que todo funcione correctamente. Presione el botón **ON AIR** en el mezclador o haga clic en el botón **AL AIRE** en el panel de opciones para transmisiones en directo.

Ya está transmitiendo en directo. Si quiere comprobar el estado de la emisión, haga clic en el ícono de su cuenta y seleccione **Back to Twitch**. En la página principal de la plataforma, haga clic sobre su perfil y seleccione **Channel**. A continuación, podrá ver el programa en directo, y el indicador correspondiente aparecerá en la parte superior de la ventana.

Transmisión por Internet compartiendo la red del equipo informático

Una vez vinculado el programa ATEM Software Control al mezclador, es posible configurar la transmisión mediante la conexión a Internet del equipo informático. Esto permite utilizar la conexión inalámbrica del equipo informático si no se dispone de una conexión convencional.

Para configurar el mezclador a fin de controlarlo mediante el programa y transmitir directamente:

1. Conecte el mezclador al puerto Ethernet del equipo informático. Es posible que el protocolo DHCP demore un momento en detectar el dispositivo y asignarle una dirección IP.
2. Ejecute el programa ATEM Software Control.
3. A continuación, el mezclador aparecerá en la lista de equipos conectados a la red. Bastará con seleccionarlo.
4. Haga clic en **Conectar**.
5. Configure el equipo informático para compartir la conexión a Internet mediante el puerto Ethernet.

Para compartir la conexión a Internet en equipos Mac: Haga clic en **Compartir** en las Preferencias del Sistema y seleccione **Compartir Internet** en la lista de servicios. En el menú **Compartir conexión desde**, seleccione **WiFi** si el equipo informático se encuentra conectado a la red de manera inalámbrica. En la lista disponible, seleccione la opción **Ethernet**. En la lista **Servicio**, marque la casilla **Compartir Internet**. Haga clic en **Comenzar** cuando el sistema le pregunte si desea activar esta opción.

Para compartir la conexión a Internet en equipos Windows: Escriba *ver conexiones de red* en la barra de búsqueda y presione la tecla **Enter**. Haga clic con el botón derecho en la conexión de Internet y seleccione **Propiedades**. En la pestaña **Compartir**, seleccione la opción **Permitir a otros usuarios de red conectarse a Internet a través de este equipo**. Seleccione una conexión de red en el menú y haga clic en **OK**.

Los botones e indicadores del programa ATEM Software Control se encenderán. A continuación, podrá controlar el mezclador de la misma manera que a través de una conexión USB-C. La unidad está lista para transmitir directamente mediante el equipo informático.

Conexión mediante teléfonos móviles

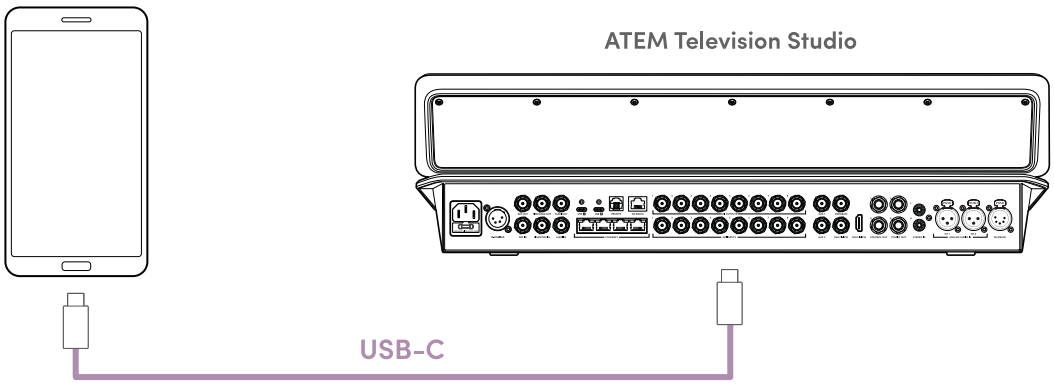
Una vez que el mezclador está configurado para transmitir por Internet a través de plataformas como YouTube o Twitch, es posible realizar la emisión directamente usando un teléfono móvil. Esta opción brinda la oportunidad de preparar el dispositivo rápidamente y comenzar a transmitir desde cualquier lugar con cobertura 4G o 5G, mediante un teléfono que permita compartir la red.

1. Simplemente conecte el teléfono a uno de los puertos USB-C del mezclador.
2. A continuación, asegúrese de que el teléfono tenga activada la opción para compartir la conexión.

En dispositivos con sistema iOS, asegúrese de que la opción **Permitir que otros se conecten** esté activada en el menú correspondiente de los ajustes para el punto de acceso personal.

En dispositivos con sistema Android, deslice el dedo hacia abajo sobre la pantalla a fin de acceder al menú rápido. Mantenga pulsado el ícono **Compartir conexión** y active el anclaje mediante la conexión USB.

A continuación, presione el botón **ON AIR** en el mezclador para comenzar a emitir al aire.



Si se ha conectado un teléfono inteligente al mezclador y a su vez este se encuentra conectado a una red Ethernet, es posible establecer la conexión prioritaria para la transmisión en el programa utilitario ATEM Setup.

Funciones adicionales en los modelos ISO

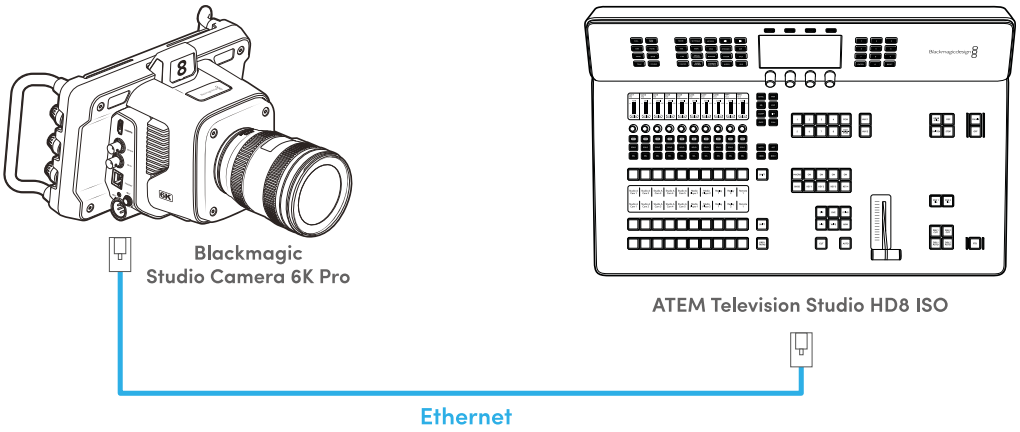
El modelo ATEM Television Studio HD8 ISO incluye prestaciones adicionales que brindan más opciones al transmitir. Por ejemplo, es posible grabar cada señal entrante de manera aislada o conectarse a fuentes remotas durante transmisiones a través de redes Ethernet. Esto facilita el uso de cámaras locales o situadas en cualquier lugar del mundo.

Algunas cámaras de Blackmagic Design, tales como los modelos Blackmagic Studio Camera 6K Pro y URSA Broadcast G2, incluyen un motor de transmisión integrado que permite enviar la señal directamente a un mezclador ATEM Television Studio HD8 ISO.

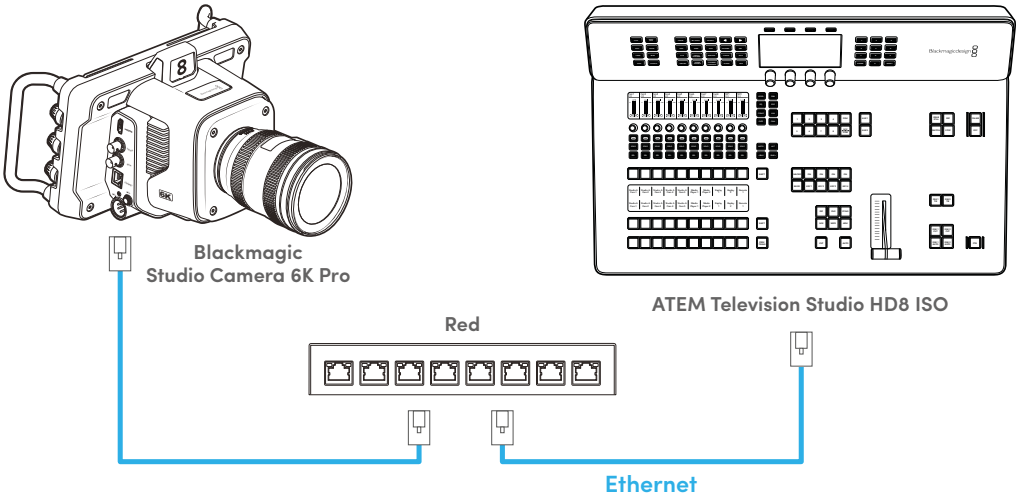
Conexión de fuentes remotas mediante una red local

Por defecto, los mezcladores ATEM Television Studio HD8 ISO y las unidades Blackmagic Studio Camera 6K Pro utilizan el protocolo DHCP. En consecuencia, después de conectar los dispositivos entre sí mediante una red Ethernet, basta con seguir unos pocos pasos para comenzar a transmitir.

Conexión directa



Conexión mediante conmutadores de red

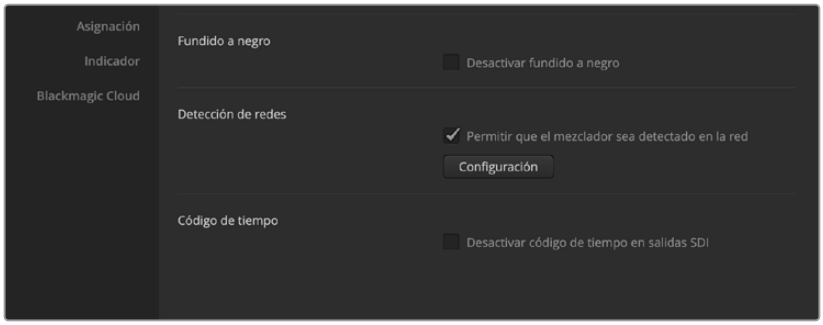


En primer lugar, es preciso verificar que el mezclador pueda ser detectado en la red. Para ello, compruebe los ajustes generales en el programa ATEM Software Control.

1 Ejecute el programa ATEM Software Control.

2 Haga clic en el ícono del engranaje situado en la esquina inferior izquierda para acceder al menú de opciones.

3 En el último ajuste de la pestaña **General**, compruebe que la opción para detectar el mezclador en la red esté marcada.

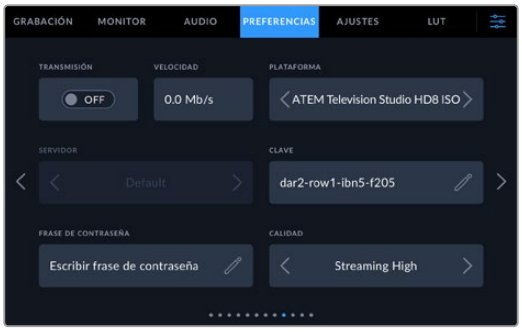


Luego de comprobar que el mezclador se vea en la red, se pueden configurar las cámaras.
Al usar una red local, el mezclador identificará cada unidad mediante el nombre asignado en la claqueta virtual. Por consiguiente, al conectar diversas fuentes, es recomendable asignar un nombre distinto a cada cámara (por ejemplo, A, B y C, o Cam 1, Cam 2, etc.) con el propósito de facilitar su identificación. Consulte el apartado *Ingreso de metadatos* para obtener más información al respecto.

Para comenzar a transmitir desde la cámara:

1 Presione el botón **MENU** de la cámara y pulse la pestaña **PREFERENCIAS**.

2 Acceda a los ajustes de transmisión y seleccione el modelo ATEM Television Studio HD8 ISO en la opción **Plataforma**.



3 Pulse el botón **Transmitir** para comenzar la transmisión. El indicador de señal al aire se encenderá de color azul. Si se ha activado la opción para ver los datos de la transmisión en la cámara, la velocidad de transferencia se mostrará en la pantalla de la unidad.

Selección de fuentes

Una vez comenzada la transmisión desde la cámara, es posible seleccionarla desde la pestaña de fuentes en el programa ATEM Software Control.

Para seleccionar una fuente remota:

1 En el menú de ajustes del programa ATEM Software Control, seleccione la pestaña **Fuentes**.

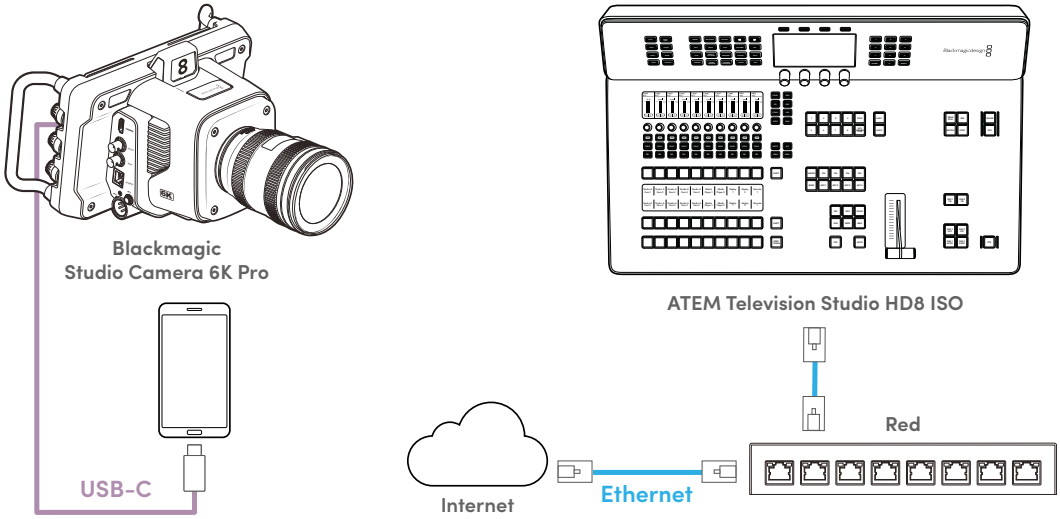
2 Haga clic en el menú junto a la entrada 1. La cámara aparecerá en la lista con el nombre asignado en la claqueta virtual.

3 Seleccione la fuente. Una vez elegida la entrada, será posible ver la señal proveniente de la cámara, al igual que cualquier otra señal SDI.

Para activar el control de cámaras y activar la luz piloto, el número identificatorio de la unidad debe configurarse de forma que coincida con el de la entrada asignada en el mezclador. De esta forma, la cámara detectará la señal que permite encender la luz piloto cuando se encuentra al aire. Asimismo, será posible controlar la unidad desde el mezclador y realizar diversos ajustes mediante el programa ATEM Software Control. Los modelos Blackmagic Studio Camera configuran la identificación de la unidad de manera que coincida con el número de la entrada una vez que esta se asigna y la cámara comienza a transmitir. En el caso de las demás cámaras, el número identificatorio solo puede cambiarse cuando la cámara no está transmitiendo. Por consiguiente, quizás sea preciso detener la transmisión y reiniciar la unidad luego de efectuar tal cambio. Consulte el manual de la cámara a fin de obtener más información al respecto.

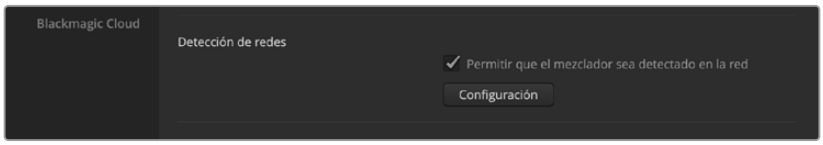
Conexión de fuentes remotas mediante Internet

El modelo ATEM Television Studio HD8 ISO permite utilizar fuentes remotas ubicadas en cualquier lugar del mundo. De este modo, un usuario puede transmitir la señal de la cámara a través de Internet, empleando una conexión Ethernet fija o el anclaje a red de un teléfono inteligente. A su vez, el programa ATEM Software Control brinda la oportunidad de generar una clave con el propósito de exportar un archivo XML que contiene toda la información relativa a la conexión. Al enviar dicho archivo por correo electrónico al camarógrafo, este puede importarlo desde la cámara y comenzar la transmisión de inmediato.



El primer paso para generar una clave de transmisión es confirmar que el mezclador esté visible para las redes externas.

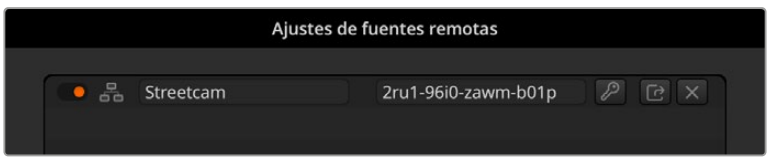
1. Ejecute el programa ATEM Software Control y acceda a las opciones de configuración mediante el ícono del engranaje en la esquina inferior izquierda.
2. Seleccione la pestaña **General** y haga clic en **Configuración** en los ajustes de detección de red.



3. Haga clic en el botón **Detectar**. El mezclador analizará la conexión a Internet y mostrará la dirección IP pública del equipo, el puerto seleccionado y el estado de la conexión. Si el indicador dice *visible globalmente*, podrá proceder. Si aparece un mensaje relativo a un error en el redireccionamiento del puerto, es posible que sea preciso modificar la configuración de la red o solicitarle al proveedor de Internet o al administrador de red que establezca el redireccionamiento de puertos de la conexión como *TCP Port 1935*. Esto es muy sencillo.

4. Una vez que el mezclador pueda ser detectado en la red, haga clic en **Aceptar**. Ahora puede generar una clave de transmisión mediante la pestaña de fuentes en la ventana de ajustes.
5. Seleccione **Fuentes** a la izquierda y haga clic en **Ajustes de fuentes remotas** en la parte inferior de la ventana.

6. Haga clic en **Agregar fuente** en la parte inferior de la ventana. Aparecerá una clave en la ventana de configuración. Es posible cambiar el nombre de la fuente haciendo clic en el campo de texto. Esto puede facilitar la identificación de la fuente remota al seleccionarla en la pestaña **Fuentes**. Al hacer clic en el ícono de la llave, se genera una nueva contraseña.



7. Haga clic en el botón **Compartir** y siga las instrucciones para guardar la configuración en un archivo XML. A continuación, envíe dicho archivo al camarógrafo mediante un correo electrónico, a fin de que pueda copiarlo a una unidad USB o una tarjeta SD para importarlo desde la cámara.

8 Después de generar la clave de transmisión, la fuente puede seleccionarse en el menú de entradas. Esto permite asignar la entrada antes de que la cámara remota comience la transmisión. Una vez que esta se inicie, la señal podrá verse en la pantalla. En la pestaña **Entrada** de la ventana **Fuentes**, elija una entrada y, en el menú emergente, haga clic en el nombre de la fuente correspondiente a la clave de transmisión exportada.

9 Además de enviarle al camarógrafo un correo electrónico con la clave de transmisión, puede indicarle la entrada asignada para que el número identificatorio de la cámara coincida con esta. Si dicho número coincide con el número de la entrada, la luz piloto se activará cada vez que esta se encuentre al aire. Asimismo, será posible controlar la unidad desde el mezclador o el programa ATEM Software Control y realizar diversos ajustes. El número identificatorio de la unidad en los modelos Blackmagic Studio Camera se actualiza automáticamente una vez que la cámara se asigna a una entrada y comienza a transmitir.

Consulte el manual del modelo de cámara correspondiente a fin de obtener más información al respecto.

Conexión de fuentes desde Stream Router

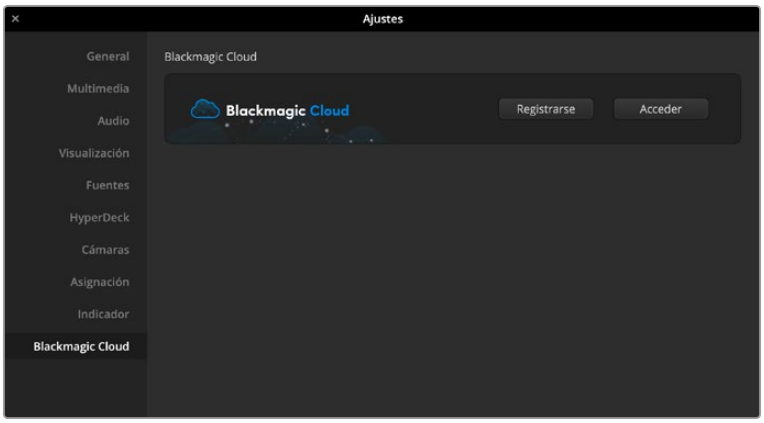
La aplicación Stream Router es una matriz de conmutación virtual que permite conectar y direccionar señales SRT y RTMP en directo a través de la plataforma Blackmagic Cloud. Además, es compatible con funciones de control de cámaras y luz piloto.

Antes de poder conectar una fuente, necesitará tener asignada una salida de la matriz en Blackmagic Cloud. Esto puede realizarse utilizando un perfil personal o de una organización en su cuenta de Blackmagic Cloud, o mediante una asignación otorgada por otro usuario.

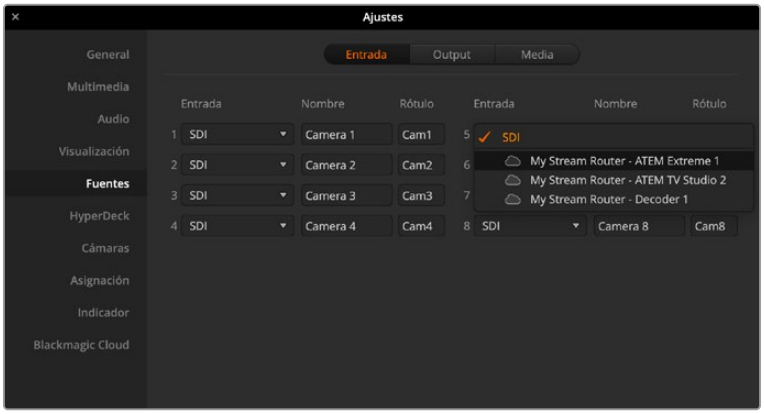
Una vez configurada la salida, esta puede añadirse mediante la pestaña de fuentes.

Añadir una fuente desde la matriz:

1 El primer paso es asegurarse de haber iniciado sesión en Blackmagic Cloud.



2 Una vez iniciada la sesión, seleccione la pestaña **Fuentes**. Haga clic en el menú junto a la entrada a la que desea conectarse (en este ejemplo, la entrada 5). Las salidas de la matriz que se le hayan asignado aparecerán en la lista con el ícono de una nube a la izquierda del nombre. A continuación, figuran el nombre de la matriz y de la salida.



3 Ahora debería poder ver las imágenes transmitidas en el modo de visualización simultánea. Si no aparece nada, es posible que deba confirmar si se ha direccionado una fuente a la matriz en Blackmagic Cloud. La entrada conectada aparecerá arriba del nombre de la salida.

Repita estos pasos para añadir hasta 8 fuentes de transmisión al modelo ATEM Television Studio HD8 ISO.

SUGERENCIA: Al elegir una fuente de la matriz, la conexión se mantiene incluso después de cerrar la sesión. De este modo, la próxima vez que inicie sesión en Blackmagic Cloud en el mismo mezclador, la entrada de la matriz ya estará configurada.

Si desea liberar dicha salida para que otros equipos (por ejemplo, una unidad Blackmagic Streaming Decoder o un mezclador ATEM Mini Extreme ISO G2) puedan usarla, simplemente cambie la entrada a cualquier fuente HDMI. Eso es todo lo necesario para liberarla.

Si olvidó cambiar la entrada antes de cerrar la sesión, acceda a Blackmagic Cloud a través de un navegador web, cambie la asignación del usuario de la matriz a **No asignado** y luego vuelva a asignársela.

Si otra persona le asignó originalmente la salida, deberá comunicarse con su administrador de Blackmagic Cloud o con el usuario con permisos de configuración para que la reasigne.

Grabación de archivos ISO

El modelo ATEM Television Studio HD8 ISO permite grabar en archivos individuales cada una de las señales recibidas a través de las distintas entradas.

De manera predeterminada, este modelo graba un archivo de la señal transmitida mediante la salida principal. No obstante, al grabar cada señal por separado, se crea una carpeta que contiene las imágenes correspondientes a cada una de las fuentes, los archivos de audio y un proyecto de DaVinci Resolve.

Cómo grabar señales aisladas

Para crear una carpeta con archivos correspondientes a cada señal, basta con acceder a la pestaña **Grabación** del programa ATEM Software Control y seleccionar la opción **Grabar fuentes aisladas**. Al hacer clic en el botón **Grabar** o presionar el botón respectivo en el panel frontal del mezclador, se creará una carpeta con el contenido.

Para grabar cada señal independientemente, marque la casilla **Grabar fuentes aisladas** en la pestaña **Grabación** del programa ATEM Software Control.

Es importante usar un soporte de almacenamiento que sea lo suficientemente rápido. En tal sentido, se aconseja emplear memorias flash, ya que a menudo los discos mecánicos no brindan la velocidad necesaria para grabar las nueve señales de alta definición en archivos H.264. Visite nuestra página de soporte técnico para consultar una lista actualizada de modelos recomendados.

Nota Si el formato de funcionamiento del mezclador es entrelazado –por ejemplo, 1080i60–, la función de grabación aislada no estará disponible.

¿Qué contiene la carpeta ISO?

La carpeta adopta el nombre ingresado en el panel **Grabación** del programa ATEM Software Control. A pesar de que incluye los archivos correspondientes a cada fuente, también contiene una grabación del programa. Al grabar señales aisladas, estos se guardarán en dicha carpeta junto con los demás.

Los archivos correspondientes a las señales aisladas se guardan en una carpeta denominada **Video ISO Files**. Cada uno de ellos contiene las imágenes de la fuente conectada a una entrada SDI específica. Además, incluyen el código de tiempo sincronizado y los metadatos con el número de cámara, lo cual facilita la posterior edición del material. El audio también se encuentra registrado en estos archivos.

Dado que los archivos incluyen información sobre el número de cámara y el código de tiempo, es posible emplear la bandeja de sincronización de DaVinci Resolve para seleccionar un plano rápidamente y realizar el montaje.

Asimismo, cabe destacar que los gráficos que contiene el panel multimedia se guardan automáticamente en una subcarpeta denominada **Media Files**, dentro de la carpeta **Video ISO Files**. Esto permite modificar los títulos utilizados durante el programa en directo.

Por otra parte, también se graba el audio de cada fuente y del micrófono conectado en archivos WAV. Estos se guardan en una subcarpeta denominada **Audio Source Files** e incluyen el audio en formato estéreo, sin ningún tipo de procesamiento o ecualización.

De esta forma, es posible crear una mezcla de audio profesional con programas informáticos especializados. Los archivos también incluyen el código de tiempo, de manera que están sincronizados con las imágenes.

Uno de los archivos más importantes que contiene la carpeta es el que corresponde al proyecto de DaVinci Resolve. Este se crea a partir de las acciones realizadas con el mezclador desde el comienzo de la grabación. Al abrirlo en DaVinci Resolve, se muestra una línea de tiempo que incluye todos los cambios de plano.

Actualmente, es posible grabar cortes y transiciones entre distintas fuentes, así como composiciones posteriores con títulos, y el contenido reproducido desde el reproductor multimedia. Estas son las funciones empleadas con mayor frecuencia y podrán editarse en DaVinci Resolve. En el futuro, añadiremos nuevas prestaciones.

Grabación en un mismo archivo

Si el nombre del proyecto no se modifica, al grabar, el material se agregará al contenido del archivo previamente guardado en el disco. Esto resulta de gran utilidad, ya que permite hacer una pausa y continuar el rodaje más adelante. Ambas grabaciones aparecerán en la misma línea de tiempo, y es posible juntarlas para que el espectador no note la interrupción. Si no desea emplear esta función, cambie el nombre del proyecto o utilice otra unidad de almacenamiento.

Ventajas de editar material transmitido

Existen varias ventajas al editar material que ha sido transmitido. Algunas de las modificaciones necesarias pueden realizarse con gran rapidez para renderizar un nuevo archivo final antes de subirlo a Internet, es decir, permite efectuar cambios adicionales a los de la emisión en vivo.

Por otra parte, la función para grabar señales aisladas brinda la oportunidad de crear programas más rápido, ya que es posible transmitir imágenes con distintos ángulos de cámara a los puestos de edición.

Al abrir el proyecto en DaVinci Resolve, se recrea toda la producción en la línea de tiempo, lo cual permite editarla al instante y realizar cambios creativos de manera rápida antes de subir el programa a Internet.

¿Qué hay en las capas?

El procesamiento en un mezclador normalmente comienza en las entradas, en la izquierda del panel de control, y finaliza en la derecha, donde están las salidas y otras funciones. Esto se debe a que la dinámica de trabajo para producciones en directo con los mezcladores empieza en las entradas. Luego se utilizan las funciones del dispositivo para, finalmente, transmitir la señal del programa.

Los procesos de edición son un tanto diferentes, ya que se obtiene una pila de capas provenientes del programa de edición. La capa de más abajo está cubierta por otras. Esto significa que cualquier clip en la capa 2 cubrirá a otro en la capa 1. En general, los profesionales al editar colocan los cortes y disolvencias en la capa 1, a pesar de que otros ajustes estarán en las capas superiores. Cualquier clip en la tercera capa cubrirá los de la primera y la segunda. En ediciones complejas, se pueden emplear decenas de capas.

De este modo, para entender lo que DaVinci Resolve realiza con el archivo del proyecto una vez importado, basta con abrirlo a fin de comprobar los distintos tipos de procesamiento que se han llevado a cabo en las diferentes capas de edición.

Capa 1	La capa 1 incluye todos los cambios principales entre las fuentes y todos los clips. A veces, los puntos de edición son cortes y, en otras ocasiones, disolvencias. Esta capa se crea a partir de la señal principal del mezclador. Todas las modificaciones, las fuentes y las capturas estarán en la primera capa.
Capa 2	La capa 2 está destinada a las composiciones posteriores. En los mezcladores ATEM, las composiciones posteriores están situadas después del bloque de transiciones. En la edición, esto significa que aparecerán en la segunda capa, lo que brinda la posibilidad de anteponerlas a la imagen principal en la capa 1. Por ejemplo, si se emitió al aire un gráfico con el canal alfa en una composición posterior, se agregará dicho título a la señal transmitida. Este se encuentra en la segunda capa y remplaza el mismo gráfico con canal alfa en la capa 1.
Capa 3	La capa 3 es para los fundidos a negro. Un fundido a negro es la última etapa del procesamiento en el mezclador y atenúa todas las capas hasta mostrar una imagen en negro. Normalmente, esta función se emplea al final del programa o para introducir una pausa publicitaria. La razón por la que se encuentra en la tercera capa es debido a que se antepone a las de más abajo, tal y como sucede en el mezclador. El fundido a negro es un generador de una señal en negro con una disolvencia aplicada al principio y al final.

Mover puntos de edición

Una ventaja de este proceso es que se pueden mover los puntos de edición. Al realizar una producción en directo, todo puede suceder rápidamente, y es complicado seguirel ritmo, por ejemplo, en una entrevista con varios invitados que hablan deprisa y se interrumpen unos a los otros. Durante una transmisión en vivo, esto puede resultar dificultoso.

La posibilidad de mover los puntos de edición permite colocarlos justo antes de que una persona comience a hablar. En una producción en directo, es necesario seguir el ritmo a fin de que los cortes no estén muy retrasados una vez que la persona está hablando. Sin embargo, ahora es posible ajustar el tiempo, por lo que, en la edición, el corte sucederá justo antes de la intervención del invitado. Esto permitirá transformar el estilo del programa.

Para desplazar el punto de edición hacia adelante, basta con seleccionarlo en la línea de tiempo y moverlo a la posición correcta en la línea de tiempo inferior. La barra de herramientas se duplicará. Al hacer clic y arrastrarlo hacia la izquierda, el punto de edición se adelanta. Al hacer clic y arrastrarlo hacia la derecha, se retrasa.

Asegúrese de no hacer clic sobre las flechas en la barra de herramientas, puesto que son opciones de recorte. Conforme se mueve el puntero sobre los puntos de edición, se puede apreciar como las herramientas cambian automáticamente. De este modo, si se emplean dichas herramientas, se aumentará o disminuirá la duración de toda la pista, y el audio en la pista verde de abajo quedará desincronizado.

Remplazar una toma

La bandeja de sincronización brinda la posibilidad de buscar tomas que coincidan con el punto seleccionado en la línea de tiempo. Esto significa que se pueden solucionar situaciones en las que se realizó un corte de cámara incorrecto, o buscar tomas mejores, puesto que se cuenta con más tiempo para ver las alternativas.

Para usar la bandeja de sincronización, basta con seleccionarla en la parte superior izquierda del módulo Montaje. Una vez seleccionada, se abrirá el panel multimedia en dicho lugar, y el visor cambiará. El panel multimedia mostrará una línea de tiempo con los clips disponibles, y en el visor aparecerán las distintas tomas que corresponden al punto donde se encuentra el cursor en la línea de tiempo. Al desplazarse por la línea de tiempo, dichas tomas cambiarán.

La bandeja de sincronización es como un asistente de edición que busca las tomas y las muestra simultáneamente, a fin de que se puedan editar.

El número de la cámara se indica en los metadatos, ya que el modelo ATEM Television Studio HD8 ISO puede determinar a qué entrada corresponde la imagen y además graba dicha fuente en un archivo. Es decir, la cámara 1 en la bandeja de sincronización es la fuente conectada a la entrada 1 del mezclador, la cámara 2 a la entrada 2, y así sucesivamente.

Para seleccionar una imagen alternativa, se deben seguir dos pasos. Primero, es necesario elegir la toma y marcar un punto inicial y otro final. En segundo lugar, se debe editar la línea de tiempo, remplazando la existente.

Desplácese al inicio de la toma que desea remplazar, puesto que editará sobre la misma. Las tomas alternativas se mostrarán en el visor, de manera que se pueden observar las opciones y todos los archivos que se grabaron de las fuentes conectadas a las entradas del mezclador.

A continuación, haga clic en la toma precisa para verla en modo de pantalla completa. Además, habrá un punto inicial ya marcado en la posición del cabezal en la línea de tiempo, y otro de salida situado cuatro segundos después. Es poco probable que quiera este último en ese sitio preciso, por lo que basta con desplazarlo a lo largo de la línea de tiempo hasta dar con el lugar deseado y, a continuación, presionar la tecla **O** para moverlo hasta dicha posición.

En caso de no haber seleccionado la toma correcta, presione la tecla **Esc** para volver al modo de visualización simultánea y seguir buscando la adecuada.

Una vez que se selecciona la toma, es necesario agregarla a la línea de tiempo mediante el uso del modo **Sobrescribir original**. Los distintos modos de edición se encuentran en el centro, debajo del panel multimedia. Para ver el nombre de cada uno, basta con colocar el puntero sobre cada botón.

El modo **Sobrescribir original** analiza el clip seleccionado, luego la línea de tiempo, y lo añade de manera tal que coincida exactamente con el código de tiempo. Esto significa que todas las tomas que se editen en la línea de tiempo de este modo estarán sincronizadas a la perfección. Además, no es necesario marcar puntos de inicio y fin en la línea de tiempo, dado que es posible buscar distintas tomas y agregarlas como planos de recurso.

El modo **Sobrescribir original** siempre superpone el clip en la capa por encima del clip seleccionado en la línea de tiempo. Si esta no existe, primero la crea y luego añade el clip. En consecuencia, es fácil encontrar planos de recursos que están en las capas superiores, encima de la versión original.

Basta con desplazarse por la línea de tiempo, seleccionar los planos de recurso en el visor de la bandeja de sincronización y remplazar las tomas según sea necesario.

Agregar disolvencias

Otra herramienta excepcional de edición es la posibilidad de añadir disolvencias adicionales a la línea de tiempo. Habitualmente, al transmitir con un ancho de banda bajo, estas transiciones tienen una apariencia poco agradable. Por lo tanto, quizás no se recurra a ellas durante una transmisión en directo. Sin embargo, al cargar el programa, es posible que desee añadir más transiciones a fin de lograr una mayor elegancia y fluidez en el material grabado.

Ahora es posible añadir disolvencias para lograr una mayor fluidez. DaVinci Resolve permite arrastrar transiciones desde el panel correspondiente hasta cada punto de edición, aunque hay una manera más rápida de llevar a cabo esta tarea. En la esquina inferior derecha del panel multimedia, en el módulo Montaje, hay tres botones para transiciones. Uno elimina una transición y convierte el punto de edición en un corte, mientras que el botón central agrega una disolvencia. Es posible desplazarse por la línea de tiempo y hacer clic en dicho botón para añadir otras disolvencias.

Si observa la escala de la línea de tiempo, notará un pequeño marcador en forma de triángulo que se mueve hacia arriba y abajo. Esto muestra el punto de edición que DaVinci Resolve considera como el más adecuado para añadir la transición. Es decir, no es necesario marcar un punto de inicio, ya que, al hacer clic en este botón, se agregan automáticamente. Es un proceso sumamente rápido y sencillo.

Eliminar partes monótonas o errores

A veces, algunas partes de un programa resultan un tanto monótonas, o quizás haya sido necesario hacer una pausa debido a un error. La función **Dividir** permite eliminar estas secciones. A la izquierda, debajo del panel multimedia, hay un ícono similar a unas tijeras. Haga clic en el mismo para dividir todas las capas en la línea de tiempo. Al hacer clic en los clips entre los cortes, es posible presionar la tecla **Delete** para eliminarlos y, en consecuencia, se cerrará el espacio vacío en la línea de tiempo automáticamente.

Es evidente lo fácil que es solucionar problemas en un evento en directo. A continuación, haga clic en el botón **Exportación rápida**, situado en la esquina superior derecha del módulo Montaje, para obtener un nuevo archivo principal con todos los cambios aplicados.

Edición con DaVinci Resolve

A fin de entender cómo funciona DaVinci Resolve, recomendamos mirar algunos de los tutoriales disponibles en nuestro sitio web y descargar la versión gratuita para practicar. Este programa muy sofisticado es utilizado por los estudios cinematográficos más importantes de Hollywood. Sin embargo, es mucho más sencillo aprender las funciones del módulo Montaje. Consulte nuestro sitio web para obtener más información al respecto.

Grabación en cámaras

El modelo ATEM Television Studio HD8 ISO permite controlar unidades Blackmagic Studio Camera 4K Pro, URSA Mini Pro y URSA Broadcast G2 mediante un segundo cable SDI que conecta una de las salidas SDI del mezclador a la entrada respectiva en las cámaras. Asimismo, brinda la posibilidad de controlar cámaras conectadas de forma remota a través de Internet o una red local Ethernet.

Esto permite etalonar y modificar los ajustes del objetivo mediante el panel de control de cámaras en el programa ATEM Software Control. Consulte el apartado correspondiente para obtener más información al respecto.

Otra ventaja de este control es la posibilidad de seleccionar el ajuste **Grabar en todas las cámaras** en el panel **Grabar** con el propósito de grabar las señales de todas cámaras en un disco USB.

El beneficio de grabar las señales todas las cámaras es que estas se guardan en Blackmagic RAW, un formato con una colorimetría característica de las películas, la cual es ideal para aplicar ajustes cromáticos avanzados. Estos archivos tienen una resolución 4K, por lo que permiten masterizar toda la producción en UHD. A pesar de que estos mezcladores admiten solo señales en definición estándar, igualmente brindan la posibilidad entregar contenidos en UHD para su posterior transmisión por Internet o televisión.

Las conexiones a la cámara transmiten el código de tiempo, así como el número de la unidad e información sobre el nombre del archivo. De este modo, los archivos Blackmagic RAW estarán sincronizados según el código de tiempo del mezclador, lo cual facilita su uso.

Asegúrese de seleccionar el ajuste **Grabar en todas las cámaras** del panel **Grabar** a fin de grabar en formato Blackmagic RAW en todas las unidades. A continuación, es necesario copiar dichos archivos del mezclador en la carpeta **Video ISO Files**. Esto es importante, dado que DaVinci Resolve debe detectar estos archivos al abrir por primera vez el proyecto.

No obstante, el problema al utilizar los archivos generados por el mezclador y los de la cámara en formato Blackmagic RAW es que estos coinciden. Ambos tienen el mismo código de tiempo y número de cámara. De todas maneras, esto no es un inconveniente, ya que DaVinci Resolve utilizará los archivos del mezclador por defecto.

Para emplear los archivos Blackmagic RAW con mayor resolución en un proyecto, seleccione el botón correspondiente a los originales de la cámara, situado en la esquina superior derecha del módulo Montaje. El ícono es similar a una pequeña cámara. Al hacer clic sobre el mismo, es posible

ver el cambio en la línea de tiempo, dado que se utilizan los archivos Blackmagic RAW, los cuales presentan una colorimetría característica de las películas.

Para mejorar las imágenes, puede resultar necesario etalonarlas. Debido a que los archivos Blackmagic RAW no presentan ajustes cromáticos, es posible utilizar las excepcionales herramientas de DaVinci Resolve a fin de lograr una estética extraordinaria.

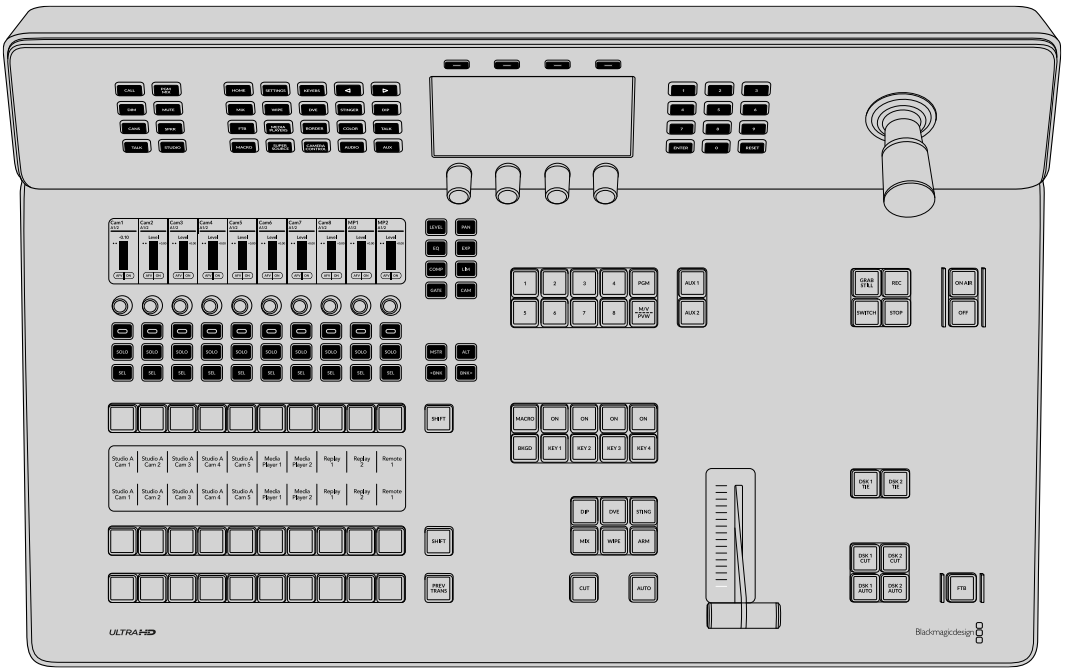
Para entregar contenidos en UHD, basta con seleccionar el menú **Resolución** junto al ícono de los originales de la cámara, el cual permite elegir diferentes resoluciones y relaciones de aspecto. El primer ajuste corresponde a la dicha resolución. Una vez seleccionado, las imágenes del proyecto se verán más nítidas.

La resolución de cualquier señal que no provenga de la cámara se aumenta automáticamente, por ejemplo, diapositivas de un equipo informático, al igual que la de las imágenes en definición estándar almacenadas el panel multimedia. Si se desea, es posible sustituir estas imágenes por versiones de mayor resolución de los gráficos en el panel multimedia.

A continuación, todo lo que resta hacer es utilizar la función **Exportación rápida** para masterizar en UHD.

Palanca de mando del modelo ATEM Television Studio 4K8

La palanca de mando dispone de 3 ejes y se utiliza para ajustar el tamaño y la posición de las imágenes superpuestas, los efectos visuales digitales y otros elementos. Asimismo, permite controlar cabezales remotos mediante el protocolo VISCA.



Control mediante la palanca de mando

Control de cámaras mediante la palanca de mando

La palanca de mando brinda la posibilidad de controlar un cabezal remoto conectado al mezclador a través del protocolo VISCA.

Esto permite ajustar de forma remota tanto el movimiento vertical y horizontal de la cámara como la distancia focal. Incluso es posible controlar varias unidades simultáneamente presionando el botón de control y seleccionando a continuación cada una mediante el mando giratorio. Realice los ajustes necesarios moviendo la palanca de mando.

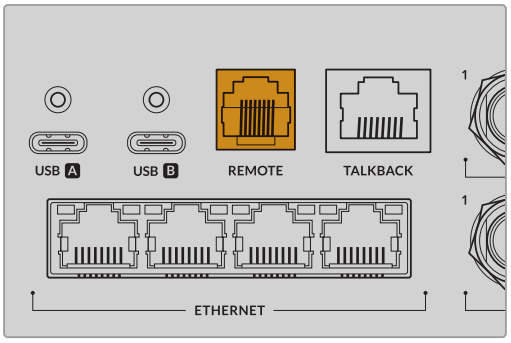
Asimismo, es posible elegir la inclinación de la dirección mediante las opciones **Normal** e **Invertida** en el grupo de ajustes respectivos del menú de configuración del panel. Cabe destacar que esta última invierte el funcionamiento de la palanca.

Conexión de cabezales remotos

En el modelo ATEM Television Studio 4K8, la comunicación con los cabezales remotos se realiza mediante el puerto RS-422 del mezclador, denominado **Remote**. Por lo general, para este tipo de conectividad se utilizan terminales RJ12 similares a los conectores tradicionales empleados en las líneas de telefonía fija.

Por otro lado, es necesario seleccionar la opción **VISCA** o **GVG** para el puerto RS-422 del mezclador mediante el menú **Puerto serial** en la pantalla del dispositivo.

Al emplear varios cabezales remotos, estos se conectan generalmente en serie a través de las entradas y las salidas RS-422 de cada unidad.



Configuración del mecanismo PTZ en cabezales remotos

Es posible configurar estas opciones mediante el menú de ajustes en la pantalla del dispositivo. Presione las flechas o el botón **8** en el teclado numérico para ver el menú de ajustes del puerto remoto y seleccionar la opción **VISCA**. Determine la velocidad en baudios de manera que coincida con la de la cámara PTZ. Consulte el manual de la cámara para obtener más información al respecto.

Al presionar el botón **CAMERA CONTROL**, es posible acceder a los ajustes para la cámara y seleccionar tanto el protocolo de control como la unidad cuyos ajustes se desea modificar. En primer lugar, es necesario comprobar que todas las cámaras conectadas hayan sido detectadas.

Para detectar los dispositivos conectados:

1. Presione el botón junto a la opción **VISCA**.
2. Presione el botón **Detect**.

La pantalla mostrará el nombre de la primera cámara conectada al mezclador (Camera 1). Pueden seleccionarse otras unidades conectadas girando el mando junto a la opción **CÁMARA**. La numeración es consecutiva, desde la primera unidad conectada hasta la última.

Si la cantidad de cámaras conectadas que aparecen en la pantalla no concuerda con el número de conexiones físicas, verifique que todos los cabezales estén recibiendo suministro eléctrico y que los puertos RS-422 estén bien conectados. Una vez que todas las cámaras hayan sido detectadas, seleccione cualquiera de las unidades mediante los botones contextuales y realice algunos ajustes sencillos con la palanca de mando para comprobar que todo funcione correctamente.

SUGERENCIA: Por defecto, las cámaras se controlan mediante una señal SDI. Asegúrese de seleccionar la opción **VISCA** al utilizar dicho protocolo con cabezales remotos.

Control PTZ mediante conexiones SDI

También es posible controlar cabezales PTZ mediante una conexión SDI. Esto puede lograrse conectando la señal de retorno del mezclador a una cámara, y luego la salida SDI del puerto de expansión de la cámara al cabezal.

Control mediante la palanca de mando

La palanca de mando proporciona un mecanismo de control sumamente intuitivo. Gírela hacia la derecha o la izquierda para acercar o alejar la imagen. Muévala hacia arriba o abajo a fin de modificar el grado de inclinación de la cámara, y hacia la izquierda o la derecha para ampliar el ángulo de visión sobre el eje horizontal. Los controles son muy sensibles a la velocidad de movimiento de la palanca, por lo que brindan la posibilidad de realizar ajustes con facilidad. No obstante, el grado de sensibilidad puede variar según el modelo de cabezal utilizado.

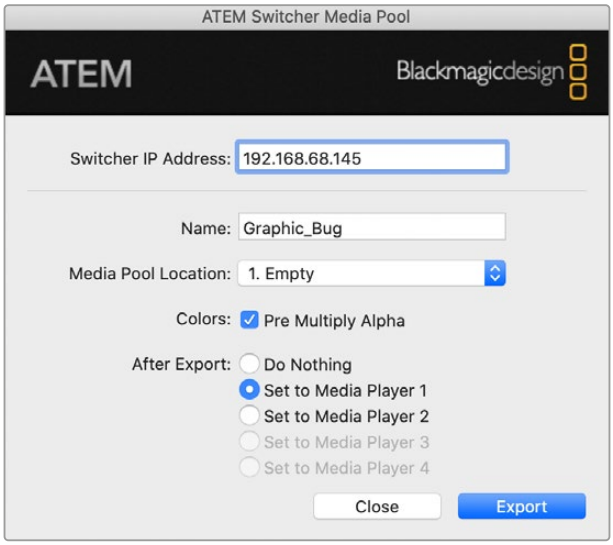
Consulte el apartado *Conexiones del puerto serial para cables de control* a fin de obtener más información al respecto.

Uso de Adobe Photoshop con mezcladores ATEM

El programa ATEM Software Control incluye un complemento para Photoshop que permite importar gráficos directamente desde el panel multimedia.

De esta forma, brinda compatibilidad con la aplicación que utilizan todos los diseñadores: Adobe Photoshop. Incluso es posible emplear las capas de una imagen en Photoshop para obtener variaciones de un mismo gráfico, por ejemplo, diferentes títulos, y luego seleccionarlas y exportarlas con un solo clic. Las capas se combinan en una sola imagen antes de ser exportadas. Sin embargo, esto sucede en segundo plano, sin afectar el documento en Photoshop.

Conviene subrayar que es necesario contar con Photoshop para poder utilizar el complemento. Se recomienda primero instalar el programa ATEM Software Control y luego Photoshop para garantizar la correcta instalación del complemento.



Complemento para exportar archivos

Configuración de la dirección IP del mezclador

Al ejecutar el complemento para Photoshop por primera vez, es necesario configurar la dirección IP del mezclador. De esta forma, el complemento podrá comunicarse con el dispositivo. La dirección IP predeterminada del mezclador es 192.168.10.240. Si desea exportar diferentes versiones del mismo archivo de Photoshop, es posible utilizar el cuadro de diálogo para cambiar el nombre de cada archivo exportado y asignarlo a uno de los reproductores multimedia.

Preparación de gráficos

A efectos de obtener mejores resultados, la resolución del archivo de Photoshop deberá coincidir con la del formato utilizado por el mezclador. Por ejemplo, para una señal HD 1080, la resolución del archivo deberá ser de 1920 x 1080 pixeles. A su vez, para el formato HD 720p, dicho valor debe ser 1280 x 720.

Al trabajar con imágenes en Photoshop para exportarlas, los contenidos deben colocarse en las capas superiores y no en el fondo. El fondo siempre debe ser una imagen negra en pantalla completa, y es necesario activar la opción para señales premultiplicadas en el mezclador si se desea superponer un elemento gráfico de Photoshop.

A modo de ayuda, hemos incluido una guía y algunas plantillas con gráficos en la carpeta **Example Graphics**, que se copia en el equipo informático al instalar el programa ATEM Software Control.

Para exportar el gráfico al panel multimedia, simplemente seleccione el menú de exportación en Photoshop y luego la opción **ATEM Switcher Media Pool**. Aparecerá una ventana para elegir la ubicación del elemento en el panel multimedia. La lista incluye todos los nombres de archivo correspondientes a los gráficos que se encuentran en el panel multimedia. Seleccione la ubicación y luego haga clic en la opción **Export**.

Si es necesario emitir el gráfico al aire en forma inmediata, es posible copiarlo directamente a cualquiera de los reproductores multimedia después de la exportación. Esto permite que la imagen se visualice en la señal emitida rápidamente. Para evitar interferir con las fuentes gráficas del reproductor multimedia, no copie el elemento gráfico.

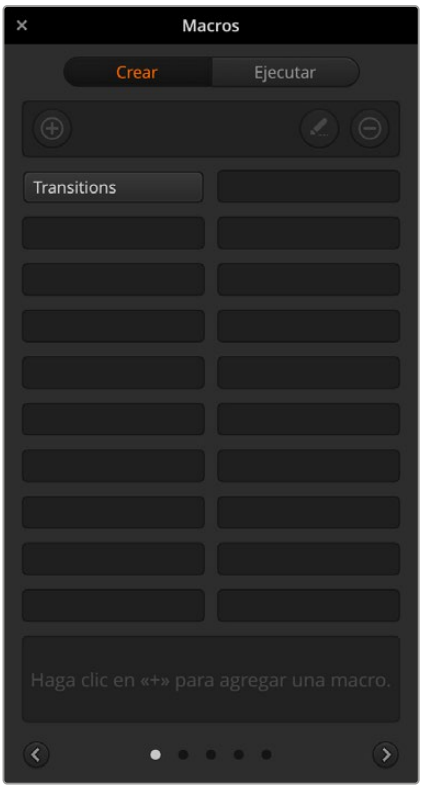
La opción para multiplicar el canal alfa casi siempre debe estar habilitada. Actívela desde el mezclador o el programa ATEM Software Control. Al realizar la premultiplicación, el color del gráfico se mezcla con su canal alfa cuando se exporta para asegurarse de que los bordes estén atenuados y se fundan con la imagen de fondo.

Macros

¿Qué es una macro?

Una macro es una secuencia de instrucciones que se llevan a cabo automáticamente al presionar un botón. Por ejemplo, es posible grabar una serie de transiciones entre distintas fuentes que incluyan imágenes superpuestas, ajustes del volumen y modificaciones en la configuración de las cámaras. Una vez registradas las instrucciones, pueden ejecutarse inmediatamente presionando dicho botón. Las macros se graban mediante el programa ATEM Software Control, el módulo de control del mezclador o ambos, y se almacenan en este último. Pueden ejecutarse desde cualquier panel de control, ya que son compatibles con todos los modelos.

Macros en el programa ATEM Software Control



Para acceder al panel **Macros** en el programa ATEM Software Control, haga clic en el menú respectivo, situado en la barra superior de la interfaz, o presione las teclas **Shift** + **Command** en Mac, o **Control** + **M** en Windows. Se abrirá una ventana que puede moverse hacia cualquier parte del escritorio. De esta forma, siempre es posible acceder a ella al cambiar entre los diferentes módulos del programa. Al grabar una macro, la ventana puede minimizarse haciendo clic en el ícono situado en la esquina superior derecha.

Las macros pueden asignarse a cualquiera de los 100 espacios disponibles. Cada página muestra hasta 20 espacios. Para desplazarse de una a otra, haga clic sobre las flechas situadas en las esquinas inferiores de la ventana. Los botones **Crear** y **Ejecutar** brindan la posibilidad de alternar entre las funciones que permiten grabar macros y ejecutarlas durante un programa en directo.

Grabación de macros

Las macros deben grabarse empleando secuencias claramente definidas de principio a fin y sin cometer errores. Esto se debe a que se registra cada ajuste modificado, botón presionado o cualquier otra acción que se lleve a cabo. Al ejecutar la macro, cada paso será repetido con la misma precisión.

Conviene subrayar que una macro solo registra los cambios realizados. Por ejemplo, si se desea realizar una transición de 3:00 segundos y el mezclador ya se encuentra configurado con este valor, será necesario modificar su duración y luego ajustarla nuevamente a 3:00 segundos para que el cambio quede registrado. De lo contrario, al ejecutar la macro, el mezclador aplicará el valor utilizado por última vez. Por este motivo, es necesario grabar las macros con suma precisión.

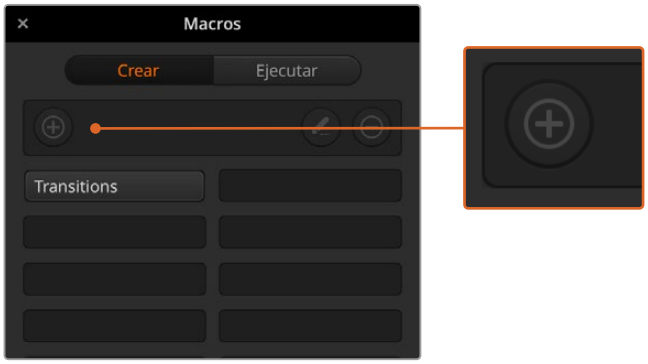
Si se modifican los ajustes al grabar una macro y se desean restablecer los valores originales, simplemente vuelva a ingresarlos al registrar los últimos pasos. Incluso es posible grabar macros para restablecer ciertos ajustes en diferentes proyectos. Existe una amplia gama de opciones en este sentido. Lo importante es no olvidar realizar todas las modificaciones necesarias para obtener los resultados deseados.

Grabación de macros en el programa ATEM Software Control

En el ejemplo proporcionado a continuación, crearemos una macro para que el mezclador lleve a cabo una disolvencia de 3 segundos entre las barras de color y un color determinado, luego haga una pausa de 2 segundos, y finalmente realice un fundido a negro con una duración de 3 segundos. Intente crear esta macro en su mezclador para familiarizarse con el proceso de grabación.

1. Ejecute el programa ATEM Software Control y acceda al panel **Macros**.
2. Haga clic en el botón **Crear macro**.
3. Haga clic en uno de los espacios disponibles para grabar macros. En este ejemplo, haremos clic en el espacio 1. Notará que aparece un borde naranja alrededor del espacio seleccionado.
4. Haga clic en el símbolo + para abrir la ventana emergente que permite crear macros.

   Es posible añadir un nombre y una descripción, si lo desea. De este modo, es más fácil organizar las macros y consultar rápidamente las funciones que realizan. Al hacer clic sobre una macro, la descripción aparecerá en el espacio situado en la parte inferior de la ventana.



Para comenzar a grabar una macro, seleccione un espacio disponible y a continuación haga clic en el símbolo **+**. Escriba la información deseada y luego haga clic en el botón de grabación.

5. Haga clic en el botón de grabación.

   La ventana emergente se cerrará y aparecerá un borde en la parte superior de la interfaz para indicar que la macro se está grabando. Asimismo, se verá el botón **AGREGAR PAUSA** en la parte superior de la pantalla.

   Una vez comenzada la grabación, puede llevar a cabo la secuencia de instrucciones en el mezclador.

El botón con el símbolo **+** cambia cuando se comienza a grabar. Al finalizar la secuencia de instrucciones, haga clic en el botón de grabación para terminar.

6 Haga clic en el botón **BARS** del bus **Programa** en la pestaña **Mezclador**. Este permite transmitir las barras de color a través de la salida principal.

7 Seleccione una opción en **Color 1** en el panel **Anticipo**.

8 Abra el panel **Transiciones** y seleccione la pestaña **Disolvencia** en la barra superior.

Si dicha opción ya se encuentra seleccionada, elija otro tipo de transición y luego haga clic en **Disolvencia** nuevamente para asegurarse de que dicha instrucción quede registrada.

9 Ajuste la duración de forma que la transición sea de 3 segundos.

10 Haga clic sobre el botón **AUTO** del módulo **Tipo de transición**. El mezclador realizará una transición entre las barras de color y el color seleccionado.

11 Para que el mezclador realice una pausa de 2 segundos antes de llevar a cabo la transición siguiente, haga clic en el botón **AGREGAR PAUSA**, situado en la parte superior de la pantalla. Aparecerá una ventana que permite añadir una pausa. Ajuste el valor a 5 segundos y 0 fotogramas. A continuación, haga clic en **Agregar pausa** para confirmar.

¿Por qué es necesario ingresar el número 5 si solo se desea realizar una pausa de 2 segundos? Esto se debe a que la transición demora 3 segundos en completarse, de modo que, al agregar una pausa, es necesario tener en cuenta tanto su duración como la de la transición previa.

En este ejemplo, la transición dura 3 segundos, y al final se desea realizar una pausa de 2 segundos, por lo tanto, el tiempo total entre una instrucción y otra es de 5 segundos. Otra forma de obtener el mismo resultado es añadir dos pausas: una que coincida con la duración de la transición, y otra a continuación con el tiempo de espera deseado. El usuario puede optar por cualquiera de estos dos métodos.

12 Seleccione la opción **Blk** en el bus de anticipos y luego haga clic sobre el botón **AUTO** del módulo **Tipo de transición**. El mezclador realizará una disolvencia al negro.

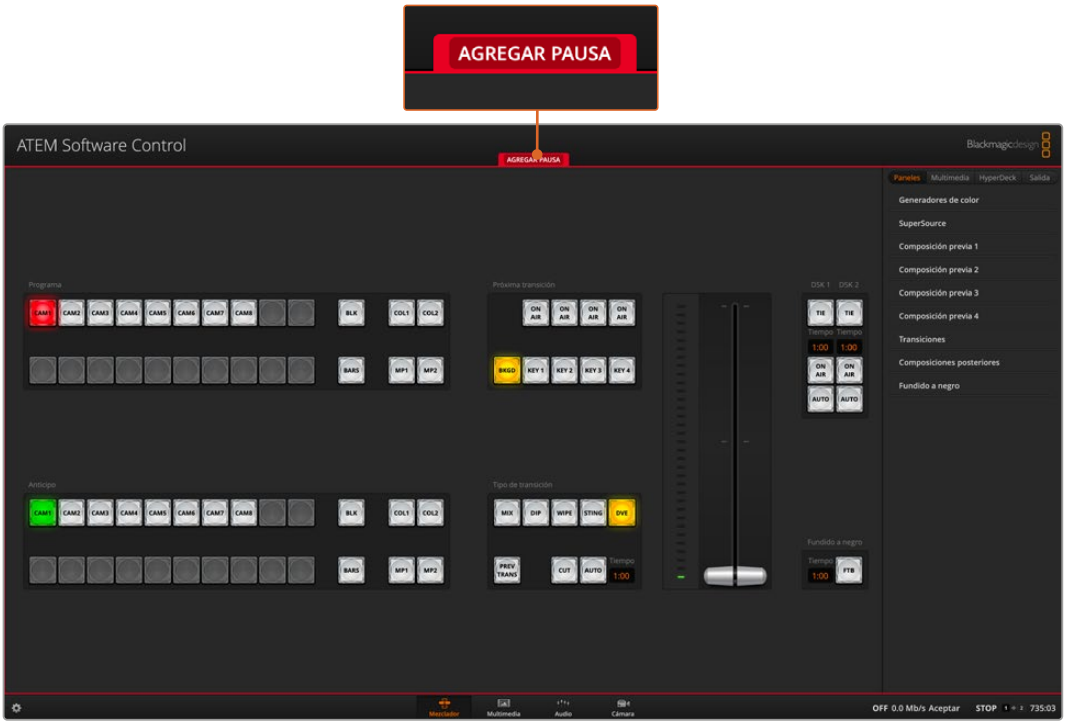
13 Haga clic en el botón de grabación de la ventana **Macros** para finalizar.

La macro creada aparecerá como un botón en el espacio seleccionado. Para ejecutarla, haga clic en el botón **Ejecutar**. La opción **Seleccionar y ejecutar** permite ejecutar la macro de forma inmediata. A continuación, haga clic sobre el botón con el nombre asignado a la macro, que en este caso es *Transitions*.

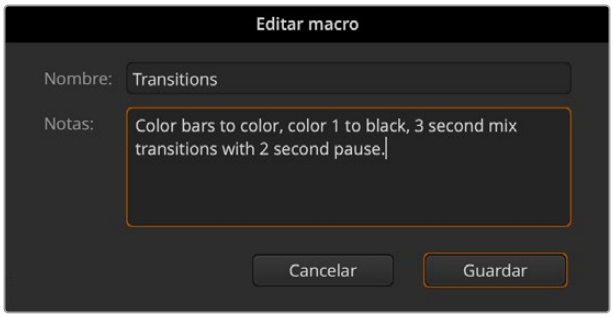
14 Para que la macro se ejecute inmediatamente una vez seleccionada, marque la opción **Seleccionar y ejecutar**. De esta forma, es posible seleccionar y reproducir la secuencia de instrucciones mediante un solo botón.

Si la macro se grabó correctamente, el mezclador realizará una disolvencia de 3 segundos entre las barras de color y el color 1, luego se detendrá durante 2 segundos, y a continuación llevará a cabo un fundido a negro con una duración de 3 segundos. Todas estas instrucciones se ejecutan presionando un solo botón en la ventana **Macros**. Asimismo, aparecerá un borde naranja alrededor de la interfaz para indicar que la macro se está ejecutando.

Si no se obtienen los resultados esperados, grabe la macro otra vez siguiendo los pasos descritos anteriormente.



El borde rojo en la parte superior de la interfaz indica que se está grabando una macro. El botón **AGREGAR PAUSA** permite añadir pausas de distinta duración entre una instrucción y otra.



Escriba un nombre y una descripción para facilitar la identificación de las instrucciones que componen la macro.

Creación de macros complejas

Una macro puede incluir otras macros más sencillas. Esto permite crear macros de mayor complejidad a partir de varias macros con instrucciones más simples. A su vez, si se comete un error al grabar una secuencia de instrucciones extensa, se evita tener que volver a grabarla. Es mucho más fácil trabajar con segmentos más pequeños que contienen una cantidad menor de instrucciones.

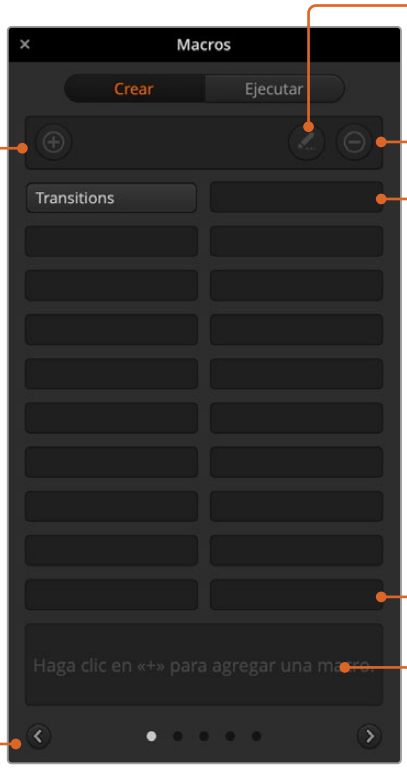
Al crear una macro de mayor complejidad que incluye varias macros simples, es posible realizar cambios grabando solamente aquellas que se desean modificar para luego volver a compilarlas.

Para compilar varias macros:

1. Comience a grabar una nueva macro y a continuación haga clic en el botón **Ejecutar**.
2. Marque la opción **Seleccionar y ejecutar** para ejecutar las macros automáticamente. De lo contrario, puede seleccionar una específica.
3. Ejecute la secuencia de macros sencillas, efectuando pausas entre las mismas hasta finalizar la compilación.
4. Detenga la grabación. Habrá obtenido una macro compleja, compuesta por varias más sencillas que pueden modificarse posteriormente, según sea necesario.

La cantidad de acciones que pueden llevarse a cabo es ilimitada. Es posible crear transiciones complejas, superponer imágenes reiteradamente, configurar los ajustes utilizados con mayor frecuencia en el modelo Blackmagic Studio Camera, o añadir gráficos y efectos visuales en primer plano para evitar tener que repetir dichas acciones cada vez que comienza un nuevo programa. Las macros permiten ahorrar tiempo valioso.

Ventana para crear macros



Crear:
Haga clic sobre este botón para abrir la ventana emergente que permite crear una macro. Desde allí, puede añadirle un nombre y una descripción, y comenzar a grabarla.

Flechas y pantallas adicionales:
Para grabar o acceder a otras macros, simplemente haga clic sobre la flecha situada en la esquina inferior derecha de la ventana. Para volver a la pantalla anterior, haga clic sobre la flecha situada a la izquierda. Los puntos entre las flechas indican la pantalla visualizada.

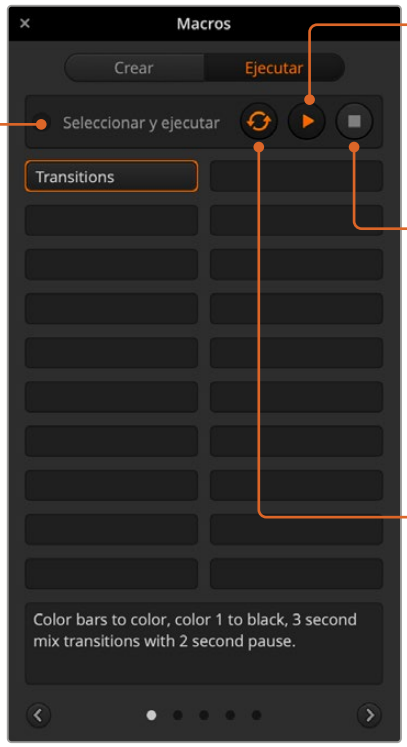
Modificar:
Seleccione la macro que desea modificar y a continuación haga clic sobre este botón para cambiar el nombre o la descripción.

Botón para eliminar macros:
Seleccione la macro que desea eliminar y presione este botón.

Espacios:
Después de grabar una macro en uno de los espacios disponibles, aparecerá un botón con su nombre. Si no se ingresa un nombre para la macro, el programa le asignará el número de la posición seleccionada para la grabación.

Estado:
Este espacio se utiliza para indicaciones útiles y otros mensajes que facilitan el proceso de grabación y ejecución de las macros. Al seleccionar una macro, se muestra la descripción correspondiente.

Ventana para ejecutar macros



Seleccionar y ejecutar:
Cuando esta opción está marcada, la macro se ejecuta inmediatamente al seleccionarla. En caso contrario, primero es preciso seleccionarla para luego ejecutarla en forma manual haciendo clic en el botón correspondiente.

Reproducir:
Cuando la opción **Seleccionar y ejecutar** está activada y se ha seleccionado una macro, este botón permite ejecutarla inmediatamente.

Detener:
Al hacer clic sobre este botón, se detiene la ejecución de una macro después de finalizar la instrucción que se está llevando a cabo en dicho momento. Por ejemplo, si esto ocurre durante una transición, el mezclador la completará antes de detenerse.

Repetir:
Al seleccionar esta opción, la macro se ejecuta nuevamente una vez finalizada hasta que se detenga en forma manual. Cuando esta opción no está marcada, la macro se ejecuta una sola vez.

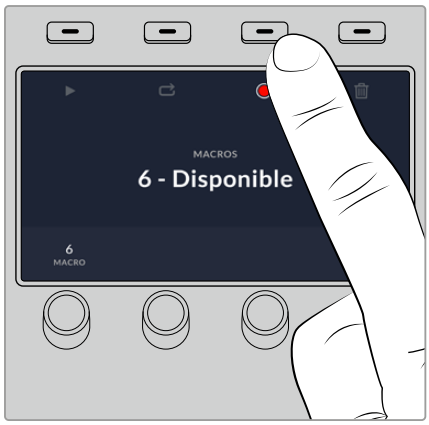
Grabación de macros en los modelos ATEM Television Studio

Los modelos ATEM Television Studio permiten grabar y ejecutar macros independientemente del programa ATEM Software Control. Todas las funciones que este último ofrece también pueden llevarse a cabo en el mezclador. Para organizar gráficos en el panel multimedia o cambiar la configuración de las cámaras, basta con acceder a los respectivos ajustes en la interfaz de la aplicación.

Los botones para la grabación y ejecución de macros se sitúan en el módulo de control del mezclador. El nombre del botón correspondiente a cada macro aparece en el bus de selección de fuentes.

Siga los pasos que se indican a continuación para crear la macro *Transitions*, descrita anteriormente al utilizar el programa ATEM Software Control. En este caso, se creará una macro en la posición 6.

1. Presione el botón contextual **MACRO** para acceder al menú de ajustes en la pantalla del dispositivo.
2. Gire el mando junto a la opción **MACRO** para seleccionar la posición en la cual se grabará. En este caso, elija la posición 6.
3. Presione el botón junto al símbolo de grabación para comenzar. Este se representa mediante un círculo rojo. Al grabar, el circulo se transforma en un cuadrado rojo, y aparece un borde del mismo color en torno a la pantalla LCD.



Presione el botón junto al ícono de grabación para finalizar.

Durante la grabación, aparecerá un borde rojo alrededor de la pantalla del dispositivo.

4 Presione **SHIFT** y luego **COLOR BARS** en el bus del programa. El botón comenzará a parpadear para indicar que la fuente ha cambiado.

5 Presione **SHIFT** y luego **COL1** en el bus de anticipos. Es posible asignar señales en negro, barras o generadores de color a cualquiera de los primeros 10 botones de los buses de programa y anticipos para facilitar el acceso a los mismos. Consulte las instrucciones correspondientes en el apartado *Asignación de botones*.

6 Presione el botón **WIPE** para cerciorarse de que la macro registre el tipo de transición seleccionado.

7 Utilice el menú en la pantalla para configurar una transición de 3:00 segundos.

8 Presione el botón **AUTO** para realizar la transición entre las barras de color y el color 1.

9 Presione el botón **MACRO** para regresar a la pantalla de inicio.

10 Para configurar una pausa de 2 segundos antes de aplicar la transición siguiente, mantenga presionado el botón contextual **AGREGAR PAUSA** y gire el mando junto a la opción **SEGUNDOS**. Presione el botón **CONFIRMAR** para guardar los cambios.

11 Presione **SHIFT** y seleccione **BLK** en el bus de anticipos. Luego oprima el botón **MIX**, y a continuación **AUTO**. El mezclador realizará una disolvencia al negro.

12 Presione el botón **MACRO** para volver al menú inicial, y luego el botón de detención para finalizar.

Acaba de crear una macro usando el mezclador. Esta se identifica mediante el botón **Macro 6**, ya que dicho número corresponde a la posición asignada. Cabe destacar que el programa ATEM Software Control permite nombrar cada macro y agregar notas haciendo clic en el botón de edición.

Para ejecutar una macro, presione el botón **MACRO** en el panel. Los botones del bus de selección se encenderán de color azul. A continuación, presione el botón **Macro 6**. Este parpadeará de color verde para indicar que la macro se está ejecutando. Asimismo, aparecerá un borde naranja en torno a la pantalla del dispositivo.

Si la macro se grabó correctamente, el mezclador realizará una disolvencia de 2 segundos entre las barras de color y el color 1, luego se detendrá durante 2 segundos y, a continuación, llevará a cabo un fundido a negro con una duración de 2 segundos. Todas estas instrucciones se ejecutan presionando un solo botón en el mezclador. Presione el botón junto al símbolo de repetición en la pantalla para ejecutar la macro de forma continua. Oprímalo nuevamente para desactivar esta función.

Es importante verificar las macros utilizando distintos ajustes en el mezclador para garantizar que realicen las funciones específicas requeridas. No olvide registrar todas las instrucciones y evite realizar cambios imprevistos.

Control de grabadores HyperDeck

Introducción

El programa ATEM Software Control brinda la oportunidad de conectar hasta 10 grabadores HyperDeck Studio y gestionarlos desde el módulo de control del mezclador o la pestaña correspondiente del programa. Esta función es de gran utilidad, ya que brinda la posibilidad de grabar la señal transmitida al aire o reproducir imágenes y secuencias previamente guardadas con solo presionar un botón.

Los controles de reproducción permiten reproducir, pausar, avanzar y retroceder clips, entre otras funciones, desde el panel **HyperDeck** del programa ATEM Software Control o los modelos ATEM Television Studio. Asimismo, es posible grabar imágenes.

Al combinar esta función con las macros del mezclador, se abre un sinfín de opciones creativas que ofrecen la posibilidad de optimizar las producciones en directo.

HyperDeck Studio HD Plus

Conexión de grabadores HyperDeck

La conexión de estas unidades mediante las entradas SDI es muy similar a la de las cámaras y otras fuentes. El único requisito adicional es la disponibilidad de una red Ethernet, a efectos de que el mezclador pueda comunicarse con el dispositivo de grabación.

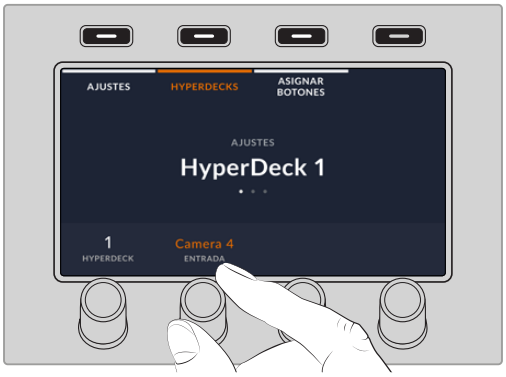
1. Conecte el grabador a la misma red que el mezclador mediante el puerto Ethernet.
2. Presione el botón **REM** en el panel frontal del grabador. Este se encenderá para indicar que la función de control remoto está activada. En el modelo HyperDeck Studio HD Mini, esta prestación puede activarse desde el menú de ajustes en la pantalla del dispositivo.
3. Conecte la salida SDI del grabador a la entrada respectiva en el mezclador.
4. Si desea grabar la señal principal transmitida por mezclador, conecte una de las salidas SDI del equipo a la entrada respectiva del grabador.
5. Repita este procedimiento para cada unidad que desee conectar.

Después de conectar el grabador al mezclador, es posible modificar su configuración mediante el panel de control y los botones que se encuentran junto a la pantalla.

En primer lugar, presione el botón **SETTINGS**.

Presione el botón junto a la opción **HYPERDECKS** para acceder a los ajustes. En la parte inferior de la pantalla correspondiente al primer ajuste, notará las opciones **HYPERDECK** y **ENTRADA**. Gire el mando debajo de la opción **HYPERDECK** para ver las unidades disponibles.

Una vez seleccionada la unidad, gire el mando debajo de la opción **ENTRADA** para seleccionar la entrada del mezclador a la cual el grabador está conectado. Por ejemplo, si la unidad HyperDeck 1 está conectada a la entrada SDI 4 del mezclador, seleccione **Camera 4**. Presione el mando giratorio para confirmar.



El segundo grupo de ajustes brinda la oportunidad de activar o desactivar la función de inicio automático y configurar un valor para el desfase en fotogramas. Esto permite que el grabador comience la reproducción automáticamente cada vez se seleccione como fuente para la salida principal del mezclador. En concreto, puede determinarse un punto de referencia en el que se desea iniciar la reproducción, y luego activar la fuente presionando el botón correspondiente en el bus del programa. Asimismo, es posible desactivar la función de inicio automático para detener el clip en un cuadro determinado o dar inicio a la reproducción en forma manual.

Dado que el dispositivo debe avanzar algunos cuadros antes de comenzar la reproducción, esta sufrirá un pequeño retraso, a fin de garantizar una transición exitosa. Este modo de funcionamiento es similar al de un videograbador. Ajuste el tiempo de retraso en el campo correspondiente. Según las pruebas realizadas, un tiempo de 5 fotogramas permite obtener mejores resultados.

Una vez asignada la entrada al grabador, es necesario introducir su dirección IP. Esto permite controlarlo desde el mezclador mediante una red Ethernet.

Presione las flechas o el botón 3 en el teclado numérico del panel para acceder al tercer ajuste disponible en el menú **HYPERDECKS**.

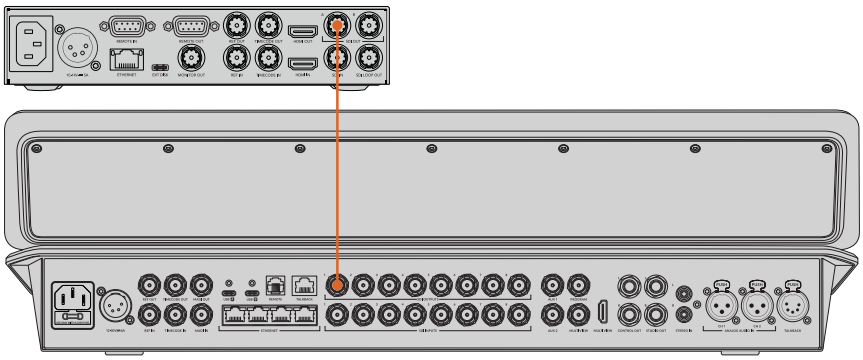
En la pantalla, verá la dirección IP de la unidad seleccionada. Cada mando situado debajo de la pantalla corresponde a un número. Para cambiar el valor, gire el mando o presiónelo e ingrese los dígitos mediante el teclado numérico.

Repita este procedimiento para cada número de la dirección IP.

Presione el botón junto a la opción **GUARDAR** para confirmar la dirección. En caso contrario, presione **DESHACER** para cancelar.

Para ingresar la dirección IP de otra unidad, es preciso seleccionarla mediante la primera opción del menú de configuración, como se describió anteriormente.

Los grabadores HyperDeck pueden controlarse desde el mezclador mediante el botón **MEDIA PLAYERS**. Consulte el apartado *Control de grabadores HyperDeck* más adelante en este manual para obtener información adicional al respecto.



Conexión de la salida SDI de un grabador HyperDeck Studio HD Plus a la entrada respectiva del mezclador

A continuación, solo es preciso indicar la dirección IP y la entrada utilizada para el grabador en el mezclador. Esto puede realizarse desde la pestaña **HyperDeck** del programa ATEM Software Control o los botones del módulo de control de los dispositivos.

Ajustes para grabadores HyperDeck

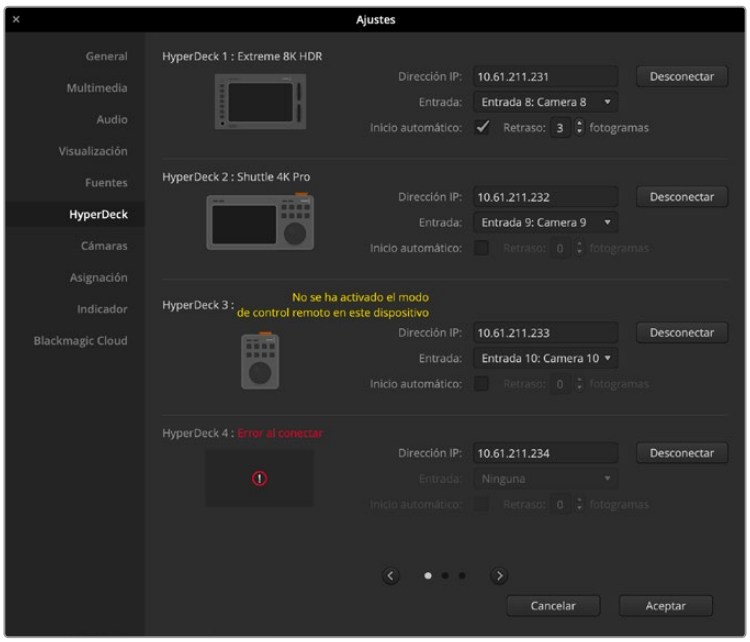
La pestaña **HyperDeck** del programa ATEM Software Control incluye diversos ajustes para los grabadores y permite configurar hasta 10 unidades.

Basta con ingresar la dirección IP del equipo HyperDeck y escoger la entrada a la que se encuentra conectado mediante el menú **Input**. Al hacer clic en **Conectar**, podrá controlar el dispositivo.

En la interfaz del programa, se indica el estado de la conexión junto a cada unidad. Un visto verde significa que el equipo está conectado y que la función de control remoto está activada.

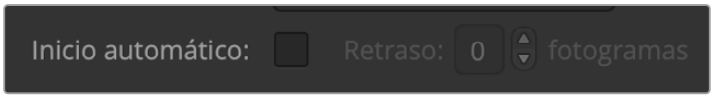
El programa indicará si dicha función no se encuentra habilitada en el dispositivo conectado.

Si no es posible detectar el dispositivo, verá un aviso de fallo en la conexión. En este caso, verifique que el grabador esté conectado a la red Ethernet y que la dirección IP sea correcta.



Inicio automático

Es posible configurar el dispositivo para que comience la reproducción automáticamente cada vez que se conecta a la salida principal del mezclador. En concreto, puede determinarse un punto de referencia en el que se desea iniciar la reproducción, y luego activar la fuente presionando el botón correspondiente en el bus del programa.



Dado que el dispositivo debe avanzar algunos cuadros antes de comenzar la reproducción, esta sufrirá un pequeño retraso, a fin de garantizar una transición exitosa. Este modo de funcionamiento es similar al de un videograbador. Ajuste el tiempo de retraso en el campo correspondiente. Según las pruebas realizadas, un tiempo de 5 fotogramas permite obtener mejores resultados.

Asimismo, es posible desactivar la función de inicio automático para detener el clip en un cuadro determinado o dar inicio a la reproducción en forma manual.

Manejo de grabadores HyperDeck desde el programa ATEM Software Control

Para controlar los grabadores conectados al mezclador, haga clic en la pestaña **Reproductores** y seleccione la opción **HyperDeck**.

En este panel, es posible seleccionar cada una de las unidades conectadas haciendo clic en los botones situados en la parte superior del mismo. El nombre del dispositivo será el mismo que haya introducido en las opciones de configuración del mezclador. Los equipos disponibles se identifican mediante el color blanco, mientras que el naranja se emplea para aquellos controlados desde el mezclador.

Seleccione hasta 10 grabadores en la pestaña **HyperDeck**.

Además del texto, el contorno de los botones también adopta diferentes colores.

Verde	Indica que la señal del grabador corresponde a un anticipo.
Rojo	Indica que la señal del grabador está al aire. Asimismo, es posible ver los siguientes mensajes sobre los botones de selección:
Listo	Se ha insertado una unidad de almacenamiento en el dispositivo, y la función de control remoto está activa. El equipo está listo para reproducir o grabar contenidos, si hay espacio suficiente.
Grabación	El dispositivo está grabando.
Sin SSD	No se ha insertado un soporte de almacenamiento.
Local	El modo de control remoto está desactivado y, por consiguiente, el grabador no puede controlarse desde el mezclador.

Al elegir una de los dispositivos conectados, es posible ver datos del clip seleccionado que incluyen el nombre, su duración, el tiempo transcurrido y el tiempo restante. Los botones de control se encuentran debajo de los mismos.

	**Grabación** Haga clic en este botón para comenzar la grabación. Haga clic nuevamente para detenerla.
	**Clip anterior** Permite retroceder hasta el comienzo del clip anterior en la lista.
	**Reproducir** Haga clic en este botón para comenzar la reproducción o detenerla. Si la opción **Inicio automático** está activada, la reproducción comenzará automáticamente cuando el dispositivo detecte la señal principal.
	**Clip siguiente** Permite avanzar hasta el clip siguiente en la lista.
	**Repetir** Haga clic en este botón para reproducir el clip seleccionado en forma continua. Al hacer clic en el mismo nuevamente, se reproducen toda la lista en forma continua.

Utilice el control situado debajo de los botones para avanzar o retroceder las imágenes. De esta forma, es posible ver el clip rápidamente o de manera más lenta, cuadro a cuadro. Asimismo, los botones situados junto a dicho control permiten cambiar el modo de reproducción.

Utilice los botones situados a la izquierda del control deslizante para reproducir, pausar, avanzar y retroceder las imágenes. Mueva el control deslizante hacia la izquierda o la derecha para adelantar o retroceder el clip.

La lista de clips que figura debajo de los controles de reproducción muestra aquellos disponibles para el equipo seleccionado. Utilice las flechas situadas a la derecha para expandirla o contraerla.

Reproducción

Reproducir contenidos multimedia en el grabador es muy sencillo. Seleccione el dispositivo como señal de anticipo y escoja el clip que desea ver. Utilice los controles de reproducción para avanzar hasta un cuadro determinado. El grabador comenzará a reproducir el material automáticamente a partir de este punto al seleccionarlo como fuente para la salida principal.

Para realizar este procedimiento en forma manual, por ejemplo, a fin de congelar una imagen y luego dar comienzo a la reproducción, desmarque la casilla **Inicio automático** en la pestaña **HyperDeck** del programa ATEM Software Control.

Grabación

Para grabar en un soporte de almacenamiento formateado con anterioridad, haga clic en el botón de grabación en el panel **HyperDeck**. El tiempo restante indica los minutos disponibles en la unidad SSD.

Control de grabadores HyperDeck con los modelos ATEM Television Studio

Una vez conectados al mezclador de la forma descrita anteriormente, es posible modificar su configuración.

Control de grabadores HyperDeck con los modelos ATEM Television Studio

Es posible controlar los grabadores desde el menú **Reproductores multimedia** en la sección de control del sistema del mezclador. Para ello, presione el botón **MEDIA PLAYERS** y luego seleccione la opción **HYPERDECKS** en la pantalla del dispositivo. Si el mezclador cuenta con más de dos reproductores multimedia, quizás sea necesario presionar las flechas una vez dentro del menú para acceder a los controles del grabador.

A continuación, podrá usar los mandos giratorios para seleccionar clips y reproducir, avanzar o retroceder las imágenes.

El texto en el centro de la pantalla indica la unidad y el clip seleccionado.

La segunda y la tercera pantalla de ajustes de este menú proporcionan controles de reproducción adicionales.

SUGERENCIA: Para reproducir todos los clips, presione **SHIFT** y oprima al mismo tiempo el botón de reproducción.

En el tercer grupo de ajustes, presione el botón junto al símbolo de grabación para grabar la señal principal transmitida por el mezclador en la unidad HyperDeck. Utilice los controles **DESPLAZAR** y **REPRODUCIR** para ver las imágenes grabadas.

Sistemas de señalización

Señalización mediante el dispositivo GPI and Tally Interface

Los mezcladores ATEM pueden comunicarse con cámaras y monitores enviando señales para identificar la fuente que está siendo transmitida.

Esta señal se utiliza generalmente para encender una luz roja sobre la cámara o el monitor, de forma que el operador sepa que está al aire. Asimismo, en dispositivos tales como los monitores Blackmagic SmartView 4K, permite identificar las imágenes al aire y los anticipos mediante bordes de distintos colores. De esta forma, el equipo de producción puede determinar con facilidad la cámara cuya señal se está transmitiendo.

El dispositivo GPI and Tally Interface cuenta con ocho relés mecánicos utilizados en sistemas de señalización. La señal se envía desde el puerto Ethernet del mezclador ATEM al dispositivo, y ambos deben compartir la misma red. Siguiendo las indicaciones en la parte trasera, se pueden conectar equipos compatibles con sistemas de señalización por cierre de contacto, tales como los monitores Blackmagic SmartView Duo o SmartView HD. Es posible conectar hasta ocho unidades GPI and Tally Interface. Al emplear los modelos ATEM Television Studio, solo se necesita una unidad.

Dispositivo GPI and Tally Interface

Las entradas consisten en interruptores ópticos que se activan por una conexión a tierra con un voltaje máximo de 5 V a 14 mA.

Las salidas consisten en relés mecánicos conectados a tierra con un voltaje máximo de 30 V a 1 A.

Modificación de ajustes en la red y el sistema de señalización

El programa ATEM Setup permite modificar los parámetros de red en el dispositivo, de modo que pueda comunicarse con el mezclador. Para ello, debe estar conectado a un equipo informático mediante el puerto USB.

1. Conecte el dispositivo a la misma red Ethernet del mezclador ATEM.
2. Conecte el dispositivo a un puerto USB del equipo informático y a una toma de corriente.
3. Ejecute el programa ATEM Setup.
4. Si el mezclador ATEM se conecta directamente al equipo informático o al panel de control sin un conmutador de red, seleccione la opción **Configure Address Using Static IP**. Sugerimos utilizar la dirección IP predeterminada del dispositivo (192.168.10.2) para simplificar el proceso.

   De todas formas, es posible emplear cualquier otra dirección IP fija dentro del mismo rango del mezclador, siempre que no corresponda a otro dispositivo de la red. Por esta razón, conviene

evitar el uso de las direcciones predeterminadas del mezclador, tales como 192.168.10.1, 192.168.10.2, 192.168.10.3, 192.168.10.10, 192.168.10.50, 192.168.10.60 y 192.168.10.240.

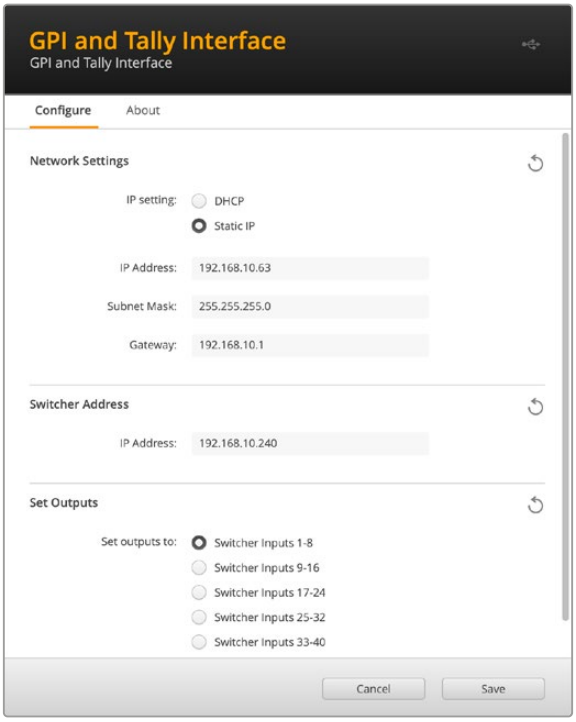
Si el mezclador ATEM se conecta mediante un conmutador de red, seleccione la opción **Configure Address Using DHCP** para obtener automáticamente la dirección IP, la máscara de subred y el puerto de enlace a partir del servidor DHCP.

5 Introduzca la dirección IP del modelo ATEM en el campo **Switcher Address**. La opción predeterminada del mezclador es **DHCP**. Alternativamente, es posible cambiarla por una dirección IP fija.

6 Seleccione **Switcher Inputs 1-8** en la opción **Set tally outputs**.

7 Haga clic en el botón **Apply**. La luz LED de color blanco situada a la derecha del puerto USB debería dejar de parpadear, permaneciendo encendida para indicar que la comunicación con el mezclador se ha establecido correctamente. A continuación, el dispositivo estará listo.

8 Cierre el programa y desconecte el cable USB.



Ajustes de red y de las salidas para el sistema de señalización

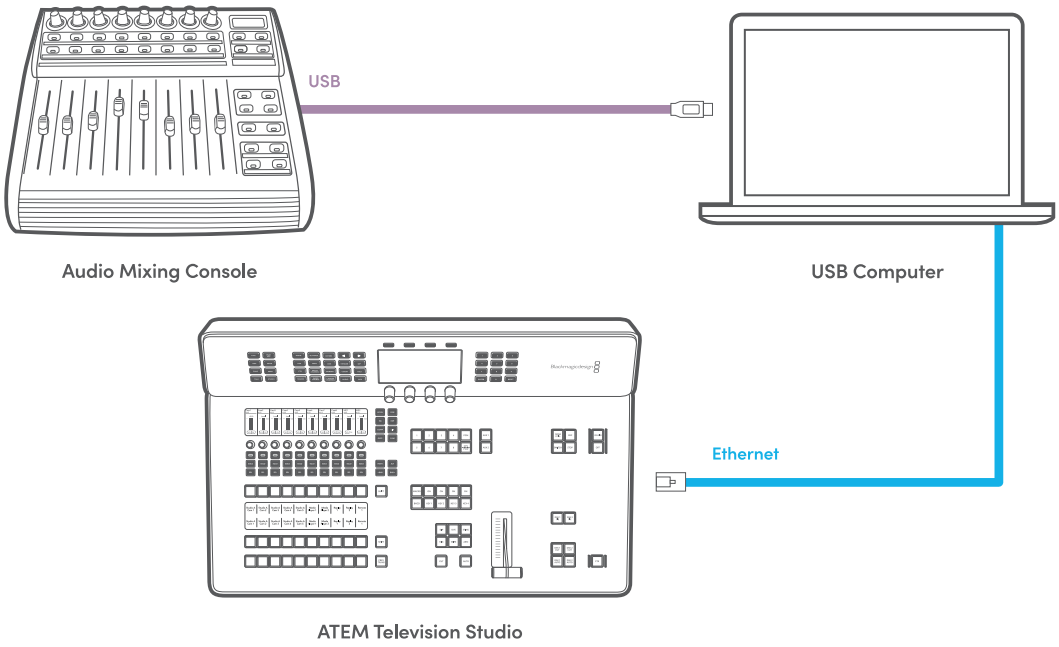
Uso de otras consolas de audio

Uso de consolas de audio

En el vertiginoso mundo de las producciones en directo, a veces el uso de equipos facilita el trabajo. A continuación, proporcionamos una idea para mezclar más de una fuente de audio al mismo tiempo en el mezclador ATEM. Una consola de audio conectada al mezclador ATEM brinda la posibilidad de utilizar ambas manos para realizar varios ajustar al mismo tiempo.

La consola puede conectarse al equipo informático como un dispositivo MIDI y se comunica con este mediante los comandos utilizados en los paneles Mackie Control.

Existen varias consolas de audio compatibles con los mezcladores ATEM, pero ante la duda, recomendamos consultar con el fabricante.



Una consola conectada al equipo informático en el que se encuentra instalado el programa ATEM Software Control brinda la posibilidad de ajustar varios niveles de audio al mismo tiempo.

Conexión de consolas de audio

1. Conecte la consola de audio compatible con formatos MIDI al equipo informático. Actualmente, la mayoría de las consolas se conectan mediante un cable USB.

2. Compruebe que el equipo informático la reconozca como un dispositivo MIDI.

   En equipos Mac OS, haga clic en **Aplicaciones**, luego en **Utilidades** y seleccione **Configuración de audio MIDI** para ejecutar la aplicación. En el menú **Ventana**, seleccione la opción **Mostrar ventana MIDI**. Compruebe que la consola aparezca como un dispositivo MIDI.

   En equipos informáticos con sistema operativo Windows, acceda al **Administrador de dispositivos** y seleccione **Dispositivos de sonido, video y juegos**. Compruebe que la consola figure en la lista de íconos.

3. El programa ATEM Software Control se comunica con la consola mediante los comandos utilizados en dispositivos Mackie, por lo cual deberá ser compatible con estos. También es preciso comprobar que la consola pueda funcionar en modo nativo, o de lo contrario realizar una emulación. Consulte el manual del fabricante para obtener más información sobre la configuración.

   Dado que algunas consolas ofrecen varios tipos de emulación, se debe elegir el que permita utilizar la mayor cantidad de funciones. Por ejemplo, en el modelo Behringer BCF 2000, al seleccionar la opción **Mackie Control Mapping for Cakewalk Sonar 3 (MCSo)**, se activan los atenuadores, los selectores de bancos, el control del balance y las funciones **AFV** y **ON/MUTE**, así como la pantalla que indica el banco seleccionado para la mezcla de audio. La pantalla no funcionará si se selecciona otro tipo de emulación.

4. Ejecute el programa ATEM Software Control para que busque automáticamente la consola utilizando el primer puerto del primer dispositivo MIDI que encuentre. Haga clic en la pestaña **Audio** para ver la consola de audio virtual del programa. Intente mover los reguladores de ganancia en la consola y compruebe que los controles del programa reflejen el aumento o la disminución correspondiente. Si es así, la consola de audio se ha configurado correctamente.

Botón MUTE

El sonido siempre está presente en la mezcla cuando el botón **ON** está encendido en la interfaz del programa informático. Si está apagado, el audio no se escuchará. El botón **MUTE** de la consola se enciende cuando el audio está presente en la mezcla, a fin de coincidir con la interfaz del programa. El botón permanece apagado si no hay una señal de audio presente, o si se ha silenciado.

Escala de decibeles

Todas las consolas son diferentes y, por lo tanto, la escala impresa sobre la superficie podría diferir de la utilizada en el programa ATEM Software Control. Siempre consulte la intensidad del audio en la interfaz para obtener una lectura correcta.

DaVinci Resolve Micro Panel

Es posible emplear un dispositivo DaVinci Resolve Micro Panel para modificar los ajustes disponibles en cada controlador de cámara. Esto permite realizar cambios con mayor rapidez y precisión.

Para configurar el panel:

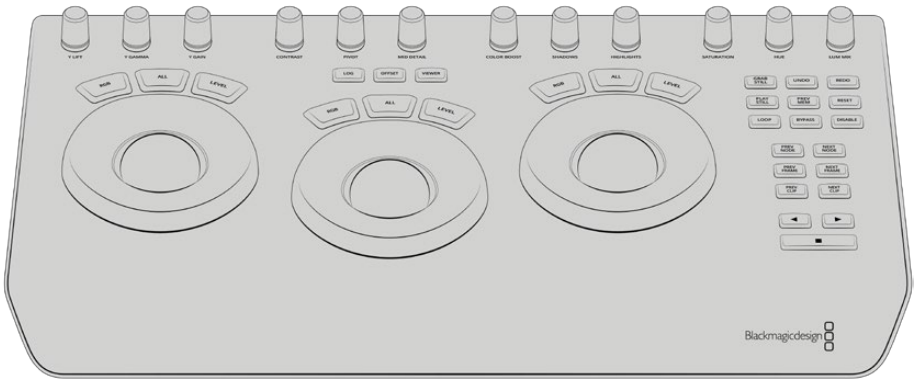
1. Conecte el panel al equipo informático mediante un cable USB-C y ejecute el programa ATEM Software Control.
2. Seleccione la pestaña **Cámara** y escoja una unidad haciendo clic en el controlador correspondiente.
3. En el panel, gire los mandos y las esferas para realizar ajustes.

Cómo realizar ajustes cromáticos

Aunque el modelo DaVinci Resolve Micro Panel ha sido específicamente diseñado para el programa DaVinci Resolve, es posible usarlo para realizar ajustes cromáticos en las imágenes captadas por las cámaras.

Esferas

Las tres esferas permiten controlar a los parámetros **Sombras**, **Tonos Medios** y **Luces** en el panel de ajustes cromáticos del programa ATEM Software Control. Por su parte, el anillo que las rodea corresponde a los controles generales situados debajo de cada círculo.



DaVinci Resolve Micro Panel

Controles

Al realizar cambios en el panel, estos se verán reflejados en la interfaz del programa. Utilice los siguientes controles para llevar a cabo ajustes.

Y LIFT	Permite modificar el contraste en la imagen mediante un ajuste de la luminancia en las sombras.
Y GAMMA	Permite modificar el contraste en la imagen mediante un ajuste de la luminancia en los tonos intermedios.
Y GAIN	Permite modificar el contraste en la imagen mediante un ajuste de la luminancia en las luces.
Contraste	Gire este control hacia la derecha o la izquierda para aumentar o disminuir el contraste, respectivamente.
HIGHLIGHTS	Este mando permite controlar la apertura del diafragma de la cámara seleccionada. Gírelo hacia la derecha para abrirlo o hacia la izquierda para cerrarlo.
Saturación	Gire este control hacia la derecha o la izquierda para aumentar o disminuir la saturación, respectivamente.
Matiz	Gire este control hacia la derecha o la izquierda para ajustar la distribución del matiz, según puede apreciarse en el círculo cromático.
Mezcla de luminancia	Gire este control hacia la derecha o la izquierda para seleccionar el modo de procesamiento RGB o YRGB.

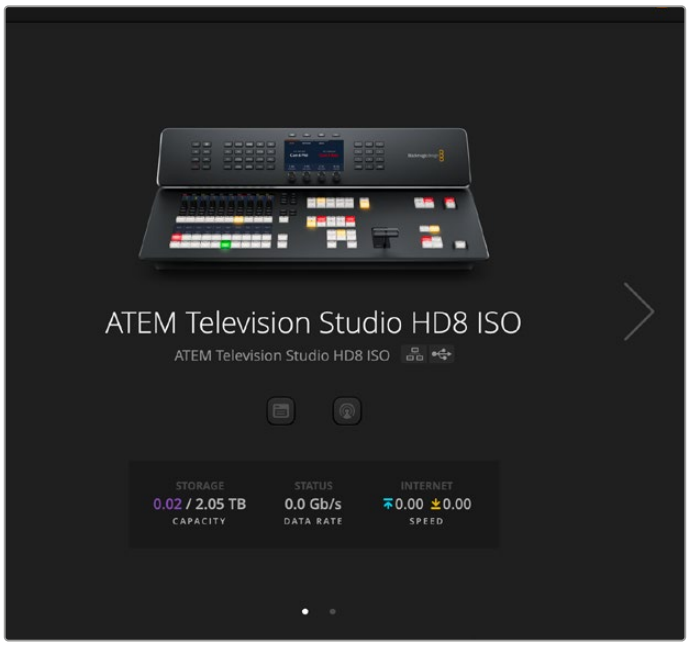
Botones de control

Flecha izquierda	Permite seleccionar la cámara anterior.
Flecha derecha	Permite seleccionar la cámara siguiente.

Consulte la información brindada anteriormente en este apartado para obtener más detalles sobre la forma en la que cada control afecta a la imagen.

Uso del programa utilitario

Este programa se instala junto con una aplicación utilitaria denominada ATEM Setup. Esta permite actualizar el mezclador, cambiar el nombre del dispositivo y modificar los ajustes de red, y además ofrece diferentes parámetros para configurar los modos de corte directo o programa/anticipo, así como distintos tipos de composiciones.



Al ejecutar el programa ATEM Setup, se verá la pantalla de inicio. Si hay más de un mezclador ATEM conectado mediante un puerto USB o en la red, podrá acceder a cada uno de ellos haciendo clic en las flechas hacia la izquierda o la derecha. Al instalar un soporte de almacenamiento interno, los indicadores en la parte inferior de la pantalla de inicio muestran la capacidad total, el espacio utilizado, el estado de la conexión a la red y la velocidad máxima de transferencia de datos. Si el número que representa el espacio utilizado se destaca de color púrpura, es posible leer el contenido del dispositivo y guardar datos en él. Si dicho número aparece en azul, solo es posible leer los datos almacenados.

Haga clic en el ícono izquierdo situado sobre los indicadores de almacenamiento para abrir la página de configuración. Haga clic en el ícono derecho para abrir el programa ATEM Software Control.

Configuración

Nombre

El campo **Name** en la pestaña **Setup** permite introducir un nombre para el mezclador. Haga clic en el botón **Save** a fin de guardar los cambios.

Sistema operativo

Esta opción muestra la versión del programa instalada en el mezclador.

Fecha y hora

Marque la casilla **Set date and time automatically** para configurar la fecha y la hora automáticamente.

El monitor utilizará el protocolo seleccionado en la opción **Network Time Protocol (NTP)**. El protocolo predeterminado es time.cloudflare.com, pero es posible cambiarlo por otro mediante el programa utilitario.

Al seleccionar la opción de configuración manual, ingrese la fecha, la hora y el huso horario en los campos correspondientes. Es importante introducir estos valores con precisión para garantizar que los datos de la red coincidan con los de los clips grabados y evitar ciertos problemas que podrían ocurrir cuando se emplean sistemas de almacenamiento en red.

Ajustes de red

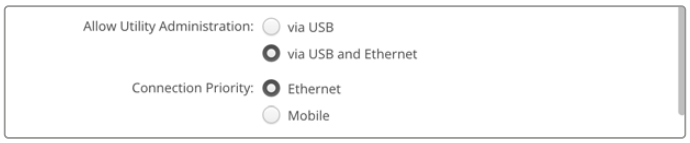
Los ajustes de la sección **Network** permiten configurar diversas opciones, tales como el uso de una dirección estática o el protocolo DHCP.

Consulte el apartado *Conexión a redes* para obtener más información al respecto.

Acceso al programa utilitario

Es posible acceder al programa ATEM Setup cuando el mezclador está conectado a un equipo informático mediante una red o el puerto USB.

Para evitar que otros usuarios accedan a través de la red, seleccione la opción **USB only**.



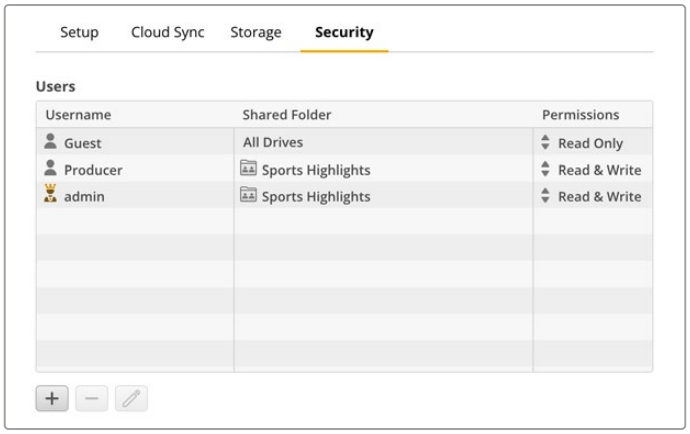
Conexión prioritaria

Al conectar el mezclador a una red Ethernet y un teléfono móvil, la opción **Connection Priority** permite seleccionar la conexión empleada para la transmisión.

Consulte el apartado *Conexión mediante teléfonos móviles* para obtener más información al respecto.

Pestaña de seguridad

La pestaña **Security** contiene opciones para la creación de usuarios, los ajustes de autenticación, la asignación de carpetas compartidas y los permisos de acceso a estas últimas.

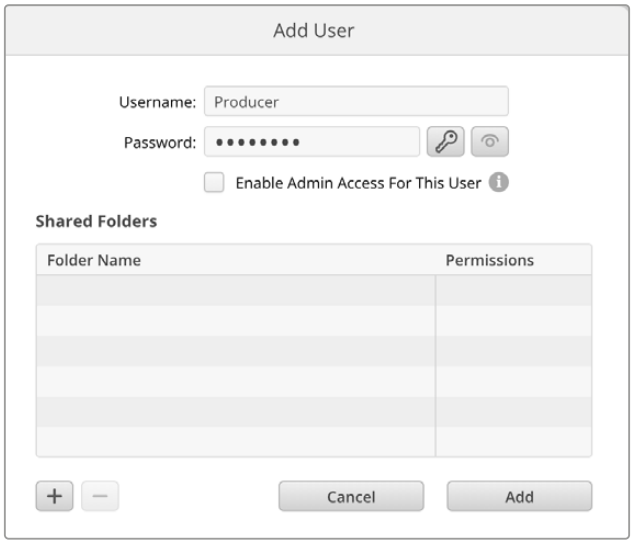


Agregar usuarios

Utilice estos ajustes para crear usuarios, compartir las carpetas y establecer los permisos de estas en caso de conexiones configuradas mediante una contraseña almacenada localmente. Por ejemplo, es posible asignar un supervisor de proyectos a una carpeta compartida y otorgarle permisos de lectura y escritura, pero solo autorizar la lectura para los usuarios que simplemente necesitan ver los archivos. Una carpeta compartida puede ser cualquier carpeta en el dispositivo de almacenamiento USB externo o la memoria interna opcional.

1 Haga clic en el botón +, ubicado en la parte inferior izquierda de la pestaña **Security**, a fin de acceder a la ventana **Add user**.

2 En la ventana a continuación, escriba el nombre del nuevo usuario. Si este usará el protocolo SMB con una contraseña almacenada localmente, escríbala en el campo **Password**. Puede generar una contraseña segura de manera automática si presiona el ícono de la llave.



Si desea otorgar al nuevo usuario acceso de administrador, marque la casilla **Enable admin access for this user**. Esta opción permite al usuario acceder al programa ATEM Setup a través de una red Ethernet y efectuar cambios en la configuración.

3 Haga clic en el botón + para abrir la ventana de carpetas compartidas.

Se mostrará una lista de todas las carpetas en el nivel superior del almacenamiento interno del mezclador. Haga doble clic en una carpeta para ver las subcarpetas; el menú situado en la parte superior de la ventana muestra el nombre de la carpeta que está visualizando y le permite navegar por los niveles de carpetas. Seleccione la carpeta compartida a la que desea que el usuario nuevo acceda y haga clic en el botón **Set**.

4 La carpeta compartida aparecerá en la lista **Shared folders** en la ventana **Add users**.

Para asignar o eliminar el acceso a otra carpeta, haga clic en los botones + o -, respectivamente. Para cerrar la ventana **Add user** y regresar a la pestaña de seguridad, haga clic en **Add** y luego en **Save**.

Ahora, el nuevo usuario podrá acceder al dispositivo y a las carpetas compartidas que se le asignaron.

Para acceder a carpetas compartidas en un equipo Mac:

1 Abra la aplicación Finder y haga clic en la opción **Red** de la barra lateral.

2 En la lista, seleccione el modelo ATEM que esté usando

3 Haga clic en **Conectar como**, escriba su nombre de usuario y contraseña, y haga clic en **Conectar**.

El mezclador aparecerá ahora en la barra lateral de ubicaciones; haga clic en el mezclador para ver sus carpetas compartidas.

Para acceder a carpetas compartidas en un equipo Windows:

1 Haga clic en la opción **Red** en la barra lateral del Explorador de Windows. El mezclador aparecerá en la lista.

2 Haga doble clic en la unidad. Aparecerá un cuadro de diálogo solicitando las credenciales de red.

3 Escriba su nombre de usuario y contraseña.

4 Haga clic en **OK**.

A continuación, verá el mezclador en la ventana del explorador y podrá acceder a su contenido, al igual que con cualquier otra unidad de almacenamiento en red.

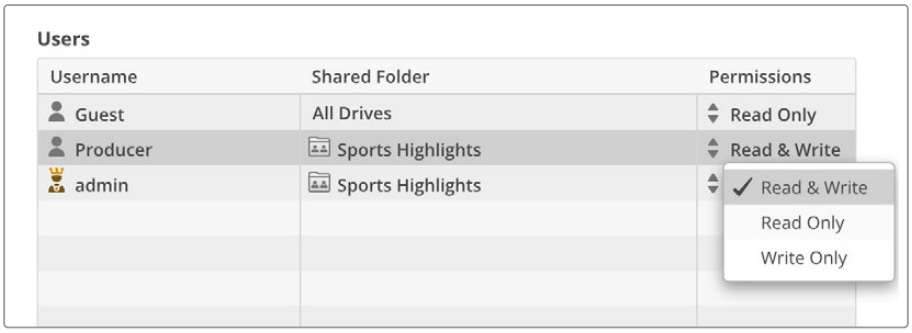
Permisos

Los permisos le permiten controlar el nivel de acceso de un usuario dentro de una carpeta compartida. Cuando asigna una carpeta a un usuario por primera vez, este recibe permisos de lectura y escritura, lo que le permite agregar, mover, modificar o eliminar el contenido de la carpeta compartida. Puede cambiar los permisos de la carpeta compartida para habilitar la lectura o la escritura únicamente. En el primer caso, el usuario puede ver el contenido de la carpeta, pero no podrá agregar, eliminar o modificar archivos. En el segundo caso, el usuario podrá copiar archivos en la carpeta, pero no ver su contenido.

Para cambiar los permisos:

1 Seleccione un usuario de la lista **Users** en la pestaña **Security**.

2 En la columna **Permissions**, haga clic en los permisos actuales del usuario y seleccione una opción de la lista.



3 Haga clic en la opción **Save** para confirmar.

SUGERENCIA: El usuario **Guest** se crea por defecto y automáticamente tiene acceso de lectura y escritura a todas las carpetas compartidas del mezclador. Puede cambiar los permisos del usuario invitado desde la sección **Permissions** de la pestaña de seguridad, seleccionando entre las opciones de lectura y escritura, solo escritura, solo lectura o sin acceso.

Administración de usuarios

Use las opciones en la sección **Manage user** para cambiar las asignaciones de carpetas, el nombre de usuario o la contraseña de un usuario, así como para habilitar o deshabilitar el acceso de administrador.

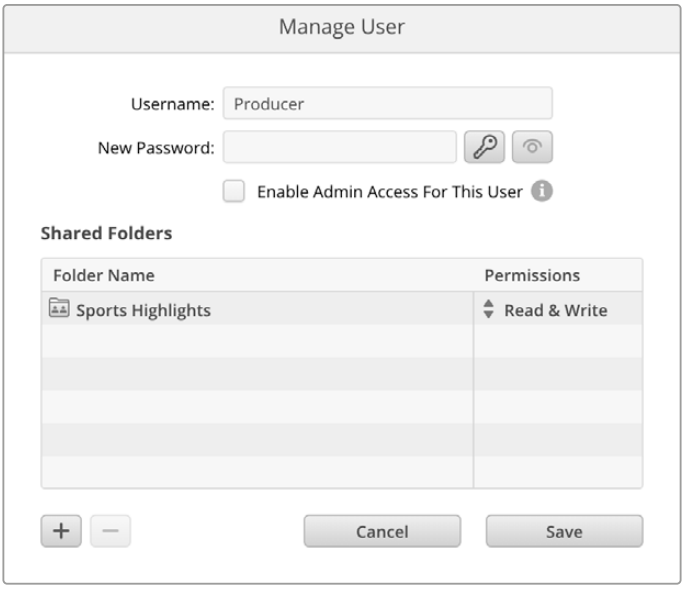
Configuración

Para administrar un usuario:

1 En la pestaña **Security**, seleccione de la lista **Users** el usuario que desea gestionar.

2 Haga clic en el icono del lápiz.

3 En la ventana **Manage user**, actualice la información del usuario.



4 Haga clic en el botón **Save** para confirmar los cambios.

Eliminar usuarios

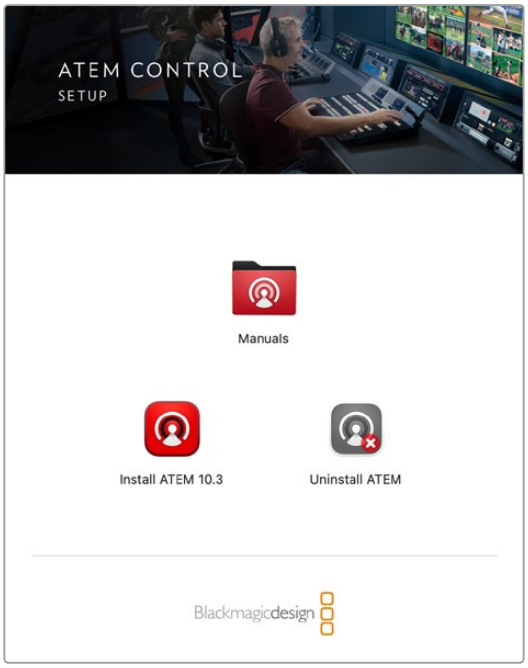
Para eliminar un usuario, seleccione el nombre de usuario que desea eliminar en la lista **Users** de la pestaña **Security** y haga clic en el botón -. A continuación, haga clic en el botón **Delete** para confirmar. Al eliminar un usuario, este no podrá acceder a las carpetas compartidas asignadas.

Actualización del sistema operativo interno

En ocasiones, Blackmagic Design lanza actualizaciones para el sistema operativo interno del mezclador y del panel, con el objetivo de incorporar nuevas funciones o corregir errores y brindar una mayor compatibilidad con otros equipos y aplicaciones.

Para acceder a las mismas, es necesario conectar el mezclador y el panel de control mediante el programa ATEM Setup. Este verificará la versión del sistema operativo interno de la unidad y le preguntará si desea actualizarlo, en caso de ser necesario.

Se recomienda actualizar todos los equipos simultáneamente para evitar que las versiones del software sean diferentes.



Programa de instalación

Para ello, conecte el mezclador directamente al equipo informático mediante un cable USB.

Alternativamente, si el dispositivo ya se encuentra conectado a un equipo informático mediante una red Ethernet, es posible actualizarlo a través de dicha conexión.

Descargue la actualización más reciente para mezcladores ATEM e instálela en su PC o Mac, siguiendo las instrucciones descritas anteriormente. Una vez instalada, las nuevas prestaciones estarán disponibles en el programa utilitario.

Actualización del mezclador

1. Conecte el mezclador a su PC mediante el puerto USB.

   Si el dispositivo ya se encuentra conectado a un equipo informático mediante una red Ethernet, es posible actualizarlo a través de dicha conexión.

   Al utilizar el puerto USB, compruebe que el mezclador sea el único dispositivo ATEM conectado al equipo informático en el que se ha instalado el programa utilitario. De lo contrario, es posible que no sea detectado.

2. Ejecute el programa ATEM Setup.
3. Aparecerá un mensaje en caso de que sea necesario actualizar el sistema operativo interno del dispositivo. Para iniciar la actualización, haga clic en la opción **Update Software**. Tenga en cuenta que este procedimiento puede tardar unos minutos. Es importante no desconectar el cable de alimentación durante el mismo.
4. Una vez que el proceso de actualización haya finalizado, aparecerá un mensaje que le solicitará reiniciar el mezclador. Apáguelo, enciéndalo nuevamente y cierre el cuadro de diálogo.

Actualización mediante una red Ethernet

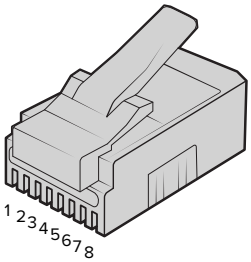
Aunque generalmente suele ser más rápido actualizar el equipo mediante una red Ethernet, hay algunos casos detallados a continuación en los que es necesario recurrir a una conexión USB:

- Es la primera vez que se actualiza el sistema operativo interno.
- Los ajustes de red de los dispositivos ATEM han sido preconfigurados para que estos funcionen inmediatamente. No obstante, si hay otros equipos audiovisuales conectados a la red, los posibles conflictos en las direcciones IP podrían generar inconvenientes de comunicación. Los ajustes de red solo pueden configurarse a través de una conexión USB.

Cables adaptadores para la comunicación y el control de cámaras

Conexión para el sistema de comunicación

La conexión **TALKBACK** en la parte trasera de los modelos ATEM Television Studio permite comunicarse con los ingenieros y la producción. Al fabricar un cable adaptador con un conector RJ45, configure los pines según el siguiente diagrama.



Eng TX+	Eng TX-	Prod TX+	Prod RX+	Prod RX-	Prod TX-	Eng RX+	Eng RX-
1	2	3	4	5	6	7	8

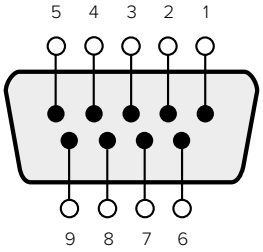
Configuración de pines del conector RJ45 para la conexión **TALKBACK** en la parte trasera de los modelos ATEM Television Studio

Conexiones del puerto serial para cables de control

Conexiones de pines RS-422 para cables de control

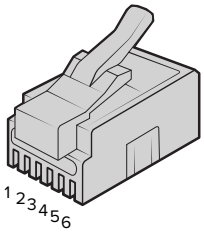
El protocolo RS-422 emplea conectores DE-9 o RJ12 tradicionales. Es posible utilizar este tipo de conexión a fin de crear una unidad de control para mecanismos PTZ.

A continuación, se proporcionan diagramas que indican la configuración de los pines en dichos conectores.



Configuración de los pines

Recepción (–)	Recepción (+)	Transmisión (–)	Transmisión (+)	Pines de conexión a tierra
8	3	2	7	1, 4, 6, 9



TX+	TX-	Tierra	Tierra	RX-	RX+
1	2	3	4	5	6

Configuración de la conexión RJ12 para el control remoto de mecanismos PTZ en el modelo ATEM Television Studio

Información para desarrolladores (en inglés)

Blackmagic SDI Camera Control Protocol

Version 1.3

If you are a software developer you can use the SDI Camera Control Protocol to construct devices that integrate with our products. Here at Blackmagic Design our approach is to open up our protocols and we eagerly look forward to seeing what you come up with!

Overview

The Blackmagic SDI Camera Control Protocol is used by ATEM switchers, Blackmagic 3G-SDI Shield for Arduino and the Blackmagic Camera Control app to provide Camera Control functionality with supported Blackmagic Design cameras. Please refer to the 'Understanding Studio Camera Control' chapter section of this manual, or the ATEM Switchers Manual and SDK manual for more information. These can be downloaded at www.blackmagicdesign.com/support.

This document describes an extensible protocol for sending a uni directional stream of small control messages embedded in the non-active picture region of a digital video stream. The video stream containing the protocol stream may be broadcast to a number of devices. Device addressing is used to allow the sender to specify which device each message is directed to.

Assumptions

Alignment and padding constraints are explicitly described in the protocol document. Bit fields are packed from LSB first. Message groups, individual messages and command headers are defined as, and can be assumed to be, 32 bit aligned.

Blanking Encoding

A message group is encoded into a SMPTE 291M packet with DID/SDID x51/x53 in the active region of VANC line 16.

Message Grouping

Up to 32 messages may be concatenated and transmitted in one blanking packet up to a maximum of 255 bytes payload. Under most circumstances, this should allow all messages to be sent with a maximum of one frame latency.

If the transmitting device queues more bytes of message packets than can be sent in a single frame, it should use heuristics to determine which packets to prioritize and send immediately. Lower priority messages can be delayed to later frames, or dropped entirely as appropriate.

Abstract Message Packet Format

Every message packet consists of a three byte header followed by an optional variable length data block. The maximum packet size is 64 bytes.

Destination device (uint8)	Device addresses are represented as an 8 bit unsigned integer. Individual devices are numbered 0 through 254 with the value 255 reserved to indicate a broadcast message to all devices.
Command length (uint8)	The command length is an 8 bit unsigned integer which specifies the length of the included command data. The length does NOT include the length of the header or any trailing padding bytes.

Command id (uint8)	The command id is an 8 bit unsigned integer which indicates the message type being sent. Receiving devices should ignore any commands that they do not understand. Commands 0 through 127 are reserved for commands that apply to multiple types of devices. Commands 128 through 255 are device specific.
Reserved (uint8)	This byte is reserved for alignment and expansion purposes. It should be set to zero.
Command data (uint8[])	The command data may contain between 0 and 60 bytes of data. The format of the data section is defined by the command itself.
Padding (uint8[])	Messages must be padded up to a 32 bit boundary with 0x0 bytes. Any padding bytes are NOT included in the command length.

Receiving devices should use the destination device address and or the command identifier to determine which messages to process. The receiver should use the command length to skip irrelevant or unknown commands and should be careful to skip the implicit padding as well.

Defined Commands

Command 0 : change configuration

Category (uint8)	The category number specifies one of up to 256 configuration categories available on the device.
Parameter (uint8)	The parameter number specifies one of 256 potential configuration parameters available on the device. Parameters 0 through 127 are device specific parameters. Parameters 128 though 255 are reserved for parameters that apply to multiple types of devices.
Data type (uint8)	The data type specifies the type of the remaining data. The packet length is used to determine the number of elements in the message. Each message must contain an integral number of data elements.

Currently defined values are:

0: void / boolean	A void value is represented as a boolean array of length zero. The data field is a 8 bit value with 0 meaning false and all other values meaning true.
1: signed byte	Data elements are signed bytes
2: signed 16 bit integer	Data elements are signed 16 bit values
3: signed 32 bit integer	Data elements are signed 32 bit values
4: signed 64 bit integer	Data elements are signed 64 bit values
5: UTF-8 string	Data elements represent a UTF-8 string with no terminating character.

Data types 6 through 127 are reserved.

128: signed 5.11 fixed point	Data elements are signed 16 bit integers representing a real number with 5 bits for the integer component and 11 bits for the fractional component. The fixed point representation is equal to the real value multiplied by 2^11. The representable range is from -16.0 to 15.9995 (15 + 2047/2048).

Data types 129 through 255 are available for device specific purposes.

Operation type (uint8)	The operation type specifies what action to perform on the specified parameter. Currently defined values are:
0: assign value	The supplied values are assigned to the specified parameter. Each element will be clamped according to its valid range. A void parameter may only be 'assigned' an empty list of boolean type. This operation will trigger the action associated with that parameter. A boolean value may be assigned the value zero for false, and any other value for true.
1: offset / toggle value	Each value specifies signed offsets of the same type to be added to the current parameter values. The resulting parameter value will be clamped according to their valid range. It is not valid to apply an offset to a void value. Applying any offset other than zero to a boolean value will invert that value.
Operation types 2 through 127 are reserved.	
Operation types 128 through 255 are available for device specific purposes.	
Data (void)	The data field is 0 or more bytes as determined by the data type and number of elements.

The category, parameter, data type and operation type partition a 24 bit operation space.

Group	ID	Parameter	Type	Index	Minimum	Maximum	Interpretation
Lens	0.0	Focus	fixed16	–	0	1	0.0 = near, 1.0 = far
	0.1	Instantaneous autofocus	void	–	–	–	trigger instantaneous autofocus

Blackmagic Embedded Tally Control Protocol

Version 1.0 (30/04/14)

This section is for third party developers or users who may wish to add support for the Blackmagic Embedded Tally Control Protocol to their products or system. It describes the protocol for sending tally information embedded in the non-active picture region of a digital video stream.

Data Flow

A master device such as a broadcast switcher embeds tally information into its program feed which is broadcast to a number of slave devices such as cameras or camera controllers. The output from the slave devices is typically fed back to the master device, but may also be sent to a video monitor.

The primary flow of tally information is from the master device to the slaves. Each slave device may use its device id to extract and display the relevant tally information.

Slave devices pass through the tally packet on their output and update the monitor tally status, so that monitor devices connected to that individual output may display tally status without knowledge of the device id they are monitoring.

Assumptions

Any data alignment / padding is explicit in the protocol. Bit fields are packed from LSB first.

Blanking Encoding

One tally control packet may be sent per video frame. Packets are encoded as a SMPTE 291M packet with DID/SDID x51/x52 in the active region of VANC line 15. A tally control packet may contain up to 256 bytes of tally information.

Packet Format

Each tally status consists of 4 bits of information:

uint4

bit 0: program tally status (0=off, 1=on)

bit 1: preview tally status (0=off, 1=on)

bit 2-3: reserved (0x0)

The first byte of the tally packet contains the monitor device tally status and a version number.

Subsequent bytes of the tally packet contain tally status for pairs of slave devices. The master device sends tally status for the number of devices configured/supported, up to a maximum of 510.

struct tally

uint8

bit 0: monitor device program tally status (0=off, 1=on)

bit 1: monitor device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4-7: protocol version (0b0000)

uint8**0**

bit 0: slave device 1 program tally status (0=off, 1=on)

bit 1: slave device 1 device preview tally status (0=off, 1=on)

bit 2-3: reserved (0b00)

bit 4: slave device 2 program tally status (0=off, 1=on)

bit 5: slave device 2 preview tally status (0=off, 1=on)

bit 6-7: reserved (0b00)

uint8**1**

Ayuda

Cómo obtener ayuda

Visite nuestra página de soporte técnico a fin de obtener ayuda rápidamente y acceder al material de apoyo más reciente para los productos descritos en este manual.

Página de soporte técnico

Las versiones más recientes de este manual, los distintos programas mencionados y el material de apoyo se encuentran disponibles en nuestro centro de soporte técnico.

Cómo ponerse en contacto con Blackmagic Design

Si no encuentra la ayuda que necesita, solicite asistencia mediante el botón **Enviar correo electrónico**, situado en la parte inferior de nuestra página de soporte técnico. De manera alternativa, haga clic en el botón **Soporte técnico local** para acceder al número telefónico del centro de atención más cercano.

Cómo comprobar la versión del software instalado

Para comprobar la versión del programa utilitario instalado en su equipo, seleccione la opción **Acerca de ATEM Software Control**.

- En equipos Mac, ejecute el programa desde la carpeta de aplicaciones. Seleccione la opción **Acerca de ATEM Software Control** en la barra superior de la ventana para ver el número de la versión.
- En Windows, ejecute el programa ATEM Software Control desde el menú Inicio. Acceda al menú **Help** y seleccione la opción **About** para ver el número de versión.

Cómo obtener las actualizaciones más recientes

Después de verificar la versión del programa instalado en el equipo informático, visite nuestro centro de soporte técnico para comprobar si existen actualizaciones disponibles. Aunque generalmente es recomendable descargar las versiones más recientes, evite actualizar el dispositivo si se encuentra en medio de un proyecto importante.

Normativas

Tratamiento de residuos de equipos eléctricos y electrónicos en la Unión Europea:
Este símbolo indica que el dispositivo no debe desecharse junto con otros residuos domésticos. A tales efectos, es preciso llevarlo a un centro de recolección para su posterior reciclaje. Esto ayuda a preservar los recursos naturales y garantiza que dicho procedimiento se realice protegiendo la salud y el medioambiente. Para obtener más información al respecto, comuníquese con el distribuidor o el centro de reciclaje más cercano.

Según las pruebas realizadas, este equipo cumple con los límites indicados para dispositivos digitales Clase A, en conformidad con la sección 15 de las normas establecidas por la Comisión Federal de Comunicaciones. Esto permite proporcionar una protección razonable contra interferencias nocivas al operar el dispositivo en un entorno comercial. Este equipo usa, genera y puede irradiar energía de radiofrecuencia, y si no se instala o utiliza de acuerdo con el manual de instrucciones, podría ocasionar interferencias nocivas para las comunicaciones radiales. El funcionamiento de este equipo en una zona residencial podría ocasionar interferencias nocivas, en cuyo caso el usuario deberá solucionar dicho inconveniente por cuenta propia.

El funcionamiento de este equipo está sujeto a las siguientes condiciones:

1. El dispositivo no debe causar interferencias nocivas.
2. El dispositivo debe admitir cualquier interferencia recibida, incluidas aquellas que pudieran provocar un funcionamiento incorrecto del mismo.

R-R-BMD-20220729001
R-R-BMD-20220729002
R-R-BMD-20230316001
R-REM-BMD-201805002

Declaración ISED (Canadá)
Este dispositivo cumple con las normas del gobierno de Canadá relativas a equipos digitales clase A.

Cualquier modificación o uso indebido del mismo podría acarrear un incumplimiento de dichas normas.

Las conexiones a interfaces HDMI deberán realizarse mediante cables blindados.

Este equipo cumple con las normas descritas anteriormente al emplearse en entornos comerciales. Nótese que podría ocasionar interferencia radial al utilizarlo en ambientes domésticos.

Seguridad

Para evitar el riesgo de descarga eléctrica, este equipo debe enchufarse a una toma de corriente que disponga de un cable a tierra. Ante cualquier duda, póngase en contacto con un electricista capacitado.

A fin de reducir el riesgo de descarga eléctrica, evite exponer el equipo a goteras o salpicaduras.

Compruebe que la fuente conectada sea compatible, según el voltaje y la intensidad de la corriente indicados junto al conector DC IN.

Este equipo puede utilizarse en climas tropicales, a una temperatura ambiente máxima de 40 °C.

Compruebe que haya suficiente ventilación en torno a la unidad.

La reparación de los componentes internos del equipo no debe ser llevada a cabo por el usuario. Comuníquese con nuestro centro de atención más cercano para obtener información al respecto.

Evite utilizar el equipo a una altura mayor de 2000 metros.

Declaración del Estado de California

Las partes plásticas de este producto pueden contener trazas de compuestos químicos, tales como polibromobifenilos (PBB), que el Estado de California reconoce como causantes de cáncer, anomalías congénitas o daños reproductivos.

Consulte la página www.P65Warnings.ca.gov para obtener más información al respecto.

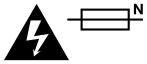
Advertencia para el personal técnico

Desconecte la alimentación de ambas tomas de entrada antes de reparar el dispositivo.



Precaución: fusible doble (polo activo/neutro)

La fuente de alimentación en este equipo incluye fusibles, tanto en el conductor de línea como en el neutro, y permite su conexión al sistema de distribución eléctrico noruego.

Garantía

12 meses de garantía limitada

Blackmagic Design garantiza que el producto adquirido no presentará defectos en los materiales o en su fabricación por un período de 12 meses a partir de la fecha de compra. Si un producto resulta defectuoso durante el período de validez de la garantía, Blackmagic Design podrá optar por reemplazarlo o repararlo sin cargo alguno por concepto de piezas y/o mano de obra.

Para acceder al servicio proporcionado de acuerdo con los términos de esta garantía, el Cliente deberá dar aviso del defecto a Blackmagic Design antes del vencimiento del período de garantía y encargarse de los arreglos necesarios para la prestación del mismo. El Cliente será responsable del empaque y el envío del producto defectuoso al centro de servicio técnico designado por Blackmagic Design, y deberá abonar las tarifas postales por adelantado. El Cliente será responsable de todos los gastos de envío, seguros, aranceles, impuestos y cualquier otro importe que surja con relación a la devolución de productos por cualquier motivo.

Esta garantía carecerá de validez ante defectos o daños causados por un uso indebido del producto, o por falta de cuidado y mantenimiento. Blackmagic Design no tendrá obligación de prestar el servicio estipulado en esta garantía para (a) reparar daños provocados por intentos de personal ajeno a Blackmagic Design de instalar el producto, repararlo o realizar un mantenimiento del mismo; (b) reparar daños resultantes del uso de equipos incompatibles o conexiones a los mismos; (c) reparar cualquier daño o mal funcionamiento provocado por el uso de piezas o repuestos no suministrados por Blackmagic Design; o (d) brindar servicio técnico a un producto que haya sido modificado o integrado con otros productos, cuando dicha modificación o integración tenga como resultado un aumento de la dificultad o el tiempo necesario para reparar el producto.

ESTA GARANTÍA OFRECIDA POR BLACKMAGIC DESIGN REEMPLAZA CUALQUIER OTRA GARANTÍA, EXPRESA O IMPLÍCITA. POR MEDIO DE LA PRESENTE, BLACKMAGIC DESIGN Y SUS DISTRIBUIDORES RECHAZAN CUALQUIER GARANTÍA IMPLÍCITA DE COMERCIALIZACIÓN O IDONEIDAD PARA UN PROPÓSITO PARTICULAR. LA RESPONSABILIDAD DE BLACKMAGIC DESIGN EN CUANTO A LA REPARACIÓN O SUSTITUCIÓN DE PRODUCTOS DEFECTUOSOS CONSTITUYE UNA COMPENSACIÓN COMPLETA Y EXCLUSIVA PROPORCIONADA AL CLIENTE POR CUALQUIER DAÑO INDIRECTO, ESPECIAL, FORTUITO O EMERGENTE, AL MARGEN DE QUE BLACKMAGIC DESIGN O SUS DISTRIBUIDORES HAYAN SIDO ADVERTIDOS CON ANTERIORIDAD SOBRE LA POSIBILIDAD DE TALES DAÑOS. BLACKMAGIC DESIGN NO SE HACE RESPONSABLE POR EL USO ILEGAL DE EQUIPOS POR PARTE DEL CLIENTE. BLACKMAGIC DESIGN NO SE HACE RESPONSABLE POR DAÑOS CAUSADOS POR EL USO DE ESTE PRODUCTO. EL USUARIO UTILIZA EL PRODUCTO BAJO SU PROPIA RESPONSABILIDAD.

致用户

感谢您选购ATEM Television Studio切换台从事现场制作!

如果您从未使用过现场制作切换台，那么您即将面对的是电视行业中最激动人心的部分——现场制作! 它有着让人为之着迷的独特魅力，当您从事实时剪辑工作的同时，现场活动跃然眼前，让人无比兴奋。这才是真正的电视制作!

早期的广播级现场制作成本之高让大部分人无法承受；而价格便宜的切换台又欠缺广播级功能和品质。ATEM Television Studio切换台改变了这一局面，您可以使用它完成极具专业水准的现场制作了。希望您能成为切换台的忠实用户，让现场制作工作成为一种享受!

本操作手册包含安装ATEM Television Studio切换台所需之全部信息。

请登陆公司网站www.blackmagicdesign.com/cn的支持页面获得ATEM切换台的最新版软件。只需用USB连接线将电脑连接到ATEM切换台和ATEM硬件控制面板即可进行软件升级，并获得所有最新功能! 下载软件时，请注册您的相关信息，以便我们发布新软件时能及时通知您。我们将不断致力于产品的功能开发和性能改进，诚挚期待您的意见和建议!

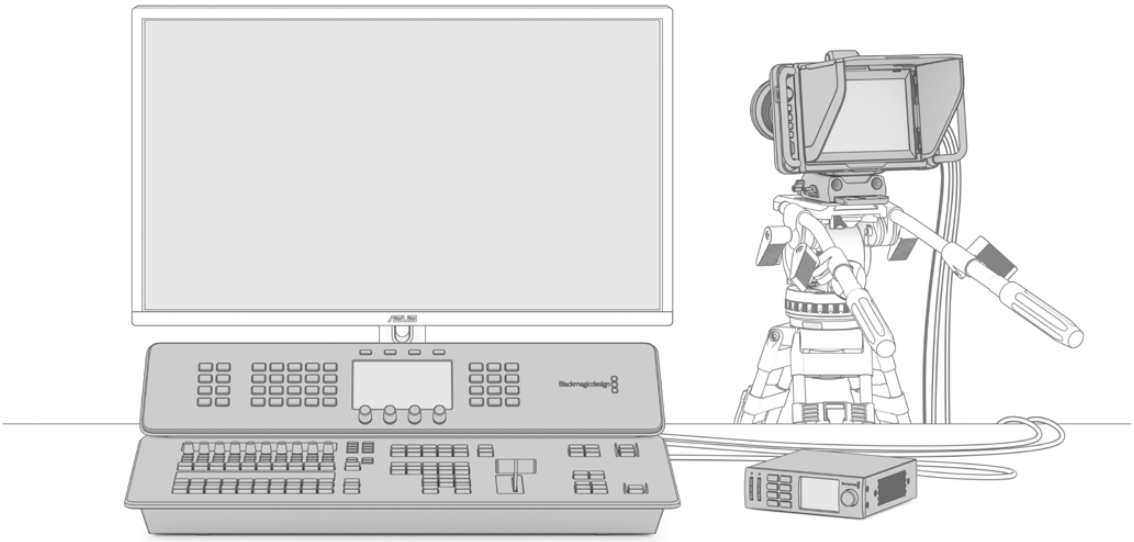
ATEM Television Studio简介

ATEM Television Studio切换台是专业的广播级数字制作切换台，它能在现场视频制作和播出环境中对各类视频源进行切换和处理。该切换台使用当今业界熟悉的混合特效设计，并有软件和硬件两种控制方式，为用户提供了界面简单快速、使用便捷的节目/预监切换的工作流程！如果您习惯使用旧式A/B切换台，ATEM切换台也支持A/B式切换，让您更易上手。

您只需ATEM切换台就能开始工作，因为它自带控制面板，因此可以直接从切换台来切换现场制作内容。但如果您想要更多的控制灵活性，还可以使用ATEM软件控制面板，或者甚至是增设一台或多台硬件控制面板获得更高级的解决方案。



设置ATEM Television Studio切换台的步骤简单直接，只要将多画面分割输出连接到监视器，连接摄影机，然后再将节目输出连接至录机即可。

什么是M/E切换台?

如果您以前使用过低成本切换台，您应该了解这些切换台也许并不具备混合特效的操作方式，即如今业界所谓的M/E式操作。而如果您以前使用过M/E式切换台，那您也许可以跳过本段直接安装并使用您的ATEM切换台了。

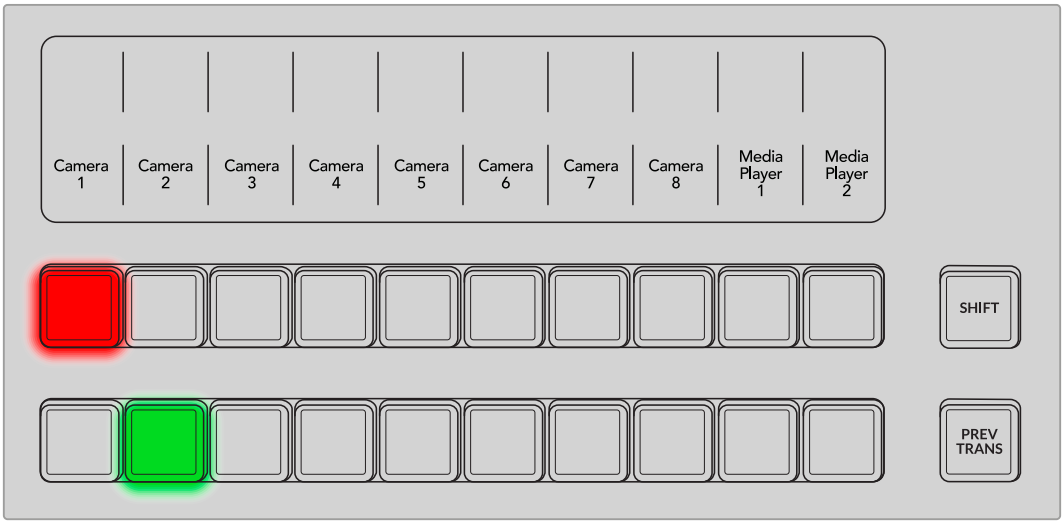
初次使用切换台时，您可能会觉得ATEM的这些密密麻麻的按钮和旋钮让人毫无头绪，其实它们的布局十分符合逻辑，并且一学就会。

ATEM是真正的高端广播级切换台，它采用的是业界标准M/E式工作流程。因此一旦熟悉了它的工作原理，您便能对目前业界常用的各款切换台操作都游刃有余了。

M/E式操作在其几十年的发展过程中不断帮助人们在现场活动制作时降低失误，无愧为广电行业的标准。您可随时直观地确认播出制作情况，不会因失误而引发播出事故。M/E式操作可让您在将信号源切入播出之前先进行确认，并可事先预览各种转场效果。每个键控和转场按钮一目了然，让您时刻掌握当前的播出情况及之后的播出安排。

了解ATEM切换台最直接的办法就是参照本手册进行实际操作。您或许可以跳过这一章节直接开始安装切换台了。

M/E控制面板上最显眼的部分是转场渐变推杆，通常就是控制面板上的T型推杆或者滑块所在的部分；其次便是PROGRAM节目信号源按钮列以及PREVIEW预监信号源按钮列。



节目和预监母线按钮可让您预览某个信号源然后再将其切换到直播

这里设有多种类型的转场，可通过LCD左侧的系统控制按钮进行选择，或通过在控制面板上按特定的转场图案按钮来进行选择。您可以选择一系列划像图案和DVE特效，并使用LCD菜单来调整转场时长以及其他转场设置。

包括ATEM在内的M/E式切换台还有另一个重要概念，即节目列和预监列上的视频在技术上称为“背景视频”。这是因为上游（特效）键控和下游键控会叠加在这一信号源之上。因此您可以将图文加载到键控上并可以在预监视频中确认效果，当启用键功能时，便能看到叠加了图层的节目视频。这一功能十分强大，而且它允许叠加多个图层。

ATEM的M/E式操作风格还有另一个绝对优势，就是您可以将键控锁定到某个转场。也就是说，当您进行混合转场同时，您可以让键控一起随之淡入或淡出。这样您就可以获得合成画面，并将所有图层同时转入播出。这一操作可使用“Next Transition”（下一个转场）按钮完成，您可以选择背景进行普通转场， 或者选定一个或多个键控将它们一同切入播出状态。

您甚至还可以按下ATEM Television Studio切换台控制面板上的多个按钮，将多个键控同时锁定到背景图层。此外，ATEM还具备专门的下游键锁定按钮，可以将下游键控锁定到某个转场上。下游键另设有“CUT”硬切和“MIX”混合按钮，十分便捷。下游键控始终位于所有图层包括转场图层之上，十分适合添加图标和台标。

最后，当现场制作接近尾声时，您还能以完美平滑的淡入黑场，也就是FTB渐黑控制，将画面上所有信息以黑场淡出。淡入黑场控制设计精致，位于切换台右下侧。这一控制可使画面所有内容淡入黑场，确保不会漏掉其中任何一个图层。淡入黑场功能适用于制作过程的最后一个环节，确保所有信号源完美结束。

M/E式切换台的最后一部分是Select选择母线。它位于节目列上方，可选择信号源用于添加特效处理及其他目的，选择母线上方还有标签提示您所切换的内容。Select选择母线通常是用来选择键输入，还可以用来从控制面板上直接运行宏命令。

综上所述，M/E式操作风格的切换台能让您更具自信地从事现场制作，并能在制作全程对现场情况、切换台状态，以及节目播出状态等给予良好反馈。由于切换台操作原理基本大同小异，因此只要您熟悉了M/E式操作，使用其他切换台时几乎无需培训便可很快上手了。

什么是A/B式切换台?

如果您使用视频切换台已有一段时日，您也许较习惯旧式的A/B切换台的操作方式。

A/B式切换台具有一个A母线和一个B母线。一个母线是节目母线，其当前节目输出以亮起红灯的按钮表示。另一个是预监母线，其预监视频以亮起绿灯的按钮表示。推拉渐变推杆时，母线之间会进行互换，亮起红灯的节目按钮会跟随推杆的移动而变化。按钮位置保持不变，只变换红绿灯光，这使得A/B式切换十分便捷。

然而如果转场时不使用渐变控制，A/B切换方式可能会变得较为复杂。如果您使用硬切或自动转场按钮将预监信号源转入到播出状态，或者使用多个控制面板操作切换台的话，那么您所使用的控制面板上的渐变控制是不会移动的。红色节目输出信号始终跟随渐变控制而变化，而因为您没有它，导致亮起红灯的节目按钮需要移动到同一列的另一个按钮上，而亮起绿灯的预监按钮需要移动到其所在列的另一个按钮上。

切换时有时使用渐变控制，有时则不用，容易让人混淆。这会使得预监和节目列上的按钮时而变换，时而保持原位，容易发生错误。

因此人们更倾向于新式的M/E式操作，因为绿色预监按钮始终位于“PREVIEW”（预监）列，而红色节目按钮也始终位于“PROGRAM”（节目）列。M/E式切换能确保一致性，可有效避免错误的发生。

了解ATEM切换台

ATEM Television Studio切换台具备完善的视频处理能力以及所有视频输入和输出接口。

这款切换台内置搭载各种按钮和旋钮的控制面板，您可以从切换台本身直接切换，或者通过以太网连接计算机使用ATEM Software Control进行切换，它可以在软件控制面板上模拟出相同的控制。通过软件面板以及内置控制面板可让多名用户对您的制作进行切换。例如，您可以通过内置面板切换摄影机，同时其他人员可通过软件面板控制摄影机和音频电平。操作选择各种各样。

ATEM Television Studio切换台通过3G–SDI支持上至1080p60的HD视频。ATEM Television Studio 4K8切换台还支持上至2160p60的4K视频。切换台上的所有输入内置同步器和格式转换器，因此您可以连接不同的格式，它们都可以自动转换成切换台所设置的输出格式。

每款切换台都设有高级色键、Fairlight调音台、摄影机控制调整和将静帧加载到媒体池的性能，以及更多功能。连接到网络后，您可以选择流媒体输入，或直接录制在网络存储方案中。

ATEM Television Studio切换台设有辅助输出，可使用任何内部和外部视频源。例如，如果您需要更多的节目输出，可通过设置让这些接口输出节目信号，或者选择其他信号，如不带下游键的Clean Feed净信号，甚至特定视频输入。ATEM Television Studio HD8切换台搭载2路辅助输出，ATEM Television Studio 4K8型号则搭载10路辅助输出。ATEM Television Studio 4K8型号上的额外辅助输出可用于连接外部HyperDeck硬盘录机，您可以录制所有视频输入用于之后的剪辑。视频输入录制被称为ISO录制，因为您录制的是独立的输入。

ATEM Television Studio HD8 ISO

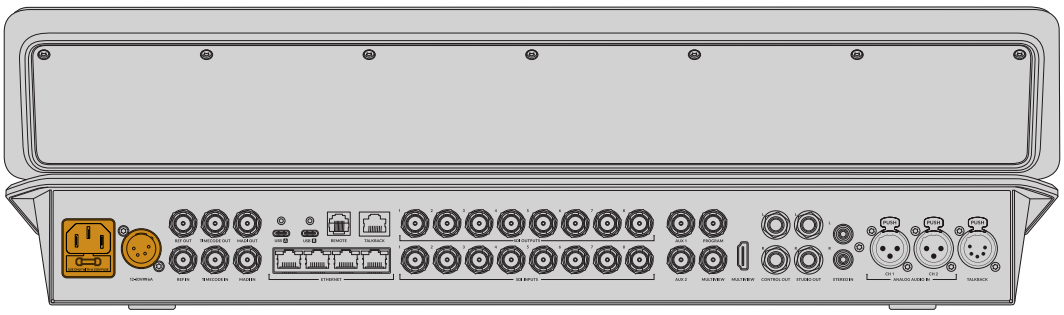
ATEM Television Studio HD8　　ATEM Television Studio 4K8

开始使用

ATEM Television Studio开始使用步骤很简单，只要连接电源，添加SDI视频源，连接多画面分割、再通过内置控制面板检查输入即可。

连接电源

为ATEM Television Studio切换台连接电源，只需将标准IEC线缆连接到后面板上的电源输入口即可。ATEM Television Studio切换台还搭载DC输入，可连接外部12V电池为其供电。连接电源后，控制面板LCD会开启，摄影机按钮也会亮起。



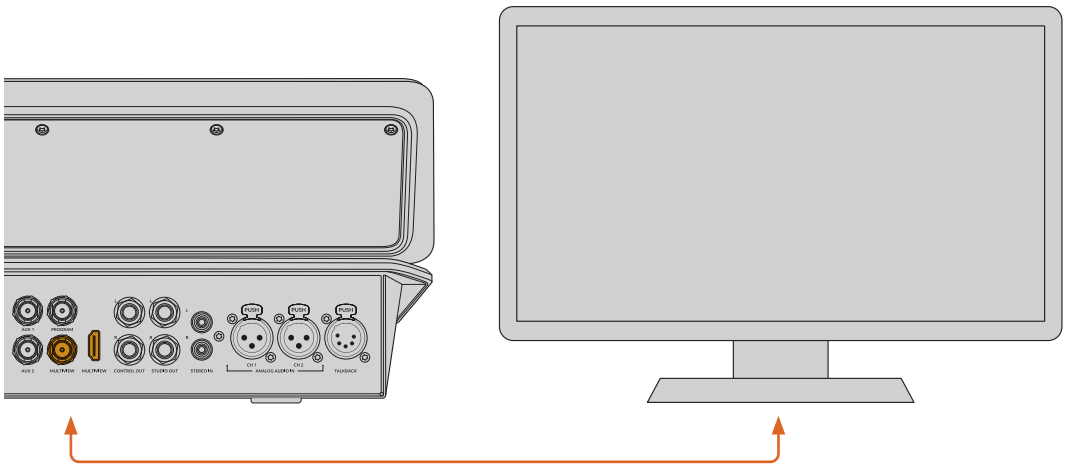
在ATEM Television Studio上通过IEC或DC输入连接电源

连接多画面分割

要检查输入，可通过SDI或HDMI多画面分割连接将一个显示器连接至多画面分割输出。

连接后，应该可以在显示器上看到8个小分割画面和2个大分割画面。每个画面都是独立的，连接其他信号源后，信号画面就会显示在相应的多画面分割上。您可以通过ATEM Software Control软件控制将多画面分割自定义为多达16个视图显示。详情请参考本手册后续在“使用多画面分割”部分的介绍。

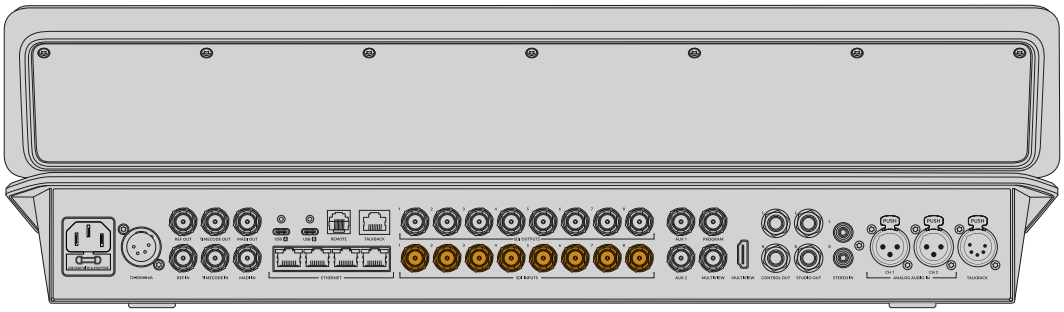
如果您能看到这一多画面分割显示，则表示ATEM已连接到电源并运行正常，下面就可以开始连接信号源了。



将您的ATEM Television Studio切换台连接至监视器来查看多画面分割输出

连接信号源

将您的SDI摄影机和其他信号源连接至ATEM Television Studio的SDI输入。这些SDI接口搭载格式转换和帧同步功能，因此所有信号都将转换为切换台所设置的视频格式 。



ATEM Television Studio的SDI输入

对于ATEM Television Studio HD8 ISO切换台，您还可以通过以太网端口连接Blackmagic Studio Camera 6K Pro等推流信号源。更多关于通过以太网选择信号源的信息，请参考本手册后面关于“ISO型号的额外功能”部分的内容。

连接音频

ATEM Television Studio切换台内置调音台，可使用来自摄影机的嵌入SDI音频，以及来自XLR和RCA输入和MADI BNC输入的外部音频。这些额外音频输入可用于摄像机麦克风和其他预录音频等其他音频源。

ATEM Television Studio上的音频输入

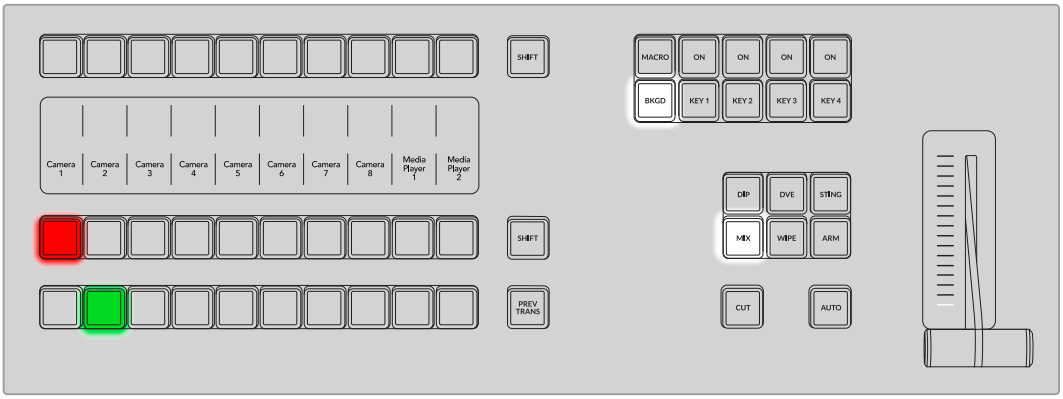
连接音频后，您可以通过查看控制面板调音台上的电平来确认每个声道的信号。

通过Fairlight调音台上的音频表来检查音频电平

详情请查阅本手册后面关于调音台部分的内容。

执行转场

M/E控制面板上最显眼的部分是转场渐变推杆，通常就是控制面板上的T型推杆或者滑块所在的部分；其次便是PROGRAM节目信号源按钮列以及PREVIEW预监信号源按钮列。

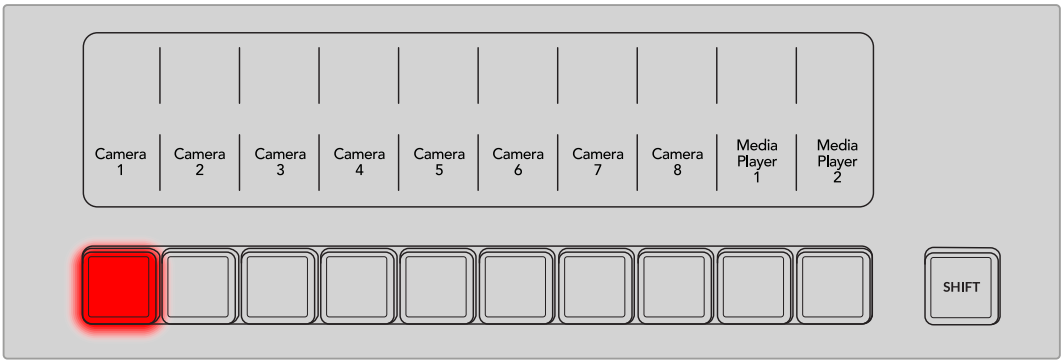


检查设置时，第一步应执行转场。

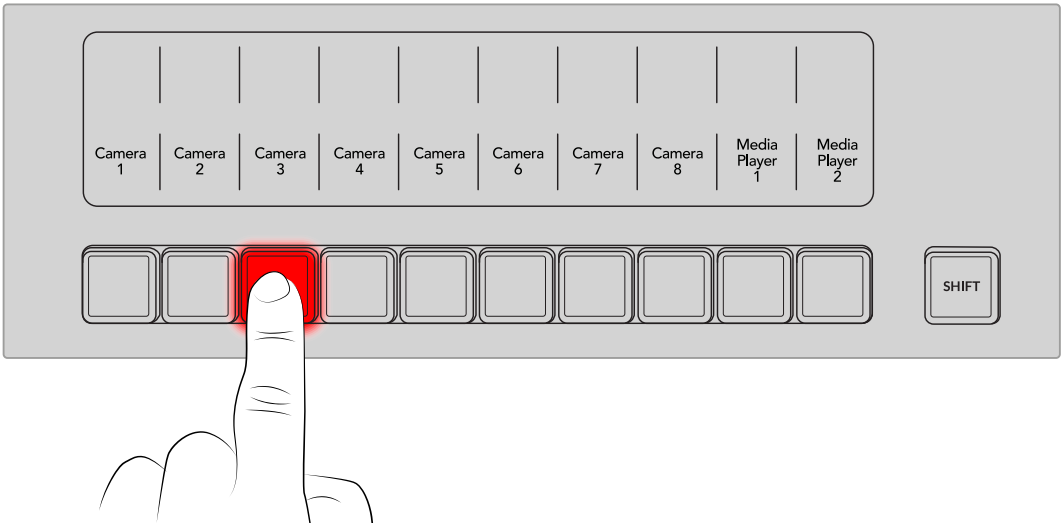
ATEM Television Studio切换台上有两个切换模式可选。默认设置是“节目预监”模式，可让您在切换到直播前预览信号。而顶部一列节目母线信号源选择按钮可用于将各信号源热切换到节目输出。请慎重选择此列信号源，因为一旦按下按钮，信号源会立即切入播出状态。

使用节目列从输入1到输入3执行硬切转场：

1 输入1亮起红色提示了输入1目前是直播状态。



2 在节目列中，按输入3。



输入1现在立即切换到输入3，您将看到输入3亮起红色，意味着现在输入3是直播状态。所谓硬切，就是您直接从一个信号切到另一个信号。

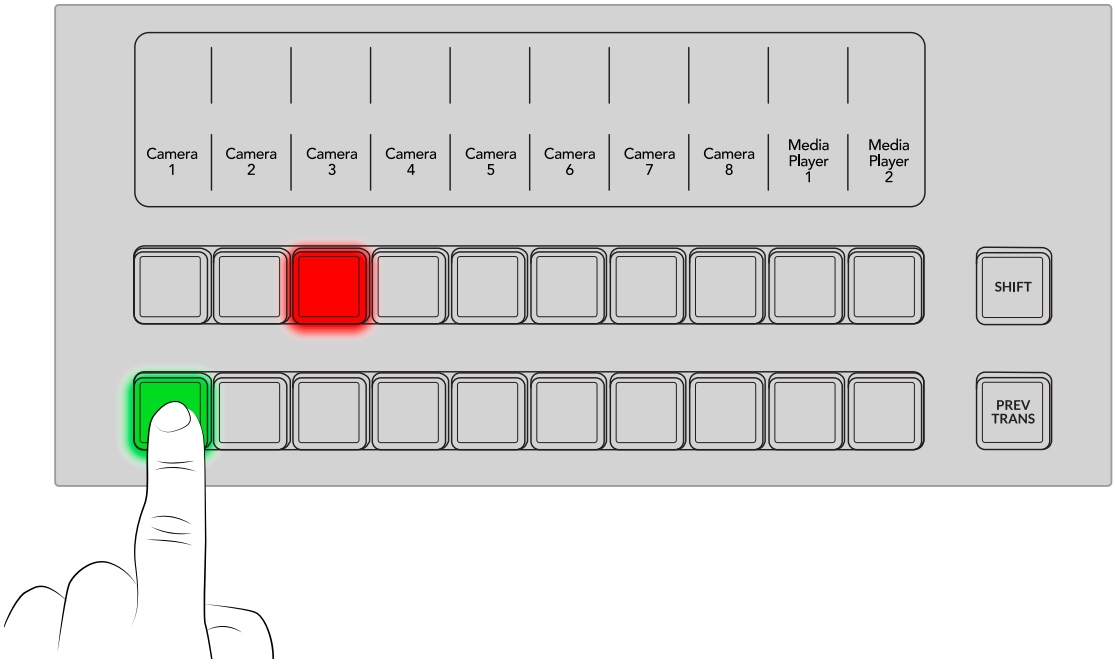
转场的另一个更安全更有序的方法是在预监按钮中选定转场信号源，然后再通过转场将其直接硬切或转场过渡到播出状态。

这一操作方式十分实用，因为您可以在预监列上选取信号源，并通过预监视频输出确认选中的信号源准确无误，然后再选择各种转场效果。整个过程都尽在掌握，因此很少出现意外。只有M/E式操作能让您实时掌握制作播出的情况。

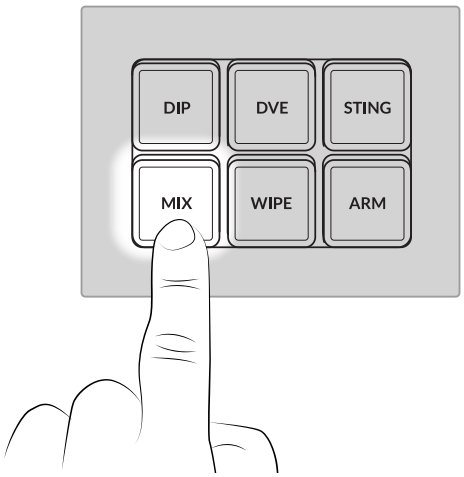
最底部的一排按钮用来选择预监母线信号源。通常在将信号源切入到播出之前，您都会在这一区域选择信号源。选中的信号源会在下一个转场过渡时发送到节目输出。按下CUT硬切按钮、AUTO自动转场按钮，或者上下移动渐变推杆均可触发下一个转场。根据您在Transition Control转场控制区块所选的转场类型，您可以在这列按钮中选择MIX（混合）、DIP（浸入）、WIPE（划像）以及DVE等转场方式。

以下示例中将使用混合转场从信号3切换回信号1。

1 在预监列上按下按钮1来选中下一个信号源。相应的按钮将亮起绿色，表示已在预监母线上选中。

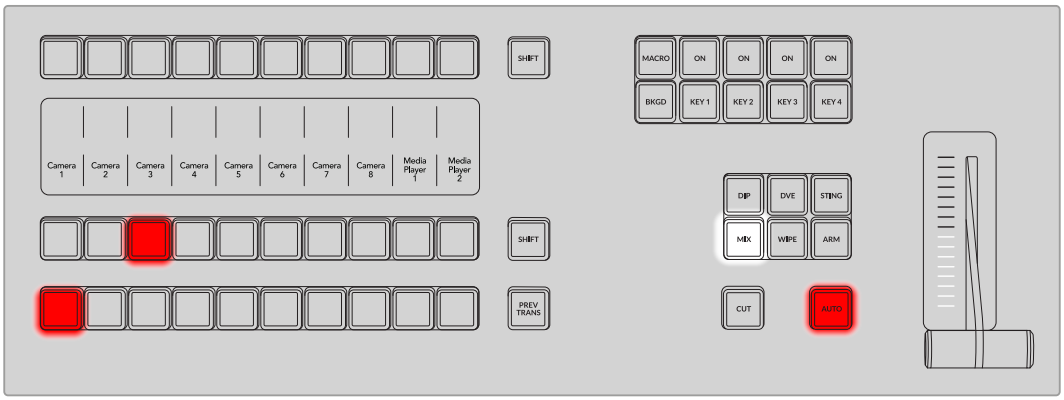


2 按下专门的“MIX”转场按钮。

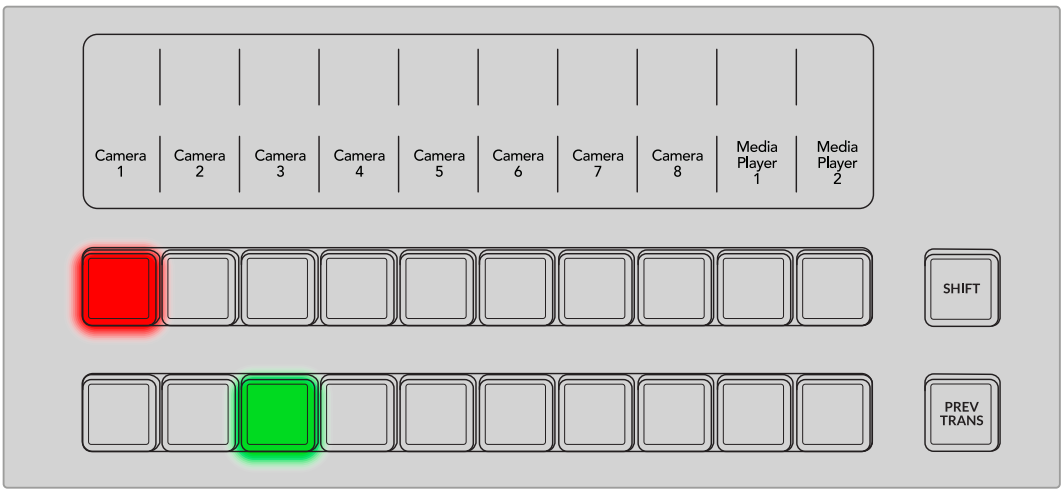


3 现在，按下“AUTO”按钮执行该转场。

转场过程中，节目和预监列上的输入按钮会亮起红色，表示它们都处于播出状态，渐变推杆提示也会亮起。



转场结束后，您会注意到预监列和节目列上选定的信号源已互换。这是因为您在预监列中选定的信号源已经切换到播出状态，因此在转场结束后它会出现在节目列上。请注意，节目列始终显示当前处于播出状态的信号。



设置您的网络

ATEM切换台的出厂设置默认硬件控制面板直接通过以太网线进行连接。同时，ATEM还支持所有以太网IP协议，因此您可以将ATEM Television Studio切换台和外接ATEM硬件控制面板连入您的网络中，或者使用因特网以便将其布置在任何地方。能联网意味着控制切换台的方式具有非常大的灵活性。例如，您可以将ATEM Camera Control Panel与您的切换台连接到相同的网络，让一名操作人员切换内容的同时其他操作人员可调整摄影机。此外，您还可以在计算机上安装软件控制面板，从而让第三名操作者处理音频或从软件面板上管理媒体文件。

ATEM Television Studio切换台默认设置为DHCP，因此切换台可以自动获取网络信息。但您可以手动设置固定IP地址。

1 如果您不在主页面菜单，可按“HOME”按钮回到主菜单。

2 按LCD上方的“网络”多功能按钮并使用右箭头导航到“IP地址”。如果您的切换台可以看到网络，那么所指派的IP地址将出现在屏幕下方。

3 要手动设置IP地址，按LCD“DHCP”上方的多功能按钮可将DHCP关闭。通过LCD下面所对应的旋钮设置手动IP地址。当使用静态IP时，切换台必须与连入的HyperDeck等其他设备共享同样的IP地址子网，通常这意味着IP地址的前三段数值必须一样。

4 IP地址输入完成后，按“保存更改”按钮。

现在您的切换台就在您的网络上了，您可以通过ATEM Software Control选择流媒体平台并通过“ON AIR”按钮开始推流。

更多关于选择流媒体平台的信息，请参考本手册后面关于“输出选项卡”部分的内容。

一切准备就绪！继续阅读本手册了解如何使用ATEM Television Studio切换台上的所有功能和控制。

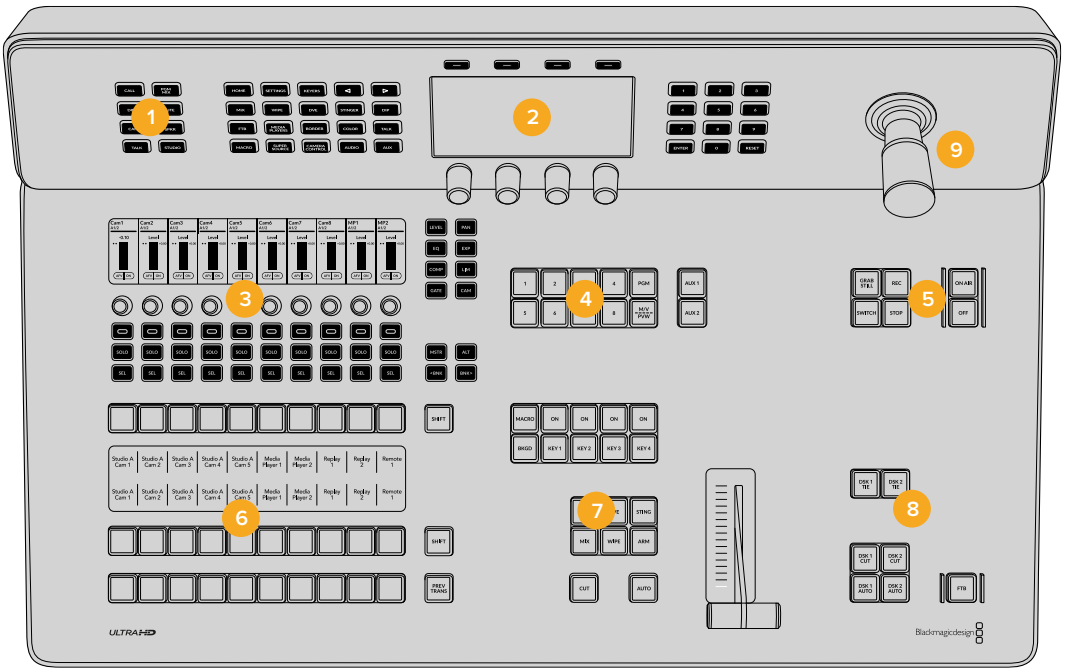
使用ATEM Television Studio

ATEM Television Studio切换台上的高级控制面板包括了节目和预监列、混合特效面板、对讲控制、专门的Fairlight调音台和摄影机控制按钮、LCD菜单和T型杆可用于精准转场控制。

内置面板和所提供的ATEM Software Control软件控制面板是一起操作的，对其中一个面板所做的任何更改会反映到另一个面板上，因此您可以同时使用两种控制面板进行操作。如果有其他人负责操作摄影机控制，您还可以连接ATEM Camera Control Panel等额外的硬件控制面板。

控制面板概述

这部分内容介绍了控制面板的主要功能，例如主系统控制、LCD菜单、节目和预监按钮、转场按钮、键控按钮、Fairlight音频控制以及更多。



ATEM Television Studio 4K8

1 对讲和CALL按钮

2 系统控制

3 调音台

4 辅助选择按钮

5 推流和录制按钮

6 节目、预监和源选择

7 DVE和转场

8 下游键控和淡入黑场

9 ATEM Television Studio 4K8 切换台上的摇杆

系统控制

控制面板的顶部区域，以及LCD屏幕和周围的按钮被称为系统控制，它就好比切换台的任务控制中心。这一块形成了中央访问菜单，可用于更改切换台重要设置和常规配置。

系统控制

LCD菜单导航

当您按下“HOME”按钮或其他系统控制按钮时，LCD将会相应地显示相关的控制和设置。使用LCD上方的多功能按钮和下方的旋钮可进行更改。

每个LCD菜单设有1页或多页设置，页数会通过菜单名称下方的圆点来表示。在设置页面导航可通过左右箭头按钮或者LCD右侧的数字键盘来实现。

例如，要在”节目预监”和“A/B式切换”之间进行切换，

1 按“SETTINGS”按钮。选定后，您会发现左右箭头按钮和数字按钮亮起。

LCD显示屏右侧的数字按钮会亮起，方便您快速进入每个菜单页面

2 反复按右箭头按钮直到出现切换模式选项，或按数字6按钮直接导航至切换模式菜单。

使用数字键盘导航菜单

3 使用LCD上方的多功能选择按钮，选择节目预监或A/B式切换模式。

使用LCD上方的多功能按钮选择切换模式

4 按“HOME”按钮退出设置菜单。

数字键盘还可以用于直接键入数值。例如，要在主页面上更改自动转场的时长，按“自动时长”所对应的旋钮，该数字键盘按钮会亮起。

输入新的时长数值并按“ENTER”。

按“ENTER”以确认更改

更改设置

主页面是您在LCD上看到的第一个菜单，包括网络设置和用户配置。任意时候想要回到主页面，按“HOME”按钮即可。

按LCD“按钮映射”上的多功能按钮可进入“按钮映射”菜单。

主页

主页面菜单将显示当前输入和转场时长以及网络设置、软件版本信息和保存配置文件等子菜单。

主页	主LCD显示
网络	将切换台设为DHCP或手动输入地址。
关于	显示软件版本
配置文件	保存控制面板的所有偏好设置和宏命令，在下次使用这台控制面板时重新加载。如果有多人共用切换台，这一功能就非常实用。

设置

按“SETTINGS”按钮将显示“设置”、“HyperDeck”、“按钮映射”等菜单，可通过LCD上方的多功能按钮来选定。

更改设置

使用旋钮、多功能按钮和数字键盘可调整设置菜单中的选项。

设置切换台视频格式	视频设置是用来为ATEM切换台选择所运行视频格式的。视频格式一经更改，之前载入媒体池的所有文件也会全部被清除。
设置多画面分割视频格式	如果您的制作视频格式设为1080p25或更高，可以将多画面分割输出调整为较低的帧率。这样您可以将多画面分割输出进行下变换，从而获得更大的监视器兼容性。
设置亮度	在亮度设置中使用旋钮来自定义按钮、标签和屏幕的亮度。在较暗的环境工作时，这个功能会非常实用。

切换台时间码	时间码发生器会在您为切换台连接电源后就自动开始运行当日时间码。您可以将计数器清零，或手动键入一个新的时间码值作为开始。
切换模式	ATEM切换台的出厂设置为节目/预监切换模式，这也是目前M/E风格切换台的标准模式。如果您较为熟悉老式的A/B式切换，您可以将这一设置更改为“A/B式切换”。
淡入黑场	ATEM Television Studio 4K8上的FTB按钮可通过系统控制上的LCD多功能按钮来实现启用或禁用。
串行端口设置	ATEM Television Studio切换台后侧搭载RJ12远程端口可用于RS–422控制。您可以通过串行端口菜单来选择如何使用。
摄影机控制设置	针对ATEM Television Studio 4K8型号，您可以选择“反向”或“正常”选项来选择摇杆的竖移方向。使用监看旋钮为摄影机控制监看选择SDI输出。
语言选择	ATEM Television Studio切换台可被设置为英语、德语、西班牙语、法语、意大利语、日语、韩语、波兰语、葡萄牙语、俄语、土耳其语、乌克兰语以及简体中文显示。
格式化存储介质	设置菜单的最后一页可以让您格式化内部存储。该设置在没有存储选项的切换台上将被禁用。详情请阅读本手册中“存储介质”部分的内容。
开机状态	如果您的ATEM Television Studio切换台针对所有制作都使用相同的设置，您可以将其保存为默认开机状态。保存后，每次重启切换台会加载所有预设和偏好设置。通过“清除开机状态”可清除这些设置。

HyperDeck设置

您可连接多达10台HyperDeck硬盘录机并通过系统控制进行控制。连接HyperDeck时，使用这些设置来设置输入、启用自动播放、帧偏移设置和配置IP地址。更多关于HyperDeck设置方面的详情，请查阅本手册中“HyperDeck控制”对应部分的内容。

按钮映射

要进入按钮映射设置，请按下“SETTINGS”按钮打开切换台通用设置的LCD菜单，然后按下“按钮映射”所对应的多功能按钮。

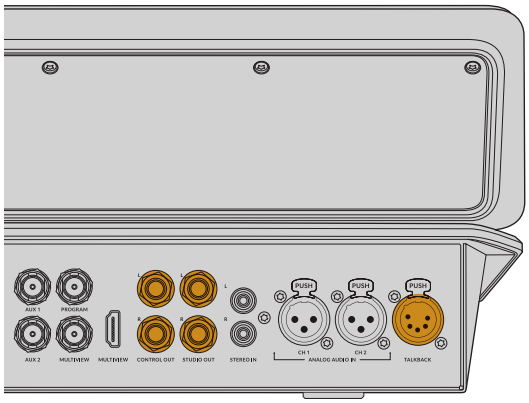
通过LCD每个设置下方所对应的控制旋钮可选择您想要映射的按钮以及您想要选择的输入。如果想要突出某些特定的源信号，您还可以更改按钮和标签在控制面板上的显示颜色。例如，您可能想要以不同的颜色来突显播放信号源，这样能立刻在控制面板是加以识别。在预监和节目母线上的按钮会同时亮起，直到该信号源被切换到预览或是节目输出后，该颜色将更为所对应的绿色或是红色。

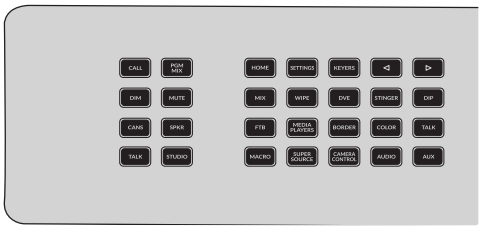
设置更改后立即生效，无需进行保存。按“HOME”按钮可返回主页面。

如果您想要更改按钮的亮度，按“SETTINGS”按钮可开启切换台通用设置LCD菜单，然后通过箭头或按数据键盘上的数字4导航到菜单第四页。转动相应的旋钮可将标签和按钮的亮度调整到理想的水平。完成所有按钮设置的配置后，可按“HOME”按钮回到主页面。详情请参阅本手册前面“亮度设置”部分的内容。

对讲和CALL按钮

面板左上角上的对讲和呼叫按钮可让您无需其他硬件就可以直接获得对讲功能。将带有麦克风的对讲耳麦连接到切换台后面板上的对讲5针XLR扩展槽。





“CALL”按钮

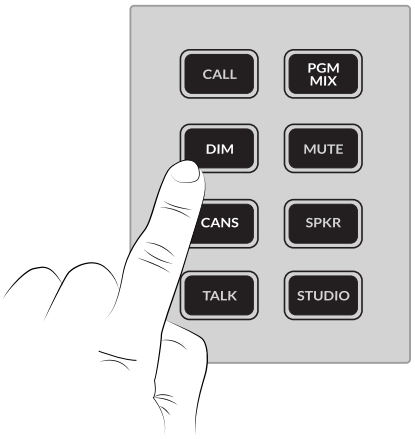
按住“CALL”按钮可在所有已连接的摄影机上闪烁Tally提示。这一功能十分有用，它可以引起摄像师的注意，或者告知摄像师即将切入直播。

节目混合

按PGM MIX可听取节目混合。当选中CANS或扬声器时，可通过对讲XLR和连接到控制输出上的扬声器听取节目混音。

半静音

按DIM, 可在不移动推子的情况下暂时降低节目混音电平。要回到设置电平, 再次按DIM可恢复到原始电平。



静音

按MUTE, 可在不移动推子的情况下暂时静音节目混音输出。

CANS

当通过切换台后侧的5针对讲XLR接口连接耳机时, 按CANS按钮可通过该连接开启音频。选中后, 按PGM MIX可听取节目混合。

扬声器

选中SPKR按钮可通过切换台后侧的控制输出连接开启音频。

对讲

当使用耳麦时, 您可以按TALK来开启麦克风输出。只有在按住或连按两次STUDIO按钮将其一直开启时, 才可以在Studio输出上听到对讲。

如果按两下TALK按钮, 麦克风将保持开启状态, 按钮会亮起, 直到您再次按两下按钮。同时按下STUDIO和SPKR按钮时, 麦克风将对所有对讲通道保持开启状态。

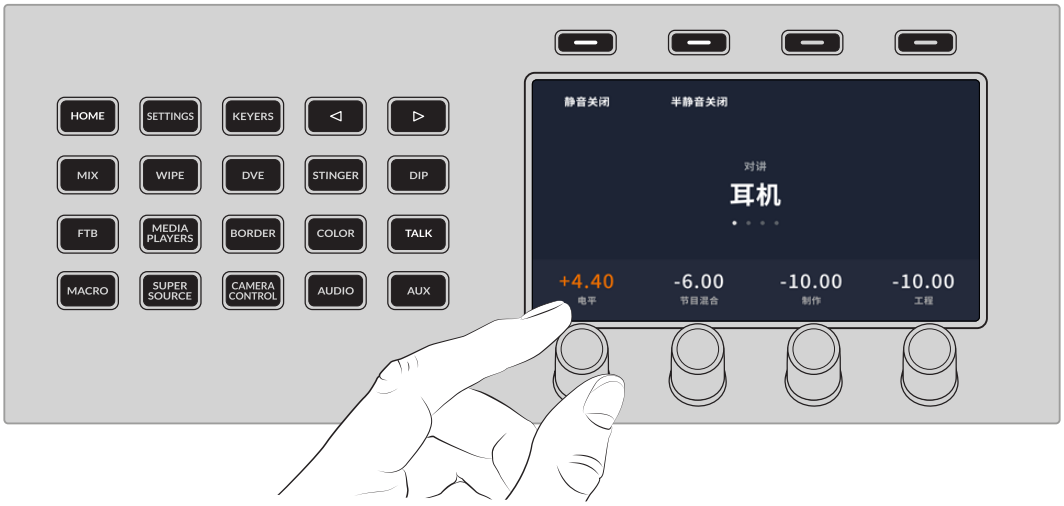
演播室

STUDIO按钮可开启面板后侧的标有“STUDIO OUT”的输出, 该输出连接至演播室内的扬声器供播报员听取。选中“TALK”后, 短暂按下或者连按两次STUDIO按钮可按住讲话。

耳机、控制和演播室输出电平可通过系统控制里的音频和对讲按钮来调整。

1 按“TALK”按钮。耳机设置可用来调整后面板上5针XLR耳机接口上的音频混音, 第二页提供更多设置。

2 旋转相应的旋钮调整您的电平。

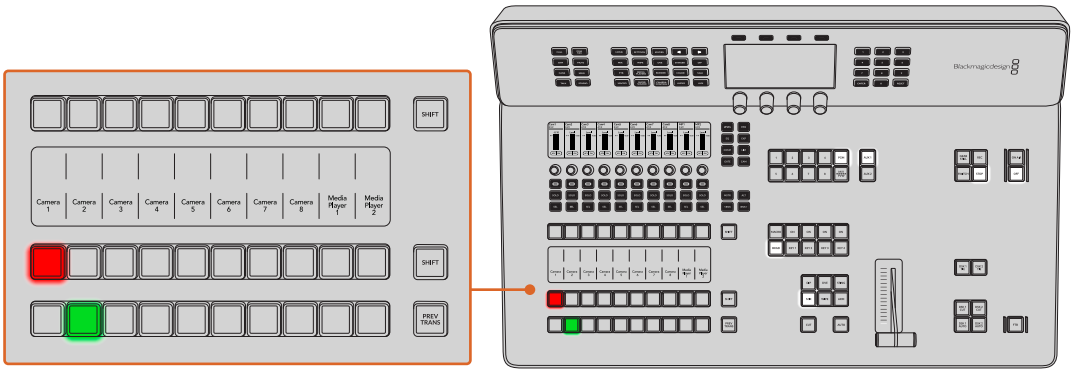


3 通过第三页和第四页屏幕调整“控制输出”和“演播室输出”电平。

设置	
电平	调整耳机、演播室输出或控制输出的整体输出电平。
节目混合	设置节目音频电平。
制作	为每路输出调高或降低制作对讲电平。
工程	为每路输出调高或降工程对讲电平。
侧音 仅耳机	仅适用于耳机，侧音电平可让您将耳机麦克风中的声音混合到监听输出中。 使用降噪耳机时，这一功能非常有用。
麦克风增益 仅耳机	有些对讲耳机具有低麦克风电平可能很难听到。调整麦克风增益设置可升高或降低麦克风音量。

混合特效

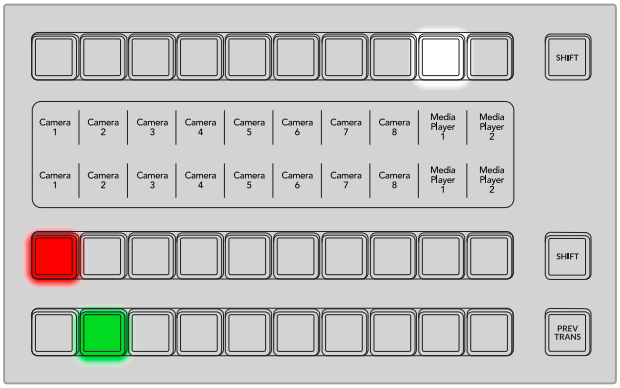
结合使用Program节目母线、Preview预监母线和源名称显示栏可切换节目和预监输出上的信号源。



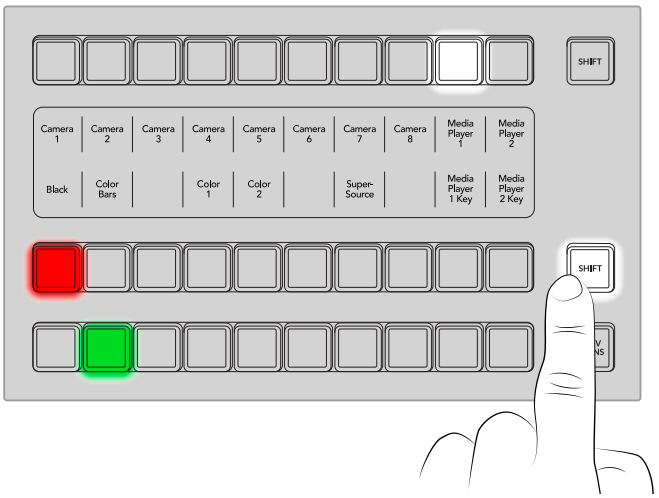
源名称显示栏

源名称显示栏使用标签来标识切换台的外部输入或内部信号源。外部输入的标签可在软件控制面板的“设置”窗口中编辑。内部信号源的标签是固定的，无需更改。

Source Select源名称选择栏、Program节目母线栏、Preview预监母线栏中的每个按钮都有标签显示。



按SHIFT按钮会让源名称显示栏显示更多信号源，称为换挡源，最多可有20个不同的信号源备选。



同时按下源信号选择及节目母线栏一侧的两个SHIFT按钮可将源名称显示更改为被保护的源信号显示，这些源信号会出现在Source Select栏，用于键控及指派到辅助输出。被保护的源是Program（节目）、Preview（预监）、Clean Feed 1（净信号1）和Clean Feed 2（净信号2）。

Program节目母线

Program节目母线可将各背景信号源热切换到节目输出。当前正在播出的信号源由亮起红灯的按钮表示。当前正在播出的换挡信号源则由闪烁红灯的按钮表示。按SHIFT按钮可显示换挡源。

预监母线

预监母线用于选择预监输出上的信号源。信号源会在下一个转场过渡时发送到节目输出。处于预监的信号源由亮起绿灯的按钮表示。处于预监的换挡信号源则由闪烁绿灯的按钮表示。按SHIFT按钮可显示换挡源。

Shift键

SHIFT按钮为通用换挡键，可将节目、预监以及选择母线连同标签一起换挡。它还提供了转场类型及其他菜单功能的换挡。

此外，连按两次预监、选择母线上的按钮或转场类型按钮，也可起到换挡作用，比按SHIFT按钮换挡更为快捷。连按功能不适用于节目母线，因为此操作可能导致节目输出显示错误信号源。

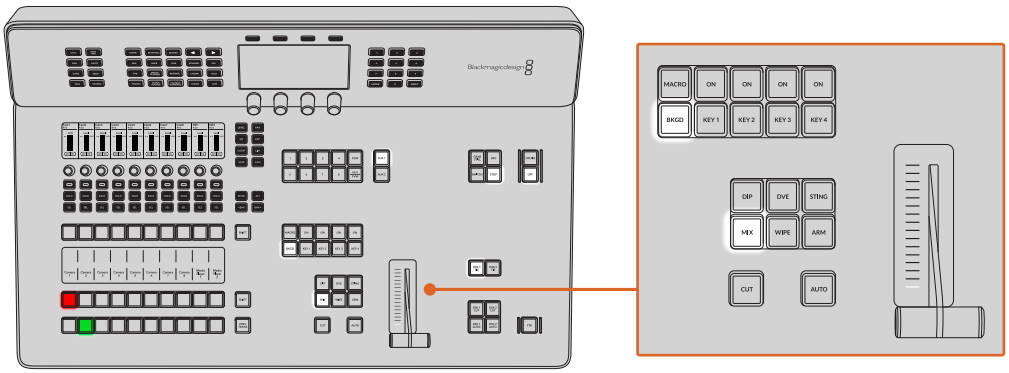
信号源选择母线

信号源选择母线可与源名称显示栏共同使用可将信号源指派给各路辅助输出和键控。当启用宏命令按钮后，这栏按钮还可以用于加载和运行录制到对应槽的宏命令。宏命令按钮启用后，按钮指示灯会亮起蓝色。

目标显示栏结合选择母线显示了各路信号源指派到键和辅助输出的情况。当前选中的信号源以亮灯按钮表示。而当前选中的换挡源则由闪烁的按钮表示。若按钮亮起绿灯则表示此为受保护的信号源。

被保护的源是Program（节目）、Preview（预监）、Clean Feed 1（净信号1）和Clean Feed 2（净信号2）。

转场控制和上游键控



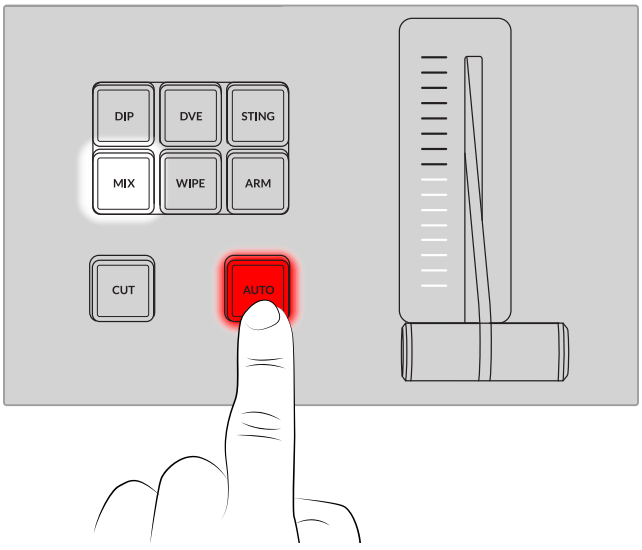
硬切

即“CUT”按钮，不论选中哪类转场类型，使用硬切按钮都可以在节目和预监输出之间快速转场。

自动

即“AUTO”按钮，可根据LCD主页中所设置的自动时长完成某一选中的转场。每种转场的时长可以在LCD菜单中设置，选定转场风格按钮后，对应的时长会在LCD菜单中显示。

AUTO（自动）按钮在转场过程中会亮起红灯，渐变推杆的LED提示会亮起以提示转场的进展程度。如果同时使用软件控制面板，软件界面上的虚拟渐变推杆也会相应发生变化，并根据转场进展给出视觉反馈。



渐变推杆及渐变推杆指示灯

渐变推杆可代替AUTO按钮使用，使操作者手动控制转场。渐变推杆一侧的指示灯会对转场进度给出视觉反馈。

AUTO（自动）按钮在转场过程中会亮起红灯，渐变推杆的提示灯会亮起以提示转场进程。如果使用软件控制面板，虚拟推杆也会同时发生变化。

转场类型按钮

操作者可通过按钮选择以下五种转场特效中的一种: MIX (混合) 、WIPE (划像) 、DIP (浸入) 、DVE和STING (Stinger) 。按下标有转场类型的按钮即可执行相应的转场。选定后, 该按钮会亮起。

当选定某个转场类型后, LCD菜单会显示转场时长并直接提供了该转场类型的所对应的所有设置。使用多功能按钮和旋钮导航到各个设置并进行更改。

ARM

“ARM”按钮可以在转场完成后, 自动启用已连接且已在预监母线上选中的HyperDeck上的播放功能。和自动播放功能类似, 在预监母线上选中的HyperDeck将会在您按下CUT或AUTO按钮触发转场时开始播放。按下专用的ARM按钮即可启用该功能。启用后, 在下一个转场发生时, 所选的HyperDeck输入将会自动播放, 该功能仅在该次转场中生效。如果要让ARM功能保持启用状态, 可连按两次ARM按钮, 此时按钮会亮起绿色, 表示该功能已持续启用。

需要注意的是, 启用ARM功能时, 所有通过HyperDeck设置的预卷功能都将被忽略。

预监转场

即“PREV TRANS”按钮, 可用于预监转场模式, 操作者可使用渐变推杆在预监输出上事先确认某个转场效果。按下此按钮可开启预监转场功能, 您可不限次数地预监转场。此功能可让您在直播前测试转场效果并可根据需要做出更改。您甚至可以预监STINGER转场! 调整后, 再次按下按钮, 转场就准备绪, 可随时切入直播。

下一个转场

BKGD、KEY 1、KEY 2、KEY 3、KEY 4按钮可用于选择与下一个转场一同转入播出或撤出播出的内容。同时按下多个按钮可将背景和键进行组合。连按两次BKGD按钮可选中所有处于播出状态的下一个转场上游键控, 并将它们复制到Next Transition (下一个转场) 按钮上。

按任意一个下一个转场按钮会取消选中其余按钮。选择下一个转场的内容时, 切换台操作者应该注意观察预监输出, 因为该输出可准确预演转场完成后节目输出的画面。当只选定BKGD按钮时, 画面会从当前位于节目母线上的信号源过渡到预监母线上选定的信号源。

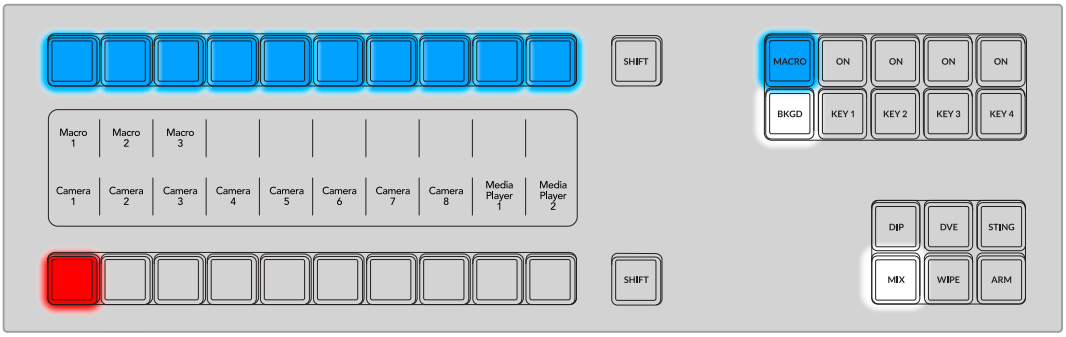
ON AIR

每个键控上方均设有一个标有“ON”的在播提示按钮, 可让您明确哪些上游键正处于播出状态, 并且也可用于将某个键立即转入播出或撤出播出。

宏命令

MACRO按钮能启用宏命令功能，从而将源选择栏的按钮更改为对应于宏命令槽的宏命令按钮。

源选择列中共有十个宏命令按钮，如果您录制了超过十个宏命令，可以打开LCD菜单中的宏命令设置，使用控制旋钮来更改宏命令群组。

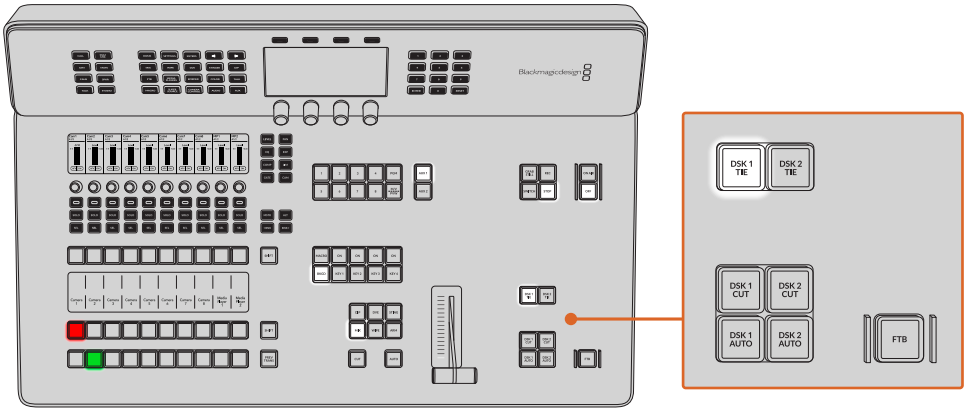


更多关于如何通过ATEM Television Studio录制和运行宏命令的信息，请参阅本手册后面“使用宏命令”部分的内容。

下游键控

下游键控锁定

DSK TIE按钮可使DSK（下游键）和下一个转场特效一起在预监输出上待命，并将其与主转场控制锁定，使DSK随下一个转场同时进入播出状态。



由于下游键控与主转场锁定，转场将会以LCD主页面中设置的自动时长完成转场。当DSK处于TIE锁定状态时，Clean Feed 1（净信号1）上的信号不受影响。

下游键控硬切

即“DSK CUT”按钮，可将DSK切入或切出直播，并可提示DSK当前是否处于播出状态。如果DSK当前处于播出状态，该按钮会亮起加以提示。

自动下游键控

即“DSK AUTO”按钮，可按照LCD菜单设置中DSK时长所指定的数值将DSK切入或切出直播。

淡入黑场

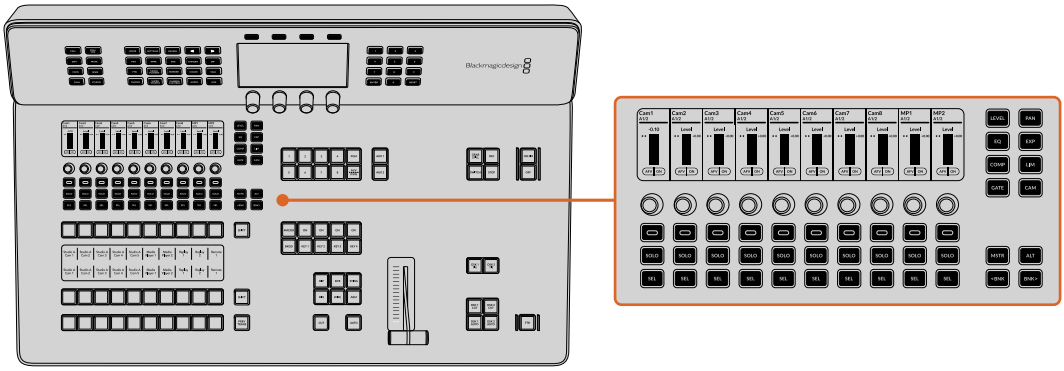
即“FTB”按钮，可将节目输出以LCD菜单设置中所指定的FTB时长转入黑场。当节目输出以黑场淡出后，FTB按钮会闪烁红光，直到再次按下该按钮时，红灯熄灭，画面会以相同时长从黑场逐渐过渡到节目输出。淡入黑场操作不支持预监。

您还可以将切换台设置为音频随视频一同淡出，只需导航到FTB LCD菜单并将AFV设置为“开启”即可。这样可以让切换台以淡入黑场中的时长设置将音频逐渐淡出。如果您想在淡入黑场的过程中和结束后保留音频，可将AFV设置为“关闭”。

调音台

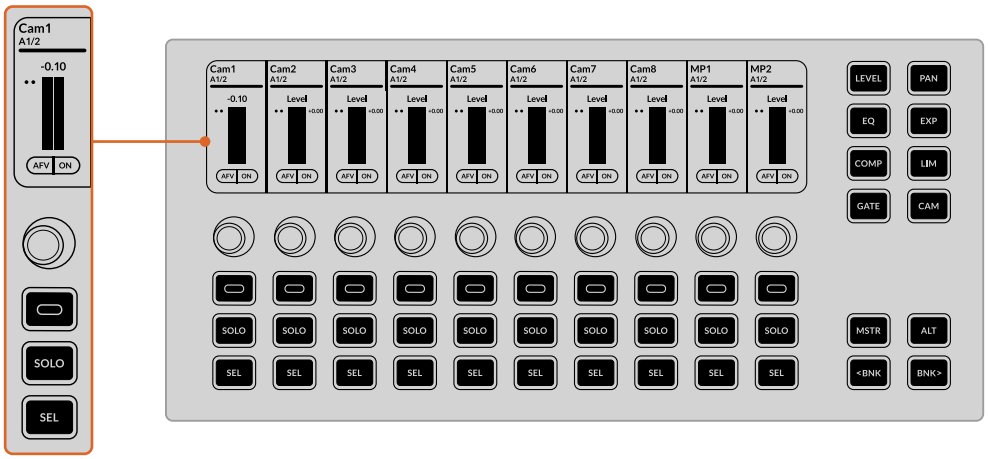
ATEM Television Studio切换台配备先进的音频控制，可强化并美化每路输入和主输出上的音质。具体包括输入电平控制、6频段参量均衡器以及强大的动态设置。本手册该部分内容将介绍如何使用不同的音频工具来完成并优化现场制作的混音。除了调整音频外，　您可以使用相同的旋钮和按钮进行摄影机控制，并调整切换台音频输出。

调音台搭载有一系列控制，可让您用来对现场制作进行监听和混音。有些按钮是单一功能，但有些则搭载多个功能，因此在讨论每个按钮和旋钮细节之前，最好先来了解不同类型的控制。



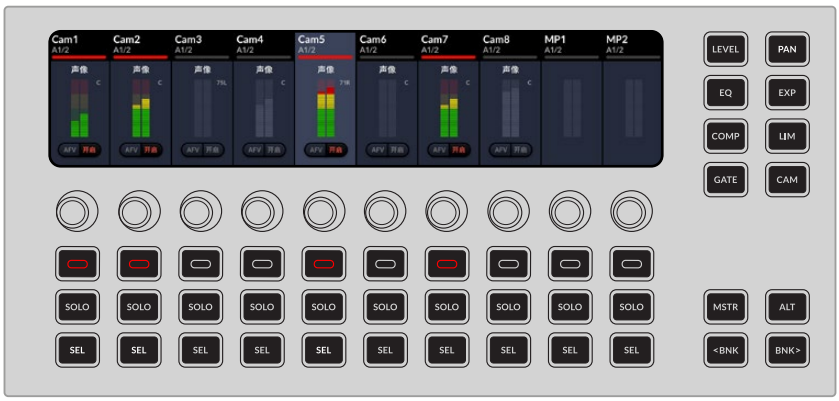
通道条

调音台上最突出的地方是专门设置的通道条。在调音台默认操作模式下提供有10个通道条，每一个又搭载有开启、SOLO和SEL按钮、以及用于调整的旋钮和显示通道信息的LCD屏幕。对通道条控制的任何更改都会被映射到ATEM Software Control软件控制的音频页面上。



LCD

当您首次使用ATEM Television Studio切换台时，每个通道条上方的LCD会显示所对应的输入名称和电平表。LCD屏幕会根据使用通道条右侧的按钮所选择的当前模式来显示不同的信息。例如，选中PAN（声像）按钮时，会显示10个输入的音频表。如果有任何输入设为分离单声道时，每个单声道输入将显示其各自的通道条。

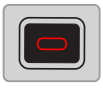


当通过LCD右侧的按钮选择其他模式时，LCD显示将自动更新。例如，当按下EQ按钮时，LCD将更改为显示低、中和高滤波器，按钮和旋钮将控制特定的EQ参数，这些参数反映了使用音频的EQ控制。

旋钮

当您需要对特定参数进行快速更改时，这些多功能旋钮可让您进行准确地转动控制，也被称为编码器。要增加输入的电平，按LEVEL按钮并向右转动旋钮。

开启按钮



这个多功能按钮可用来选择在LCD上所显示的按钮。例如，选中LEVEL时，该按钮会在音频跟随视频、开启和关闭之间切换。当选中LEVEL或PAN时，该按钮将亮起红色以提示输入处于直播状态。

独听按钮

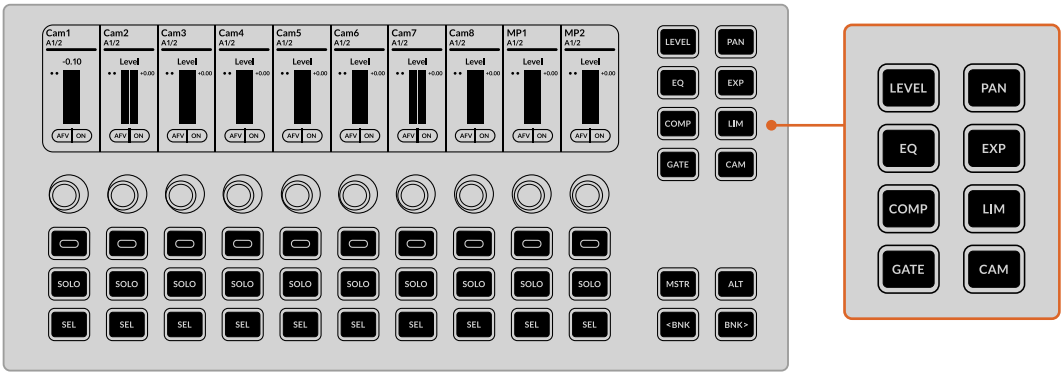
按SOLO按钮可以只查听该声道。该功能可有助于微调音频。选中后，对应声道的LCD上会出现一个耳机图标。

选择按钮

通过SEL按钮可选定或取消选定某个声道。

模式按钮

通过这些控制按钮将所对应的设置指派到通道条上。



再次按下EQ按钮可显示高通和低通控制

有些设置包含1页以上的控制，在第一个通道条上会有提示。要显示其他控制，可再次按下相应的模式按钮。例如，按EQ按钮两次可显示高通和低通滤波器。

模式

切换台前面板的调音台所提供的音频模式与ATEM Software Control软件控制所提供的设置是一样的。您还可以使用摄影机控制设置从ATEM切换台控制Blackmagic Studio Camera 6K Pro和URSA Broadcast G2等Blackmagic摄影机。

LEVEL (电平)	可通过相应的旋钮调整每个声道的音频电平输出。每个通道条的多功能按钮可在音频跟随视频、开启和关闭之间进行切换。按ALT后，您可以为每个声道调整增益。调高增益可升高所选输入的音量，反之亦然。
EQ (均衡器)	EQ控制组件设有两页控制选项。按EQ按钮可加载控制第一页，从左到右映射到各个旋钮编码器和SEL开关。 再次按EQ可切换到第二页。该EQ控制主要是针对频段1和频段6的高通和低通滤波器，所对应的多功能按钮可开启和关闭滤波器，或选择形状。再次按EQ可回到第一页，如需要可重复该操作在第一页和第二页间切换。 EQ控制与ATEM Software Control软件控制上音频页面的所有参数控制相一致。
COMP (压缩器)	压缩器控制组件包括动态窗口里所有可用的压缩器参数。跟其他控制组件一样，您可以在通道1的位置找到指派给多功能按钮的开关控制。
GATE (门限器)	门限控制组件与ATEM Software Control软件控制上音频页面的所有门限参数控制相一致。使用SEL按钮选择重点关注哪个轨道。门限相当于一个夸大的扩展器，它可以降低电平，甚至对信号中低于某一特定电平的部分进行静音，从而降低或消除录音中安静部分的噪音。
PAN (声像)	每个音频通道都设有一个立体声声像控制，可让您对输入进行声像控制。旋转所对应的通道旋钮可左右调整声道的声像。调整每个旋钮时，所选中的声道的SEL按钮将亮起以提示。
EXP (扩展器)	扩展器控制组件与ATEM Software Control软件控制上音频页面的所有门限器参数控制相一致。使用SEL按钮可选择重点关注哪个轨道。之后的七个通道条包括扩展器参数旋钮控制，与它们在动态窗口中出现的顺序一致。
LIM (限制器)	与其他动态控制组件一样，限制器控制组件包括所有限制器参数控制，指派到编解码旋钮的顺序与在动态窗口的一致。
CAM (摄影机控制)	调音台还设有摄影机控制功能，因此您可以通过ATEM切换台上相同的旋钮和按钮来控制Blackmagic摄影机。 按下“CAM”按钮可显示这些设置。摄影机控制设置分为三个菜单页面，您可以再次按CAM在这些页面间导航。您还可以通过系统控制中的“摄影机控制”控制按钮来调整设置控制设置。更多关于摄影机控制的详情，请参阅手册后面关于“使用摄影机控制”部分的内容。

通道和修改器按钮

模式按钮下方是通道和修改器按钮。

MSTR

MSTR按钮可显示切换台后面板所连接的音频输出控制，包括耳机、控制和演播室输出。此外您可以调整主输出电平。

ALT

通过ALT按钮可显示其他参数或功能。例如，当调整电平控制时，按ALT可显示增益控制。

按ALT按钮可显示增益控制

BNK

使用BNK按钮可显示LCD上的下一组输入。BNK>可以10为单位向右跳至下一个通道条组。<BNK可以10为单位向左跳至下一个通道条组。

音频控制流程指南

本部分内容会介绍基本工作流程，从而帮助您开始使用调音台来细调和优化音频混合。

1 一般来说，优化混音的第一步是要将所有输入正常化，使它们都处于其最大音量并且不出现削波。您可以通过升高或降低每路输入的输入增益电平来达到这一目的，让各路信号的峰值刚好在声道条电平指示的0dB以下。

2 如果您想要将单声道输入分离成两路单独声道作为立体声输出，请到切换台常规设置中的音频选项卡中设置。找到您想要更改为立体声的单声道输入，然后启用它的复选框。点击“完成”。

> **提示** 如果您希望将单声道输入分离成两个单独的通道，最好在第一步所述的输入正常化之前就进行操作，以便在两个通道分开后对它们同时进行正常化。

3 下面，按“EQ”按钮，并对每个输入进行均衡调整。

4 均衡器设置后，通过“EXP”和“GATE”按钮打开动态控制。对动态进行适当的调整，以改善输入音频。

5 为每路输入完成EQ和动态设置后，在ATEM Software Control打开主输出的EQ控制，美化最终音频混合。

6 打开主输出的动态控制，并根据需要进行调整，以改善最终输出的效果。

完成调音台控制调整后，您接下来需要调高或调低调音台上的电平，将它们设置到理想的实时混音电平，然后在进行制作的使用进行必要的调整。如有需要，您也可以回到任何一项设置进行进一步调整，但请务必按照上文介绍的顺序进行操作，以便让每项功能都获得理想效果。例如，请务必先设置EQ控制再更改动态控制，因为切换台的音频处理流程是先进行均衡控制再应用动态控制。

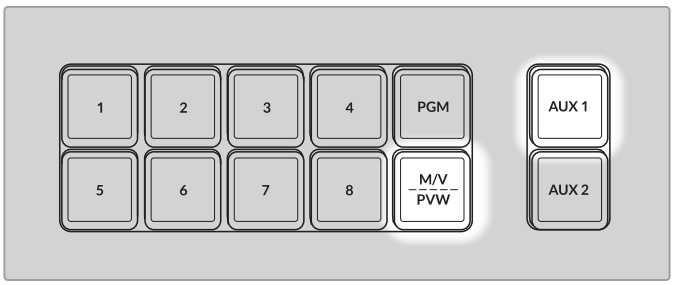
最重要的一点是，请小心应用各项效果，在确保音频自然的同时还有激动人心的效果。

更多关于调整Fairlight控制的详情，请参阅本手册后面关于“先进的Fairlight控制”的内容。

备注 需要注意的是，当USB连接设置为USB数字音频时，调音台会自动被禁用，切换台会从Fairlight Live等USB调音台检测返送音频。

选择按钮

ATEM Television Studio切换台后面板上搭载辅助输出，可以指派多路输入和内部信号。辅助输出和矩阵输出十分相似，而且所有视频输入、彩底发生器、媒体播放器、节目、预监，甚至彩条信号都可通过它们输出。前面板设有10个专门的按钮，为选择8个输入、节目提供了快捷方式，还有一个按钮可以在多画面分割和预览画面间切换。



MV/PVW按钮会在选中多画面分割时亮起白色，选中预览画面时亮起绿色。

使用系统控制中的辅助菜单可为所有可用输出选择其他内部源和媒体播放器，包括彩条。如果在所有下游键控前需要纯画面信号，那么甚至可以选择这个来输出。这样可获得没有徽标或台标的节目信号，方便您将它采集制作成播出母版，用于后期制作或信号传输。

在辅助1上选择纯画面信号：

1 在系统控制中按“AUX”按钮。

2 旋转输出1下方的旋钮直到出现纯画面信号。

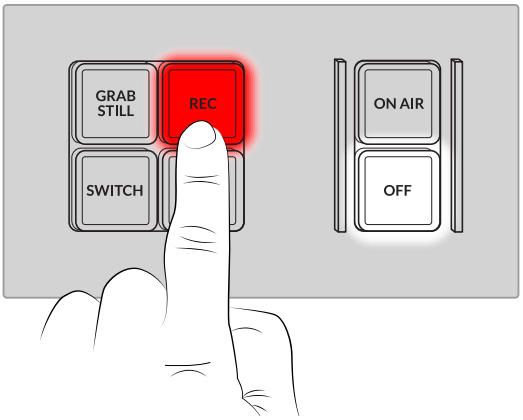
在ATEM Television Studio HD8上指派3路辅助输出

当辅助输出更改信号源时，切换台可确保进行优质的画面切换，因此您可使用切换台来切换辅助输出上的各个信号源，并得到优质稳定的画面过渡。

该输出十分强大，可通过软件控制面板指派信号。无论当前停留在哪个窗口，输出选项始终位于软件控制面板顶部的菜单栏，以便快速选择输出。更多关于通过ATEM Software control设置输出的详情，请参阅本手册后面关于“辅助输出”的内容。

推流和录制按钮

ATEM Television Studio切换台可让您通过面板上专门的按钮来推流和录制您的制作内容。



通过面板上的按钮对制作内容进行推流和录制

GRAB STILL (抓取静帧)	如需从播出内容里采集静帧，按“GRAB STILL”按钮。该操作就像静帧存储一样，可让您将采集文件添加到媒体池。然后，您可以直接将静帧加载到媒体播放器中，用于播出，或保存到您计算机的媒体池中。
REC (录制)	您可以通过USB–C使用外接硬盘或闪存盘来录制您的流媒体，或当使用ISO型号时通过可选的内部存储进行录制。通过“REC”按钮来开始录制您的制作内容。要结束录制按“STOP”。
STOP (停止)	
SWITCH (切换)	当通过USB连接两个外接存储盘时，通过“SWITCH”按钮可切换哪个存储盘可以录制。
ON AIR (直播)	切换台内置推流功能，无需其他软件就可以直接推流。连接到网络并通过ATEM Software Control选择推流服务后，按“ON AIR”按钮就可以开始立即推流。如需了解更多关于推流设置的信息，请查阅本手册后面关于“推流”部分的内容。
OFF (关闭)	

要开始推流，您需要将切换台连接至网络。除了推流到Blackmagic Cloud、YouTube和Twitch等平台外，将切换台连接至网络还可以让您在使用ATEM Television Studio HD8 ISO切换台时让ATEM Camera Control Panel等ATEM硬件面板连接至远程信号。

如果视频格式设为1080i60等隔行格式，您只能录制或推流，但不能同时进行二者。

更多关于获得推流密钥的详情，请查阅本手册后面关于“推流”部分的内容。

存储介质

ATEM Television Studio切换台可让您通过后面板上的两个USB–C接口将节目录制到外接存储盘或闪存上。您还可以连接多端口USB–C硬盘坞或MultiDock 10G，从而连接一个或多个SSD获得更大的存储容量。

您还可以在带有可选内部存储功能的ATEM切换台上进行内部存储。本章节讲述了如何为外部和内部存储做准备。

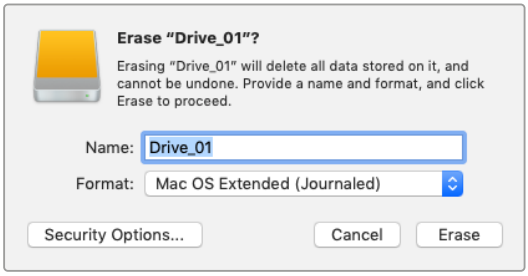
通过计算机准备存储

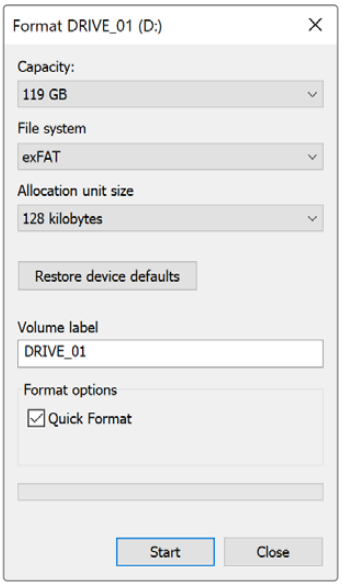
外置硬盘可通过Mac或Windows计算机格式化。HFS+也被称为Mac OS X扩展格式，因为它支持“日志功能”，所以被广为推荐。一旦发生存储介质损坏的情况，具有日志功能的存储介质更易恢复数据。HFS+受Mac系统的原生支持。exFAT则受Mac和Windows系统的支持，无需使用额外软件，但不支持日志功能。如果您需要通过Mac和Windows计算机读取或写入硬盘，这将是一个适合的选项。

在Mac计算机上格式化存储介质

Mac系统自带的“磁盘工具”应用程序可以将存储盘格式化为HFS+或exFAT格式。由于格式化后硬盘内所有文件都会被清除，因此请务必在格式化前备份硬盘上的所有重要文件。

1. 通过外接硬盘座、USB集线器或数据线将存储盘连接至计算机，忽略任何关于使用存储盘作为Time Machine备份选择的信息。
2. 在计算机上，进入“应用程序/实用工具”界面，运行“磁盘工具”程序。
3. 点击硬盘图标，然后点击“抹掉”按钮。
4. 将格式设置为“Mac OS扩展 (日志式)”或“exFAT”。
5. 输入新增分区的名字，点击“抹掉”。您的硬盘会迅速格式化，以备使用。





在Windows计算机上可使用“格式化”对话框功能将外接硬盘格式化为exFAT格式。

在Windows计算机上格式化存储介质

使用Windows PC的格式化对话框可将存储盘格式化为exFAT。由于格式化后存储盘上的所有文件都会被删除，因此请务必在格式化前备份所有重要文件。

1. 通过外接硬盘座、USB集线器或数据线将存储盘连接至计算机。
2. 打开“开始菜单”或“开始画面”，选择“我的电脑”。右键点击您的存储盘。
3. 从上下文菜单中选择“格式化”。
4. 将文件系统设置为“exFAT”，将分配单元大小设置成128kb。
5. 输入卷标，选择“快速格式化”，点击“开始”。
6. 您的存储盘会迅速格式化，以备录制使用。

使用ATEM Television Studio准备存储

内部存储可通过前面板上的系统控制或者使用ATEM Setup Utility进行格式化。此外，您还可以使用切换台的控制面板将外部存储盘格式化为Mac OS Extended或exFAT。

通过ATEM Television Studio系统控制格式化存储

如要打开格式化菜单，按下“SETTINGS”按钮，然后使用箭头前往媒体格式化屏幕。

打开“格式化存储介质”菜单后，您可以选择格式化内部存储或者任何通过USB连接的外部硬盘。

1. 对于内部存储，旋转“MEDIA”旋钮，选择“内部”。

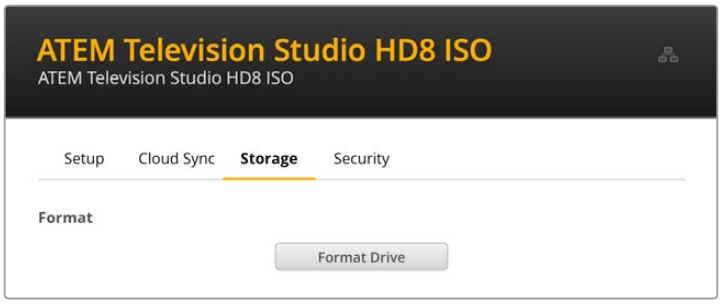
   对于外部硬盘，将“MEDIA”旋钮旋转到选定的硬盘，然后旋转“FORMAT”旋钮选择Mac OS Extended或exFAT。

2. 按LCD上方“格式化”所对应的按钮。
3. 按照屏幕上的指示，长按该格式化按钮三秒直到倒数图标出现打钩为止。格式化随即开始。
4. 格式化完成后，存储就可以使用了。按下LCD上方的“OK”按钮回到格式化存储介质菜单。

通过ATEM Setup格式化内部存储

您也可以使用随ATEM切换台软件一同安装的ATEM Setup实用程序来格式化存储介质。您需要通过USB连接切换台来格式化存储盘。

1. 打开ATEM Setup实用程序。如果是使用Mac系统，该程序位于应用程序中的Blackmagic ATEM Switchers文件夹里。在Windows计算机上，ATEM Setup可通过“开始”> “程序”> “Blackmagic Design”路径找到。
2. 打开后，点击“Storage”（存储），然后选择“Format Drive”（格式化存储盘）。



3 如果这是您第一次格式化存储介质，屏幕会弹出提示信息通知您格式化会删除存储介质上的所有文件。点击“Format”（格式化）继续。

4 屏幕将出现第二个提示信息让您确认。该步骤是确保您不是无意中删除存储上媒体文件。点击“Erase”（抹掉）。

5 格式化中会出现进度状态。完成后，内部存储就可以使用了。

访问存储

如果您使用外接存储盘进行录制，访问视频片段和任意DaVinci Resolve项目的一个简单方法就是将存储盘从切换台后面板断开连接，再将其连接至您的计算机，但是您也可以通过网络来访问文件。

使用Mac计算机访问存储：

1 打开“访达”，点击侧边栏菜单的“网络”选项。

2 在列表中双击ATEM Television Studio切换台。

3 双击内部存储。

您的ATEM Television Studio切换台将显示在地址侧边栏中。使用Windows计算机访问存储：

1 点击文件资源管理器侧边栏的“网络”菜单选项。列表中会出现ATEM Television Studio切换台。

2 双击您的ATEM Television Studio切换台后，会弹出一个Windows安全对话框，询问您网络认证。

3 输入您的用户名和密码。

备注 Windows 11已不再允许不需要用户名和密码的“访客”账户连接到网络存储。在通过网络访问ATEM切换台的存储之前，您需要使用ATEM Setup实用程序创建一个新用户并设置密码。有关创建和管理用户的信息，请参阅本手册在“使用ATEM Setup”章节中“‘安全性’选项卡”部分的介绍。

4 点击“确定”。

如此一来，您就可以在文件资源管理器窗口里看到您的切换台，并且可以像其他网络存储设备一样访问本设备。

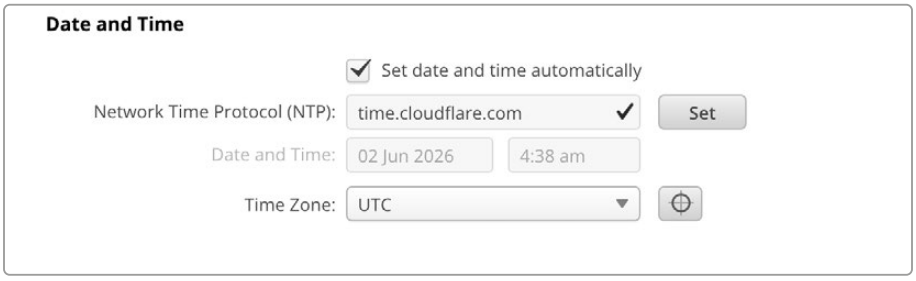
或者，您可以从设置使用程序访问您的存储。在Mac计算机上，选择在访达中显示。在Windows计算机上，选择在文件资源管理器中显示。

云同步

另一个访问媒体文件的方式是通过云同步，您可以将ATEM Television Studio型号切换台上的内部存储或外接存储盘通过Dropbox进行同步。

设置日期和时间

Dropbox等云服务平台需要正确的日期和时间才可以同步到您的ATEM切换台内部存储。默认设置下，您的ATEM Television Studio将使用Cloudflare NTP服务器自动设置日期和时间。

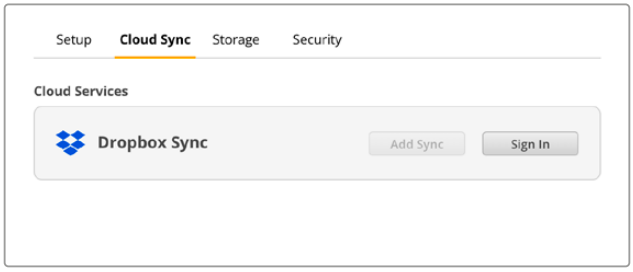


要将网络账户与ATEM Television Studio同步，您需要通过“Cloud Sync”（云同步）设置登录您的网络账户，然后再设置想要同步的文件夹，并设置同步方向。

登录Dropbox

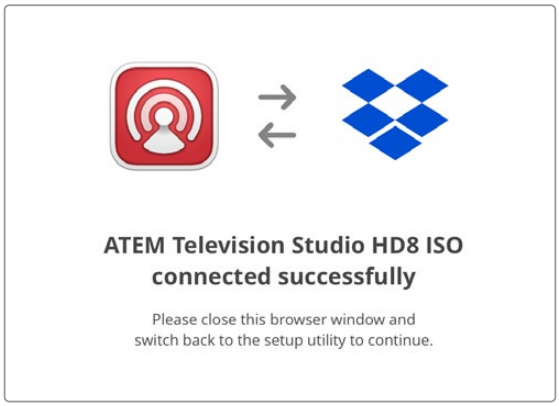
1 点击Dropbox账户的“Sign In”（登录）按钮，会出现登录窗口。

2 登录到Dropbox。



点击“Allow”（允许）按钮来确认Blackmagic Cloud Store可以编辑和查看内容的权限。

成功连接后，界面会弹出消息框确认。如果连接失败，检查计算机是否连接互联网。

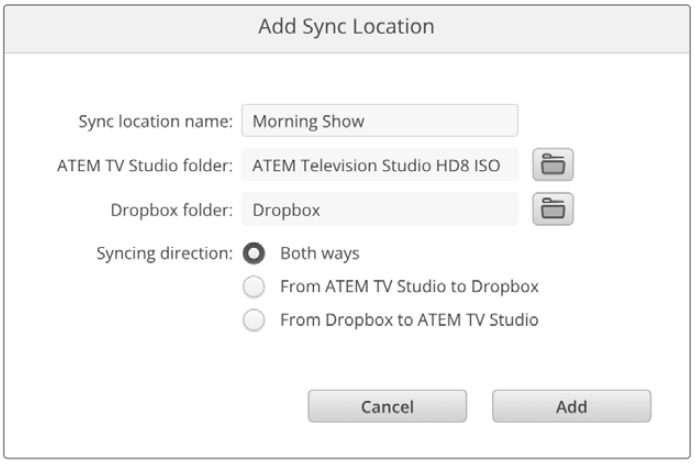


3 点击“Close”（关闭）。

同步文件夹和方向

1 下面您会看到“Add Sync”（添加同步）按钮已处于可点击状态。点击该按钮，打开“Add Sync Location”（添加同步地址）窗口。

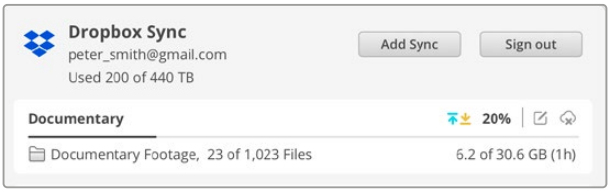
2 为同步地址命名，并点击该文件夹图标来指定您想要的多个同步文件夹。这些文件夹通常共享同一个名称。



3 选择同步方向。例如，如果您想同步到Dropbox，即从切换台上将文件同步到您的Dropbox上，而不是从Dropbox同步到切换台，那么请选择“From ATEM TV Studio to Dropbox”（从ATEM TV Studio到Dropbox）。

4 点击“Add”添加。

现在，您的云服务就和ATEM Television Studio切换台同步了。



状态提示提供有同步处理信息

同步箭头表示同步方向。蓝色箭头表示Cloud Store正在发送数据，黄色箭头表示Cloud Store正在接收数据。如果数据同时被发送和接收，那么就会显示蓝色和黄色箭头。灰色箭头表示该传输方向的数据并未同步。

同步箭头右侧的百分比数值表示当前同步处理进度状态。

点击这个表示“编辑同步”的图标可更改同步文件夹的名称和地址。

点击此提示可删除同步地址。在确认对话框中，点击“Continue”（继续）可确认，或点击“Cancel”（取消）放弃删除操作。

如果您有Blackmagic Cloud Store或Blackmagic Cloud Pod，您可以通过Blackmagic Cloud Setup实用程序将这些同步到您的存储，在录制时保留一份实时副本。

使用多画面分割

ATEM切换台拥有强大的多画面分割功能，可让您在一个屏幕上监看所有输入，以及节目和预监输出的组合。多画面分割还可以显示媒体播放器、推流状态、硬盘录制状态、音频电平、以及Fairlight均衡器和动态提示。

该功能可提供强大全面预监，让您明确了解播出的进展！

多画面分割是一项强大功能，可让您同时监看所有信号源和输出

下面是每个分割画面的描述。

预监分割画面

预监分割画面可让您监看当前切换到预监输出的信号源。该分割画面有助于在各个源、预监转场或设置键控之前演练切换，因此您可以在切换到节目输出前看到其效果。您需要将切换台操作方式更改为节目/预监切换风格，从而使用预监画面。详情请参阅本手册后面额内容。

节目分割画面

节目分割画面可显示当前切换至节目输出的内容。该分割画面显示的是您正在播出的内容。

输入分割画面

输入分割画面显示了连接到8个输入上的所有信号源。多画面分割上包含了全部输入，可让您看到来自每台摄影机的影像，从而便于您快速决定。但这些分割画面不一定来自摄影机，也可以是连接到切换台输入的计算机视频输出内容或HyperDeck录机内容，您可以在输入视图上进行监看。

当输入切换到预监或节目输出时，对应的输入分割画面外围将以绿色或红色Tally边框显示。绿色代表是预监输出，红色代表节目输出或直播。

媒体播放器分割画面

该分割画面显示了当前加载在媒体播放器中的图文。要加载图文，只要到ATEM Software Control的媒体池，并将静帧拖至媒体播放器中即可。更多关于如何使用媒体播放器和媒体池的内容，请参阅“ATEM媒体池”部分的内容。

推流分割画面

该分割画面显示了推流直播状态，包括播出数据速率和缓存状态等。您还可以看到当前正在播出的流媒体平台，该信息显示在此分割画面的底部。

- **ON AIR直播提示** 录制前，直播状态提示将显示“关闭”，以表示切换台此刻为待命状态，可以开始播出。开始推流直播后，这一状态提示将亮起红色“ON AIR”字样，直到直播结束。

  如果推流时出现中断，例如网速太慢、缓存不足等，直播提示会开始闪烁。

- **播出数据速率** 数据速率的单位为兆比特每秒。以ATEM Television Studio切换台播出1080p60视频不出现丢帧，需要数据速率在大约每秒5到7兆。

- **缓存状态** 缓存状态显示了ATEM切换台内置缓存的性能。缓存是很小一部分内部存储，可持续录制和播放节目输出。如果播出数据速率下降到无法维持视频信号的水平时，它可以作为安全措施。网络变化大多数是因为网络活动或无线信号强度，因此如果播出数据速率降低，缓冲数据就会相应加快。如果连接速度太慢以至于无法支持视频流，那么缓存就会填充视频帧加以补偿。但是，一旦缓存达到100%满额，视频流就会有所损失，因此请尽量避免出现缓存满额的情况。设置流媒体时，可测试连接速度。在播出测试时，以多画面分割观看缓存显示。如果缓存频繁接近100%，可在推流直播设置中选择一个较低质量的选项。
- **网络共享状态** 当ATEM切换台通过移动网络共享连接到网络时，会显示一个智能手机图标。处于播出状态时，该图标会变成红色。

录制分割画面

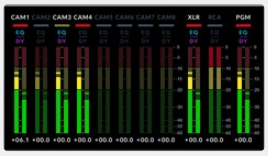
如果您通过USB–C外录到外置硬盘或录制到内部存储时，该分割画面可显示当前录制状态。

- **录制提示** 录制前，或未连接硬盘时，录制提示会显示“停止”字样。硬盘连接后，会以图标的形式显示在录制提示下方。

  当硬盘正在录制时，该提示显示有“录制”，并将亮起明亮的红色。

- **时长计数器** 紧靠录制提示下方的是时长计数器。当您按下切换台的录制按钮时，时长计数器将会开始运行。
- **录制状态提示** 这些提示提供了每个硬盘的信息和录制状态。例如，如果您使用两个硬盘，将显示硬盘名称以及可用空间和剩余录制时间。硬盘录制时，该提示将亮起红色，并显示了剩余硬盘空间。

  硬盘按照容量排序。例如，如果您通过Blackmagic MultiDock 10G连接了4个SSD，剩余空间最大的硬盘将被标为“1”。硬盘“2”是剩余空间第二大的SSD。当硬盘1和2都存满后，提示“1”将显示硬盘3，“2”将显示硬盘4信息。您可以清楚的明确哪个硬盘被指派到哪个号码，每个数字下方显示有硬盘名称。



音频分割画面

播出时，您可以通过音频分割画面监看到每路信号源的音频电平和节目输出电平。

- **音频表** 每路输入和节目输出都设有单独的音频表，您可以同时监看所有数据。如果音频电平上升到–10dB，音频表会亮起红色警告您该数值接近最大限度0dB。一旦电平达到0dB，音频就会出现削波。削波意味着音频出现失真，此时您需要使用切换台的音频电平按钮或ATEM Software Control上的调音台来降低音频电平。更多关于ATEM Software Control的信息，请参考本手册下一章节。

  音频表是监看电平的重要工具，让您可以确保音频无误。

- **Fairlight图标** 这些图标可让您知晓ATEM Software Control音频页面里的EQ和动态控制是否启用。

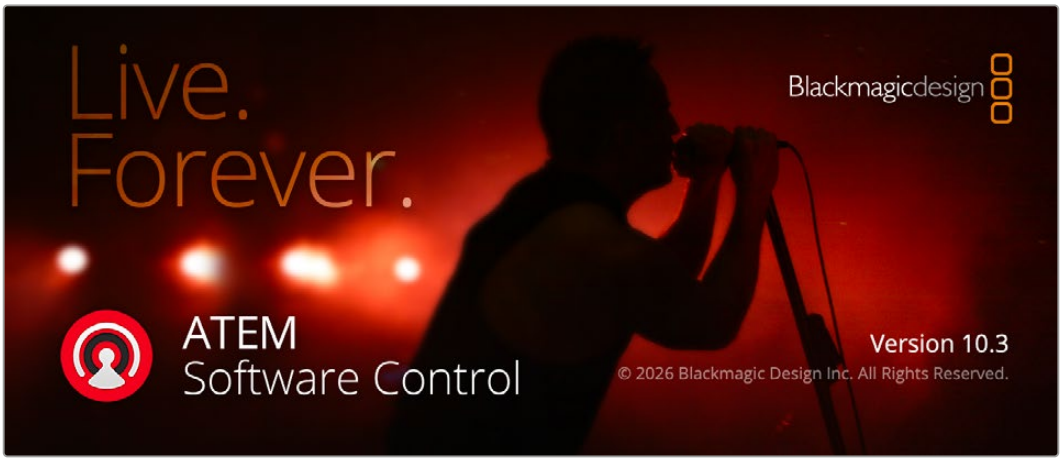
EQ DY	如果Fairlight图标有颜色且亮起，那么EQ或动态工具是启用状态，输入是直播状态。
EQ DY	如果图标有颜色但不亮，意味着这些工具是启用状态，但输入不是直播。
EQ DY	如果图标既没有亮起又没有颜色，那么这些工具未启用，或者绕过了音频页面的操作。

多画面分割是一项强大的功能，可让您看清每个细节，把握每个时刻。例如，它可以帮您在切换至节目输出前在预监窗口呈现视觉化效果。您可以监看每个SDI信号、测试在这些信号间切换、设置色键、或甚至在切换到节目输出前预览转场以查看效果如何！

ATEM Software Control

ATEM切换台内附ATEM Software Control软件控制面板，您可以通过它来控制切换台，操作原理和切换台的内置控制面板相似。与硬件控制面板的不同的是，它没有采用菜单按钮，而是在界面右边设计了一些设置面板，可显示切换台的全部处理功能。这样可以让您从其他地点对切换台进行控制，例如切换台安装在某个设备房机架上，操作人员从其他房间进行操控。

在开始使用ATEM Software Control前，需要先安装该软件。

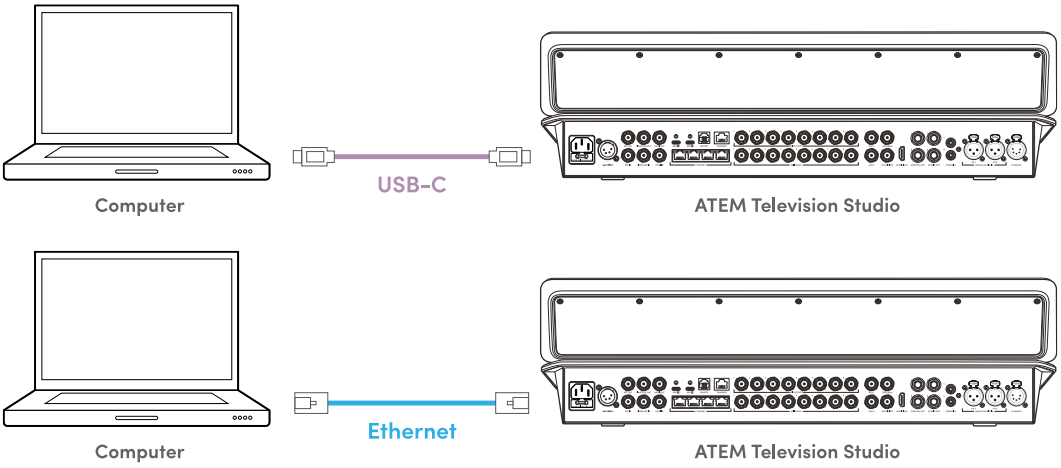


要安装ATEM Software Control：

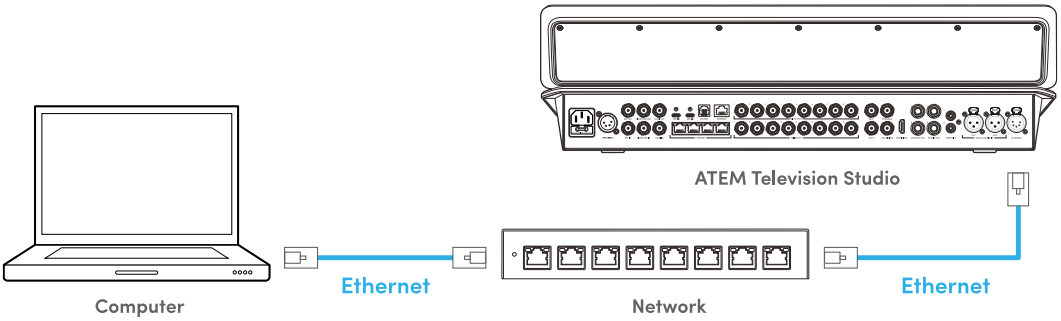
1. 打开浏览器，访问网站 www.blackmagicdesign.com/cn/support，并下载ATEM切换台最新版软件。
2. 下载结束后，双击“Install ATEM”图标运行安装程序。按照提示按下“Install”来安装该软件。
3. 安装完软件后，在应用程序或程序文件夹中导航到“Blackmagic ATEM Switchers”文件夹，双击“ATEM Software Control”。

软件安装后，您需要将切换台连接至计算机。要完成该步骤，只需将设备直接通过以太网或USB连接到网络即可。

直接连接



通过网络连接



最后，请确保电脑已成功连接网络并工作正常。当运行ATEM Software Control软件时，会提示您选择一台切换台。如果该切换台可以在网络上看到，您就可以从列表上将其选中，否则请手动输入IP地址。此时请输入您之前为切换台设置的IP地址，以便ATEM Software Control找到切换台并建立通信。

切换台控制面板

软件控制面板主要由四个选项卡组成：切换台、媒体、音频以及摄影机。点击位于界面底部的相应按钮可打开各个选项卡，或按住Shift键加左/右箭头热键组合在不同选项卡之间切换。选择界面左下方的齿轮按钮可打开主设置窗口。切换台、媒体、音频和摄影机选项卡可分别对切换台进行各项特定设置，这些特定设置只可通过软件控制面板完成。

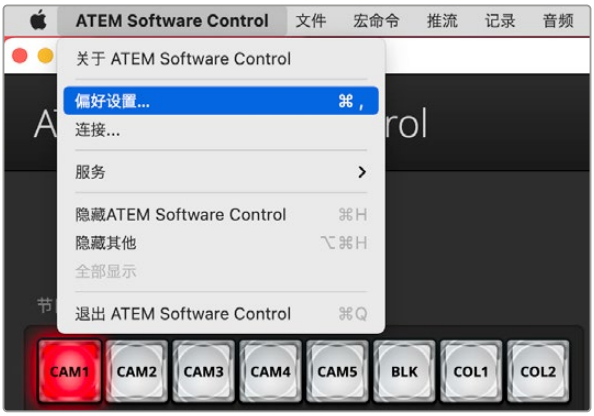
切换台面板

首次运行软件时，软件会显示切换台选项卡界面，该界面是切换台的主控制界面。软件控制面板必须连接到切换台方可运行。

ATEM Software Control窗口

偏好设置

偏好设置分为“常用”偏好设置和“映射”偏好设置。常用偏好设置包括转场控制、语言选择和启用或禁用MIDI控制等设置。映射偏好设置可让您将输入指派到预监和节目列的某个按钮上。到屏幕上方的菜单栏中选择“ATEM Software Control”并打开“偏好设置”。



从ATEM Software Control菜单打开偏好设置

常用偏好设置

ATEM切换台的出厂设置为节目/预监切换模式，这也是目前M/E风格切换台的标准模式。如果您较为熟悉老式的A/B式切换，您可以将这一设置更改为“A/B式切换”。

ATEM Software Control可被设置为英语、德语、西班牙语、法语、意大利语、日语、韩语、波兰语、葡萄牙语、俄语、土耳其语、乌克兰语以及简体中文显示。

安装后首次运行ATEM Software Control时，系统会弹出初始设置对话框，提示您设置软件语言，您也可以在之后随时更改软件的语言设置。

从语言菜单选择您想要的语言。屏幕将弹出提示信息要求确认您的更改。点击“更改”。

ATEM Software Control将关闭后重启，并应用您所选择的语言。

如果您想要通过MIDI控制器来运行ATEM切换台，请勾选该复选框以启用MIDI控制。

设置您的常用偏好设置

按钮映射

在映射偏好设置中，您可以将各路输入指派到位于预监和节目列的相应按钮上。

ATEM软件和硬件控制面板均支持按钮映射，以便您将来自摄影机等设备的重要信号源指派到节目列和预监列触手可及的按钮上。不常用的信号源可指派到相对次要的按钮上。每个控制面板可单独设置按钮映射，因此软件控制面板上设置的按钮映射并不会影响硬件控制面板上的按钮映射。

更改切换台设置

点击左下角的齿轮形切换台设置图标可打开设置窗口，您可以在这里更改常用切换台设置、音频、多画面分割、源、HyperDeck以及摄影机控制等设置。这些设置分成不同选项卡。

ATEM Television Studio HD8 ISO常用设置

常用设置

常用选项卡包括视频格式、媒体池设置以及选择摄影机控制监看输出等设置。

视频

设置切换台视频格式

视频设置是用来为ATEM切换台选择所运行视频格式的。您可以将视频格式设置为符合您所在区域的广播要求，例如若您在使用NTSC制式的国家广播时可选择1080i59.94或720p59.94或等格式。若您在使用PAL制式的国家广播时，可以将视频设置为1080i50或720p50格式。请检查摄影机视频格式，再将切换台设置成与之相同的视频格式即可。

设置您的视频格式

ATEM Television Studio切换台支持以下视频格式：

HD视频格式	720p50、720p59.94、720p60 1080p23.98、1080p24、1080p25、1080p29.97、1080p30、1080p50、1080p59.94、1080p60 1080i50、1080i59.94、1080i60

ATEM Television Studio 4K8切换台还支持以下视频格式：

Ultra HD格式	2160p23.98、2160p24、2160p25、2160p29.97、2160p30、2160p50、2160p59.94、2160p60

要设置视频格式，从菜单中选择视频格式菜单，选定后按“Set”按钮。视频格式一经更改，之前载入媒体池的所有文件也会全部被清除。

设置多画面分割视频格式

如果您的制作视频格式设为1080p25或更高，可以将多画面分割输出调整为较低的帧率。这样您可以将多画面分割输出进行下变换，从而获得更大的监视器兼容性。例如，如果您的视频格式设为1080p60，可将多画面分割输出设为1080i60。

设定3G SDI输出级别

将1080p50或更高的HD视频输出到配有3G–SDI输入的设备时，您可能需要在A级3G–SDI和B级3G–SDI输出格式间进行选择从而与只支持A级或只支持B级3G–SDI视频的设备所兼容。默认设置为与大多数设备都兼容的B级选项，但您也可以切换到A级，只要点击“A级”单选按钮即可。

淡入黑场

要将切换台前面板以及ATEM Software Control的FTB按钮禁用，点击“禁用淡入黑场”复选框。

下游键

您可以选择在下游键的不透明度为100%时覆盖摄影机Tally提示，比如使用DaVinci Resolve Replay Editor播出体育赛事回放的情况。这样有助于摄影师明了播出回放画面的时候，他们的摄影机不处于直播状态。但是，如果下游键控的不透明度并非100%，那么Tally提示就会始终显示。

网络发现

ATEM Television Studio HD8 ISO型号切换台默认在本地网络上可以被看到，所以如果您计划通过Blackmagic Studio Camera 6K Pro或URSA Broadcast G2直接推流到切换台的话，可以立即开始。要关闭该功能，可取消勾选“启用切换台的网络发现”。

媒体文件设置

媒体池

调整媒体池片段长度

每款ATEM切换台型号都有一个图文存储，称为“媒体池”。该存储可保存带有Alpha通道的图像和视频片段，以便指派到媒体播放器中供制作之用。

ATEM切换台型号	静帧	视频片段	视频格式	片段长度
ATEM Television Studio HD8	20	2	720p	400帧
			1080p	200帧
ATEM Television Studio HD8 ISO	20	2	720p	400帧
			1080p	200帧
ATEM Television Studio 4K8	20	2	720p	1600帧
			1080p	800帧
			2160p	200帧

媒体池容量

根据默认设置，每个片段会平均分配可用内存，这决定了其最大帧数。如果您存储的片段所含帧数大于该内存，请调整可存储帧数。请注意，增加一个片段的存储帧数会相应减少另一段片段的存储帧数。

媒体池共享

音频设置

“音频”选项卡包含所有音频设置，共设五个类别，分别是：“常用”、“分离音频”、“分离MADI”、“对讲”，以及“输出”或“混音消除”。

常用

通过常用音频选项卡来设置音频跟随视频设置。

音频跟随视频设置

使用AFV时，您可以通过单选按钮选择转场过程中的音频行为。想要在输入改变时交叉渐变音频，点击单选按钮来添加转场。只有在输入处于播出时，音频才会发送到节目输出。

USB连接

ATEM Television Studio切换台后面板上的USB连接可用于安装软件更新，并可提供网络摄像头输出支持。您还可以将这个USB端口配置为USB数字音频接口，以配合Fairlight Live使用。Fairlight Live是一款功能强大、基于软件的现场调音台，它支持数百个通道，可处理从立体声到环绕声在内的众多标准格式，并且支持Ambisonic以及沉浸式音频工作流程。

要使用Fairlight Live，请选择“USB数字音频”，并点击“设置”。

当USB连接设为USB数字音频时，如果切换台检测到USB调音台返送音频时，就会自动禁用ATEM Software Control以及切换台上的调音台控制。

当使用Fairlight Live ATEM节目模板时，该操作将会在节目开始时立即发生。当使用自定义节目模板或其他USB混音界面时，该操作会在您将音频输出路由回切换台时发生。

对于Fairlight Live，输出路由可在分配矩阵窗口里进行配置。

分离音频

使用ATEM Television Studio切换台时，您可以将一个立体声输入信号分离成两个独立的单声道。这样能有助于将单声道输入混合到立体声主输出的两个声道中。您还可以选择将所有音频分离成单独通道，或挨个选择每个输入。

您还可以将MADI通道分离成独立的单声道。

使用复选框将MADI分离为独立的单声道

对讲

通过对讲选项卡设置对讲功能。制作对讲嵌入在SDI 15和16通道上，工程对讲嵌入在SDI 13和14通道上。对讲可通过勾选复选框启用或禁用。

您可能需要将ATEM输出环通连接至输入上以达到想要的效果。在某些情况下，这可能会导致SDI对讲通道出现反馈回路。如果发生上述状况，只需勾选每路输入对应的“静音”复选框，将SDI通道对讲静音即可。如果您想要对接收到的对讲音频静音，请确保同时勾选制作和工程对讲的复选框。

将输入上的制作对讲信号静音

输出

ATEM Television Studio HD8型号切换台上的输出菜单可用来调整SDI音频返送、远程信号源和辅助。

SDI音频

该菜单可用来选择音频返送选项。其中包括节目混合、监听、制作对讲、工程对讲和混音消除。当选择混音消除时，使用此菜单选择音频源。这将从返送音频里移除所选的信号源。

辅助音频

当辅助输出指派到摄影机信号源时，为一路输入启用混音消除功能后，您就可以对那路输入进行静音处理，所有其他节目音频照常输出。

远程源音频

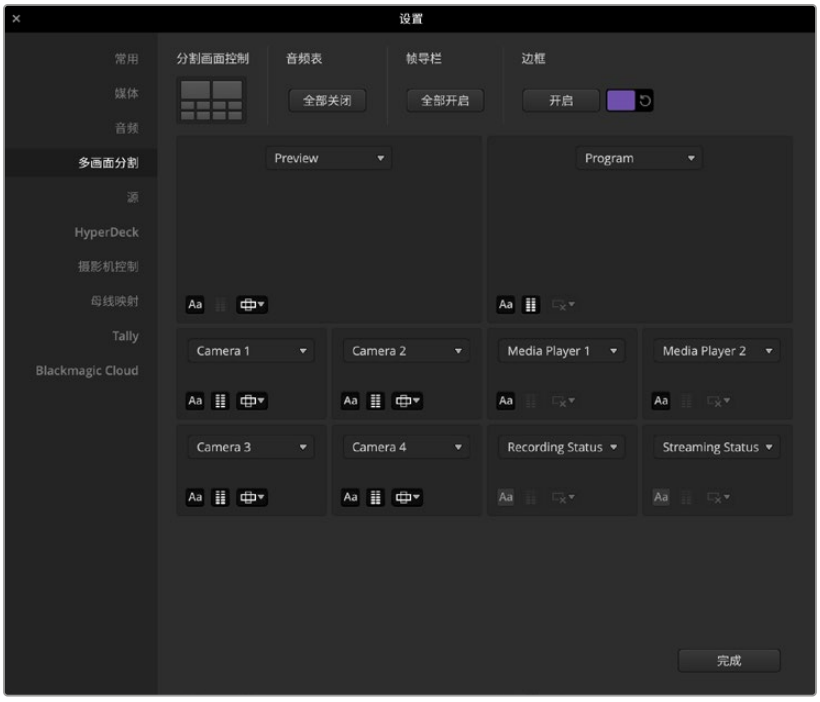
当使用ATEM Television Studio HD8 ISO型号和远程信号源时，您可以通过“将返送设置为：”指定返送音频。当选择混音消除时，使用此菜单选择音频源。这将从返送音频里移除所选的信号源。

混音消除

ATEM Television Studio 4K8型号上的混音消除设置可以将来自节目返送信号中的音频进行静音设置。例如，进行现场连线直播时，音频可能出现延迟的现象，因此当主持人通过节目返送信号听到自己的声音就会容易分散注意力。在一路输入上启用混音消除功能后，您就可以对那路输入进行静音处理，所有其他节目音频照常输出。

多画面分割设置

多画面分割设置可用来设置多画面布局。默认的分割画面布局是上面2个大窗口，下面8个小窗口，但每个多画面分割象限区域都可以设为1个大画面或4个小画面，因此还可以设置为4、7、10、13或16个分割画面布局。在“分割画面控制”中点击每个象限，可在1到4个画面中进行切换。



配置多画面分割

在多画面分割设置中使用“开启全部”按钮可将所有切换台源媒体和节目分割画面的音频都开启或关闭；您也可以在每个窗口中点击音频表图标将它们逐个开启或关闭。

在每个信号源和节目视图上，您可以启用安全区标识，以便确认节目在任何监视器上都可正确显示。帧导栏显示为16:9 (横向) 或9:16 (纵向) 。选择“全部”，可打开两个帧导栏。

多画面分割还可以显示Tally功能，因此只要多画面分割中的任何信号源作为节目或预监输出的画面使用，对应的分割画面会分别标以红色或绿色边框。红色边框代表此信号源正用于节目输出，绿色边框代表此信号源处于预监输出。使用边框设置可以禁用边框，或者使用色彩菜单选择颜色。当在预览或节目输出上时，多画面分割上的标签也将变成为红色或绿色。只要点击“Aa”图标，就可以禁用任何窗口上的标签。

多画面分割包括推流、录制和音频等更多状态视图，因此您可以在推流时监看硬盘空间或数据速率。详情请参考本手册后续在“使用多画面分割”部分的介绍。

源

源选项卡可用来为切换台输入、输出和媒体播放器更改标签。每个输入和输出可以设置一个长名称和一个短名称。

长名称最长支持20个字符，它们分别会在软件控制面板的视频源选择框中、多画面分割窗口的屏幕标签上，以及切换台的LCD上显示。而简短的4字符名称用于在软件控制面板上来识别输入按钮。

要更改输入名称，请点相应文本框，输入文本并选择Set (设定) 。新的输入名称就会在多画面分割和软件控制面板上显示，如果连接了切换台，也会显示切换台上。建议您同时更改长标签和短标签，以确保名称一致匹配。例如，使用“Camera 1”作为长标签时，请使用“CAM1”作为对应的短标签。

为输入和输出键入长名称和短名称

在ATEM Television Studio HD8 ISO型号切换台上，您可以使用源选项卡在本地网络或通过互联网添加远程摄影机。更多信息，请参考本手册后面关于“ISO型号的额外功能”部分的内容。

HyperDeck设置

ATEM Television Studio切换台可连接多达10台HyperDeck Studio硬盘录机，并可通过ATEM Software Control进行控制。当连接HyperDeck设备时，使用这些设置来配置IP地址、选择HyperDeck所连接的输入、开启或关闭每台HyperDeck的自动播放功能、设置它们的帧偏移设置从而可以纯净切换等等。

每台HyperDeck上方和下方会出现状态提示，以便查看它们是否连接成功以及它们的远程按钮是否启用。

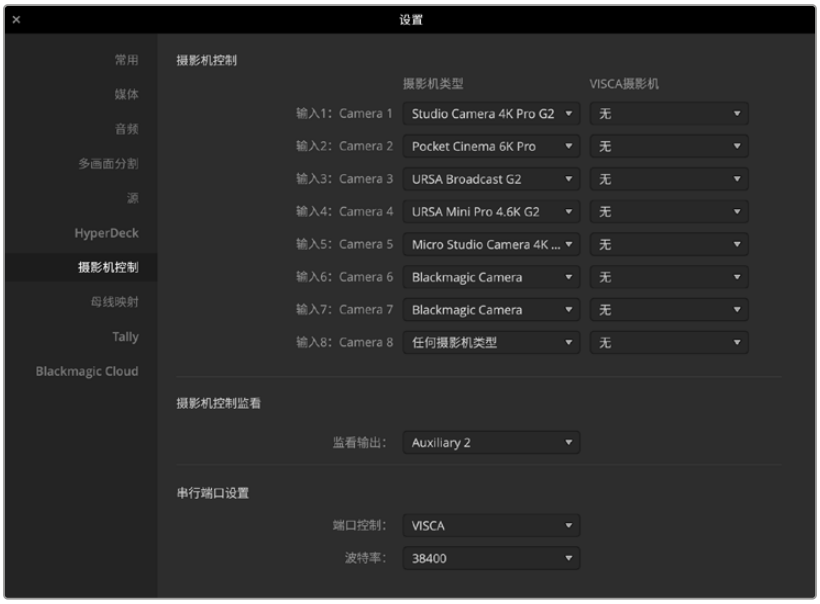
添加多达10台HyperDeck

为您的HyperDeck输入自定义标签可方便您从列表上进行识别。

关于设置HyperDeck和ATEM切换台，以及设置“HyperDeck”配置的详情，请参阅本手册“HyperDeck控制”部分的内容。

摄影机控制设置

摄影机控制选项卡设有多项设置，可用来将摄影机指派到各路输入，并选择您的监看输出。



摄影机控制

摄影机类型菜单可用来为每路输入选择一台Blackmagic摄影机；如果添加的是第三方摄影机，则可以选择“任何摄影机类型”。为输入选择正确的摄影机可以确保该摄影机的所有参数都可以准确设置。

添加通过VISCA over IP控制的PTZ摄影机和PTZ云台步骤如下：

1. 使用摄影机类型菜单选择“任何摄影机类型”。
2. 点击对应的VISCA摄影机菜单。如果已经添加了VISCA摄影机，它会出现在列表中，或者您可以点击“添加VISCA IP摄影机”选项。
3. 在“添加VISCA IP摄影机”菜单中，输入PTZ摄影机或PTZ云台的IP地址。您也可以输入一个自定义摄影机名称。点击“添加”。

摄影机控制监看

您可选择任何一路SDI输出或网络摄像头输出用于摄影机控制监看。当您的摄影机通过摄影机控制面板进行控制时，可通过这路输出监看调整效果。点击菜单选择您想要使用的输出。

串行端口设置

您可以使用端口控制菜单来选择其用途。具体有“无”、“VISCA”及“GVG”三个选项，其中GVG设置使用的是GVG100，这是与线性剪辑系统等设备通信的一个常用传统接口。如果选择“VISCA”，请选择9600或38400波特率。

要检测远程VISCA摄影机，请点击“VISCA摄影机设置”按钮。

软件会弹出一个窗口，列出可用的串行VISCA摄影机。您还可以点击“+”加号图标按钮来添加“VISCA IP摄影机”。检测到串行VISCA摄影机后，就可以通过每路输入的“VISCA摄影机”菜单进行选择。要移除某个VISCA over IP摄影机，可点击“–”减号图标按钮。

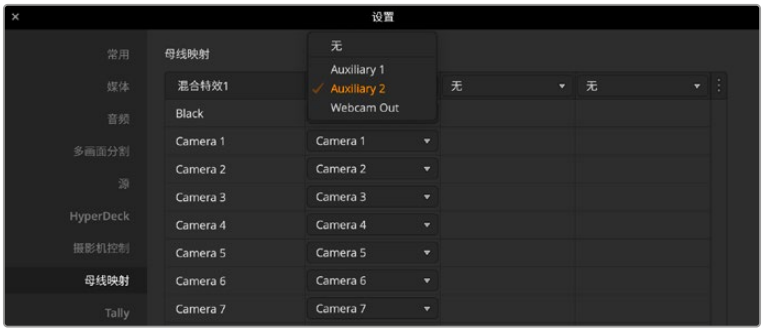
母线映射

ATEM Television Studio切换台支持将辅助输出和网络摄像头输出链接到主M/E，使其跟随主M/E的各类操作。这样，您就可以为同个节目创建多个输出，跟随输出都由节目列来控制。

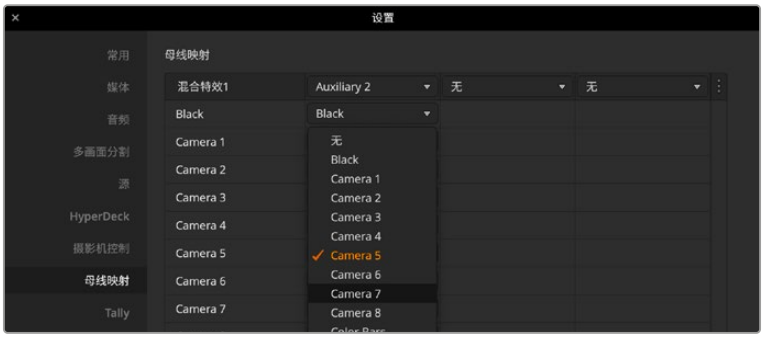
通过使用“设置”中的“母线映射”选项卡，您可以在跟随辅助输出或网络摄像头输出上替换源，以覆盖选定的输入。设置完成后，跟随信号将和节目列的硬切和转场保持匹配，但在需要时仍可以输出不同的源。需要注意的是，这些都只是简单的纯硬切输出，不会包含您可能在节目中使用的任何转场。例如，您可以将每个输出上的标题字幕图文替换成不同语言，从而实现节目的本地化。然后，跟随信号将和主信号同步执行每个转场，并将所有转场替换为简单的硬切，同时还可以显示您已分配的本地化图文，最终可实现多达4路不同的节目输出。

设置替代源：

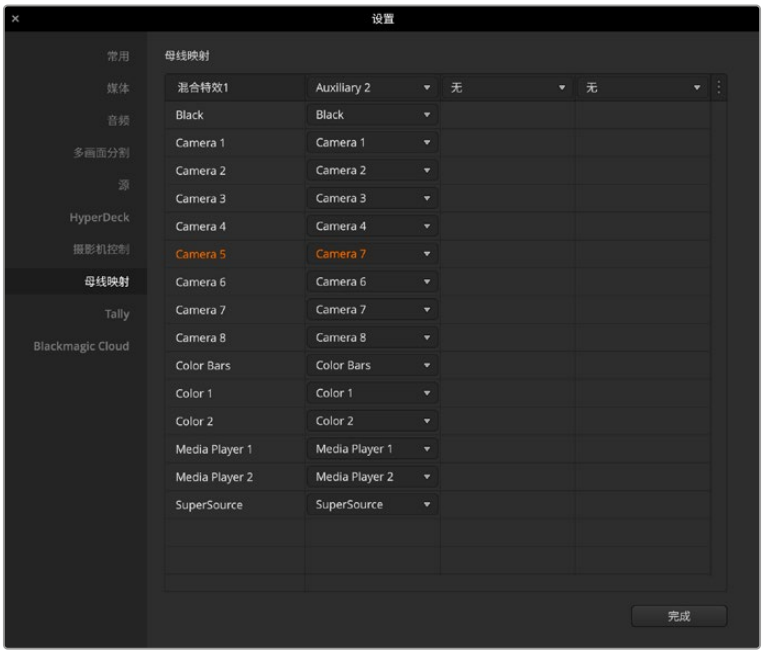
1. 使用位于第二栏顶部的菜单，选择一个辅助输出或网络摄像头输出作为跟随信号，例如辅助输出2。ATEM Television Studio HD8型号搭载2路辅助输出，ATEM Television Studio 4K8型号搭载10路辅助输出。



2 在这个例子中，摄影机5将被替代。导航到辅助2下的摄影机5对应的源列表，然后点击该列表菜单。



3 从列表中选择摄影机7。混合特效1下的摄影机5将以橙色高光显示，表示替代操作已完成。



现在，当您在混合特效节目上硬切或转场到摄影机5时，辅助2将硬切到摄影机7。如果要快速查看这一效果，可以将节目和辅助2都映射到多画面分割输出上。

需要注意的是，这些都只是简单的纯硬切输出，不会包含您可能在节目中使用的任何转场。

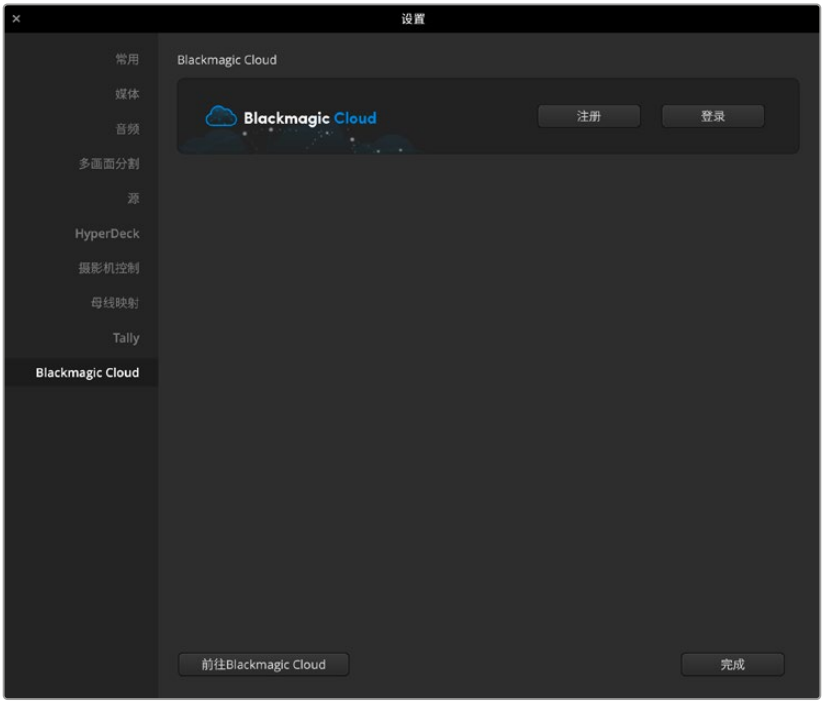
Tally

使用Tally菜单可以为每个M/E启用Tally。这些可以按每级M/E单独设置，1个M/E可以有不同的Tally输出。

当下游键直播时，要禁用Tally可点击“启用Tally覆盖”复选框。

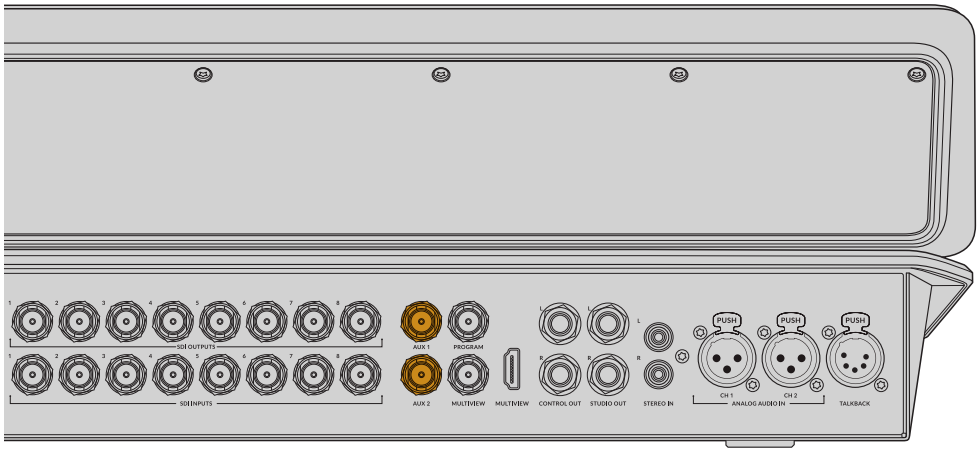
Blackmagic Cloud

如果推流到Blackmagic Cloud Stream Router，或者将项目同步到Blackmagic Cloud，您就需要登录Blackmagic Cloud。该操作可通过设置窗口中的Blackmagic Cloud菜单或使用“推流直播”面板完成。

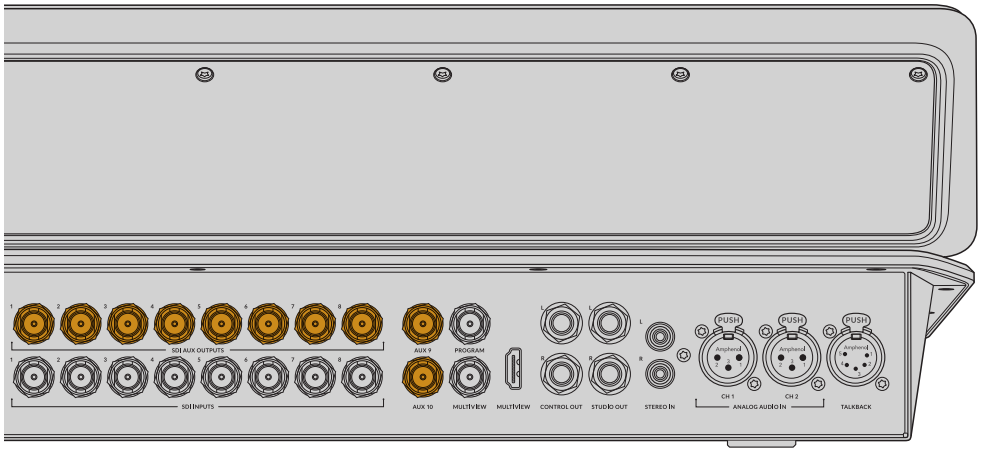


辅助输出

ATEM切换台上设有独立的SDI辅助输出和网络摄像头输出，您可将各种输入和内部信号源指派给它们。辅助输出和矩阵输出十分相似，而且所有视频输入、彩底发生器、媒体播放器、节目、预监，甚至彩条信号都可通过它们输出。ATEM Television Studio HD8切换台搭载3路辅助输出，ATEM Television Studio 4K8切换台则搭载11路辅助输出。



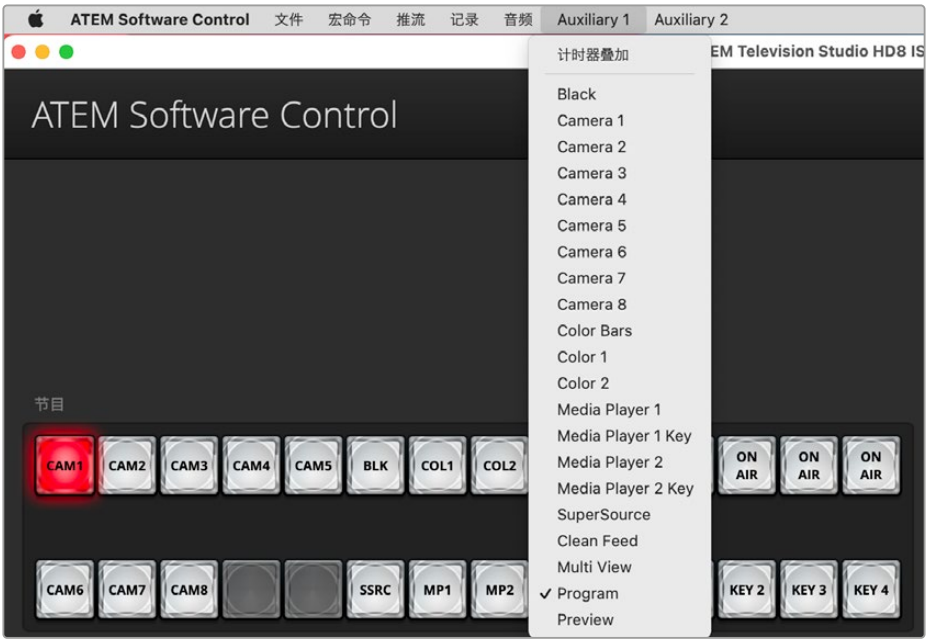
ATEM Television Studio HD8上的辅助输出



ATEM Television Studio 4K8上的辅助输出

指派辅助输出

使用专门的辅助或输出菜单来指派辅助输出。只需选择菜单，并在列表上滚动寻找需要输出的视频源即可。选定后辅助输出信号会立即更改。菜单中则会显示当前信号源被勾选。信号源种类繁多，包括黑场信号、视频输入信号、彩条信号、媒体播放器的填充和键输出信号、节目信号、预监信号以及净信号。



ATEM Television Studio HD8上的输出菜单

辅助输出功能极其强大，使用灵活便捷，可作为备用切换台输出。此外，在音乐会和现场表演时它们还常用于连接视频投影仪以及舞台大屏幕输出画面。如今大多数现场表演都有着十分复杂的多媒体制作，而辅助输出正好可以让您从ATEM控制这些画面显示！

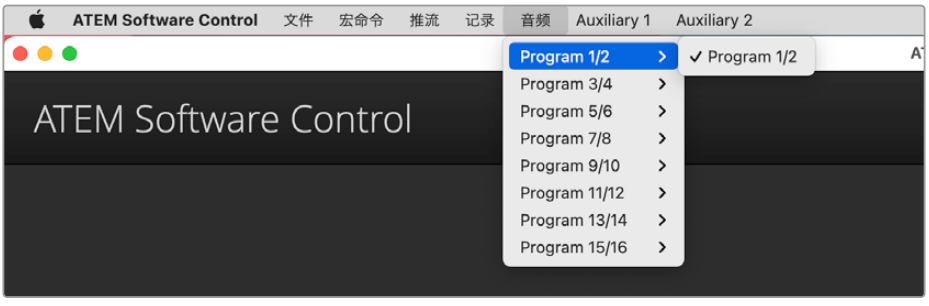
音频输出通道映射

您可以在切换台的视频输出中映射嵌入式音频通道。也就是说，您可以将各种音频源指派到SDI视频输出的通道上，因此可以在HyperDeck录机上录制。

例如，您可能想要将麦克风连接至摄影机，然后将这个特定输入指派到节目输出上的嵌入式音频通道3和4。如果您在HyperDeck设置里选择录制4路或更多音频通道，该录制除混音外还将录制摄影机麦克风的原始录音，并且在后期制作的混音处理时，任何音频工程师都可以获得这些特定的音频源。

这一音频指派功能可让您控制SDI视频输出的所有嵌入式音频通道，功能非常强大。

ATEM切换台可通过音频菜单单独指派节目输出音频通道。



ATEM Software Control里的ATEM Television Studio音频指派选项

节目混合总是会被指派到通道1和2，工程对讲会被指派到通道13和14，制作对讲是通道15和16，但其他通道都可以使用SDI、MADI、XLR、RCA或麦克风输入单独映射。

通过ATEM Software Control指派节目音频

1 点击顶部工具栏的音频菜单。

2 选择一对节目音频输出通道，并在右面的菜单里选择您想要指派的SDI输入。例如，从SDI输入2指派通道3和4到节目输出的通道3和4，在第一个列表菜单里选择“音频输出3/4”，并从第二个列表里选择“SDI输入音频3/4”。

使用SuperSource

ATEM Television Studio切换台搭载一个称为SuperSource的功能，可一次在一个监视器上显示多个视频源画面。例如，如果您正在播出四位演讲人的讨论内容，就可以将他们的画面都叠加在一个背景之上。SuperSource处理器在ATEM切换台上只占用一路视频输入。

设置SuperSource

您可以通过ATEM Software Control里的“面板”选项卡或按下LCD屏幕左侧的SuperSource按钮来设置SuperSource。

查看SuperSource

请先找到软件控制面板中的SuperSource设置面板，才能对其进行设置。想要查看，可以通过输出菜单将SuperSource指派到其中一个SDI输出，或者将SuperSource放在其中一个多画面分割布局的窗口中。

视频源的布局

SuperSource设置

打开SuperSource面板并根据需要在四个预设布局中挑选最适合您的一个。然后系统会根据软件控制面板的预设自动将各视频源指派到相应窗口。通过控制菜单，选择您想要调整的窗口。现在您就可以更改X和Y位置参数以及每个窗口的尺寸，或者取消“启用窗口”将该窗口从SuperSource视图中移除。裁切设置可让您对窗口两侧进行裁切。勾选裁切复选框并调整上、下、左、右各侧的参数。要重置窗口位置、大小或裁切参数或所有参数，请点击窗口控制右侧的图标。

在ATEM Television Studio切换台上，按下标有SuperSource的按钮，并使用系统控制箭头按钮在SuperSource设置间移动。在SuperSource菜单的第二页，旋转预设旋钮来挑选布局，并按下LCD上方的多功能按钮“应用预设”。一旦窗口选定后，所有额外设置以及摇杆控制都会应用到所对应的窗口。

尺寸调整和窗口位置可通过LCD第三页菜单下方的多功能旋钮完成，但使用面板摇杆操作会更快。使用摇杆可一起更改X和Y位置。顺时针转动摇杆可增大窗口尺寸，逆时针转动可缩小窗口尺寸。

背景和前景画面

点击“风格”选项卡可显示风格设置。在菜单中选择填充源。当使用切换台控制面板时，可通过源信号选择母线来选择填充源。将信号源放置在背景或前景中。选择完前景后，您可以从菜单上或通过切换台控制面板上的源选择母线来选择键源。

“风格”背景控制

选定前景单选按钮后，您需要需要是否预乘图文。预乘的话，请点击此复选框。这样可使画面置于启用窗口的上层。如果使用非预乘素材，则可以使用限幅和增益控制选项，具体操作方式，请参阅本手册“抠像”章节中的介绍。您还可以反转键。

在控制面板上，通过系统控制上的箭头按钮可在各个设置间导航。通过填充源旋钮选择您的风格，然后通过LCD上方的多功能按钮选择是在前景或者背景中。如果填充源为预乘，请继续前往设置的下一页，并确保预乘键按钮是启用状态。这样可使画面置于一个或多个启用窗口的上层。如果使用非预乘素材，则可以使用限幅和增益控制选项，具体操作方式请参阅本手册的抠像章节。您可能还需要反转键。

复制设置

将窗口1的设置复制到窗口2

如果使用ATEM Software Control执行复制功能，只需点击“复制”选项卡，便会弹出“复制”的窗口设置对话框。您可快速便捷地将当前选中窗口的设置复制到其他窗口，轻轻一点即可精确克隆。复制的窗口会直接显示在被复制的窗口下层，两者使用相同的信号源。

如果您是使用ATEM Television Studio切换台来调整设置，导航至SuperSource菜单的最后一页，通过LCD下面的多功能旋钮选中要复制的窗口和想要粘贴的窗口。您还可以通过旋钮选择复制到所有窗口。

将SuperSource切换到播出

SuperSource处理器在ATEM切换台上相当于一个视频输入。只要通过ATEM Software Control或切换台控制面板，在节目母线上选择SuperSource就可以使用刚刚制作的合成。

保存和恢复切换台设置

设置完ATEM切换台后，您可以通过两个不同选项来保存您的设置。

保存开机状态

如果您的切换台针对所有制作都使用相同的设置，您可以将其保存为默认开机状态。保存后，每次启动ATEM Software Control时所有预设和偏好设置都会加载。通过“清除开机状态”可清除这些设置。

保存设置为XML

有些流程可能会涉及多个制作环境，每个都具有各自的设置，这时您可以使用“另存为”功能。这一强大功能对于使用常规设置的现场制作而言，可为您节省大量时间。例如，您可以从笔记本电脑或USB存储盘立即恢复之前保存的摄影机设置、下横栏图文及具体的键设置。

保存设置步骤如下:

1. 到ATEM Software Control软件控制面板的菜单栏上选择“文件” > “另存为”。
2. 之后将弹出一个窗口询问您文件名称和文件夹地址。完成操作后，点击“保存”。
3. 保存切换台状态面板包含了ATEM切换台每个区块的所有可用设置及对应的复选框。默认选中“全选”复选框。如果勾选“全选”复选框后进行保存，ATEM Software Control将会保存切换台全部设置。如果您只需要对某些具体设置进行保存，请取消勾选不需要保存的设置选项，或者取消勾选“全选”复选框，取消全部设置选项后，便可单独选择想要保存的个别设置。
4. 点击“保存”。保存状态将出现在面板的右下方以确认保存完毕。

ATEM Software Control将您的切换台设置保存为XML格式，另外还有包含ATEM媒体池内容的文件夹。

保存设置之后，您可随时通过“文件”> “保存”路径进行快速保存，或者通过热键保存，该热键在Mac电脑上为Command加S，在Windows电脑上为Ctrl加S。此操作不会覆盖您之前保存的设置，而会将保存的设置作为一个新的XML文件添加到目标文件夹下，您可通过文件标注的时间和日期将它们清楚区分。这样您就可以根据需要随时恢复之前保存的设置。

ATEM Software Control软件控制面板可以保存和恢复切换台现场制作时的所有设置，包括键设置、转场风格、媒体池内容等。

如果您的切换台设置保存在笔记本电脑上，那么您就可以将这些设置携带到工作场地。只需要将您的笔记本电脑连接到任何一台ATEM切换台，便可快速恢复切换台设置。

现场制作繁忙而令人兴奋，因此紧张忙碌的您也有可能会在制作结束后忘记备份保存文件。

如果您想要保存一些设置，请将这些设置保存到您的电脑和外部存储盘，如USB存储盘。这样，您一方面可以将设置随身携带，另一方面，单一电脑上的设置被误删，您还能使用备份文件。

要恢复设置步骤如下:

1. 到ATEM Software Control软件控制面板的菜单栏上选择“文件”> “恢复”。
2. 此时会弹出窗口询问您要打开的文件。选择您保存的文件并点击“打开”。
3. 然后会出现一个窗口，里面含有ATEM切换台每个区块中您所保存的所有设置，每个设置都有一个激活的复选框。勾选“全选”可恢复所有保存的设置，或者只勾选您需要恢复的设置。
4. 点击“恢复”。

恢复出厂设置

如要将ATEM切换台恢复到出厂设置，打开ATEM Setup Utility，然后点击“Factory Reset”。恢复出厂设置之前保存的切换台设置将保持不变。

使用ATEM Software Control进行切换

“切换台”选项卡是切换台的主控制界面。在现场制作中，切换台窗口可用于选择信号源及切换信号到直播所用。

您可以选择转场风格，管理上游/下游键控以及开启/关闭淡入黑场控制。界面右侧的设置面板可调节转场时长、调整彩底发生器、控制媒体播放器、调整上游及下游键控以及控制淡入黑场时长等转场设置。

通过鼠标或触控板操作

如果使用笔记本电脑，请使用鼠标或触控板来操控软件控制面板上的虚拟按钮、滑块以及推杆。

要启用某一按钮，请以鼠标左键单击该按钮。要启用某一滑块，请以鼠标左键点住并拖动该滑块。同样，要使用推杆，请以鼠标左键点住推杆并上下拖动。

使用键盘热键

在标准QWERTY键盘上使用热键可快速控制切换台的某些功能，各类热键详见下表：

热键	功能
<1> – <0>	预监切换台输入1–10的信号源。0 = 输入10。
<Shift> <1> – <0>	预监切换台输入11–20的信号源。Shift 0 = 输入20。
<Control> <1> – <0>	将切换台输入1–10的信号源热切换到节目输出
按下并松开<Control>，然后按<1> – <0>	将切换台输入1–10的信号源热切换到节目输出。热切换保持开启，CUT按钮亮起红灯。
<Control> <Shift> <1> – <0>	将切换台输入11–20的信号源热切换到节目输出
按下并松开<Control>，然后按<Shift> <1> – <0>	将切换台输入11–20的信号源热切换到节目输出 热切换保持开启，CUT按钮亮起红灯。
<Control>	关闭热切换（如果热切换当前呈开启状态）。CUT硬切按钮亮起白色。

<Space>	硬切
<Return>或<Enter>	自动

切换台控制面板更多使用信息详见后续章节。

混合特效

切换台选项卡上的混合特效区块包含了所有节目和预监母线上的信号源选择按钮，可选定外部输入或内部信号源作为下一个转场的预监或切入播出状态。

ATEM Television Studio上的混合特效面板

节目母线源选择按钮

节目母线源选择按钮用于将背景源热切换到节目输出。当前正在播出的信号源由亮起红灯的按钮表示。

预监母线源选择按钮

预监母线源选择按钮用于选择预监输出上的背景源，这一信号源在下一个转场发生时将被发送到节目母线。当前选中的预监源由亮起绿灯的按钮表示。

节目母线的源选择按钮和预监母线是对应的。

输入 (CAM加数字)	输入按钮与切换台外部输入的编号对应。
黑场 (BLK)	由切换台内部生成的黑场信号。
SUPERSOURCE	使用SuperSource在监视器上一次管理多个源。按Shift键时该按钮可作为Bars彩条按钮使用。
彩条 (BARS)	由切换台内部生成的彩条信号。同时按住Shift键和SuperSource可选择彩条。
彩底发生器 (COL1和COL2)	由切换台内部生成的色彩信号。
媒体播放器 (MP1和MP2)	内部媒体播放器，可显示切换台中存储的静帧或片段。

转场控制和上游键控

转场控制

硬切

即使选定了转场风格，CUT硬切按钮依然可执行节目和预监输出的即时转换。

自动/时长

点击AUTO（自动）按钮可按照“时长”中设置的转场时长完成指定转场。每种转场的时长可以在“转场”设置面板中设定，当选定“转场风格”中的某个按钮时，对应的转场时长会显示在位于转场控制区块的“时长”窗口中。

AUTO（自动）按钮在转场过程中会亮起红灯，“时长”显示框会在转场过程中实时更新并提示剩余帧数。ATEM Television Studio切换台上的渐变推杆指示灯会对转场进度作出视觉反馈。

渐变推杆

渐变推杆可代替AUTO（自动）按钮使用，使操作者可用鼠标手动控制转场。AUTO（自动）按钮在转场过程中会亮起红灯，“时长”显示框会在转场过程中实时更新并提示剩余帧数。切换台上的渐变推杆指示灯会对转场进度给出视觉反馈。

转场风格

转场风格部分的按钮为操作者提供以下五种转场特效：MIX（混合）、DIP（浸入）、WIPE（划像）、DVE和STING（Stinger）。所选的转场风格由黄色的按钮表示。选定这些按钮后，转场设置面板中会显示相应的风格。例如，如果您展开转场设置面板，并点击“WIPE”划像，该设置面板会自动显示划像选项卡，以便您调整时长或图案风格等转场设置。

ARM

“ARM”按钮可以在转场完成后，自动启用已连接且已在预监母线上选中的HyperDeck上的播放功能。和自动播放功能类似，在预监母线上选中的HyperDeck将会在您选择CUT或AUTO按钮触发转场时开始播放。要使用ARM功能，请按下Shift键，使原本的STING按钮切换为ARM按钮，此时再点击该按钮即可启用ARM功能。点击一次，在下一个转场发生时，所选的HyperDeck输入将会自动播放，该功能仅在该次转场中生效。如果要让ARM功能保持启用状态，可按下键盘上的Shift键，然后连续点击两次ARM按钮。

需要注意的是，启用ARM功能时，所有通过设置菜单HyperDeck选项卡设置的预卷功能都将被忽略。

预监转场

PREV TRANS按钮用于预监转场模式，操作者可使用渐变推杆在预监输出上事先确认MIX（混合）、DIP（浸入）、WIPE（划像）、DVE等转场效果。选定PREV TRANS按钮后，您会看见预监输出会显示当前节目输出画面，然后便可通过渐变推杆轻松预演并确认转场效果。这一操作能避免直播过程中出现失误，是一项十分有用的功能！

下一个转场

BKGD、KEY 1、KEY 2、KEY 3、KEY 4按钮可用于选择与下一个转场一同转入播出或撤出播出的内容。可选的键控数量取决于您的切换台型号。主转场发生时，所有键都随之转入播出或撤出播出，或者您也可以只选择键进行单独转场，这样主转场控制可用于将键转入播出或撤出播出。

选择下一个转场的内容时，切换台操作者应该注意观察预监视频输出，因为该输出可准确预演转场完成后节目输出的画面。当只选定BKGD（背景）按钮时，当前节目母线上的信号源和预监母线上选定的信号源之间将不使用任何键控完成过渡。您可以只切换键，让背景画面在转场过程中保持不变。

ON AIR

ON AIR提示按钮可让您明确哪些键正处于播出状态，并且也可用于将某个键即时转入播出或撤出播出。

下游键控

TIE

TIE按钮可启用在预监输出上的DSK（下游键）和下一个转场特效，并将其与主转场控制锁定，使DSK和下一个转场同时进入播出状态。

DSK会依照转场控制区块的“时长”中所设置并显示的时间完成转场。当DSK处于锁定状态时，Clean Feed 1（净信号1）上的信号不受影响。

ON AIR

ON AIR按钮用于将DSK转入或撤出播出，并可显示DSK是否处于播出状态。如果DSK当前处于播出状态，该按钮会亮起加以提示。

自动

AUTO按钮会按照“下游键”区块中的“时长”窗口设定的时间将DSK转入或撤出播出。这与转场控制区块中用于主AUTO转场的“时长”显示框类似，但此区块的“时长”只限于某一具体的下游键控。这一功能可在不影响主节目转场的情况下加入或移除台标和角标，如制作过程中的“直播”和“画面回放”等字样。

下游键和淡入黑场

淡入黑场 (FTB)

FTB按钮可将所有节目视频输出以淡入黑场区块中的“时长”窗口中指定的时长转入黑场。当节目输出以黑场淡出后，FTB按钮会亮起红色，直到再次按下该按钮。再次按下该按钮可以相同时长将节目从黑场逐渐带入播出画面，或者您也可以时长窗口中输入新的时长。淡入黑场操作多用于节目开头和结尾，以及插入广告的时候。它可确保切换台中所有图层都同时消退。淡入黑场操作不支持预监。您还可以使用调音台将音频设置为随渐黑视频一同淡出，只需按位于主音频推子上的AFV按钮即可。

处理设置面板

软件控制面板设有“面板”、“媒体播放器”及“输出”的选项卡。这些设置面板是根据切换台的各类处理顺序来排列的。您可以展开和收起设置面板以节省空间，请将上下滚动菜单找到所需设置。

“面板”选项卡

面板选项卡包括了如下处理控制：

彩底发生器1和2

ATEM切换台具备两个彩底发生器，可在彩底发生器控制板上使用颜色取样器或通过设置色相、饱和度及亮度等数值进行调整。

SuperSource

ATEM Television Studio切换台具有SuperSource功能，可一次在一个监视器上显示多个视频源画面。详情请阅读本手册后续关于“SuperSource”部分的介绍。

上游键

设有四个上游键控，可通过上游键设置面板进行配置。每个键控都有其各自的设置面板。每个设置面板中，键控可指定为亮度键、色键、图案键或DVE。

选定的设置面板将显示键控的所有设置参数。更多关于如何使用上游键控的内容，请参阅本手册后续章节。

转场

转场设置面板可用来配置每个转场风格的参数。例如，浸入转场设置面板设有一个下拉菜单，可以选择浸入信号源，而划像转场设置面板则会显示所有划像图案。转场的类型丰富多样，而且您还可在转场设置面板上通过组合设置和功能创造出大量转场。

备注 在此设置面板中选定某一转场风格只能调整其转场设置，如要执行某一转场，您仍然需要在软件或硬件切换台的转场控制区块选择转场风格。为使用方便，有些用户喜欢用硬件控制面板操作切换，用软件控制面板设置转场。软件和硬件控制面板可一起操作，两者设置一致，可搭配使用！

下游键

下游键控可在“下游键”设置面板中配置。您可展开设置面板选择键控的填充和键信号，使用滑块设置限幅和增益值、预乘和遮罩。ATEM Television Studio切换台搭载两个下游键控。

淡入黑场

在淡入黑场设置面板中可设置渐黑转场时长。该设置面板中还设有“音频跟随视频”复选框，可用于快速选定调音台主音频推子的AFV按钮。选中这一功能可实现音频随渐黑视频一同淡出。

媒体选项卡

媒体选项卡包括了ATEM切换台的媒体播放器及所连接HyperDeck的控制。

媒体播放器

ATEM切换台具备多个媒体播放器，可回放存储在切换台内置媒体池中的片段和静帧。下拉列表用于选择将要在切换台的媒体播放器上播放的静帧或片段。选定片段后，媒体播放器中的播放控制按钮可用来播放、暂停以及循环播放片段。该控制还可对片段进行逐帧前进或后退。ATEM Television Studio切换台拥有2个媒体播放器。

HyperDeck选项卡

HyperDeck选项卡可让您控制多达10台HyperDeck。

HyperDeck

您可以连接多达10台HyperDeck硬盘录机并通过ATEM Software Control的“HyperDeck”面板进行控制。要更改HyperDeck显示数量，可点击齿轮图标并从该列表上选择数字。详情请参阅本手册“HyperDeck控制”部分的内容。

输出选项卡

使用输出选项卡设置推流直播和录制设置。输出选项卡还可以用来调整时间码和计数器设置，并且采集静帧。

推流直播

使用切换台时，这一输出选项可让您从流媒体平台输出推流信息来设置您的推流直播。指定完所有设置后，点击“ON AIR”按钮可开始直播，然后按“OFF”可停止播出。

推流直播状态将清晰显示您的直播状态，提示有红色大字样“ON AIR”以及时间码生成器，您可以通过时间码生成器选项进行设置。

平台	点击“平台”菜单，为播出选择流媒体平台。选项包括Facebook Live、YouTube Live和Twitch。
服务器	点击设置窗口并通过菜单来选择距离您所在地点最近的服务器。
密钥	键入流媒体平台指派给您播出的推流密钥。更多关于如何获得推流密钥的信息，请参阅“连接网络”章节中“获取推流密钥”部分的信息。
密码短语	如果您使用的推流服务设有SRT视频流协议，那么请输入您流媒体平台分配的密码短语。
分辨率	当ATEM Television Studio 4K8切换台设为2160p时，您可以通过分辨率选项将推流直播下变换为HD或保持切换台格式。
质量	选择您想要的推流质量和推流录制质量。 该设置包含以下选项: • HyperDeck High 45 to 70 Mb/s • HyperDeck Medium 25 to 45 Mb/s • HyperDeck Low 12 to 20 Mb/s • Streaming High 6 to 9 Mb/s • Streaming Medium 4.5 to 7 Mb/s • Streaming Low 3 to 4.5 Mb/s 手册本章节包含更多关于质量设置的信息。

更多关于在设置直接通过以太网直接推流直播时如何使用这些选项的信息，包括如何获取推流密钥等，请阅读本手册在“推流”部分的介绍。

该设置很棒很简单，您只需要选择服务和一些其他选项，此外，还有一个XML文件包含了额外设置，可供有相关知识的用户来以低级别设置添加其他流媒体服务并自定义流媒体菜单。更多关于如何使用XML文件进行保存和恢复的信息，可参阅“更改切换台设置/设置和恢复切换台设置”部分的内容。

流媒体和HyperDeck质量设置

质量设置使用的数据速率会根据切换台的视频格式而改变。比如，如果选择“Streaming High”的高质量流媒体，并以1080p24运行，则会使用6Mb/s的数据速率。

“HyperDeck High”使用的是45到70 Mb/s高数据速率，“HyperDeck Medium”使用的是25到45 Mb/s中数据速率，“HyperDeck Low”使用的是12到29 Mb/s低数据速率。流媒体的数据速率较低，以便数据在网络上传输，“Streaming High”使用的是6到9 Mb/s高数据速率，“Streaming Medium”使用的是4.5到7 Mb/s中数据速率，“Streaming Low”使用的是3到4.5 Mb/s低数据速率。

您会发现每个设置都提到了两种数据速率。较低的数字用于24p、25p和30p等较低的帧率，而较高的数据速率用于50p和60p等较高的帧率。另外值得注意的是，推流质量的默认设置是“Streaming High 6 to 9 Mb/s”，为推流直播频道提供了非常高的画质和较高的录制质量。

如果您没有直播，可以选择任意一项HyperDeck质量设置。这些设置与HyperDeck Studio Mini设置的质量一样，当您需要广播级质量的录制时将为提供高质量的数据速率。而安装了新发布的HyperDeck Studio Mini软件更新后，还能播放较低质量的流媒体数据速率。

录制

如果您录制视频流，可使用这一设置面板来控制硬盘并开始和停止录制。您还可以设置文件名和所有连接Blackmagic摄影机的触发录制功能。要了解更多关于格式化存储介质进行录制的信息，请参考“准备存储介质”部分的介绍。

文件名	录制前，在文件名窗口键入文件名称。点击窗口之外的任意区域以确定。如果停止和开始录制，文件名会递增版本号码。
存储盘	所有连接到切换台的格式化存储盘会以列表的形式出现在录制窗口。您可到菜单中选择存储盘来进行指派。存储盘窗口显示了存储盘的容量和剩余录制时间。 设备始终会先使用剩余空间最大的存储盘开始录制，然后再使用其次剩余空间最大的存储盘。然而，您可以手动切换想要录制的存储盘，点击“切换”按钮即可。如果当前存储盘剩余时长不超过5分钟，而且您想要在特定时间将播出切换到下一个存储盘时，该设置很实用。
切换	点击此按钮可把当前录制的存储盘更改到下一个剩余空间最大的存储盘。

提示 您也可以在ATEM Television Studio控制面板上按下“SWITCH”按钮来切换存储盘。

停止按钮	点击“停止”按钮可停止录制。
录制按钮	点击标有“录制”的录制按钮可开始录制。
显示状态	在录制选项中勾选“显示状态”复选框可启用或禁用此功能。显示状态将出现在ATEM Software Control用户界面的右下方，并显示录制状态。录制时，录制提示将亮起红色，并显示当前硬盘和剩余录制时间。
在所有摄影机中录制	当按下录制按钮后，此功能可让您将所有所连接的Blackmagic摄影机设置为录制。如果您想要从每台摄影机单独录制稍后进行剪辑，那么此功能将很有用。摄影机将自动设为以摄影机最后一次设置的品质来录制Blackmagic RAW文件。

同步到Blackmagic Cloud

Blackmagic Cloud是一个协作平台，它可以帮助您开展团队合作，在全球共享DaVinci Resolve项目。

当您在ATEM型号切换台上登录到Blackmagic Cloud时，可以选择将来自外部存储盘或闪存的录制或ISO项目和片段直接上传到DaVinci Resolve云项目。此外，流媒体录制还可以直接录制并上传到您的私人Blackmagic Cloud存储，无需同步到Resolve云项目。

登录Blackmagic Cloud

在ATEM切换台上登录到Blackmagic Cloud之前，需要通过一根网线将其以太网端口连接到网络路由器或网络交换机，将您的切换台连接到网络。

使用ATEM Television Studio型号登录Blackmagic Cloud账户步骤如下:

1 点击“输出”选项卡，并选择“录制”菜单。

2 选择复选框同步到Blackmagic Cloud，并点击“登录”按钮从而打开Blackmagic Cloud登录窗口。

3 在电子邮件和密码栏输入您的认证信息并点击“登录”。或者，点击右上角的“通过网页登录”选项，并通过网页浏览器登录。

4 接下来会出现一个窗口，让您选择是使用个人Blackmagic Cloud账户还是公司账户。点击您想要的账户配置后，并点击“继续”。

现在您已登录到Blackmagic Cloud，使用项目菜单来选择您想要将媒体文件同步到哪个项目。该菜单将显示已有的Blackmagic DaVinci Cloud项目。

如果您的项目没有出现在该列表，或者想要新建项目，那么您需要调整设置或通过DaVinci Resolve创建一个新的DaVinci Resolve云项目。

在DaVinci Resolve中允许访问

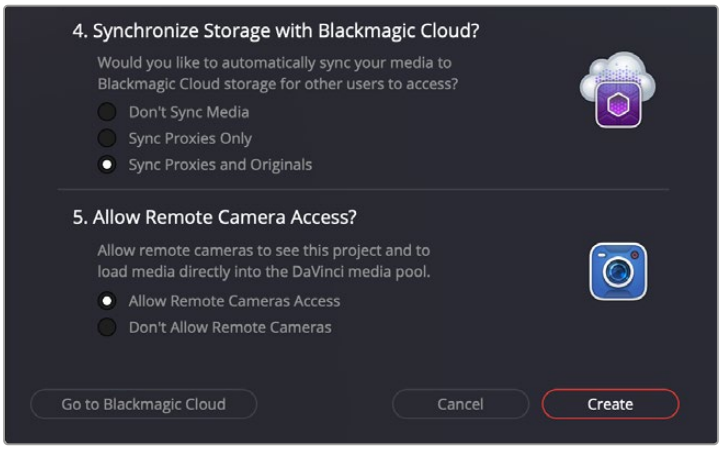
在DaVinci Resolve的设置中允许远程摄影机访问后，您就可以从ATEM切换台上传新建或者已有Blackmagic Cloud项目了。远程访问项目被启用后，它会出现在项目菜单的“录制”选项卡中。

允许访问新项目步骤如下:

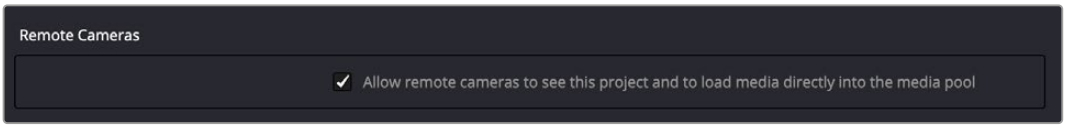
1 打开DaVinci Resolve。在“项目管理器”窗口中，选择“云”选项卡并输入您的Blackmagic Cloud登录详细信息。

2 从项目库列表中选择Blackmagic Cloud项目库，然后点击“新建项目”。

3 在打开的新建项目窗口中输入项目的详细信息。在新的云项目窗口里启用“同步代理与原始文件”以及“允许远程摄影机访问吗？”功能，并点击“创建”。



如果要将片段上传到已有的DaVinci Resolve云项目，请打开项目设置并选择“Blackmagic Cloud (云) ”。在“远程摄影机”设置中启用“允许远程摄影机查看此项目并将媒体直接加载到达芬奇媒体池中。”选项。



当您的切换台连接到网络并登录到Blackmagic Cloud账户时，Blackmagic Cloud项目会出现在ATEM切换台的录制选项卡中。

更多关于DaVinci Resolve云项目的信息，请参考DaVinci Resolve用户手册。手册下载链接：https://www.blackmagicdesign.com/cn/support/family/davinci-resolve-and-fusion。

采集静帧

如需从播出内容里采集静帧，只要点击“采集静帧”按钮。该操作就像静帧存储一样，可让您将采集文件添加到媒体池。然后，您可以直接将静帧加载到媒体播放器中，用于播出，或保存到您计算机的媒体池中。

保存媒体池步骤如下:

1 进入屏幕上方的菜单栏，并点击“文件/保存为”。

2 选择您想要保存的位置。

3 点击“保存”。

现在媒体池就保存到了您的计算机中，您可以在图文软件中找到并使用所截取的静帧。

时间码发生器

时间码发生器会在您启动ATEM Software Control时自动开始运行当日时间码。您可以将计数器清零，或手动键入一个新的时间码值作为开始。

时间码发生器可设为“当日时间”，也可设为“自由运行”，以便手动设置预设时间码。

要手动设置预设时间码值：

1. 从“运行模式”菜单中选择“自由运行”。
2. 在小的时间码计数器中，键入您定义的时间码值。输入时，新数值变成绿色。
3. 要确认更改并设置时间码开始运行，点击“设置”。

当日时间

当ATEM Television Studio切换台连接至计算机后，它将与您计算机上的当日时间码进行同步。内置的时钟大约可持续运行6天，因此一旦您将切换台从计算机断开连接，当日时间码将继续运行，直到电池耗尽。通过USB连接至计算机时，设备会为电池充电。

计数器

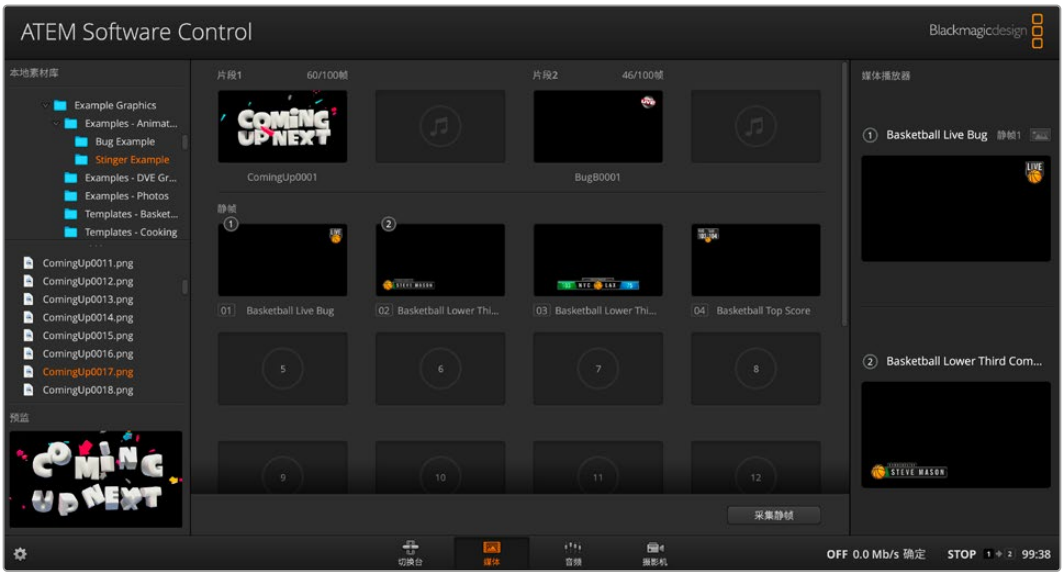
您可以使用ATEM Television Studio的计数器选项在输出1上叠加定时器。这对演讲者监视器十分有用，如果演讲有时间限制，可以显示倒数；如果没有时间限制，可以显示正数以提示演讲持续时间。

设置计数器步骤如下：

1. 选择倒数或正数。
2. 为倒数设置时间限制，输入开始时间。
3. 使用设置，您可以放置计数器叠加位置，并设置尺寸和不透明度。
4. 设置完毕后，可以开始计时器。在顶部工具栏中的输出菜单里，在输出1上勾选“计时器叠加”，从而确保选中计时器叠加。

ATEM媒体池

在切换台下方工具栏中，点按媒体图标打开媒体窗口。ATEM切换台的媒体窗口可让您将静帧和视频片段等图文添加至切换台，并将它们指派到切换台的任意媒体播放器上。切换台窗口设有两个主要区域，左侧是浏览窗口，右侧是媒体池和媒体播放器窗口。



点击控制面板底部的“媒体”选项卡可打开媒体池

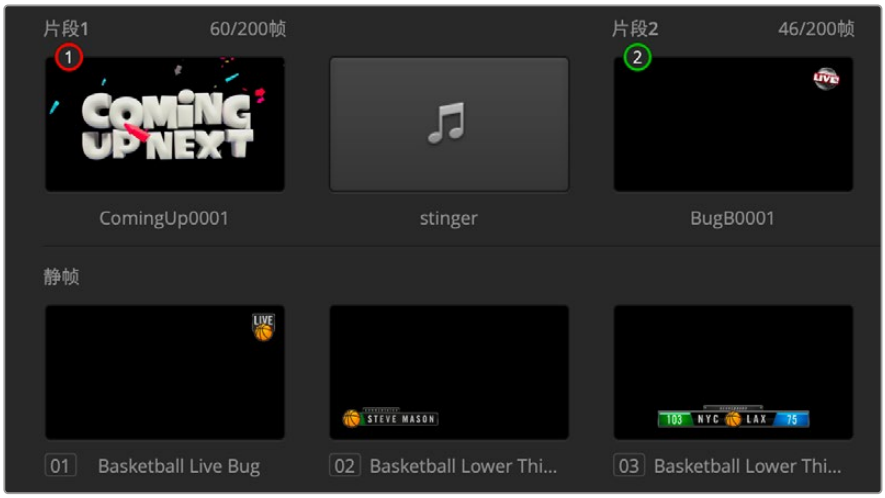
浏览窗口

浏览窗口是简化版文件浏览器，用来浏览和查找电脑中的图像文件。窗口中可显示电脑上所有硬盘，您可从中选择文件夹。点击每个文件夹边上的箭头按钮可展开下一级文件夹。左下方的预监窗口可显示任意所选文件。ATEM媒体池支持PNG、TGA、BMP、GIF、JPEG和TIFF静帧图像格式。音频文件必须为WAV、MP3或AIFF格式。这些文件可以随后添加到媒体池中。

媒体池窗口

当文件加载到媒体池中时，存放了静帧和片段的媒体框将以缩略图画面显示。片段媒体框将显示位于加载序列中间的图像。片段媒体框上方会显示所加载片段的帧数信息，以及以您所选的视频格式可加载的最大帧数的信息。静帧会以媒体框号码标出，因此指派静帧图像时能清楚指派对象。每个加载的静帧或片段的文件名会显示在媒体框底部，便于您对所加载的静帧和片段进行管理。所加载片段和静帧以及其名称和号码的列表会出现在切换台选项卡的媒体播放器面板中，ATEM硬件面板的媒体播放器视图中，以及Photoshop插件中。在切换台前面板中，除非媒体框为空，否则将只显示静帧名称。

缩略图左上方会显示数字，这样可以清楚表明哪个媒体框被指派给相关的媒体播放器。当媒体播放器的某个媒体框中的内容被切换到节目输出后，该号码外围的圆圈会变成红色，以提示此媒体框的内容正在播出。当媒体框中的内容作为预监输出时，圆圈会变成绿色。



浏览和加载文件

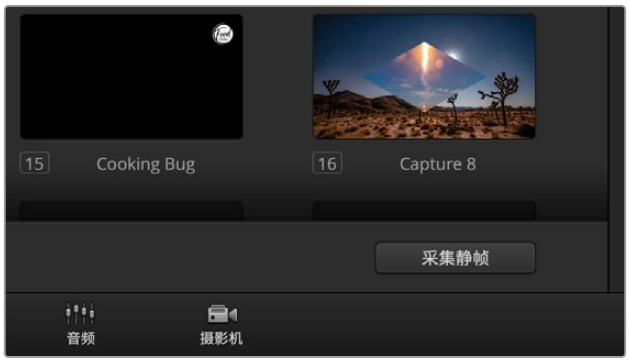
加载静帧非常容易，只要从浏览窗口拖动静帧并放置在媒体池中空的媒体框中即可。要加载一个动态片段，您需要加载一系列静帧图像。如果该序列在文件夹中，可从浏览窗口中点击并拖动该文件夹，放在两个片段媒体框中的一个。如果该序列不在其文件夹中，可点击该序列中的第一个文件，滚动到底，然后按住Shift并点击该序列的最后一个文件。然后所有高光的文件序列就可以被拖动到媒体池中的两个片段媒体框中的任意一个位置了。您可以在加载片段时一同加载音频文件，例如当播放Stinger转场时，从浏览器中拖动音频文件并放在片段媒体框旁边的音频媒体框中。通过音频图标可识别出它是音频媒体框。

当将静帧、片段或音频文件拖放入一个媒体框时，进度指示器会显示加载的状态。由于文件会按顺序依次导入，因此即使之前的图像未完成加载，您仍然可将多个文件拖放到媒体池中。如果将片段或静帧拖动到已有内容的窗口，那么新导入的文件将替换之前的内容。

您可以从媒体选项卡中的“媒体”列表中选择想要的片段或静帧来更改媒体播放器的指派内容。只要点击播放器“媒体”列表里的箭头就可以从媒体池媒体框的列表中进行选择。

您还可以使用系统控制中的媒体播放器菜单更改媒体指派，甚至可以在Photoshop中通过ATEM切换台媒体池选项导出时更改媒体指派。更多使用Photoshop导出插件的信息，请参阅本手册后面关于“ATEM搭配使用Adobe Photoshop”部分的内容。

采集静帧



点击采集静帧按钮从播出内容中保存静帧

您还可以使用媒体池右下角的采集静帧按钮在播出中采集静帧。点击该按钮，静帧会出现在媒体池的下一个可用的图像媒体框中。

使用调音台

在“音频”选项卡中，您可以混合来自ATEM切换台SDI接口的音频源，模拟音频，MADI音频，以及来自内置媒体播放器的音频源。

摄影机、媒体播放器、MADI和外部音频源，以及用于切换台节目输出的主声道音频输出都列在调音台上方。

每个音频源下方都有一个音频电平表、一个用于设置最大音频电平的推子，以及一个用于控制左右声道平衡的旋钮。调音台右侧的主推子用于设置SDI节目输出上的音频电平增益，并有其单独的音频电平表。监听推子和按钮都位于主声道推子下方，可单独设置音频电平，并可单独监听音频输出。

每个音频电平表下方的按钮可用来控制音频是否始终可用于混音还是只有在信号源播出时才可以混音。单独监听（即耳机图标）按钮均可用来进行单独音频监听。

调音台会为当前正处于播出或选中了AFV的音频源亮起Tally指示灯。此外，调音台还会显示音频电平、音频平衡，以及用来选择音频的按钮。

Tally

任何信号源，只要其音频处于播出状态，在软件中均以红色Tally指示灯表示。外部音频默认为播出状态，因此EXT Tally指示灯通常为红色。本页所举的例子中，Cam4和Cam7都亮起，这是因为它们的音频始终设置为“开启”的播出状态。如选择了AFV，并且该通道所对应的摄影机处于非播出状态，则Tally指示灯会亮起暗黄色。同理，当主声道推子AFV按钮被选中时，主声道推子上的Tally灯也会亮起暗黄色。启用FTB时，主声道推子的Tally会闪烁红灯。

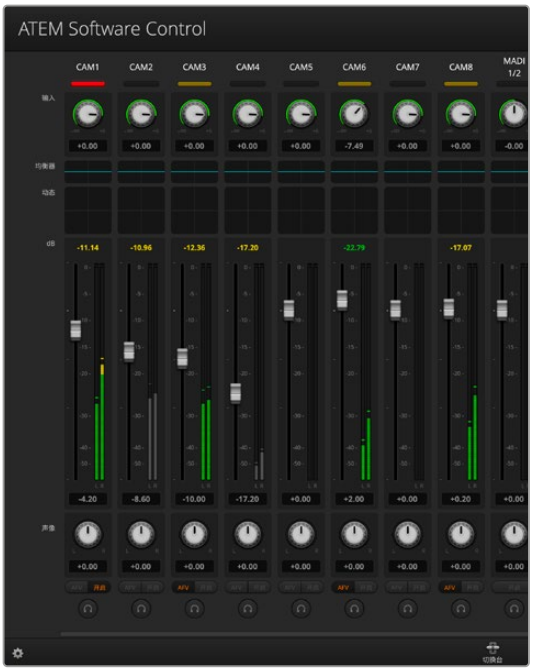
音频电平

点击并上下拖动音频电平推子来设置每台摄影机以及音频源的音频电平增益。每个音频电平表下方的橙色数字代表推子设定的最高音频电平。

音频电平表上方的数字代表音频源达到的峰值电平。如果该数值为绿色则代表中低电平。如果音频电平表经常出现红色，并且其上方的数字也始终不变，则代表您需要降低音频电平以避免音频失真。调整好音频电平后，请单击红色数字使其复位。请注意观察，确保数字不断变化，而不是立即飙升后停留在某个红色数字上。如果发生此类现象，请再次降低音频电平。

音频平衡

调音台支持来自每个音频源的立体声音频。如果您需要改变摄影机或其他音频源的左右声道平衡，请将旋钮调至合适的平衡点。



图中Cam1的ON和AFV按钮都未选定，因此其对应的音频表显示为灰色，表示此路音频不会被使用。Cam2的AFV被选定，但Tally指示灯显示暗黄色，说明摄影机未处于播出状态，因此该音频未处于使用状态。Cam4和Cam7的直接混合ON复选框被选中，因此它们的混合音频一直处于使用状态，并且即使有另一台摄影机也处于播出状态，它们的Tally指示灯也会保持亮起。Cam3、Cam5、Cam6以及Cam8的音频电平表显示未从这几台摄影机检测到音频信号。

音频源选择

每个音频电平表下方都设有“开启”和“AFV”按钮，用来选择将哪路音频源发送到切换台的节目输出。

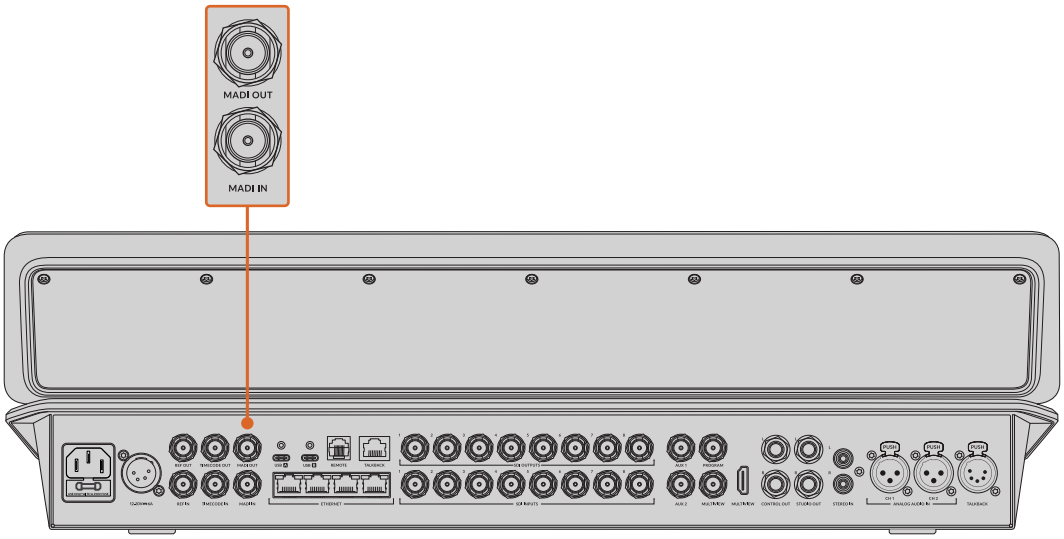
开启	将直接混合选择为“开启”后，即使对应的视频源并未处于播出状态也可使音频输入永久混合在节目输出中。因为音频始终处于播出状态，红色Tally指示灯也会一直亮起。选择这一选项后会自动禁用AFV功能。
AFV	AFV即“音频跟随视频”，启用后可让音频在输入源发生变化时交叉渐变。音频只会在输入源处于播出状态时发送至节目输出，同时，其上方Tally指示灯会亮起红色。从直播切换下来时，其对应的Tally指示灯会亮起暗黄色。选择这一选项后，系统会自动禁用直接混合ON设置。

主音频电平输出

调音台右侧的主推子用于设置SDI节目输出上的音频电平增益，并有其单独的音频电平表。在主音频输出推子上选定AFV按钮可启用AFV淡入黑场功能。当点击FTB按钮时，主音频也会逐渐减弱。

使用MADI

您的ATEM切换台支持使用MADI协议传输数字音频，MADI是“多通道音频数字接口”的英文首字母缩写。MADI多用于专业级音频生产商、播出机构和高端录音等设备。这些MADI端口采用经久耐用的BNC接口，可通过75欧姆同轴电缆实现最长100米的音频数据传输。



除了配备用于MADI音频的BNC接口之外，还设有1/4英寸TRS接口，可输入和输出模拟音频。

MADI输入

MADI通道1–32可接收采样率为48kHz的24bit位深数字音频。这些接口可连接调音台的额外16个立体声通道，用来混合到节目输出上，并且拥有与视频输入混音通道相同的EQ和动态控制。有了这16个额外的立体声通道输入，您就能在ATEM切换台内进行各种复杂的混音。

MADI输出1

MADI输出1可发送以下信号源：

通道1–16	SDI输入1–8的通道1和2
通道17/18	媒体播放器1音频
通道19/20	媒体播放器2音频

耳机设置

耳机设置用来调整耳机混音。可通过前面板上的5针XLR接口连接耳麦，与摄像师对话。但是耳机的使用范围并不局限于对讲，您还能利用它的麦克风来添加画外音，用耳机来监听节目音频。

耳机设置可以混合每个监听输出的电平。比如，您可以根据节目音频调高或调低对讲音频的电平。

主设置

调整主声道电平滑块可设置耳机的节目音频电平，如果不想听到节目音频，只要把这个滑块移到最左侧即可。

对讲

对讲电平滑块可用来调整摄影师与您对话时的音频电平。通过调整主声道和对讲滑块，您可以为耳机上的对讲和节目音频设置最佳平衡。

侧音

侧音电平滑块可让您将耳机麦克风中的声音混合到监听输出中。使用降噪耳机时，这一功能非常有用。

先进的Fairlight控制

ATEM Television Studio切换台配备先进的Fairlight音频控制，可强化并美化每路输入和主输出上的音质。具体包括输入电平控制、6频段参量均衡器以及强大的动态设置。本手册该部分内容将介绍如何使用不同的Fairlight音频工具来完成并优化现场制作的混音。

输入电平

一般来说，设置混音时，第一步是要先正常化各路输入。这就需要调整每路输入上的输入电平旋钮，以便将各路电平提升到最高级别，并且不出现削波。

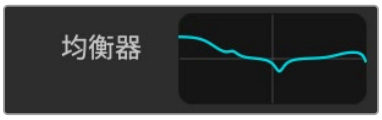
这项控制位于每个轨道顶部，Tally灯下方的位置。点击旋钮并左右拖动来更改电平，向左拖可降低电平，向右拖则提高电平。设置输入控制后，所有输入都会调整为常规信号强度，也就是削波阈值范围内的最高值。然后，您可以开始进行更高级的改动和修整。

对所有输入电平进行正常化处理后，您就可以开始使用6频段参量均衡器和动态控制来优化和完成每路音频输入了。

6频段参量均衡器

每路输入以及主输出都设有一个6频段参量均衡器，可用来控制特定的频率。这包括减少麦克风输入的低频嗡嗡声或噪音，或者提高音量较轻轨道上的低频，甚至添加每路输入上的独特性，让它们在终混中更具辨识度。您可以有很多创意选择。

点击相应的均衡器标识，就可以打开某路输入或主输出的参量均衡器。



点击某路输入的均衡器图标可打开6频段参量均衡器

您最先注意到的是窗口顶部的图表，以及依次排开的1到6号数字指示。这些被编号的指示是可以调节的控制柄，分别对应1到6频段。

这个6频段参量均衡器的每个频段都设有一栏设置。根据您控制的频段以及您使用的滤波器类型，这些设置也会有所不同。

每路音频输入都设有专门的6频段参量均衡器。

如果您想要更改设置，首选需要确保该频段处于启用状态。点击相应频段标签将其启用。启用后，该按钮的标签会亮起蓝色。现在，您就可以更改该频段的设置，或点击拖动控制柄进行快速调整。

提示 本章节后面部分内容会详细介绍频段滤波器。

控制柄

每个频段的曲线图上都分布了多个控制柄。您可以分别点击拖动每个控制柄来选择想要调整的该频段的频率，并相应设置增益。用鼠标来移动一个控制柄的时候，频率和增益设置都会同时受到影响，从而对全范围频率的每个频段进行快速调整。

备注 用控制柄进行调整时，请务必确保频段已启用。点击您希望调整的频段。启用后，频段标签将亮起蓝色。

左右拖动控制柄时，您会注意到频段设置中的频率和分贝会相应更新。这也会通过“低”、“中低”、“中高”、以及“高”所对应的频率范围预设按钮给出反馈。

频率旋钮

您还可以使用每个频段的频率旋钮来选择特定的频率进行调整。

范围预设

每个频段的频率范围是通过范围预设按钮予以定义的。例如，低的频率范围会以“低”表示，它包括从30到395Hz的频率范围。

接下来的例子可以快速示范范围预设是如何定义频率范围的：请从频段滤波器列表中选择陷波滤波器，然后点击每个范围预设。您会看到滤波器沿着曲线图移动到一个位置，这个位置对应您选择的范围预设。这样您就可以快速定义一个特定频率范围，让滤波器作用于该范围。

下面的表格列出了每个范围预设设置的频率范围。

范围预设	频率范围
低	30Hz到395Hz
中低	100Hz到1.48kHz
中高	450Hz到7.91kHz
高	1.4kHz到21.7kHz

增益旋钮

左右拖动增益旋钮可降低或升高所选频率的音量电平。

品质因数

对2、3、4、5频段应用了钟形滤波器时，就可以进行品质因数控制。该控制可以设置滤波器将会影响的频率范围。例如，设置为最小可以让滤波器的影响范围扩展到周边频率，设置为最大可以将影响细化到一个点。如果您在进行更改时需要包括或排除周边频率，而这些周边频率当中含有音质，那么这一设置就很重要。

调整品质因数时，请注意观察曲线效果形状的变化，它会从一个平缓圆滑的边缘变成一个尖角。这一视觉反馈显示了目标频率周围的频率区域所受的影响。

提示 点击均衡器窗口最上方的绕过按钮，即可对比修改后的音频和未修改的原始音频。您可以打开或关闭均衡器。

频段滤波器

共有六种不同的频段滤波器可供选择。这些滤波器包括钟形滤波器、高架滤波器、低架滤波器、陷波滤波器、高通滤波器和低通滤波器。这些滤波器能帮助您控制频率范围内的特定区域。例如，低架滤波器可以用来提高或降低图表中较低频率的音量电平，而高架滤波器可以用来控制更高的频率。

为频段3设置一个低架滤波器，并更改增益设置。您会看到，所做更改影响的是图表中较低部分的频率。

以下是每类滤波器的描述。

钟型滤波器

该滤波器可用来提高或降低指定频率周边的频率范围。

高架滤波器

可提高或降低图表中较高频率的音量电平。

低架滤波器

可提高或降低图表中较低频率的音量电平。

陷波滤波器

该滤波器可移除或剪切某个特定频率。

高通滤波器

可平滑地移除极低频率，允许高频率顺利无阻地通过。

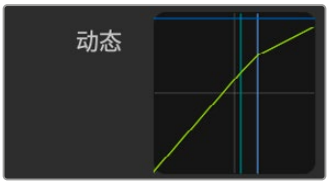
低通滤波器

可平滑地移除极高频率，允许低频率顺利无阻地通过。

提示 进行多项调整时，会出现每个频段的滤波器在曲线图上重叠的情况。比如，您可以对频段4应用低架滤波器，并对频段5应用陷波滤波器，从而降低同一个范围的频率。

动态控制

除了6频段参量均衡器之外，您还可以使用动态控制来强化并微调输入和主输出音频。均衡器可以用来控制信号的频率，而动态控制可以用来设置电平的表现方式。您可以调整信号中的电平，包括扩展低电平和高电平之间的动态范围以及对输入设置门限，以便选择信号中需要更强或更弱的部分，甚至可以使用压缩器和限制器，在不出现削波的前提下整体提升音频使之更响。



点击相应的动态提示标识可打开每路输入和主输出的动态控制

结合均衡器控制，这些功能就会非常强大，让您精准操控和定义音频，并整体优化主输出的音质。

本章节会介绍扩展器、门限器、压缩器和限制器等控制。

常用动态设置

扩展器/门限器、压缩器和限制器采用同样的设置，可用来分别控制每个功能对音频的影响。比如，某项功能在到达哪一数值时启用，该功能的作用时长，以及功能的强度等。具体可用的设置取决于您所使用的动态控制。

阈值	可设置功能启用的声音电平。比如，把压缩器的阈值设置为–20dB后，当信号超过–20dB时，切换台就会激活压缩功能。而把扩展器的阈值设置为–40dB后，当信号电平低于–40dB时，切换台就会激活扩展功能。
范围	该设置可定义受功能影响的分贝范围。
比例	该设置可定义功能启用后的最大强度。
启动	可设置功能启用后的平滑度。比如，较长的启动时间可以让这一功能逐渐作用于信号，整个处理过程相对和谐，因此不容易被察觉；而较短的启动时间则更适合存在较多且较快音量变化的复杂声音活动，在这种情况下使用较长的启动时间则容易造成瑕疵。
维持	动态功能的持续时间，可调节。
释放	与“启动”类似，只是作用于功能的结束部分。比如，当电平超过设定的阈值时，该设置可以让动态功能逐渐或快速结束作用。

扩展器/门限器

第一组动态控制参数可在扩展和门限之间切换。

扩展可通过降低信号中与较响的部分相比相对较轻部分的电平，从而突出音量的差别。扩展器可以用来强调音轨中安静和响亮部分的差异，也可以用来提高某个信号的动态范围从而将不需要的噪音最小化处理。

门限相当于一个夸大的扩展器，它可以降低电平，甚至对信号中低于某一特定电平的部分进行静音，从而降低或消除录音中安静部分的噪音。例如，15到20dB的范围可以降低人声轨道中的呼吸声，但声音听上去依旧很自然。

门限极其有效且非常强大，因此使用时需要小心谨慎。如果门限器的阈值设得过高，就会产生瑕疵，比如某个音节的开头被剪掉了，或者某个词结束后忽然变安静。您可以进行补偿，具体做法是略微降低阈值，或提高启动时间和释放时间。

压缩器

压缩可以降低音频信号中的峰值，并降低信号的动态范围，以便您在不出现削波的前提下提升整体电平。这一工具有助于帮您确保信号中较响的元素不盖住较轻元素的声音，或者帮助您平滑改变信号的音频电平。

提示 设置完均衡器控制后，还需要应用压缩器。

补偿

补偿设置可结合压缩设置来提高整体信号。使用压缩器降低较响的音频后，您就可以使用补偿控制来强化整体声音并且不出现削波。

限制器

限制器能防止信号峰值超过设定的最大电平。限制器有助于防止硬削波。例如，如果您将限制器设置为–8dB，那么输入信号就不会超过该电平。调整启动、维持和释放时间设置可以设定限制器对信号的影响强弱程度。

动态控制的特点

控制	最小	默认	最大
扩展器/门限器			
扩展器控制*			
阈值	–50dB	–45dB**	0dB
范围	0dB	18dB	60dB
比例	1.0:1	1.1:1	10:1
启动	0.5ms	1.4ms	30ms
维持	0.0ms	0.0ms	4s
释放	50ms	93ms	4s
门限控制*			
阈值	–50dB	–45dB**	0dB
范围	0dB	18dB	60dB
启动	0.5ms	1.4ms	30ms
维持	0.0ms	0.0ms	4s
释放	50ms	93ms	4s
压缩器			
压缩器控制			
阈值	–50dB	–35dB	0dB
比例	1.0:1	2.0:1	10:1
启动	0.7ms	1.4ms	30ms
维持	0.0ms	0.0ms	4s
释放	50ms	93ms	4s
限制器			
限制器控制			
阈值	–50dB	–12dB	0dB
启动	0.7ms	0.7ms	30ms
维持	0.0ms	0.0ms	4s
释放	50ms	93ms	4s

* 主动态控制中未使用主动态扩展器/门限控制。

** 主动态控制扩展器/门限阈值默认为–35dB。麦克风动态控制和XLR动态扩展器/门限阈值默认为–45dB。

使用摄影机控制

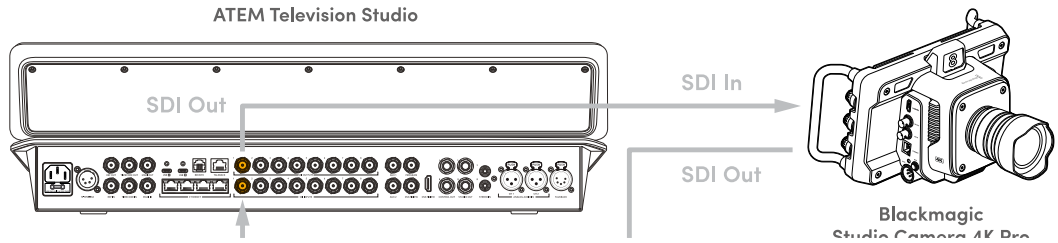
点击ATEM Software Control中的“摄影机”按钮后，可打开摄影机控制功能，实现从ATEM切换台控制多台Blackmagic Studio Camera 6K Pro和URSA Broadcast G2等Blackmagic摄影机。使用兼容镜头时，您可以通过这一功能轻松设置Blackmagic摄影机的光圈、增益、对焦和变焦控制，并能使用摄影机内置的DaVinci Resolve一级调色工具平衡摄影机色彩，缔造独特炫彩画面。

ATEM摄影机控制的工作原理是通过所有ATEM切换台的非下变换SDI输出接口向目标设备发送摄影机控制数据包。也就是说，您将切换台的一路SDI输出连接到摄影机的SDI返送输入上后，摄影机会检测到SDI连接中包含的控制数据包，可供您控制摄影机的各项功能。

ATEM摄影机控制

要连接摄影机：

1. 将Blackmagic摄影机的SDI输出连接到ATEM切换台的SDI输入。
2. 将ATEM切换台的任何一路SDI输出（多画面分割输出口除外）连接到摄影机的节目SDI输入接口。摄影机控制信号不通过多画面分割输出口发送。
3. 在摄影机设置中，请将摄影机ID编号设置为匹配您切换台输入的号码。例如，如果Studio Camera 1连接到ATEM切换台的“Input 1”接口，那么您摄影机设置中的摄影机编号应设置为1。这样可以确保Tally信号被准确发送到相应的摄影机上。



摄影机控制面板

启动ATEM Software Control，点击位于软件窗口底部的摄影机按钮后，系统会显示一排有标签的Blackmagic摄影机控制窗口，窗口内包含各类工具，可用来调节和美化每台摄影机的画面。这些控制窗口使用起来十分简单。只需以鼠标点击某个按钮，或点击并拖动来调节即可。

摄影机控制选择
